Henriquesia Pass. & Thüm. (1879) [non *Henriquesia* Spruce ex Benth. 1854, *Rubiaceae*] ≡ Delpinoina.

Hepataria Raf. (1808) ? = Tremella Pers. fide Merrill (*Index Rafinesq.*: 69, 1949).

hepatic (1) concerning the liver; (2) a liverwort.

hepaticolous, growing on liverworts (*Hepaticae*); see Bryophilous fungi.

Heppia Nägeli ex A. Massal. (1854), Lichinaceae (L). 7, widespread (esp. desert or dry areas). See Wetmore (*Ann. Mo. bot. Gdn* **57**: 158, 1971; N. Am.), Swinscow & Krog (*Norw. Jl Bot.* **26**: 213, 1979; E. Afr.), Filson (*Muelleria* **6**: 495, 1988; Australia), Egea (*Biblthca Lichenol.* **31**, 1989; W. Eur. & N. Afr.), Henssen (*Acta Bot. Fenn.* **15**: 57, 1994; key), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key), Schultz & Büdel (*Lichenologist* **35**: 151, 2003; posn).

Heppiaceae Zahlbr. (1906) = Lichinaceae.

Lit.: Büdel (*Biblthca Lichenol.* **23**: 105 pp., 1987), Upreti & Büdel (*J. Hattori bot. Lab.* **68**: 279, 1990), Henssen (*Acta Bot. Fenn.* **150**: 57, 1994), Schultz *et al.* (*Pl. Biol.* **3**: 116, 2001), Schultz & Büdel (*Lichenologist* **35**: 151, 2003; phylogeny), Jørgensen (*Nordic Lichen Flora* **3**: Cyanolichens: 43, 2007).

Heppiomyces Cif. & Tomas. (1953) ≡ Heppia.

Heppsora D.D. Awasthi & Kr.P. Singh (1977), Tephromelataceae (L). 1, India; Middle East. See Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1989), Poelt & Grube (*Nova Hedwigia* **57**: 1, 1993; status), Mies & Schultz (*Biblthca Lichenol.* **88**: 433, 2004;

Yemen).

Heptameria Rehm & Thüm. (1879), Dothideomycetes. 2, Europe. See Lucas & Sutton (*TBMS* **57**: 283, 1971).

Heptasporium Bref. (1908) = Sistotrema Fr. fide Rogers (*Mycol.* **36**: 70, 1944).

Heptaster Cif., Bat. & Nascim. (1956), anamorphic *Capnodiales*, Hsy.0bP.?. 2, Brazil. See Hughes (*Mycol.* **68**: 810, 1976; ? = *Tripospermum*).

Heraldoa Bat. (1959) = Lembosia fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Herbampulla Scheuer & Nograsek (1993), ? Magnaporthaceae. 1 (on grasses), Austria. See Scheuer & Nograsek (*Mycotaxon* **47**: 415, 1993).

herbarium (pl. **-ia**), (1) a collection of dried plants; (2) the place in which such a collection is stored. Often also used for dried Reference collections (q.v.) of fungi, especially when curated along with plant specimens.

herbarium beetle, *Stegobium paniceum*, may eat the spores of certain fungi, esp. *Lycoperdon* and smuts. See Gordon (*TBMS* **21**: 193, 1938), Bridson & Forman (*The herbarium handbook*, rev. edn, 1992; control), Pinniger (*Biodet. Abstr.* **5**: 125, 1991; control).

herbicolous, living on herbs.

Hercospora Fr. (1825), Diaporthales. Anamorph *Rabenhorstia*. 2 (from bark), Europe. See Petrak (*Annls mycol.* **36**: 44, 1938), Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Herculea Fr. (1823) = Podaxis fide Kuyper (*in litt.*).

Hericiaceae Donk (1964), Russulales. 3 gen. (+ 9 syn.), 12 spp.

Lit.: Donk (*Persoonia* **3**: 199, 1964), Ginns (*Windahlia* **16**: 35, 1986), Koski-Kotiranta & Niemelä (*Karstenia* **27**: 43, 1987), Stalpers (*Stud. Mycol.* **40**: 185 pp., 1996), Hibbett & Donoghue (*Syst. Biol.* **50**: 215, 2001), Larsson & Larsson (*Mycol.* **95**: 1037, 2003).

Hericiales = Russulales.

Hericium Fr. (1825) ≡ Hericium Pers. fide Hall & Stuntz (*Mycol.* **63**: 1103, 1971; subgen. key).

Hericium Pers. (1794), Hericiaceae. 5, widespread (north temperate). See Stalpers (*Stud. Mycol.* **40**: 79, 1996; key), Arnolds (*Coolia* **46** 3, Suppl.: 96 pp., 2003; The Netherlands and Belgium), Bohlin (*MR* **108**: 3, 2004; conservation status).

Hericius Juss. (1789) ≡ Hericium Pers.

Heringia Schwein. ex Berk. & Curtis (1853) nom. nud., ? Fungi.

Hermanniasporidium Thor (1930) nom. dub., ? Fungi. 1, Svalbard.

Hermatomyces Speg. (1910), anamorphic *Pezizomycotina*, Hsp.#eP.1. 3, widespread (tropical). See Hughes (*Mycol. Pap.* **50**: 100, 1953).

Herminia R. Hilber (1979) = Eosphaeria fide Petrini *et al.* (*TBMS* **82**: 554, 1984), Barr (*Mycotaxon* **39**: 43, 1990; status), Hilber & Hilber (*The genus Lasiosphaeria and Allied Taxa*, 2002).

Herpobasidium Lind (1908), Eocronartiaceae. Anamorph *Glomopsis*. 4, widespread. See Donk (*Persoonia* **4**: 158, 1966), Donk (*Persoonia* **4**: 214, 1966), Oberwinkler & Bandoni (*TBMS* **83**: 639, 1984), Bauer & Oberwinkler (*CJB* **72**: 1229, 1993; ultrastr., posn).

Herpocladiella J. Schröt. (1894) nom. dub., ? Mucorales. See Hesseltine (*Mycol.* **47**: 344, 1955).

Herpocladium J. Schröt. (1886) [non *Herpocladium* Mitt. 1873, *Hepaticae*] ≡ Herpocladiella.

Herpomyces Thaxt. (1903), Herpomycetaceae. 25 (on cockroaches), widespread. See Tavares (*Mycol.* **57**: 104, 1965; development), Tavares (*Mycotaxon* **11**: 485, 1980), Santamaría (*Fl. Mycol. Iberica* **5**, 2003; Iberian peninsula).

Herpomycetaceae I.I. Tav. (1981), Laboulbeniales. 1 gen., 25 spp.

Lit.: Majewski & Sugiyama (*Trans. Mycol. Soc. Japan* **26**: 295, 1985), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Majewski (*Trans. Mycol. Soc. Japan* **29**: 33, 1988), Santamaria *et al.* (*Treb. Inst. Bot. Barcelona* **14**: 1, 1991).

Herposira Syd. (1938), anamorphic *Pezizomycotina*, Hsy/Cpd.0eP.?. 1, Australia.

Herpothallaceae Tomas. ex Tomas. (1950) = Arthoniaceae.

Herpothallon Tobler (1937) = Cryptothecia fide Thor (*Bryologist* **94**: 278, 1991).

Herpothallonomyces Cif. & Tomas. (1954) ≡ Herpothallon.

Herpothrix Clem. (1909) ? = Chaetomastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Herpotrichia Fuckel (1868), Pleosporales. Anamorph *Pyrenochaeta*. 28, widespread. *H. juniperi* (brown felt blight, snow moulds, of conifers in cold regions). See Sivanesan (*Mycol. Pap.* **127**, 1972; key), Barr (*Mycotaxon* **20**: 1, 1984; key 4 spp., gen. concept), von Arx & Müller (*Sydowia* **37**: 6, 1984), Hyde & Aptroot (*Nova Hedwigia* **66**: 247, 1998), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999; phylogeny), Chen & Hsieh (*Sydowia* **56**: 24, 2004; Taiwan), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Herpotrichiella Petr. (1914) = Capronia fide Müller *et al.* (*TBMS* **88**: 63, 1987).

Herpotrichiellaceae Munk (1953), Chaetothyriales. 13 gen. (+ 22 syn.), 84 spp.

Lit.: Barr (*Rhodora* **78**: 53, 1976), Müller *et al.* (*TBMS* **88**: 63, 1987), Janex-Favre (*Cryptog. Mycol.* **9**: 133, 1988; ontogeny), Braun & Feiler (*Microbiol. Res.* **150**: 81, 1995), Untereiner *et al.* (*MR* **99**: 897, 1995; molec. taxonomy), Untereiner *et al.* (*MR* **99**: 897, 1995), Haase *et al.* (*J. Clin. Microbiol.* **34**: 2049, 1996), Uijthof & Hoog (*Culture Collections to Improve the Quality of Life, Proceedings of the Eighth International Congress for Culture Collections, Veldhoven, The Netherlands, 25-29 August 1996*: 389, 1996), Untereiner (*Mycol.* **89**: 120, 1997), Hoog *et al.* (*Medical Mycology* **36** Suppl. 1: 52, 1998), Au *et al.* (*Mycol.* **91**: 326, 1999), de Hoog (*Stud. Mycol.* **43**, 1999; ecology, phylogeny), Gerrits van den Ende & Hoog (*Stud. Mycol.* **43**: 151, 1999), Haase *et al.* (*Stud. Mycol.* **43**: 80, 1999), Hoog *et al.* (*Stud. Mycol.* **43**: 133, 1999), McKemy *et al.* (*Mycol.* **91**: 200, 1999), Rogers *et al.* (*Stud. Mycol.* **43**: 122, 1999), Untereiner & Naveau (*Mycol.* **91**: 67, 1999), Gams (*Stud. Mycol.* **45**: 192, 2000), Untereiner (*Stud. Mycol.* **45**: 141, 2000), Abliz *et al.* (*FEMS Immunol. Med. Microbiol.* **40**: 41, 2004).

Herpotrichiopsis Höhn. (1914) = Pyrenochaeta fide Clements & Shear (*Gen. Fung.*, 1931).

Herpotrichum Fr. [not traced] nom. dub. = Protonema fide Fries (*Syst. orb. veg.*, 1825) based on mycelium fide, Fries (*Summa veg. Scand.*, 1849).

Herreromyces R.F. Castañeda & W.B. Kendr. (1991), anamorphic *Pezizomycotina*, Hso.0eH.15. 1, Cuba. See Castañeda Ruiz & Kendrick (*Univ. Waterloo Biol. Ser.* **35**: 60, 1991).

Herteliana P. James (1980), Ramalinaceae (L). 4,

widespread. See James (*Lichenologist* **12**: 106, 1980).

Hertelidea Printzen & Kantvilas (2004), ? Stereocaulaceae (L). 4, widespread. See Printzen & Kantvilas (*Biblthca Lichenol.* **88**: 541, 2004), Kantvilas & Elix (*Australasian Lichenology* **59**: 30, 2006; Australia).

Hertella Henssen (1985), Placynthiaceae (L). 2, southern hemisphere. See Henssen (*Mycotaxon* **22**: 382, 1985), Henssen (*Biblthca Lichenol.* **88**: 195, 2004).

Hesperomyces Thaxt. (1891), Laboulbeniaceae. 5, widespread. See Weir & Beakes (*Mycol.* **88**: 677, 1996; ontogeny), Weir & Blackwell (*Mycol.* **93**: 802, 2001; DNA extraction), Santamaría (*Fl. Mycol. Iberica* **5**, 2003; Iberian peninsula).

Hessea Ormières & Sprague (1973), Microsporidia. 1.

Hesseltinella H.P. Upadhyay (1970), Cunninghamellaceae. 1, Brazil. See Upadhyay (*Persoonia* **6**: 111, 1970), Stuart & Young (*TBMS* **89**: 392, 1987; morphology), Benny & Khan (*Scanning Microsc.* **2**, 1988), Benny & Samson (*Mem. N. Y. bot. Gdn* **49**: 11, 1989), Benny & Benjamin (*Mycol.* **83**: 713, 1991), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

Heterina Nyl. (1858) = Heppia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

hetero- (prefix), other; not normal; different.

Heteroacanthella Oberw. (1990), Auriculariales. Anamorph *Acanthellorhiza*. 2, Taiwan; USA; British Isles. See Duhem & Trichiès (*Bulletin, Société Mycologique du Limousin* **121**: 119, 2005; France).

Heteroacanthellaceae P. Roberts (1998) = Ceratobasidiaceae.

Heterobasidiaceae Jülich (1982) = Bondarzewiaceae.

Heterobasidiomycetes R.T. Moore (1980), see *Basidiomycota*.

Heterobasidion Bref. (1888), Bondarzewiaceae. Anamorph *Spiniger*. 6, widespread (temperate). *H. annosum* (syn. *Fomes annosus*), serious root rot of conifers. See Stalpers (*Stud. Mycol.* **40**: 79, 1996; key), Bahnweg *et al.* (*J. Phytopath.* **150**: 382, 2002; PCR detection), Dai *et al.* (*MR* **106**: 1435, 2002; sexuality and intersterility in *Heterobasidion insulare* complex), Johannesson & Stenlid (*Mol. Phylogen. Evol.* **29**: 94, 2003; phylogeography), Ota *et al.* (*Mycol.* **98**: 717, 2006; phylogeny Japanese species).

Heterobasidium Massee (1889) nom. conf., Agaricomycetes.

heterobasidium, see basidium.

Heterobotrys Sacc. (1880) = Seuratia fide Meeker (*CJB* **53**: 2462, 1975).

Heterocarpon Müll. Arg. (1885), Verrucariaceae. 1, USA. See Harada (*SA* **10**: 1, 1991).

Heterocephalacria Berthier (1980) = Syzygospora fide Ginns (*Mycol.* **78**: 619, 1986).

Heterocephalum Thaxt. (1903), anamorphic *Pezizomycotina*, Hsy.0eH.15. 1, widespread (tropical). See Onofri *et al.* (*TBMS* **87**: 551, 1987; SEM), Persiani & Maggi (*TBMS* **87**: 631, 1986; Cote d'Ivoire), Sharma *et al.* (*Journal of Mycology and Plant Pathology* **34**: 69, 2004; India).

Heteroceras Sacc. (1915) ≡ Neoheteroceras fide Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Heterochaete Pat. (1892), Auriculariaceae. *c.* 40, widespread (esp. tropical). See Bodman (*Lloydia* **15**: 193, 1952), Roberts (*Mycotaxon* **87**: 25, 2003; Venezuela), Roberts (*Mycotaxon* **96**: 83, 2006; Jamaica).

Heterochaetella (Bourdot) Bourdot & Galzin (1928), Auriculariales. *c.* 2, widespread. See Luck-Allen (*CJB* **38**: 559, 1960), Roberts (*Mycotaxon* **69**: 209, 1998), Weiss & Oberwinkler (*MR* **105**: 403, 2001; phylogeny).

Heterochlamys Pat. (1895) [non *Heterochlamys* Turcz. 1843, *Euphorbiaceae*] ≡ Gilletiella.

Heteroconidium Sawada (1944), anamorphic *Pezizomycotina*, Hsy.≡ eH+0eH.?. 1 (dimorphic), Taiwan.

Heteroconium Petr. (1949), anamorphic *Antennulariella*, Hso.≡ eP.3. 11, S. America; S. Africa. See Ellis (*More Dematiaceous Hyphomycetes*, 1976), Morgan-Jones (*Mycotaxon* **4**: 498, 1976), Chaudhary *et al.* (*MR* **95**: 1070, 1991; India), Castañeda Ruíz *et al.* (*Mycotaxon* **71**: 295, 1999), Hughes & Crane (*Mycol.* **98**: 141, 2006), Hughes (*Mycol.* **99**: 628, 2007), Narisawa *et al.* (*Mycoscience* **48**: 274, 2007; root endophyte), Usuki & Narisawa (*Mycol.* **99**: 175, 2007; symbiosis with *Cruciferae*).

Heterocyphelium Vain. (1927), Lecanorales (L). 1, widespread. See Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Tibell (*Symb. bot. upsal.* **27** no. 1, 1987), Tibell (*Fl. Neotrop.* Monogr. **69**: 78 pp., 1996).

heterocytic, see astatocoenocytic.

Heterodea Nyl. (1868), Cladoniaceae (L). 2, Australia. See Filson (*Lichenologist* **10**: 13, 1978; key), Wedin *et al.* (*Lichenologist* **32**: 171, 2000; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Zhou *et al.* (*J. Hattori bot. Lab.* **100**: 871, 2006; phylogeny).

Heterodeaceae Filson (1978) = Cladoniaceae.
Lit.: Rambold (*Cryptog. Bot.* **5**: 111, 1995), Wedin *et al.* (*Lichenologist* **32**: 171, 2000).

Heterodermia Trevis. (1868), Physciaceae (L). *c.* 80, widespread (esp. tropical). See Swinscow & Krog (*Lichenologist* **8**: 103, 1976; E. Afr. spp.), Kashiwadani *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **16**: 147, 1990; Peru), Trass (*Folia Cryptog. Estonica* **29**: 2, 1992; tab. key), Esslinger & Bratt *in* Glenn *et al.* (Eds) (*Lichenogr. Thomsoniana*: 25, 1998; N. Am., distr.), Kurokawa (*Folia Cryptog. Estonica* **32**: 21, 1998; checklist), Moberg & Nash (*Bryologist* **102**: 1, 1999; Sonoran Desert), Lohtander *et al.* (*Mycol.* **92**: 728, 2000; Scandinavia), Chen & Wang (*Mycotaxon* **77**: 107, 2001; China), Grube & Arup (*Lichenologist* **33**: 63, 2001; morphology, phylogeny), Trass (*Folia cryptog. Estonica* **37**: 93, 2000; Russia etc.), Helms *et al.* (*Mycol.* **95**: 1078, 2003; phylogeny), Moberg (*Biblthca Lichenol.* **88**: 453, 2004; Europe), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Lücking *et al.* (*Systematics & Biodiversity* **6**: 31, 2008; Costa Rica).

Heterodoassansia Vánky (1993), Doassansiaceae. 7 (on aquatic plants), widespread. See Vánky (*Mycotaxon* **48**: 28, 1993).

Heterodothis Syd. & P. Syd. (1914) = Strigula fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

heteroecious (n., **heteroecism**), undergoing different parasitic stages on two unlike hosts, as in the *Pucciniales* (q.v.).

Heteroepichloë E. Tanaka, C. Tanaka, Gafur & Tsuda (2002), Clavicipitaceae. 2, Japan; Java. See Tanaka *et al.* (*Mycoscience* **43**: 92, 2002).

heterogametes, gametes of different form.

heterogamy, the copulation of heterogametes; cf. isogamy.

Heterogastridiaceae Oberw. & R. Bauer (1990), Het-

erogastridiales. 4 gen., 7 spp.

Lit.: Seeler (*Farlowia* **1**: 119, 1943), Bandoni & Oberwinkler (*CJB* **59**: 1613, 1981), Oberwinkler *et al.* (*Mycol.* **82**: 48, 1990), Swann *et al.* (*Mycol.* **91**: 51, 1999), Scorzetti *et al.* (*FEMS Yeast Res.* **2**: 495, 2002).

Heterogastridiales Oberw. & R. Bauer (1990). Microbotryomycetes. 1 fam., 4 gen., 7 spp. Fam.: **Heterogastridiaceae**
For *Lit.* see under fam.

Heterogastridium Oberw. & R. Bauer (1990), Heterogastridiaceae. Anamorph *Hyalopycnis*. 1, widespread (north temperate). See Oberwinkler & Bauer (*Mycol.* **82**: 57, 1990), Bauer *et al.* (*Mycol. Progr.* **5**: 41, 2006).

Heterographa Fée (1824) = Polymorphum fide Hawksworth & Punithalingam (*TBMS* **60**: 501, 1973).

heterokaryosis (adj. **heterokaryotic**), (1) (of cells), the condition of having two or more genetically different nuclei, sometimes as a result of anastomosis, cf. dikaryotic; (2) (of mycelia), being made up of heterokaryotic cells; see Parmeter *et al.* (*Ann. Rev. Phytopath.* **1**: 51, 1963; in plant pathogenic fungi), Caten & Jinks (*TBMS* **49**: 81, 1966; occurrence in nature).

heterokaryotic (1) having two or more slightly (‹ 5%) genetically different nuclei in common cytoplasm (fungi); (2) showing nuclear dimorphism (protists).

heterokaryotise (of rusts and pyrenomycetes), fusion of haploid structures of opposite sex which does not give a conjugate arrangement of the nuclei, cf. diploidization.

heterokont (1) condition whereby a flagellum possesses two rows of tripartite tubular hairs (heterokont flagellum, syn. flimmergeissel, tinsel flagellum); (2) of an organism possessing flagella in pairs, the members of which differ in length; type of motion; external appendages. Usually with kinetosomes mutually attached at a wide angle. Cf. isokont.

heteromerous (1) (of a lichen thallus), having the mycobiont and photobiont in well-marked layers, usually between the medulla and the upper cortex; (2) (of trama in *Russulaceae*), having sphaerocyst nests among filamentous hyphae; cf. homoiomerous.

heteromixis, see heterothallism.

heteromorphic (heteromorphous), (1) having variation from normal structure; (2) having organs of different length; (3) (of agaric lamella edge), sterile due to the pressure of cystidia; cf. homomorphous.

Heteromyces L.S. Olive (1957) ≡ Oliveonia.

Heteromyces Müll. Arg. (1889), Cladoniaceae (L). 1, Brazil. See Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA).

Heteromycophaga P. Roberts (1997), anamorphic *Tremellomycetes*. 2, Great Britain. See Roberts (*Mycotaxon* **63**: 210, 1997).

Heteronectria Penz. & Sacc. (1898) = Cercophora fide Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972).

Heteropatella Fuckel (1873), anamorphic *Heterosphaeria*, St.≡ eH.10. 5, widespread (temperate). *H. antirrhini* (*Antirrhinum* shot hole). See Leuchtmann (*Mycotaxon* **28**: 261, 1987), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993; key).

Heteropera Theiss. (1917) = Phomatospora fide Petrak (*Sydowia* **14**: 347, 1960).

Heterophracta (Sacc. & D. Sacc.) Theiss. & Syd. (1918) = Merismatium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

heterophytic, the equivalent in the sporophyte generation of dioecious in the gametophyte generation (Blakeslee, *Bot. Gaz.* **42**: 161, 1906); cf. homophytic.

Heteroplacidium Breuss (1996), Verrucariaceae (L). 9, widespread. See Breuss (*Annln naturh. Mus. Wien* Ser. B, Bot. Zool. **98**: 40, 1996), Mies & Schultz (*Biblthca Lichenol.* **88**: 433, 2004; Socotra), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

heteroplastic, see heterokaryotic.

Heteroplegma Clem. (1903) = Peziza Fr. fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Heteroporimyces M.K. Elias (1966), Fossil Fungi. 1, New Zealand.

Heteroporus Lázaro Ibiza (1916) ≡ Abortiporus fide Fidalgo (*Rickia* **4**: 99, 1969).

Heteroradulum Lloyd (1917) nom. dub., Fungi.

Heterorepetobasidium Chee J. Chen & Oberw. (2002), Auriculariales. 2, Taiwan. See Chen *et al.* (*Mycol.* **94**: 515, 2002).

Heteroscypha Oberw. & Agerer (1979), Auriculariales. 1, S. Africa. See Oberwinkler & Agerer (*Beih. Sydowia* **8**: 31, 1979).

Heteroscyphaceae Jülich (1979) = Auriculariaceae.

Heteroseptata E.F. Morris (1972), anamorphic *Pezizomycotina*, Hsy.≡ eP.15. 1, Costa Rica. See Morris (*Mycol.* **64**: 889, 1972).

Heterospermales. Le Gal's (1953) term for inoperculate discomycetes; cf. *Homospermales*.

Heterosphaeria Grev. (1824), Helotiaceae. Anamorph *Heteropatella*. 6, Europe. See Leuchtmann (*Mycotaxon* **28**: 261, 1987; key 8 spp.).

Heterosphaeriaceae Rehm (1888) = Helotiaceae.

Heterosphaeriopsis Hafellner (1979), Dothideomycetes. 1, Ecuador. See Hafellner (*Nova Hedwigia* Beih. **62**: 175, 1979).

Heterosporiopsis Petr. (1950), anamorphic *Pezizomycotina*, Hsy.≡ eP.?. 1, S. America. See Petrak (*Sydowia* **4**: 521, 1950), Hughes & Seifert (*Sydowia* **50**: 192, 1998; revision).

Heterosporis Schubert (1969), Microsporidia. 3.

Heterosporium Klotzsch ex Cooke (1877) = Cladosporium fide Hughes (*CJB* **36**: 727, 1958), David (*Mycol. Pap.* **172**: 157 pp., 1997; revision), Braun *et al.* (*Mycol. Progr.* **2**: 3, 2003; phylogeny).

Heterosporula (Singer) Kühner (1980) = Gamundia fide Kuyper (*in litt.*).

heterospory (1) having asexually produced spores of more than one kind (de Bary, 1887: 496) (obsol.); (2) having spores which differ in the mating type (+ or -) in heterothallic fungi (e.g. in *Mucorales*) (Blakeslee, *Bot. Gaz.* **42**: 161, 1906); (3) polymorphism of basidiospores in *Agaricales* associated with extreme conditions (Heim, *Rev. Mycol.* **8**: 32, 1943).

Heterostomum Fr. [not traced] nom. dub., Pezizomycotina.

Heterotextus Lloyd (1922) = Guepiniopsis fide Reid (*TBMS* **62**: 474, 1974).

Heterothallism. Condition of sexual reproduction in which 'conjugation is possible only through the interaction of different thalli' (Blakeslee, 1904). Heterothallism and homothallism (q.v.) were first applied by Blakeslee to the methods of zygospore formation in the Mucorales, and he considered the terms to correspond to dioecism and monoecism for higher plants. Heterothallism has, however, been used as the equivalent of haplodioecism or dioecism (as in *Dictyuchus monosporus*, where male and female organs are produced on different individuals), and self-

sterility or self-incompatibility (as in *Ascobolus magnificus*, where male and female organs are developed on one individual). Whitehouse (*Biol. Rev.* **24**: 411, 1949) distinguished the first type (haplodioecism) as '**morphological -**', and the second (haploid incompatibility) as '**physiological -**'. Physiological heterothallism may be determined either by two allelomorphs at one locus or by multiple allelomorphs at one or two loci (Whitehouse, *New Phytol.* **48**: 212, 1949). Multiple-allelomorph physiological heterothallism is characteristic of the hymenomycetes and gasteromycetes, among which Whitehouse has estimated 35% are heterothallic and bipolar (with one locus), 55% are heterothallic and tetrapolar (with two loci). Pontecorvo (*Adv. Genetics* **5**: 194, 1953) designated as **relative -** the formation of crossed asci in excess of 50% by the combination of certain homothallic strains of *Aspergillus nidulans*. Drayton & Groves (*Mycol.* **44**: 132, 1952) proposed to restrict heterothallism to morphological heterothallism, Korf (*Nature* **170**: 534, 1952) proposed to use heterothallism in a wide physiological sense, distinguishing a morphologically heterothallic organism as being both haplo-dioecious (dioecious) and heterothallic.

Burnett (*New Phytol.* **55**: 50, 1956) proposed the following terminology for mating systems of fungi: **heteromixis** (adj. heteromictic) for fusion of genetically different nuclei which includes **dimixis** when 2 types of nuclei (= heterothallism sensu Blakeslee, morphological, and 2-allelomorph physiological heterothallism), **diaphoromixis** when more than 2 types of nuclei (= multiple allelomorph physiological heterothallism), and **homoheteromixis** = secondary homothallism, amphithallism; **homomixis** (adj. homomictic) = homothallism; **amixis** (adj. amictic), apomixis in haploid organisms.

Manipulation of the mating locus MAT which governs heterothallism in many ascomycetes has been used experimentally to change the reproductive strategy of one species (*Gibberella zeae* from homothallic to heterothallic, making possible simple procedures to obtain sexual recombinants of this species of value in genetic analysis of pathogenicity and the ability to produce mycotoxins (Lee *et al.*, *Molecular microbiology* **50**: 145, 2003). Heterothallism has also been observed in *Peronospora* and *Pythium* and is thus not confined to true Fungi (Danielsen, *J. basic microbiol.* **41**: 305, 2001). See Bistis (*Fungal genetics and biology* **23**: 213, 1998; review in Euascomycetes), Feofilova (*Prikl. biokhim. Mikrobiol.* **42**, 2006; review for Mucoraceae of biological implications and uses in biotechnology).

Heterothecium Flot. (1850) ≡ Megalospora Meyen fide Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Heterothecium Mont. (1852) nom. illegit. ≡ Lopadium.

Heterotolyposporium Vánky (1997), Anthracoideaceae. 2 (on *Cyperaceae*, *Juncaceae*), Australiasia; S. Africa. Has two kinds of spores. See Vánky (*Mycotaxon* **63**: 143, 1997), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002; New Zealand).

heterotroph (adj. **heterotrophic**) (of living organisms), using organic compounds as primary sources of energy, cf. autotrophic.

Heterovesicula C.E. Lange, C.M. Macvean, J.E. Henry, D.A. Streett (1995), Microsporidia. 1.

heteroxenous, having more than one host.

heterozygous, having heterokaryosis resulting from the fusion of gametes.

Heuflera Bail (1860), Pezizomycotina. 1, Europe.

Heufleria Auersw. (1869), Rhytismatales. 1 (on *Elyna*), Europe.

Heufleria Trevis. (1853) ≡ Astrothelium.

Heufleria Trevis. (1861) [non *Heufleria* Trevisan 1853; fide Trevisan 1861] = Cryptothelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Heufleridium Müll. Arg. (1883), Pyrenulales (L). 2, widespread (tropical; New Zealand).

Hexacladium D.L. Olivier (1983), anamorphic *Pezizomycotina*, Hso.1bH.1/10. 1 (on pollen grains), S. Africa. See Olivier (*TBMS* **80**: 237, 1983).

Hexagona, see *Hexagonia Fr.*

Hexagonella F. Stevens & Guba ex F. Stevens (1925), Schizothyriaceae. 1, Hawaii.

Hexagonia Fr. (1838), Polyporaceae. 16, widespread (esp. tropical). See Bondartzev & Singer (*Polyporaceae of the European part of the U.S.S.R. and Caucasus*: 1106 pp., 1953) = Polyporus (Polypor.) sensu, Fidalgo (*Mem. N. Y. bot. Gdn* **17**: 35, 1968), Fidalgo (*Taxon* **17**: 37, 1968), Pegler (*The polypores [Bull. BMS Suppl.]*, 1973), Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 366, 1980; key 11 Afr. spp.), Jülich (*Persoonia* **12**: 107, 1984; nomencl.) = Apoxona (Coriol.) sensu.

Hexagonia Pollini (1816) nom. rej. = Polyporus P. Micheli ex Adans. fide Ryvarden (*Syn. Fung.* **5**, 1991).

Hexajuga Fayod (1889) ≡ Clitopilus.

Heydenia Fresen. (1852), anamorphic *Pezizomycotina*. 4, widespread (north temperate). See Carmichael *et al.* (*Genera of Hyphomycetes*, 1980), Hairaud & Moreau (*Bulletin Mycologique et Botanique Dauphiné-Savoie* **42** no. 166: 47, 2002; France).

Heydeniopsis Naumov (1915) = Chaenotheca fide Seifert & Brodo (*Sydowia* **45**: 101, 1993).

Heyderia Link (1833), ? Hemiphacidiaceae. 6, widespread. See Maas Geesteranus (*Persoonia* **3**: 87, 1964), Knudsen (*Bot. Tidsskr.* **69**: 248, 1978; Denmark), Benkert (*Gleditschia* **10**: 141, 1983; key 5 spp.), Siepe (*Beitr. Kenntn. Pilze Mitteleur.* **2**: 193, 1986; key 3 spp. Eur.), Malaval (*Docums Mycol.* **19**: 9, 1989; ascus ultrastr.), Wang *et al.* (*Am. J. Bot.* **92**: 1565, 2005; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

hiascent, becoming wide open.

Hiatula (Fr.) Mont. (1854) ? = Mycena fide Singer (*Agaric. mod. Tax.* 4th ed: 846, 1986).

Hiatulopsis Singer & Grinling (1967), Agaricaceae. 2, Brazil; Congo. See Singer & Grinling (*Persoonia* **4**: 364, 1967), Singer (*Fieldiana, New Series* **21**: 1, 1989).

Hidakaea I. Hino & Katum. (1955), ? Microthyriaceae. 1, Japan. See Hino & Katumoto (*Bulletin of the Faculty of Agriculture, Yamaguchi University* **6**: 38, 1955).

Hiemsia Svrček (1969), Pyronemataceae. 1 or 2, Europe. See Hohmeyer (*Mitt. Arbeitsg. Pilzk.Niederrhein* **6**: 11, 1988).

Higginsia Nannf. (1932) [non *Higginsia* Pers. 1805, *Rubiaceae*] ≡ Blumeriella.

higher fungi, *Ascomycota*, *Basidiomycota*, Anamorphic fungi.

hilar appendage (of basidiospores), the small wart-like or cone-like projection which connects the spore with

the sterigma; sterigmatal appendage (Smith); apicule (Josserand). Cf. apophysis.

Hilberina Huhndorf & A.N. Mill. (2004), Sordariomycetes. 1. See Miller & Huhndorf (*MR* **108**: 31, 2004).

Hildebrandiella Naumov (1917) ? = Syzygites fide Hesseltine (*Mycol.* **47**: 344, 1955).

Hildenbrandia Nardo (1834), Algae. Algae.

Hilidicellites Kalgutkar & Janson. (2000), Fossil Fungi, anamorphic *Ascomycota*. 18, widespread. See Kalgutkar & Jansonius (*AASP Contributions Series* **39**: 133, 2000).

Hilitzeria Dyr (1941) nom. nud. ? = Dichotomocladium fide Benny (*A taxonomic revision of the Thamnidiaceae (Mucorales)*, 1973).

Hillia, see *Sillia*.

hilum, a mark or scar, esp. that on a spore at the point of attachment to a conidiogenous cell or sterigma.

Himanthites, see *Himantites*.

Himantia (Fr.) Zoll. (1844) = Cylindrobasidium fide Donk (*Taxon* **12**: 161, 1963; nomencl.).

Himantia Pers. (1801), anamorphic *Fungi*. *c*. 4 (sterile mycelium), Europe. See Donk (*Taxon* **11**: 85, 1962; refs).

himantioid (of mycelium), in spreading fan-like cords, as in *Himantia*.

Himantites Debey & Ettingsh. (1859), Fossil Fungi. 1, Europe.

Himantormia I.M. Lamb (1964), Parmeliaceae (L). 1, Antarctica. See Kärnefelt *et al.* (*Nova Hedwigia* **67**: 71, 1998), Fryday (*Lichenologist* **37**: 313, 2005), Thell *et al.* (*Biblthca Lichenol.* **95**: 531, 2007; phylogeny).

Hindersonia Lév. (1846) ≡ Hendersonia Berk. fide Holm (*Taxon* **24**: 275, 1975).

Hindersonia Moug. & Nestl. ex J. Schröt. (1897) ≡ Ceriospora.

Hinoa Hara & I. Hino (1961), anamorphic *Pezizomycotina*. 2, Japan. See Hara & Hino (*Icones Fungorum Bamb. Jap.*: 67, 1961).

Hinomyces Narumi & Y. Harada (2006), anamorphic *Grovesinia*. 2, Japan. See also *Cristulariella*. See Narumi-Saito *et al.* (*Mycoscience* **47**: 351, 2007).

Hiospira R.T. Moore (1962), anamorphic *Brooksia*, Hso.0-≡ hP.1. 1, widespread (tropical). See Moore (*TBMS* **45**: 145, 1962).

Hippocrepidea Sérus. (1997), Gomphillaceae (L). 1, Papua New Guinea. See Aptroot *et al.* (*Biblthca Lichenol.* **64**: 68, 1997).

Hippocrepidium Sacc. (1874) = Hirudinaria fide Hughes (*Mycol. Pap.* **39**, 1951).

Hippoperdon Mont. (1842) nom. rej. = Calvatia fide Stalpers (*in litt.*).

Hiratsuka (Naohide; 1903-2000; Japan). Undergraduate (1923-1926) then graduate (1926-1928) then lecturer (1928-1929), Department of Agricultural Biology, Hokkaido Imperial University; Professor of Botany and Plant Pathology, Tottori Agricultural College (1929-1946); Professor of Mycology and Plant Pathology, College of Agricultural Education, Tokyo (1946-1949); Professor of Mycology and Plant Pathology, Tokyo University of Education, 1949-1967); Director, Totori Mycological Institute (1967-1994). Celebrated for his studies on rusts and widely recognized as the foremost authority on taxonomy and biology of east Asian rust fungi; he named more than 250 species in 31 different rust genera. *Publs. A Monograph of the Pucciniastreae* (1936); *Uredinological Studies* (1955); *Revision Monograph of the Pucciniastreae* (1958); *Rust Flora of Japan* (1992). Histoplasmataceae Redaelli & Cif. (1934) = Ajellomycetaceae.

histoplasmin, an antigen prepared from *Histoplasma capsulatum*, esp. for skin testing.

histoplasmosis, see *Histoplasma.*

History. Basidiomycetes and larger ascomycetes, including larger lichen-forming species have been used by man as food and in other ways since early times. There are references to fungi, including lichen-forming species in Greek and Roman literature (see Buller, *TBMS* **5**: 21, 1915) and illustrated accounts can be found in the European printed herbals of the sixteenth and seventeenth centuries (e.g. those of Bauhin, Dodoens, Parkinson) but their systematic investigation stems mainly from the studies of Tournefort, Dillenius, and, particularly, Micheli in the eighteenth century. Many of the earliest studies include a wide range of groups, but as the nature of lichens was not accepted until the end of the nineteenth century lichenology tended to be a rather independent study; integration of the two specialities has accelerated only since the 1970s, and the first well-integrated classifications are even later (see *Ascomycota*).

The first phase of mycology was mainly systematic. The chief contribution of Linnaeus was binomial nomenclature, but before 1800 advances were made by Tode and others. Outstanding among later workers before 1900 were Persoon, Fries, Berkeley, Corda, the Tulasne brothers, de Bary, Brefeld, and Saccardo – for all of whom (and selected others) there are short biographical notices (see Authors' names). The twentieth century saw major developments in the knowledge of cytology, sex, genetics, physiologic specialization, etc. in fungi and a great expansion in medical and industrial mycology and mycological aspects of plant pathology. There was also a growing awareness that fungi need protection and conservation no less than other organisms. In the early twenty-first century, molecular and digital technologies are being applied to mycology, the one revolutionizing classifications, and the other enabling huge amounts of information to be processed and disseminated.

At the beginning of the nineteenth century Acharius put lichenology on a sound scientific basis and many terms and currently accepted genera were introduced by him. With improvements in the microscope by the mid-century spore characters were first used in lichen taxonomy, particularly by de Notaris, Massalongo, Trevisan, and Körber; and the dual nature of lichens was recognized by de Bary and Schwendener. During the latter part of the nineteenth century important regional and monographic studies were made by Nylander, Müller-Argoviensis, Hue, and Crombie. From the 1950s particularly metabolic products (q.v.) came to play an increasing role in lichen systematics, and physiological (see Physiology) and ultrastructural (see Ultrastructure) studies have increased the understanding of their symbiotic nature.

Hoehnelomycetaceae Jülich (1982) = Phleogenaceae.

Hohenbuehelia Schulzer (1866) nom. rej., Pleurotaceae. Anamorph *Nematoctonus*. *c.* 50, widespread. See Barron & Dierkes (*CJB* **55**: 3054, 1977; ecology, anamorph), Thorn & Barron (*Mycotaxon* **25**: 321, 1986; N. Am. spp.), Thorn *et al.* (*Mycol.* **92**: 241, 2000; phylogeny), Fazio & Albertó (*Mycotaxon* **77**: 117, 2001; Argentina).

Höhnel (Franz Xavier Rudolf von; 1852-1920; Austria). PhD, Strassburg (1877); Professor of Botany, Vienna Technical College, 1884-1920. Proposed 250 new genera and 500 species of fungi; his taxonomic research on coelomycetes being particularly noted. His most important work was disseminated through two extensive but dispersed groups of papers, both aptly named *Fragmente*. See also (by Weese) v. Höhnel's mykologischen Nachlass-Schriften 1-150. *Mitteilungen der Botanischen Institut der Technischen Hochschule, Wien* **1-12** (1924-1935) [(index **12**: 33]. Most of his collections are in Harvard (**FH**). *Publs.* Fragmente zur Mykologie. *Sitzungsberichten der Kaiserliche Akademie der Wissenschaften in Wien* Mathematische-Naturwissenschaftliche Klasse Abt. I (1902-1923) [index for fragmente 1-1000 printed separately 1916; index to fragmente 1001-1225, see *Mitteilungen der Botanischen Institut der Technischen Hochschule, Wien* **9**: 66, 1932;. see also the facsimile reprint by J. Cramer, *Fragmente zur Mykologie i-xxiv* (1967)]. Mykologische Fragmente *Annales Mycologici* **1-18** (1903-1920) [reprint 1967]. *Biogs, obits etc.* Stafleu & Cowan (*TL-2* **2**: 229, 1979); Weese (*Bericht der Deutschen Botanischen Gesellschaft* **38**: (103), 1921).

Holcomyces Lindau (1904) = Diplodia fide Höhnel (*Annls mycol.* **3**: 187, 1905).

holdfast, a process from the thallus for attachment, e.g. appressorium, hyphopodium, stigmatopodium, and stomatopodium; cf. rhizoid, hapteron, haustorium.

Holleya Y. Yamada (1986) = Eremothecium fide Yamada & Nagahama (*J. gen. appl. Microbiol.* Tokyo **37**: 199, 1991), Kurtzman (*J. Industr. Microbiol.* **14**: 523, 1995), Prillinger *et al.* (*Yeast* Chichester **13**: 945, 1997), de Hoog *et al. in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 201, 1998).

Hollosia Gyeln. (1939) = Scutula fide Santesson (*Svensk bot. Tidskr.* **43**: 141, 1949).

Holmiella Petrini, Samuels & E. Müll. (1979), Patellariaceae. Anamorph *Cornicularella*. 1 (on *Juniperus*), widespread. See Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Holmiodiscus Svrček (1992), Helotiaceae. 1, Sweden. See Holm & Nannfeldt (*Thunbergia* **16**: 19, 1992).

holo- (prefix), all; whole; entire.

Holobasidiomycetes, see *Basidiomycota.*

Holobasidiomycetidae, see *Basidiomycota.*

holobasidium, see basidium.

Holobispora Voronin (1986), Microsporidia. 1.

holoblastic, see blastic.

holocarpic, having all the thallus used for the fruitbody.

holocarpous (of lichen thalli), ones formed by colonies of a free-living photobiont being invaded by a mycobiont and developing directly into fruiting bodies (Henssen, *Lichenologist* **18**: 51, 1986).

Holocoenis Clem. (1909) = Coenogonium Ehrenb. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995) but see Rivas Platas *et al.* (*Fungal Diversity* **23**: 255, 2006; Costa Rica).

holocoenocytic, see astatocoenocytic.

Holocoryne (Fr.) Bonord. (1851) = Clavaria fide Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**, 1950).

Holocotylon Lloyd (1906), Agaricaceae. 3, Mexico; N. America (subtropical). See Zeller (*Mycol.* **39**: 282, 1947).

Holocryphia Gryzenh. & M.J. Wingf. (2006), Cryphonectriaceae. 1 (on *Eucalyptus* and *Tibouchina*), widespread. See Venter *et al.* (*Sydowia* **54**: 98, 2002), Myburg *et al.* (*Mycol.* **96**: 990, 2004; phylogeny), Gryzenhout *et al.* (*FEMS Microbiol. Letters* **258**: 161, 2006; phylogeny), Gryzenhout *et al.* (*Stud. Mycol.* **55**: 48, 2006), Heath *et al.* (*Australas. Pl. Path.* **36**: 560, 2006; *Tibouchina* as host), Nakabonge *et al.* (*Australas. Pl. Path.* **37**: 154, 2008; population biology).

Holocyphis Clem. (1909) = Thelomma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

hologamy, the condition in which all the thallus becomes a gametangium, i.e. there is fusion between two mature individuals as in *Polyphagus.*

Hologloea Pat. (1900) = Favolaschia fide Kuyper (*in litt.*).

Hologymnia Nyl. (1900) = Evernia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

holomorph, see States of fungi.

holomorphum, two or more accepted species, each comprising teleomorph and anamorph, but scarcely distinguishable in one of the morphs (Tribe, *Bull. BMS* **17**: 94, 1983).

holophyte, a physiologically self-supporting green plant.

holosaprophyte, a true saprophyte (Johow).

Holospora Tomas. & Cif. (1952) = Polyblastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Holosporomyces Cif. & Tomas. (1953) ≡ Holospora.

holosporous (of conidial maturation), the conidium approaches its final size and shape before delimiting cells and maturing as a whole (Luttrell, 1963).

Holothelis Clem. (1909) = Thelopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

holotype, see type.

Holstiella Henn. (1895) = Trypethelium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Holtermannia Sacc. & Traverso (1910), Tremellaceae. 7, S.E. Asia; Brazil. See Kobayasi (*Sci. Rep. Tokyo Bunrika Daig.* B **50**: 75, 1937), Mahamulkar *et al.* (*Indian Phytopathology* **55**: 464, 2002; India n.sp.).

Holttumia Lloyd (1924), Xylariaceae. 1, E. & S.E.

Asia. See Læssøe (*SA* **13**: 43, 1994), Rogers & Ju (*Mycotaxon* **68**: 358, 1998; synonym of *Kretzschmaria*).

Holubovaea Mercado (1983), anamorphic *Pezizomycotina*, Hso.≡ eP.19. 1, Cuba. See Mercado (*Acta Bot. Cubana* **15**: 5, 1983), Mercado Sierra *et al.* (*Monografie* Museo Regionale di Scienze Naturali, Torino **23**, 1997).

Holubovaniella R.F. Castañeda (1985), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 2, Cuba; Kenya. See Castañeda (*Deuteromycotina de Cuba* Hyphomycetes **III**: 14, 1985).

Holwaya Sacc. (1889), ? Bulgariaceae. Anamorph *Crinula*. 1, widespread (north temperate). See Korf & Abawi (*CJB* **49**: 1879, 1971), Krieglsteiner & Häffner (*Z. Mykol.* **51**: 131, 1985), Aronsson (*Svensk bot. Tidskr.* **85**: 9, 1991), Roth (*Schweiz. Z. Pilzk.* **69**: 197, 1991; anamorph), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Holwayella H.S. Jacks. (1926) = Chrysocyclus fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Homalopeltis Bat. & Valle (1961), anamorphic *Pezizomycotina*, Cpt.1eP.?. 1, Brazil. See Batista & Valle (*Publções Inst. Micol. Recife* **337**: 5, 1961).

Homaromyces R.K. Benj. (1955), Laboulbeniaceae. 1, USA; Europe. See Benjamin (*Aliso* **3**: 183, 1955), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

homeostasis, the maintenance of constant chemical and physical conditions within a living organism. See Whittenbury *et al.* (Eds) (*Homeostatic mechanisms in micro-organisms*, 1987).

homo- (prefix), one and the same.

Homobasidiomycetes R.T. Moore (1971), see *Basidiomycota*.

homobasidium, see basidium.

homobium, a self-supporting association of a fungus and an alga, as in lichens.

Homodium Nyl. ex H. Olivier (1903) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

homohetromixis, see heterothallism.

homohylic vesicle, sporangial vesicle, the wall of which is continuous with, and of the same material as the wall layer, or one of the wall layers of the sporangium. See also plasmamembranic vesicle, precipitative vesicle.

homoiomerous (1) (of a lichen thallus), having the mycobiont and phycobiont evenly intermixed throughout the thallus, as in *Collema*; (2) (of trama in agarics), composed of hyphal tissue only; cf. heteromerous.

homokaryotic, having genetically identical nuclei, as in a line of isolates without variation (Brierley, *Ann. appl. Biol.* **18**: 429, 1931).

homokaryotic diplospory, incorporation of one or more homogenetic diploid nuclei in an oospore formed in response to abortive meioses in the oogonium (Dick, 1972).

homologous, showing a resemblance in form or structure, but not necessarily function, which is considered to be evidence of evolutionary relatedness; cf. analogous. See Poelt (*in* Hawksworth (Ed.), *Frontiers in mycology*: 85, 1991; homologous characters in lichens). See also alternation of generations, Cladistics.

homomixis, haplo-monoecism or monoecism. Whitehouse (*Biol. Rev.* **24**: 428, 1949) recognized two types: **primary homothallism** such as occurs in a homokaryotic individual and **secondary homothallism** (= pseudo heterothallism or facultative heterothallism (Dodge), **amphithallism**, Lange, 1952) as in a thallus derived from one heterokaryotic spore containing nuclei of compatible mating types; cf. heterothallism.

homomorphous (of an agaric lamella edge), hymenium on edge not differentiated from that on the faces; cf. heteromorphous.

Homonemeae, the *Algae* and *Fungi* (obsol.).

homonym, a name which (under the *Code*) must not be used because of an earlier name in a different sense, i.e. the names are the same but the types different; Donk (*Bull. bot. Gard. Buitenzorg* ser. 3 **18**: 282, 1949) in addition to heterotypic homonyms recognizes homotypic, non-synonymous, synonymous, and monadelphous homonyms, the last being derived from a common source, particularly from one devalidated name.

Homophron (Britzelm.) W.B. Cooke (1953) = Psathyrella fide Kuyper (*in litt.*).

homophytic, the equivalent in the sporophyte generation of monoecious in the gametophyte generation (Blakeslee, *Bot. Gaz.* **42**: 161, 1906); cf heterophytic.

homoplasmic, see karyotic.

Homopsella Nyl. (1887) = Porocyphus fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

Homopsellomyces Cif. & Tomas. (1953) ≡ Homopsella.

Homospermales. Le Gal's (1953) term for operculate discomycetes; cf. *Heterospermales*.

homospory (1) having asexually produced spores of only one kind (= isospory); (2) having spores which are not differentiated according to mating type (c.f. heterospory).

Homostegia Fuckel (1870), Dothideomycetes. 1 or 5 (on lichens), Europe. See Hawksworth *et al.* (*Biblthca Lichenol.* **88**: 187, 2004).

homothallism (adj. **homothallic**), the condition in which sexual reproduction can occur without the interaction of two differing thalli.

Homothecium A. Massal. (1853), Collemataceae (L). 3, widespread (temperate; S. America). See Henssen (*Lichenologist* **3**: 29, 1965).

homozygous, with identical alleles at the same locus on homologous chromosomes.

honey agaric (honey fungus), *Armillaria mellea*; shoestring or boot-lace fungus.

honey-dew (1) a secretion, attractive to insects, associated with the *Sphacelia* phase of *Claviceps* (Mower & Hancock, *CJB* **53**: 2826, 1975); (2) a secretion by aphids.

Honoratia Cif., Vegni & Montemart. (1963) = Preussia fide von Arx & Storm (*Persoonia* **4**: 407, 1967).

Hoornsmania Crous (2007), anamorphic *Davidiellaceae*. 1, Europe. See Crous (*Fungal Planet* **11**, 2007).

Horakia Oberw. (1976) ≡ Verrucospora.

Horakiella Castellano & Trappe (1992), Sclerodermataceae. 1, Australia. See Castellano & Trappe (*Aust. Syst. Bot.* **5**: 641, 1992).

Horakomyces Raithelh. (1983) ? = Melanomphalia fide Kirk (*in litt.*).

Hormiactella Sacc. (1886), anamorphic *Pezizomycotina*, Hso.1eP.3. 4, Europe; West Indies. See Holubová-Jechová (*Folia geobot. phytotax.* **13**: 433, 1978), Borisova (*Mikol. Fitopatol.* **34**: 26, 2000).

Hormiactina Bubák (1916) ? = Hormiactis fide Carmichael *et al.* (*Genera of Hyphomycetes*, 1980).

Hormiactis Preuss (1851), anamorphic *Pezizomycotina*, Hso.1eH.3. 5, Europe; Sri Lanka.

Hormiokrypsis Bat. & Nascim. (1957), anamorphic *Ophiocapnocoma*, Hso.0bP.28. 1, USA. See Hughes (*N.Z. Jl Bot.* **5**: 117, 1967), Hughes (*N.Z. Jl Bot.* **10**: 225, 1972).

Hormisciella Bat. (1956) = Antennatula fide Hughes (*N.Z. Jl Bot.* **8**: 153, 1970).

Hormiscioideus M. Blackw. & Kimbr. (1979), anamorphic *Pezizomycotina*, Hso.?.?. 1 (on *Insecta*), USA. See Blackwell & Kimbrough (*Mycol.* **70**: 1275, 1978).

Hormisciomyces Bat. & Nascim. (1957), anamorphic *Euantennaria*, Hso.0eP.15. 1, Cuba. See Hughes (*N.Z. Jl Bot.* **12**: 299, 1974), Hughes & Arnold (*Mem. N. Y. bot. Gdn* **49**: 198, 1989).

Hormisciopsis Sumst. (1914), anamorphic *Pezizomycotina*, Hso.0eP.3. 1, N. America.

Hormiscium Kunze (1817) = Torula fide Hughes (*CJB* **36**: 727, 1958), Crane & Schoknecht (*Mycol.* **78**: 86, 1986).

Hormoascus Arx (1972) = Ambrosiozyma fide van der Walt & von Arx (*Syst. Appl. Microbiol.* **6**: 90, 1985), Goto & Takami (*J. gen. appl. Microbiol.* Tokyo **32**: 271, 1986), Kurtzman & Robnett (*CJB* **73** Suppl. 1: S824, 1995), Smith *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 129, 1998).

Hormocephalum Syd. (1939), anamorphic *Pezizomycotina*, Hso.≡ eP.4. 1, Ecuador.

Hormocladium Höhn. (1923), anamorphic *Pezizomycotina*, Hso.0-1eP.?. 1, Japan. See Braun & Melnik (*Trudy Botanicheskogo Instituta im. V.L. Komarova* **20**: 18, 1997).

Hormococcus Preuss (1852) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Hormococcus Robak (1956), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1, Norway. See Robak (*Friesia* **5**: 379, 1956).

Hormoconis Arx & G.A. de Vries (1973), Amorphothecaceae. 1. See Partridge & Morgan-Jones (*Mycotaxon* **83**: 335, 2002), Braun *et al.* (*Mycol. Progr.* **2**: 8, 2003), Seifert *et al.* (*Stud. Mycol.* **58**: 235, 2007; phylogeny, nomenclature).

hormocyst, a propagule or diaspore produced in a special **hormocystangium** comprising a few cyanobacterial cells and fungal hyphae (Fig. 22I); produced by a few gelatinous lichens, e.g. *Lempholemma cladodes*, *L. vesiculiferum*. See Degelius (*Svensk bot. Tidsk.* **39**: 419, 1945), Henssen (*Lichenologist* **4**: 99, 1969).

hormocystangium, see hormocyst.

Hormodendraceae Nann. (1934) = Davidiellaceae.

Hormodendroides M. Moore & F.P. Almeida (1937) = Rhinocladiella Nannf. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Hormodendron (orthographic variant), see *Hormodendrum*.

Hormodendrum Bonord. (1851) = Cladosporium fide de Vries (*Contribution to the knowledge of the genus Cladosporium Link ex Fr.*, 1952), David (*Mycol. Pap.* **172**, 1997).

Hormodochis Clem. (1909) = Trullula fide Sutton (*Mycol. Pap.* **141**, 1977).

Hormodochium (Sacc.) Höhn. (1911) = Trullula fide Sutton (*Mycol. Pap.* **141**, 1977).

Hormographiella Guarro & Gené (1992), anamorphic *Coprinellus*, Hso.0eH.38/39. 3 (from humans, coprophilous), Europe. See Guarro *et al.* (*Mycotaxon* **45**: 179, 1992), Cáceres *et al.* (*Antonie van Leeuwenhoek* **89**: 79, 2006; anamorphs of *Coprinellus domesticus*).

Hormographis Guarro, Punsola & Arx (1986), anamorphic *Pezizomycotina*, Hsy.0eH.40. 1 (from soil), Spain. See Guarro *et al.* (*Mycol.* **78**: 969, 1986).

Hormomitaria Corner (1950) = Physalacria fide Kuyper (*in litt.*).

Hormomyces Bonord. (1851), anamorphic *Tremella*, Hsp.0eH.3. 3, widespread (temperate). See Tubaki (*TMSJ* **17**: 243, 1976; culture), Roberts (*Mycotaxon* **63**: 195, 1997; UK), Zang & Wang (*Acta Bot. Yunn.* **19**: 324, 1997; China).

Hormonema Lagerb. & Melin (1927), anamorphic *Dothiora*, Hso.0eH.1/10. 5, widespread. Apparently polyphyletic. See Hermanides-Nijhof (*Stud. Mycol.* **15**: 166, 1977), Funk *et al.* (*CJB* **63**: 1579, 1985), Shin *et al.* (*J. Clin. Microbiol.* **36**: 2157, 1998; in humans), Yurlova *et al.* (*Stud. Mycol.* **43**: 63, 1999), Peláez *et al.* (*Syst. Appl. Microbiol.* **23**: 333, 2000; endophyte), Bills *et al.* (*Stud. Mycol.* **50**: 149, 2004; Spain).

hormones (sex or sexual), of fungi, see antheridiol, progamones, sirenin, trisporic acids; also erogen, etc. Machlis (*Mycol.* **64**: 235, 1972), Gooday (*Ann. Rev. Biochem.* **43**: 35, 1974), reviews. Cf. pheromone.

Hormopeltis Speg. (1912) = Micropeltis fide Clements & Shear (*Gen. Fung.*, 1931).

Hormosperma Penz. & Sacc. (1897) = Lasiosphaeria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Hormosphaeria Lév. (1863) nom. dub., ? Arthoniales. 1, S. America. See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Hormospora De Not. (1844) [non *Hormospora* Bréb. 1839, *Algae*] = Bombardioidea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Hormosporites Grüss (1928), Fossil Fungi ? Fungi. 1 (Devonian), Europe.

Hormotheca Bonord. (1864) = Coleroa fide Corlett & Barr (*Mycotaxon* **25**: 255, 1986), Müller (*SA* **5**: 310, 1986).

Hormyllium Clem. (1909) ≡ Hormococcus Robak fide Sutton (*Mycol. Pap.* **141**, 1977).

horn of plenty, basidioma of the edible *Craterellus cornucopioides*.

Hornodermoporus Teixeira (1993) = Perenniporia fide Decock (*in litt.*).

horse mushroom, basidiomata of the edible *Agaricus arvensis*.

horse-hair blight fungi, the rhizomorphic mycelia of tropical species of *Marasmius*, e.g. *M. equicrinis* (E. trop.) and *M. sarmentosus* (W. Indies). See Petch (*Ann. R. bot. Gdns Peradeniya* **6**: 43, 1915). Cf. thread blight.

horse-tail lichen, see rock hair.

Hortaea Nishim. & Miyaji (1984), anamorphic *Teratosphaeriaceae*, Hso.1eP.21. 1, widespread. See Mittag (*Mycoses* **36**: 242, 1993; fine structure), Uijthof *et al.* (*Mycoses* **37**: 307, 1994; genotypes of *H. werneckii*), Piontelli L. *et al.* (*Bol. Micol.* Valparaíso **12**: 89, 1997; saline environments, Chile), Rogers *et al.* (*Stud. Mycol.* **43**: 122, 1999; phylogeny), Haritani *et al.* (*Jap. J. Med. Mycol.* **43**: 175, 2002; from guinea pig), Hölker *et al.* (*Antonie van Leeuwenhoek* **86**: 287, 2004; from lignite), Ng *et al.* (*Mycopathologia* **159**: 495, 2005; from blood), Ster-

flinger (*The Yeast Handbook* **[1]**: 501, 2006; review), Crous *et al.* (*Stud. Mycol.* **58**: 1, 2007).
Hosseusia Gyeln. (1940), ? Pannariaceae (L). 1, Argentina.
host (1) a living organism harbouring a parasite; frequently in the sense of 'suscept' (q.v.); sometimes, as in 'host index', in a general sense covering certain substrata; (2) a commercial computer operator keeping databases other than their own on its machines and making them available to others for on-line searching for a fee (see Literature).
house fungus (or **dry rot fungus**), *Serpula lacrimans*.
Hrabyeia J. Lom & I. Dykova (1990), Microsporidia. 1. See Lom & Dykova (*Eur. J. Protist.* **25**: 243, 1990).
hülle cells, terminal or intercalary thick-walled cells which occur in large numbers in association with the ascomata of, e.g. *Aspergillus nidulans*.
Huangshania O.E. Erikss. (1992), Triblidiaceae. 2, China. See Magnes (*Biblthca Mycol.* **165**, 1997).
Hubbsia W.A. Weber (1965), Roccellaceae (L). 3, new world. See Follmann (*Nova Hedwigia* **31**: 285, 1979), Tehler (*CJB* **68**: 2458, 1990; cladistics), Tehler *et al.* (*Symb. bot. upsal.* **32** no. 1: 255, 1997), Myllys *et al.* (*Bryologist* **101**: 70, 1998; phylogeny), Myllys *et al.* (*Lichenologist* **31**: 461, 1999; phylogeny), Follmann (*J. Hattori bot. Lab.* **90**: 251, 2001; key), Follmann (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **30-32**: 61, 2002; biogeography), Tehler & Irestedt (*Cladistics* **23**: 432, 2007).
Huea C.W. Dodge & G.E. Baker (1938) = Caloplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Hueella Zahlbr. (1926) nom. rej. prop. = Fuscopannaria fide Jørgensen (*Taxon* **49**: 812, 2000; nomencl.).
Hueidea Kantvilas & P.M. McCarthy (2003), Fuscideaceae (L). 1, Australia. See Kantvilas & McCarthy (*Lichenologist* **35**: 398, 2003).
Hughesiella Bat. & A.F. Vital (1956) = Chalara fide Nag Raj & Kendrick (*Monogr. Chalara Allied Genera*, 1975).
Hughesinia J.C. Lindq. & Gamundí (1970), anamorphic *Pezizomycotina*, Hso.0bP.28. 1, Chile; Cuba. See Lindquist & Gamundí (*Boln Soc. argent. Bot.* **13**: 54, 1970), Delgado *et al.* (*Fungal Diversity* **20**: 31, 2005; Cuba).
Huguenínia J.L. Bezerra & T.T. Barros (1970), ? Microthyriaceae. 1, New Caledonia. See Hyde (*Sydowia* **49**: 1, 1997), Mouchacca (*Mycotaxon* **67**: 99, 1998).
Huilia Zahlbr. (1930) = Porpidia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Humaria (Fr.) Boud. (1885) ≡ Octospora.
Humaria Fuckel (1870), Pyronemataceae. *c.* 16, widespread (north temperate). See Kanouse (*Mycol.* **39**: 635, 1947), Denison (*Mycol.* **51**: 612, 1961), Eriksson & Hawksworth (*SA* **11**: 179, 1993; nomencl.), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny), Erős-Honti *et al.* (*Mycorrhiza* **18**: 133, 2008; mycorrhizas, Hungary).
Humariaceae Velen. (1934) = Pyronemataceae.
Humariella J. Schröt. (1893) ≡ Scutellinia.
Humarina Seaver (1927) ≡ Octospora.
Humboldtina Chardón & Toro (1934) = Leptosphaeria fide Barr (*SA* **5**: 134, 1986).
Humicola Traaen (1914), anamorphic *Chaetomiaceae*, Hso.0eP.1. 6, widespread. See Fassatiová (*Česká Mykol.* **18**: 102, 1964; key), Nicoli & Russo (*Nova Hedwigia* **25**: 737, 1974; 8 spp.), de Bertoldi (*CJB* **54**: 2755, 1976; 13 spp., physiol. analysis), Rodrigues *et al.* (*Revista de Microbiologia* **21**: 232, 1990; cytology), Rodrigues *et al.* (*MR* **95**: 169, 1991; cytology, biochemistry), Weinstein *et al.* (*Mycol.* **89**: 706, 1997; ecology), Hambleton *et al.* (*Stud. Mycol.* **53**: 29, 2005; phylogeny), Singh *et al.* (*Curr. Sci.* **89**: 1745, 2005; in mushroom compost).
Humicolopsis Cabral & S. Marchand (1976), anamorphic *Pezizomycotina*, Hso.0eH.?. 1, Argentina. See Cabral & Marchand (*Boln Soc. argent. Bot.* **17**: 69, 1976).
Humicolopsis Verona (1977), anamorphic *Pezizomycotina*, Hso.0eH.10. 1, Italy. See Verona (*G. bot. ital.* **111**: 88, 1977).
humicolous, living in or on decaying organic matter, soil.
Humidicutis (Singer) Singer (1959), Hygrophoraceae. 10, widespread (north temperate). See Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000; molec.; related to *Pluteaceae*).
Humphreya Steyaert (1972), Ganodermataceae. 4, widespread (tropical). See Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 94, 1980; key 4 Afr. spp.), Kotlaba & Pouzar (*Czech Mycol.* **55**: 7, 2003; Cuba).
Husseia Berk. (1847) = Calostoma fide Stalpers (*in litt.*).
Hyalacrotes (Korf & L.M. Kohn) Raitv. (1991), Hyaloscyphaceae. 2, Europe. See Azbukina (*Nizshie Rasteniya, Griby i Mokhoobraznye Sovetskogo Dal'nego Vostoka* Griby. Tom **2**. Askomitsety. Erizifal'nye, Klavitsipital'nye, Gelotsial'nye: 337, 1991), Raitviir (*Scripta Mycologica* Tartu **20**, 2004).
Hyalasterina Speg. (1919) nom. dub., Fungi.
Hyalina, see *Hyalinia*.
hyaline, transparent or nearly so; translucent; frequently used in the sense of colourless.
Hyalinia Boud. (1885) [non *Hyalinia* Stackh. 1809, *Algae*] = Orbilia fide Baral (*SA* **13**: 113, 1994).
Hyalinocysta E.I. Hazard & Oldacre (1975), Microsporidia. 2.
hyalo- (prefix) (of spores), hyaline or brightly coloured, esp. for groups of Anamorphic fungi (q.v.) (**hyalodidymae**, etc.).
Hyalobelemnospora Matsush. (1993), anamorphic *Subbaromyces*, Hso.0eH.19. 1, Peru. See Matsushima (*Matsush. Mycol. Mem.* **7**: 54, 1993).
Hyalobotrys Pidopl. (1948) = Stachybotrys fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).
Hyalocamposporium Révay & J. Gönczöl (2007), anamorphic *Pezizomycotina*. 4, widespread. See Révay & Gönczöl (*Fungal Diversity* **25**: 197, 2007).
Hyalocapnias Bat. & Cif. (1963) = Scorias fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Hyaloceras Durieu & Mont. (1849) = Seiridium fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **125**: 27, 1916), Sutton (*Mycol. Pap.* **141**, 1977).
Hyalochlorella Poyton (1970) nom. dub., ? Algae. See Alderman (*Veröff. Inst. Meeresf. Bremerhaven* Sonderband **5**: 251, 1974).
Hyalocladium Mustafa (1977), anamorphic *Pezizomycotina*, Hso.#eH.10. 1, Kuwait. See Mustafa (*TBMS* **67**: 537, 1976).
Hyalococcus J. Schröt. (1889) ? = Trichosporon fide Barnett *et al.* (*Yeasts: Characteristics and Identification* 3rd edn, 2000).

Hyalocrea Syd. & P. Syd. (1917), Dothideomycetes. 4, widespread (tropical). See Pirozynski (*Kew Bull.* **31**: 595, 1977), Rossman (*Mycol. Pap.* **157**: 71 pp., 1987).

Hyalocurreya Theiss. & Syd. (1915) = Uleomyces fide von Arx (*Persoonia* **2**: 421, 1963).

Hyalocylindrophora J.L. Crane & Dumont (1978) = Dischloridium fide Bhat & Sutton (*TBMS* **84**: 723, 1985), Seifert & Gams (*Mycotaxon* **24**: 459, 1985).

Hyalodema Magnus (1910) = Coniodictyum fide Donk (*Reinwardtia* **4**: 115, 1956).

Hyalodendriella Crous (2007), anamorphic *Helotiales*. 1, Netherlands. See Crous *et al.* (*Stud. Mycol.* **58**: 33, 2007).

Hyalodendron Diddens (1934) = Trichosporon fide Fell & Scorzetti (*Int. J. Syst. Evol. Microbiol.* **54**: 995, 2004).

Hyaloderma Speg. (1884), Pezizomycotina. 1, S. America. See Pirozynski (*Kew Bull.* **31**: 595, 1977), Rossman (*Mycol. Pap.* **157**: 71 pp., 1987).

Hyalodermella Speg. (1918), Pezizomycotina. 1, S. America.

Hyalodictys Subram. (1962) = Miuraea fide Deighton (*Mycol. Pap.* **133**, 1973).

Hyalodictyum Woron. (1916), anamorphic *Pezizomycotina*, Cac.#eH.1. 1, former USSR. See Mel'nik (*Opredelitel' Gribov Rossii* Klass Coelomycetes Byp. **1**. Redkie i Maloizvestnye Rody, 1997).

Hyalodothis Pat. & Har. (1893) nom. dub. ? = Melanodothis fide Arnold (*Mycol.* **59**: 246, 1967).

Hyaloflorea Bat. & H. Maia (1955) = Cylindrocarpon fide Carmichael *et al.* (*Genera of Hyphomycetes*, 1980).

Hyalohelicomina T. Yokoy. (1974), anamorphic *Pezizomycotina*, Hso.0-≡ hH.1. 1, Japan. See Yokoyama (*TMSJ* **15**: 159, 1974).

hyalohyphomycosis, a mycotic infection of humans or animals caused by a non-dematiaceous fungus. Cf. phaeohyphomycosis.

Hyalomelanconis Naumov (1954) = Melanconis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Hyalomeliolina F. Stevens (1924), Pseudoperisporiaceae. 2, C. & S. America. See Sivanesan (*SA* **6**: 201, 1987), Hughes (*Mycol. Pap.* **166**, 1993).

Hyalopesotum H.P. Upadhyay & W.B. Kendr. (1975) = Pesotum fide Upadhyay & Kendrick (*Mycol.* **67**: 801, 1975), Harrington *et al.* (*Mycol.* **93**: 111, 2001).

Hyalopeziza Fuckel (1870), Hyaloscyphaceae. Anamorph *Phialophora*-like. 20, widespread. See Raschle (*Sydowia* **29**: 170, 1977; key, anam.), Korf & Kohn (*Mycotaxon* **10**: 503, 1980), Huhtinen (*Karstenia* **29**: 45, 1990), Raitviir & Huhtinen (*Mycotaxon* **62**: 445, 1997), Baral & Galán (*Beitr. Kenntn. Pilze Mitteleur.* **12**: 133, 1999), Raitviir (*Scripta Mycol.* **20**, 2004).

Hyalopleiochaeta R.F. Castañeda, Guarro & Cano (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Cuba. See Castañeda Ruíz *et al.* (*Mycotaxon* **57**: 458, 1996).

Hyalopsora Magnus (1902), Pucciniastraceae. *c.* 11 (on *Abies* (0, I; where known) (*Pinaceae*); on *Pteridophyta* (II, III)), widespread (esp. north temperate). See Pady (*Ann. Bot.* **49**: 71, 1985; cytology, morphology).

Hyalopus Corda (1838) ? = Acremonium fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Hyalopycnis Höhn. (1918), anamorphic *Heterogastridium*. 1, Europe; N. America. See Seeler (*Farlowia* **1**: 119, 1943), Scorzetti *et al.* (*FEMS Yeast Res.* **2**: 495, 2002; phylogeny).

Hyalopyrenia H. Harada (1996), ? Verrucariaceae (L). 1, Japan. See Harada (*Lichenologist* **28**: 415, 1996).

Hyaloraphidium Korshikov (1931), ? Chytridiomycetes. 1. See Ustinova *et al.* (*Protist* **151**: 253, 2000), Forget *et al.* (*Mol. Biol. Evol.* **19**: 310, 2002; mol. biol.).

Hyalorbilia Baral & G. Marson (2000), Orbiliaceae. Anamorph *Dactylella*. 1, widespread. See Baral & Marson (*Micologia 2000*: 44, 2000), Liu *et al.* (*Nova Hedwigia* **81**: 145, 2005; China), Wu *et al.* (*Fungal Diversity* **25**: 233, 2007).

Hyalorhinocladiella H.P. Upadhyay & W.B. Kendr. (1975), anamorphic *Ceratocystiopsis, Ophiostoma*, Hso.0eH.10. 1, widespread. See Upadhyay & Kendrick (*Mycol.* **67**: 800, 1975), Benade *et al.* (*Mycol.* **87**: 298, 1995), Benade *et al.* (*CJB* **74**: 891, 1996), Zipfel *et al.* (*Stud. Mycol.* **55**: 75, 2006; phylogeny).

Hyaloria Möller (1895), Hyaloriaceae. 1, Brazil. See Wells (*Mycol.* **61**: 77, 1969), Weiss & Oberwinkler (*MR* **105**: 403, 2001), Weiss *et al.* (*Frontiers in Basidiomycote Mycology*: 7, 2004).

Hyaloriaceae Lindau (1897), Auriculariales. 3 gen., 8 spp.

Lit.: Wells (*Mycol.* **61**: 77, 1969), Bandoni (*Trans. Mycol. Soc. Japan* **25**: 489, 1984), Bononi & Capelari (*Rickia* **11**: 109, 1984), Roberts (*Mycotaxon* **69**: 209, 1998), Weiss & Oberwinkler (*MR* **105**: 403, 2001), Kirschner & Chen (*Stud. Mycol.* **50**: 337, 2004).

Hyaloscolecostroma Bat. & J. Oliveira (1967), ? Capnodiaceae. 1, Brazil. See Batista & Oliveira (*Atas Inst. Micol. Univ. Pernambuco* **5**: 448, 1967).

Hyaloscypha Boud. (1885) nom. cons., Hyaloscyphaceae. Anamorphs *Clathrosphaerina, Pseudaegerita, Cheiromycella*. 38, widespread. See Svrček (*Česká Mykol.* **39**: 205, 1985; spp. descr. by Velenovský), Huhtinen (*Karstenia* **29**: 45, 1990; key), Cantrell & Hanlin (*Mycol.* **89**: 745, 1997; DNA), Hosoya & Huhtinen (*Mycoscience* **43**: 405, 2002; Japan), Raitviir (*Scripta Mycol.* **20**, 2004), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny).

Hyaloscyphaceae Nannf. (1932), Helotiales. 74 gen. (+ 61 syn.), *c.* 933 spp.

Lit.: Dennis (*Mycol. Pap.* **32**, 1949; UK), Korf (*Lloydia* **14**: 129, 1951; *Arachnopezizae*), Dennis (*Kew Bull.*: 289, 1954; trop. Am.), Dennis (*Kew Bull.* **13**: 32, 1958; Australia), Dennis (*Kew Bull.* **14**: 418, 1960; Venezuela), Dennis (*Kew Bull.* **17**: 319, 1963; redispos.), Dennis (*Persoonia* **2**: 171, 1972; *Lachneae*), Hein (*Nova Hedwigia* **32**: 31, 1980; SEM hairs), Korf & Kohn (*Mycotaxon* **10**: 503, 1980; spp. glassy hairs), Sharma (*Nova Hedwigia* **43**: 381, 1986; 76 spp. India), Baral (*Z. Mykol.* **53**: 119, 1987), Huhtinen (*Mycotaxon* **29**: 267, 1987; hairs, gen. limits), Raitviir (*Mikol. Fitopatol.* **21**: 200, 1987; subfams.), Spooner (*Biblthca Mycol.* **116**: 711 pp., 1987; Australasia), Svrček (*Česká Mykol.* **41**: 193, 1987; key 50 gen. Eur.), Baral (*Beitr. Kenntn. Pilze Mitteleur.* **5**: 209, 1989), Huhtinen (*Karstenia* **29**: 45, 1989), Haines (*Nova Hedwigia* **54**: 97, 1992), Galán *et al.* (*MR* **98**: 1137, 1994), Verkley (*Nova Hedwigia* **63**: 215, 1996), Cantrell & Hanlin (*Mycol.* **89**: 745, 1997; phylogeny), Hosoya & Otani (*Mycoscience* **38**: 187, 1997; Jap. spp.), Zhuang (*Mycotaxon* **69**: 359, 1998),

Leenurm *et al.* (*Sydowia* **52**: 30, 2000; ultrastr.), Raitviir (*Scripta Mycol.* **20**, 2004), Zhang & Zhuang (*Nova Hedwigia* **78**: 475, 2004), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006).

Hyaloseta A.W. Ramaley (2001), Niessliaceae. Anamorph *Monocillium*. 1, USA. See Ramaley (*Mycotaxon* **79**: 269, 2001).

Hyalosphaera F. Stevens (1917), Dothideomycetes. 3, C. & S. America. See Rossman (*Mycol. Pap.* **157**, 1987; key).

Hyalospora Nieuwl. (1916) ≡ Catharinia.

Hyalostachybotrys Sriniv. (1958) = Stachybotrys fide Barron (*Mycol.* **56**: 313, 1964).

Hyalosynnema Matsush. (1975), anamorphic *Pezizomycotina*, Hsy.≡ eH.10. 1, Japan; Taiwan. See Matsushima (*Icon. microfung. Matsush. lect.*: 85, 1975), Kirschner *et al.* (*Fungal Science* Taipei **16**: 47, 2001).

Hyalotexis Syd. (1925) = Hyalosphaera fide Petrak (*Annls mycol.* **26**: 385, 1928).

Hyalotheles Speg. (1908), Elsinoaceae. 1, S. America.

Hyalothyridium Tassi (1900), anamorphic *Pezizomycotina*, Cpd.#eH.1. 3, widespread. See Latterell & Rossi (*Mycol.* **76**: 506, 1984; reinstatement of genus), Nag Raj (*CJB* **67**: 3169, 1989).

Hyalothyris Clem. (1909) ≡ Hyalothyridium.

Hyalotia Guba (1961) = Bartalinia fide Nag Raj (*CJB* **53**: 1615, 1975).

Hyalotiastrum Abbas, B. Sutton, Ghaffar & Abbas (2003), anamorphic *Pezizomycotina*. 1, Pakistan. See Abbas *et al.* (*Pakist. J. Bot.* **35**: 449, 2003).

Hyalotiella Papendorf (1967), anamorphic *Pezizomycotina*, St.≡ eP.10. 2, widespread (tropical to subtropical; S. Africa). See Papendorf (*TBMS* **50**: 69, 1967).

Hyalotiopsis Punith. (1970), anamorphic *Ellurema*, St.≡ eP.19. 1, India. See Punithalingam (*Mycol. Pap.* **119**: 12, 1969).

Hyalotricha Dennis (1949) = Hyalopeziza fide Raschle (*Sydowia* **29**: 170, 1977).

Hyalotrochophora Finley & E.F. Morris (1967) ? = Delortia fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Hybogaster Singer (1964), Hybogasteraceae. 1, Chile. See Singer (*Sydowia* **17**: 13, 1964).

Hybogasteraceae Jülich (1982), Russulales. 1 gen., 1 spp.

Lit.: Singer (*Sydowia* **17**: 13, 1964).

hybrid, the result of a cross between organisms belong to different taxa which yield viable progeny. It is unclear how common the process is in nature with fungi; as with plants, hybridization can occur at levels from genus down; e.g. *Saccharomycopsis fibuligera* × *Yarrowia lipolytica* (Nga *et al.*, *J. gen. Microbiol.* **138**: 223, 1992), *Cladonia grayi* × *C. merochlorophaea* (Culberson *et al.*, *Am. J. Bot.* **75**: 1135, 1988); a **sexual -**. A **mechanical -** (in lichens) is formed by the growth together of propagules from different genera, species or genotypes to form a single thallus not involving sexual crossing (Hawksworth, *in* Street (Ed.), *Essays in plant taxonomy*: 211, 1978; see Lichens). The existing rules of nomenclature for hybrids and grafts are available to name both kinds of progeny (Hawksworth, *Internat. Lich. Newsl.* **21**: 59, 1988).

Hydnaceae Chevall. (1826), Cantharellales. 9 gen. (+ 12 syn.), 190 spp.

Lit.: Coker & Beers (*Stipitate hydnums of the Eastern United States*, 1951), Maas Geesteranus (*Fungus* (*The stipitate hydnums of the Netherlands*, I) **26**, 1956), Maas Geesteranus (*Fungus* (*The stipitate hydnums of the Netherlands*, II) **26**, 1956), Maas Geesteranus (*Fungus* (*The stipitate hydnums of the Netherlands*, III) **27**, 1957), Maas Geesteranus (*Persoonia* (*The stipitate hydnums of the Netherlands*, IV) **1**: 115, 1959), Harrison (*The stipitate hydnums of Nova Scotia* [*Can. Dep. Agric. Res. Branch Publ.* **1099**], 1961), Nikolaeva (*Fl. Pl. Crypt. URSS* **6** Fungi **2**, 1961), Donk (*Persoonia* **3**: 199, 1964), Maas Geesteranus (*Hydnaceous fungi of the eastern old world*, 1971), Harrison (*Mycol.* **65**: 277, 1973), Maas Geesteranus (*Verh. K. Ned. Akad. Wet., Natur.* **60**, 1975; Eur. spp.), Maas Geesteranus (*Die terrestrichen Stachelpilze Europas: the terrestrial hydnums of Europe*, 1975), Grand & van Dyke (*J. Elisha Mitchell scient. Soc.* **92**: 114, 1976; SEM spores), Harrison & Grund (*Mycotaxon* **28**: 427, 1987), Harrison & Grund (*Mycotaxon* **28**: 419, 1987), Wilkinson (*CJB* **65**: 150, 1987; as *Sistotremataceae*), Ryvarden (*Syn. Phylogen. Evol.* **22**: 76, 2002), Hibbett & Binder (*Proc. R. Soc. Lond.* B. Biol. Sci. **269**: 1963, 2002; as *Sistotremataceae*), Larsson *et al.* (*MR* **108**: 983, 2004), Binder *et al.* (*Systematics and Biodiversity* **3**: 113, 2005; as *Sistotremataceae*), Küffer & Senn-Irlet (*Mycol. Progr.* **4**: 77, 2005; as *Sistotremataceae*).

Hydnangiaceae Gäum. & C.W. Dodge (1928), Agaricales. 2 gen. 76 spp.

Lit.: Bougher *et al.* (*MR* **97**: 613, 1993; generic delimitation), Kropp & Mueller (*Laccaria – Ectomycorrhizal fungi, key genera in profile*, 1999; generic classification), Hibbett *et al.* (*Nature* **407**: 506, 2000), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000).

Hydnangium Wallr. (1839) = Laccaria fide Kuyper (*in litt.*); originally treated as a sequestrate genus.

Hydnellum P. Karst. (1879), Bankeraceae. 38, widespread. See Coker & Beers (*The Stipitate Hydnums of the Eastern United States*: 56, 1951), Maas Geesteranus (*Persoonia* **2**: 388, 1962), Stalpers (*Stud. Mycol.* **35**: 168 pp., 1993; key), Dickson (*Field Mycology* **1**: 99, 2000; key British spp.), Arnolds (*Coolia* **46** 3, Suppl.: 96 pp., 2003; Netherlands and Belgium), Parfitt *et al.* (*MR* **111**: 761, 2007; molecel. phylog. British spp.).

Hydnellum P. Karst. (1896) nom. dub., Basidiomycota. See Stalpers (*in litt.*).

Hydnites Mesch. (1892), Fossil Fungi. 2 (Tertiary), Europe.

Hydnobolites Tul. & C. Tul. (1843), Pezizaceae. 3 (hypogeous), N. America; Europe. See Kimbrough *et al.* (*Bot. Gaz.* **152**: 408, 1991; posn), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Hydnocaryon Wallr. (1833) = Genea fide Trappe (*TBMS* **65**: 496, 1975), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Hydnochaete Bres. (1896), Hymenochaetaceae. 8, widespread (esp. tropical). See Ryvarden (*Mycotaxon* **15**: 425, 1982), Parmasto (*Mycotaxon* **91**: 137, 2005).

Hydnochaete Peck (1897) ≡ Hydnochaetella.

Hydnochaetella Sacc. (1898) ≡ Asterodon fide Donk (*Taxon* **5**: 96, 1956).

Hydnocristella R.H. Petersen (1971), Lentariaceae. 1, N. America. See Petersen (*Česká Mykol.* **25**: 130, 1971).

Hydnocystis Tul. (1844), Pyronemataceae. 2 (hypogeous), Europe; Japan. See Burdsall (*Mycol.* **60**: 503, 1968), van Brummelen *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 398, 1994; posn), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Hydnodon Banker (1913) = Trechispora fide Ryvarden (*Syn. Fung.* **15**: 31, 2002).

Hydnodontaceae Jülich (1982), Trechisporales. 15 gen. (+ 7 syn.), 105 spp.
Lit.: Larsson (*MR* **111**: 1040, 2007; phylogeny).

Hydnofomes Henn. (1900) = Echinodontium fide Banker (*Mycol.* **5**: 293, 1914).

Hydnogloea Curr. (1871) = Pseudohydnum P. Karst. fide Donk (*Persoonia* **4**: 173, 1966).

hydnoid, of a form resembling *Hydnum*; specifically, with a teeth-like hymenium.

Hydnomerulius Jarosch & Besl (2001), Paxillaceae. 1. Perhaps *Boletaceae*. See Jarosch & Besl (*Pl. Biol.* **3**: 447, 2001).

Hydnophlebia Parmasto (1967), Meruliaceae. 1, N. America. See Parmasto (*Consp. Syst. Cort.*: 384, 1967).

Hydnophysa Clem. (1909) ≡ Hydnofomes.

Hydnoplicata Gilkey (1955), Pezizaceae. 1 (hypogeous), Australia. See Trappe (*Mycotaxon* **2**: 109, 1975), Trappe & Claridge (*Australas. Mycol.* **25**: 33, 2006).

Hydnopolyporus D.A. Reid (1962), Meripilaceae. 3, widespread. See Fildago (*Mycol.* **55**: 713, 1963).

Hydnoporia Murrill (1907) = Hydnochaete Bres. fide Banker (*Mycol.* **5**: 293, 1914).

Hydnopsis (J. Schröt.) Rea (1909) = Tomentella Pat. fide Donk (*Taxon* **5**: 69, 1956).

Hydnopsis Tul. & C. Tul. (1865) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Hydnospongos Wallr. (1839) = Gautieria fide Stalpers (*in litt.*).

Hydnotrema Link (1833) ≡ Sistotrema Fr.

Hydnotrya Berk. & Broome (1846), Discinaceae. *c.* 15 (hypogeous), widespread. See Gilkey (*N. Amer. Fl.* **2**, 1954; key), Zhang (*Mycotaxon* **42**: 155, 1991), Pegler *et al.* (*British truffles*, 1993; key 4 Br. spp.), Abbott & Currah (*Mycotaxon* **62**: 1, 1997; N. Am.), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Tedersoo *et al.* (*New Phytol.* **170**: 581, 2006; ectomycorrhiza), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Hydnotryaceae M. Lange (1956) = Discinaceae.

Hydnotryopsis Gilkey (1916), Pezizaceae. 2 (hypogeous), N. America. See Gilkey (*N. Amer. Fl.* **2**, 1954; key, as *Choiromyces*), Trappe (*Mycotaxon* **2**: 115, 1975), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny), Tedersoo *et al.* (*New Phytol.* **170**: 581, 2006; ectomycorrhiza), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Hydnum L. (1753) nom. cons., Hydnaceae. 120, widespread. Some spp. are a cause of heartwood-rot in living trees. See Petersen (*Taxon* **26**: 144, 1977; typification).

Hydrabasidium Park.-Rhodes ex J. Erikss. & Ryvarden (1978) = Scotomyces fide Jülich (*Persoonia* **10**: 334, 1979).

Hydraeomyces Thaxt. (1896), Laboulbeniaceae. 1, widespread. See Siemaszko & Siemaszko (*Polsk. Pismo Entom.* **12**: 125, 1933), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Santamaría (*Fl. Mycol. Iberica* **5**, 2003).

Hydrocina Scheuer (1991), Helotiales. Anamorph *Tricladium*. 1 (aquatic), British Isles. See Webster *et al.* (*Nova Hedwigia* **52**: 65, 1991), Wang *et al.* (*Am. J. Bot.* **92**: 1565, 2005; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Hydrocybe (Fr. ex Rabenh.) Wünsche (1877) = Cortinarius fide Kauffman (*N. Amer. Fl.* **10**, 1932).

Hydrocybium Earle (1909) = Cortinarius fide Kauffman (*N. Amer. Fl.* **10**, 1932).

hydrofungi, aquatic fungi (Cooke, 1963).

Hydrogen-ion concentration (pH). Like other organisms, fungi are sensitive to the pH of their environment, and there is a large literature on this topic, exemplified by the following: in plants, fungal cell wall-degrading enzymes are influenced by pH (Akimitsu *et al.*, *Physiological and molecular plant pathology* **65**: 271, 2004); pathogenicity of some conifer needle endophytes has been related to their ability to change host pH, and host resistance to innate needle buffer capacity (Scholz & Stephan, *Eur. J. Forest Pathol.* **4**: 118, 1974); soil pH can determine populations of keratinophilic fungi (Böhme & Ziegler, *Mycopathologia* **38**: 247, 1969); gene expression can be pH regulated in *Aspergillus nidulans* (Denison, *Fungal genetics and biology* **29**: 61, 2000; general review of pH regulation of gene expression in fungi); ambient pH affects gene expression in *Metarrhizium anisopliae* but can itself be altered by the fungus (St Leger *et al.*, *Microbiology***145**: 2691, 1999). In maintaining pure cultures of fungi, the medium pH is also important. Most fungi grow best at approximately pH 7 but tolerate a wide range from pH 3-10 (or even 11). This property is made use of for freeing fungal cultures from bacteria or inhibiting bacterial growth when making isolates from soil by using an acid medium (pH 4). See Webb (*Ann. Mo. bot. Gdn* **6**: 201, 1919), MacInnes (*Phytopath.* **12**: 290, 1922), acidiphilous, alkaphilic.

Hydrogera F.H. Wigg. ex Kuntze (1891) ≡ Pilobolus.

Hydrometrospora J. Gönczöl & Révay (1985), anamorphic *Pezizomycotina*, Hso.1bH.1. 1 (aquatic), Hungary. See Gönczöl & Révay (*Nova Hedwigia* **40**: 199, 1984).

Hydromycus Raf. (1808) = Dacrymyces fide Merrill (*Index Rafinesq.*: 69, 1949).

Hydromyxales. An order of '*Myxomycetes*' fide Jahn (*Nat. PflFam.* Aufl. 2, **2**, 1928) but excluded from this *Dictionary* as protozoans not now studied by 'mycologists'. Cf. monads.

Hydronectria Kirschst. (1925), ? Nitschkiaceae (L). 1 (algicolous), Europe. Marine species are now placed in *Kallichroma*. See Kohlmeyer & Volkmann-Kohlmeyer (*MR* **97**: 753, 1993), Harris *in* Rossman *et al.* (Eds) (*Stud. Mycol.* **42**, 1999).

Hydronectriaceae Riedl (1987) = Nitschkiaceae.

Hydrophilomyces Thaxt. (1908), Laboulbeniaceae. 12, widespread. See Santamaria (*Nova Hedwigia* **82**: 349, 2006; Spain).

Hydrophora Tode (1791) nom. rej. prop. = Mucor Fresen. fide Hesseltine (*Mycol.* **47**: 344, 1955).

Hydrophorus Battarra ex Earle (1909) = Hygrocybe fide Kuyper (*in litt.*).

Hydropisphaera Dumort. (1822) nom. rej., Bionectriaceae. Anamorph *Acremonium*-like. 18 (on dead plant material and old fungi), widespread (esp. tropical). See Gamundí (*Darwiniana* **18**: 548, 1974), Samuels (*N.Z. Jl Bot.* **14**: 231, 1976), Rossman *et al.* (*Mycol.* **85**: 685, 1993), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny), Samuels *et al.* (*CBS Diversity Ser.* **4**, 2006; USA), Zhang & Zhuang (*Mycosystema* **25**: 15, 2006; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Hydropus Kühner ex Singer (1948), Marasmiaceae. *c.* 100, widespread (esp. tropical). See Singer (*Fl. Neotrop.* **32**, 1982; key), Robich (*Rivista di Micologia* **35**: 155, 1992), Hausknecht *et al.* (*Öst. Z. Pilzk.* **6**: 181, 1997; Austrian spp.), Pegler & Legon (*Mycologist* **15**: 60, 2001), Moreau & Courtecuisse (*Mycotaxon* **89**: 331, 2004; *Hydropus kauffmanii* from Europe).

Hydrotelamonia Rob. Henry (1957) nom. inval. = Cortinarius fide Kuyper (*in litt.*) used as a genus but only validly published at subgenus rank.

Hydrothyria J.L. Russell (1856) = Peltigera fide Feige *et al.* (*Herzogia* **8**: 69, 1989), Miądlikowska & Lutzoni (*Int. J. Pl. Sci.* **161**: 925, 2000; phylogeny, morphology, chemistry).

hydrotropism, see tropism.

Hygramaricium Locq. (1979) = Cortinarius fide Kuyper (*in litt.*).

Hygroaster Singer (1955), Tricholomataceae. 2, America (tropical). See Singer (*Sydowia* **9**: 370, 1955), Ludwig (*Z. Mykol.* **63**: 155, 1997), Lechner *et al.* (*Mycotaxon* **91**: 9, 2005; Argentina).

Hygrochroma DC. [not traced] ? nom. dub. = Phloeospora fide Mussat (*Syll. fung.* **15**: 170, 1901).

Hygrocrocis C. Agardh (1824) ≡ Typhoderma.

Hygrocybe (Fr.) P. Kumm. (1871), Hygrophoraceae. *c.* 150, widespread. See Orton (*TBMS* **43**: 248, 1960; key), Hesler & Smith (*North American species of Hygrophorus*, 1963; key), Heinemann (*Fl. Icon. Champ. Congo* **15**: 280, 1966; keys 13 spp. Congo), Singer (*Agaric. mod. Tax.* edn 3, 1975), Bon (*Docums Mycol.* **7** no. 25: 1, 1976; keys), Boertmann (*The genus Hygrocybe. Fungi of Northern Europe* **1**, 1995; N. Europ. spp., key), Boertmann (*Biblthca Mycol.* **192**: 168 pp., 2002; monogr.).

Hygromitra Nees (1816) = Leotia fide Fries (*Syst. mycol.* **1**: 1, 1821).

Hygromyxacium Locq. (1979) = Cortinarius fide Kuyper (*in litt.*).

hygrophanous, having a water-soaked appearance when wet.

hygrophilous, preferring a moist habitat.

Hygrophoraceae Lotsy (1907), Agaricales. 9 gen. (+ 14 syn.), 325 spp. Possibly polyphyletic but recent data are consistent with the monophyly of the taxon; not yet listed as nom. rej. against *Tricholomataceae*.

Lit.: Hesler & Smith (*North American species of Hygrophorus*, 1963; key), Chandrasrikul *et al.* (*Thai J. Agric. Sci.* **18**: 287, 1985), Arnolds (*Persoonia* **14**: 43, 1989), Boertmann (*Nordic Jl Bot.* **10**: 311, 1990), Horak (*N.Z. Jl Bot.* **28**: 255, 1990), Boertmann (*Fungi of Northern Europe* **1**: 184 pp., 1995), Bougher & Young (*Mycotaxon* **63**: 25, 1997), Young (*Australas. Mycol.* **18**: 63, 1999), Hibbett (*Nature* **407**: 506, 2000), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000; phylogeny), Beisenherz (*Regensb. Mykol. Schr.* **10**: 3, 2002), Boertmann (*Biblthca Mycol.* **192**: 168 pp., 2002), Moncalvo *et al.* (*Mol. Phylogen. Evol.* **23**: 357, 2002), Young & Mills (*Muelleria* **16**: 3, 2002), Young & Mills (*Muelleria* **16**: 3, 2002; Tasmania), Young (*Australas. Mycol.* **21**: 114, 2002), Cantrell & Lodge (*MR* **108**: 1301, 2004), Larsson & Jacobsson (*MR* **108**: 781, 2004), Young (*Fungi of Australia: Hygrophoraceae*: 188 pp., 2005), Matheny *et al.* (*Mycol.* **98**: 982, 2006; phylogeny).

Hygrophoropsidaceae Kühner (1980), Boletales. 2 gen., 18 spp.

Lit.: Šutara (*Česká Mykol.* **46**: 50, 1992), Binder *et al.* (*Z. Mykol.* **63**: 189, 1997), Bresinsky *et al.* (*Pl. Biol.* **1**: 327, 1999), Watling (*MR* **105**: 1440, 2001), Tuthill & Frisvad (*Mycol.* **94**: 240, 2002).

Hygrophoropsis (J. Schröt.) Maire ex Martin-Sans (1929), Hygrophoropsidaceae. 5, widespread (esp. temperate). See Singer *et al.* (*Beih. Nova Hedwigia* **98**: 6, 1990; key C. Am. spp.).

Hygrophorus Fr. (1836), Hygrophoraceae. *c.* 100 (usually mycorrhizal), widespread (esp. north temperate). See Heinemann (*Bull. Jard. Bot. État* **33**: 421, 1963; keys Centr. Afr. spp.), Hesler & Smith (*North American species of Hygrophorus*, 1963; keys), Bon (*Docums Mycol.* **7** no. 27-28: 1, 1977; keys), Bird & Grund (*Proc. Nova Scotia Int. Sci.* **29**: 1, 1979; keys 53 Can. spp.), Boertmann (*Biblthca Mycol.* **192**: 168 pp., 2002; monogr.).

Hygrophyllum, see *Hypophyllum Paulet*.

hygroscopic (1) becoming soft in wet air, hard in dry; (2) (of a sporocarp), opening and discharging spores in dry air.

Hygrotrama Singer (1959) = Camarophyllopsis fide Kuyper (*in litt.*).

Hylophila Quél. (1886) [non *Hylophila* Lindl. 1833, *Orchidaceae*] ≡ Hebeloma.

Hylostoma Pers. (1822), Pezizales. 1, Europe.

Hymenagaricus Heinem. (1981), Agaricaceae. 10, widespread (esp. tropical). See Heinemann & Sister Little Flower (*Bull. Jard. bot. nat. Belg.* **54**: 151, 1984), Reid & Eicker (*South African Journal of Botany* **64**: 356, 1998; key South African spp.).

Hymenangiaceae Corda (1842) = Cortinariaceae.

Hymenangium Klotzsch (1839) = Descomyces. *Descomyces* is not yet conserved against *Hymenangium*. fide Kuyper (*in litt.*).

Hymenelia Kremp. (1852), Hymeneliaceae (L). 26, widespread (north temperate). See Lutzoni & Brodo (*Syst. Bot.* **20**: 224, 1995), Lumbsch (*Bryologist* **100**: 180, 1997), Wedin *et al.* (*MR* **109**: 159, 2005; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Hymeneliaceae Körb. (1855), Ostropomycetidae (inc. sed.) (L). 5 gen. (+ 4 syn.), 37 spp. *Aspicilia* is now excluded and referred to the *Megasporaceae*.

Lit.: Janex-Favre (*Cryptog. Bryol.-Lichénol.* **6**: 25, 1985; ontogeny), Lutzoni & Brodo (*Syst. Bot.* **20**: 224, 1995), Lumbsch (*Bryologist* **100**: 180, 1997), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**:

753, 2006), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny).

Hymenella Fr. (1822), anamorphic *Pezizomycotina*, Cpd.0eH.?. 20, widespread. See Tulloch (*Mycol. Pap.* **130**, 1972; typification).

hymenial algae (or gonidia), algal cells in the hymenium of a lichenized ascomycete, e.g. *Endocarpon, Staurothele, Thelendia*; **- cystidium**, see cystidium; **- veil**, see annulus.

hymeniderm (of basidiomata), an outer layer composed of an unstratified layer of single cells or hyphal tips; see derm.

Hymeniopeltis Bat. (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Batista (*An. Soc. Biol. Pernambuco* **16**: 147, 1959), Farr (*Mycol.* **78**: 269, 1986).

hymenium, the spore-bearing layer of a fruit-body; (of basidiomycetes) **euhymenium** (Donk, *Persoonia* **3**: 210, 1964), a hymenium in which the basidia and their sterile homologues are the first elements to be formed, as a palisade; in a **static** (non-thickening) **euhymenium** the exhausted basidia are replaced at the same level by intercalation; in a **thickening euhymenium** the tramal hyphae grow between the exhausted basidia to form a new hymenium above the old, as in the Cantharellaceae; **catahymenium** (Lemke, *CJB* **42**: 218, 1964), a hymenium in which hyphidia are the first-formed elements and the basidia embedded at various levels elongate to reach the surface and do not form a palisade. Cf. thecium, apothecium.

Hymenoascomycetes. A class proposed by Kimbrough (*in* Wheeler & Blackwell (Eds), *Fungus-insect relationships*: 184, 1984) for operculate and inoperculate discomycetes and pyrenomycetes; see *Ascohymeniales*.

Hymenobactron (Sacc.) Höhn. (1916), anamorphic *Pezizomycotina*, Hsp.0eH.?. 1 or 2, Europe.

Hymenobia Nyl. (1854), Pezizomycotina. 1 (on lichens), Europe. See Triebel (*Biblthca Lichenol.* **35**, 1989; sub *Hymenobiella*).

Hymenobiella Triebel (1989) ≡ Hymenobia fide Eriksson & Hawksworth (*SA* **9**: 13, 1990).

Hymenobolus Durieu & Mont. (1845), Helotiales. 1 (on *Agave*), N. Africa. See Rieuf (*Al Awamia* **4**: 127, 1962).

Hymenochaetaceae Imazeki & Toki (1954), Hymenochaetales. 27 gen. (+ 47 syn.), 487 spp.

Lit.: Donk (*Persoonia* **3**: 199, 1964), Fiasson & Niemelä (*Karstenia* **24**: 14, 1984; emend.), Dai *et al.* (*Mycotaxon* **65**: 273, 1997), Müller *et al.* (*MR* **104**: 1485, 2000), Parmasto (*Mycotaxon* **79**: 107, 2001), Wagner (*Mycotaxon* **79**: 235, 2001), Wagner & Fischer (*MR* **105**: 773, 2001), Germain *et al.* (*Can. J. Pl. Path.* **24**: 194, 2002), Góes-Neto *et al.* (*Mycotaxon* **84**: 337, 2002), Gottlieb *et al.* (*Mycol. Progr.* **1**: 299, 2002), Kauserud & Schumacher (*CJB* **80**: 597, 2002), Wagner & Fischer (*Mycol. Progr.* **1**: 100, 2002), Wagner & Ryvarden (*Mycol. Progr.* **1**: 105, 2002), Nam *et al.* (*Mycobiology* **31**: 133, 2003), Fischer & Binder (*Mycol.* **96**: 799, 2004), Gatica *et al.* (*Phytopath. Mediterr.* **43**: 59, 2004), Binder *et al.* (*Systematics and Biodiversity* **3**: 113, 2005), Küffer & Senn-Irlet (*Mycol. Progr.* **4**: 77, 2005), Parmasto (*Mycotaxon* **91**: 137, 2005).

Hymenochaetales Oberw. (1977). Agaricomycetes. 2 fam., 48 gen., 610 spp. Fams:
(1) **Hymenochaetaceae**
(2) **Schizoporaceae**
For *Lit.* see under fam.

Hymenochaete Lév. (1846) nom. cons., Hymenochaetaceae. 110, widespread (esp. tropical). *H. agglutinans* (canker of young hardwoods). See Job (*Mycol. helv.* **5**: 1, 1990; temp. S. Hemisph. spp.), Léger (*Biblthca Mycol.* **171**: 1, 19XX; world monograph).

Hymenochaetella P. Karst. (1889) = Hymenochaete fide Donk (*Persoonia* **3**: 199, 1964).

Hymenoconidium Zukal (1888) ? = Marasmius fide Donk (*Beih. Nova Hedwigia* **5**, 1962).

Hymenodecton Leight. (1854) nom. rej. prop. = Phaeographis fide Lücking *et al.* (*Taxon* **56**: 1296, 2007; nomencl.).

Hymenogaster Vittad. (1831), Strophariaceae. *c.* 100, widespread (temperate). See Smith (*Mycol.* **58**: 100, 1966; keys N. Am.), Bougher & Castellano (*Mycol.* **85**: 273, 1993), Peintner *et al.* (*Am. J. Bot.* **88**: 2168, 2001), Binder & Bresinsky (*Mycol.* **7**: 85, 2002; phylogeny).

Hymenogasteraceae, see *Hymenogastraceae*.

Hymenogastraceae Vittad. (1831) = Strophariaceae.

Hymenogastrales = Agaricales. See also *Lit.* under *Gasteromycetes*.

Hymenogloea Pat. (1900), Marasmiaceae. 1, America (tropical).

Hymenogrammaceae Jülich (1982) = Grammotheleaceae.

Hymenogramme Mont. & Berk. (1844), Polyporaceae. 1, S.E. Asia. See Ryvarden (*TBMS* **73**: 9, 1979).

Hymenomarasmius Overeem (1927) ? = Marasmius fide Kuyper (*in litt.*).

Hymenomycetes Fr. (1821), see *Basidiomycota*.

Hymenophallus Nees (1816) = Phallus fide Stalpers (*in litt.*).

hymenophore, a spore-bearing structure, esp. a basidioma, or that part of it bearing the hymenium. Cf. sporophore., incl.

Hymenopleella Munk (1953) = Lepteutypa fide Shoemaker & Müller (*CJB* **43**: 1457, 1965), Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973).

Hymenopodium Corda (1837) = Clasterosporium fide Hughes (*TBMS* **34**: 577, 1951).

hymenopodium (hymenopode), tissue under the hymenium; subhymenium or hypothecium.

Hymenopsis Sacc. (1886), anamorphic *Pezizomycotina*, Ccu.0eP.15/19. 13, widespread. See Sutton (*The Coelomycetes*, 1980), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Kohlmeyer & Volkmann-Kohlmeyer (*MR* **105**: 500, 2001).

Hymenoscypha (Fr.) W. Phillips (1887) ≡ Hymenoscyphus.

Hymenoscyphaceae Bellem. (1978) = Helotiaceae.

Hymenoscyphus Gray (1821), Helotiaceae. Anamorphs *Idriella, Geniculospora, Dimorphospora, Helicodendron, Tricladium, Articulospora, Scytalidium*-like. *c.* 155, widespread. See Dennis (*Persoonia* **3**: 29, 1964), Kimbrough & Atkinson (*Am. J. Bot.* **59**: 165, 1972), Thind & Sharma (*Nova Hedwigia* **32**: 121, 1980; Indian spp.), Dumont (*Mycotaxon* **12**: 313, 1981; neotrop. spp.), Dumont (*Mycotaxon* **13**, 1981; temp. spp.), Descals *et al.* (*TBMS* **83**: 541, 1984), Lizoň (*Mycotaxon* **45**: 1, 1992), Verkley (*Persoonia* **15**: 303, 1993; asci), Baral (*SA* **13**: 113, 1994; gen. concept), Hengstmengel (*Persoonia* **16**:

191, 1996), Chambers *et al.* (*MR* **103**: 286, 1999; sp. on liverworts), McLean *et al.* (*New Phytol.* **144**: 351, 1999; DNA, ericoid mycorrhizas), Monreal *et al.* (*CJB* **77**: 1580, 1999; DNA, ericoid mycorrhizas), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Zhang & Zhuang (*Mycosystema* **21**: 493, 2002; China), Sivichai *et al.* (*Mycol.* **95**: 340, 2003; Thailand), Athipunyakom *et al.* (*Kasetsart Journal* Natural Sciences **38**: 216, 2004; Spain), Baral *et al.* (*Sydowia* **58**: 145, 2006; phylogeny, Spain), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny).

Hymenostilbe Petch (1931), anamorphic *Ophiocordyceps*, Hsy.0eH.?. 15, widespread. See Samson & Evans (*Proc. K. ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **78**: 73, 1975; key), Hywel-Jones (*MR* **99**: 154, 1995; Thailand), Hywel-Jones (*MR* **99**: 1201, 1995; on cockroaches), Guzmán *et al.* (*Mycotaxon* **78**: 115, 2001; Mexico), Stensrud *et al.* (*MR* **109**: 41, 2005; phylogeny), Sung *et al.* (*Stud. Mycol.* **57**, 2007; review, phylogeny).

Hymenula Fr. (1825) ≡ Hymenella.

Hypasteridium Speg. (1923) nom. dub., ? Meliolaceae. See Eriksson & Hawksworth (*SA* **7**: 74, 1988).

hyper- (prefix), above.

Hyperdermium J.F. White, R. Sullivan, Bills & Hywel-Jones (2000), Cordycipitaceae. 2, C. & S. America. See White *et al.* (*Mycol.* **92**: 908, 2000), Sung *et al.* (*Stud. Mycol.* **57**, 2007; review, phylogeny), Chaverri *et al.* (*Stud. Mycol.* **60**, 2008; phylogeny, neotropics).

hyperepiphyllous, growing on epiphyllous or foliicolous lichens or bryophytes, esp. in tropical rain forests.

Hyperomyxa Corda (1839) = Cheirospora fide Hughes (*CJB* **36**: 727, 1958).

hyperparasite, a parasite growing on another parasite (obsol.); Fungicolous fungi (q.v.) is a preferable general term where parasitism has not been established.

Hyperphyscia Müll. Arg. (1894), Physciaceae (L). 1 or 9, widespread (esp. tropical). See Hafellner *et al.* (*Herzogia* **5**: 39, 1979), Kashiwadani (*Bull. natn. Sci. Mus.* Tokyo, B **11**: 91, 1985), Moberg (*Nordic Jl Bot.* **7**: 719, 1987; key 7 spp., E. Afr.), Scutari (*Mycotaxon* **61**: 87, 1997), Lohtander *et al.* (*Mycol.* **92**: 728, 2000; phylogeny), Nordin & Mattsson (*Lichenologist* **33**: 3, 2001; phylogeny), Scheidegger *et al.* (*Lichenologist* **33**: 25, 2001; evolution), Helms *et al.* (*Mycol.* **95**: 1078, 2003; phylogeny), Cubero *et al.* (*MR* **108**: 498, 2004; phylogeny).

hyperplasia, over-development of some sort (e.g. swellings, galls, witches' brooms) as a reaction to a disease-producing agent; cf. hypoplasia.

Hyperrhiza Spreng. (1827) ≡ Uperhiza.

hypersaprophyte, a saprophyte only found on substrates invaded by other saprophytes, e.g. *Herpotrichiellaceae*, *Lasiosphaeria*, *Nectria sanguinea*, etc. (Munk, *Sydowia, Beih.* **1**, 1957).

hypersensitivity, increased sensitivity, as in the condition in which there is death of the host tissue at the point of attack by a pathogen, so that the infection does not spread; esp. of reaction to rusts for which the word was first used by Stakman; intolerance; (and see Allergy, Medical fungi).

hypertonic (of culture media), having an osmotic pressure higher than that of the organism cultured; cf. hypotonic.

hypertrophy (of organs, etc.), the state of having growth greater than normal.

hypertrophyte, a parasitic fungus causing hyperplasia in a plant (Wakker).

Hypha Pers. (1822) nom. dub., anamorphic *Fungi*. See Donk (*Taxon* **11**: 86, 1962).

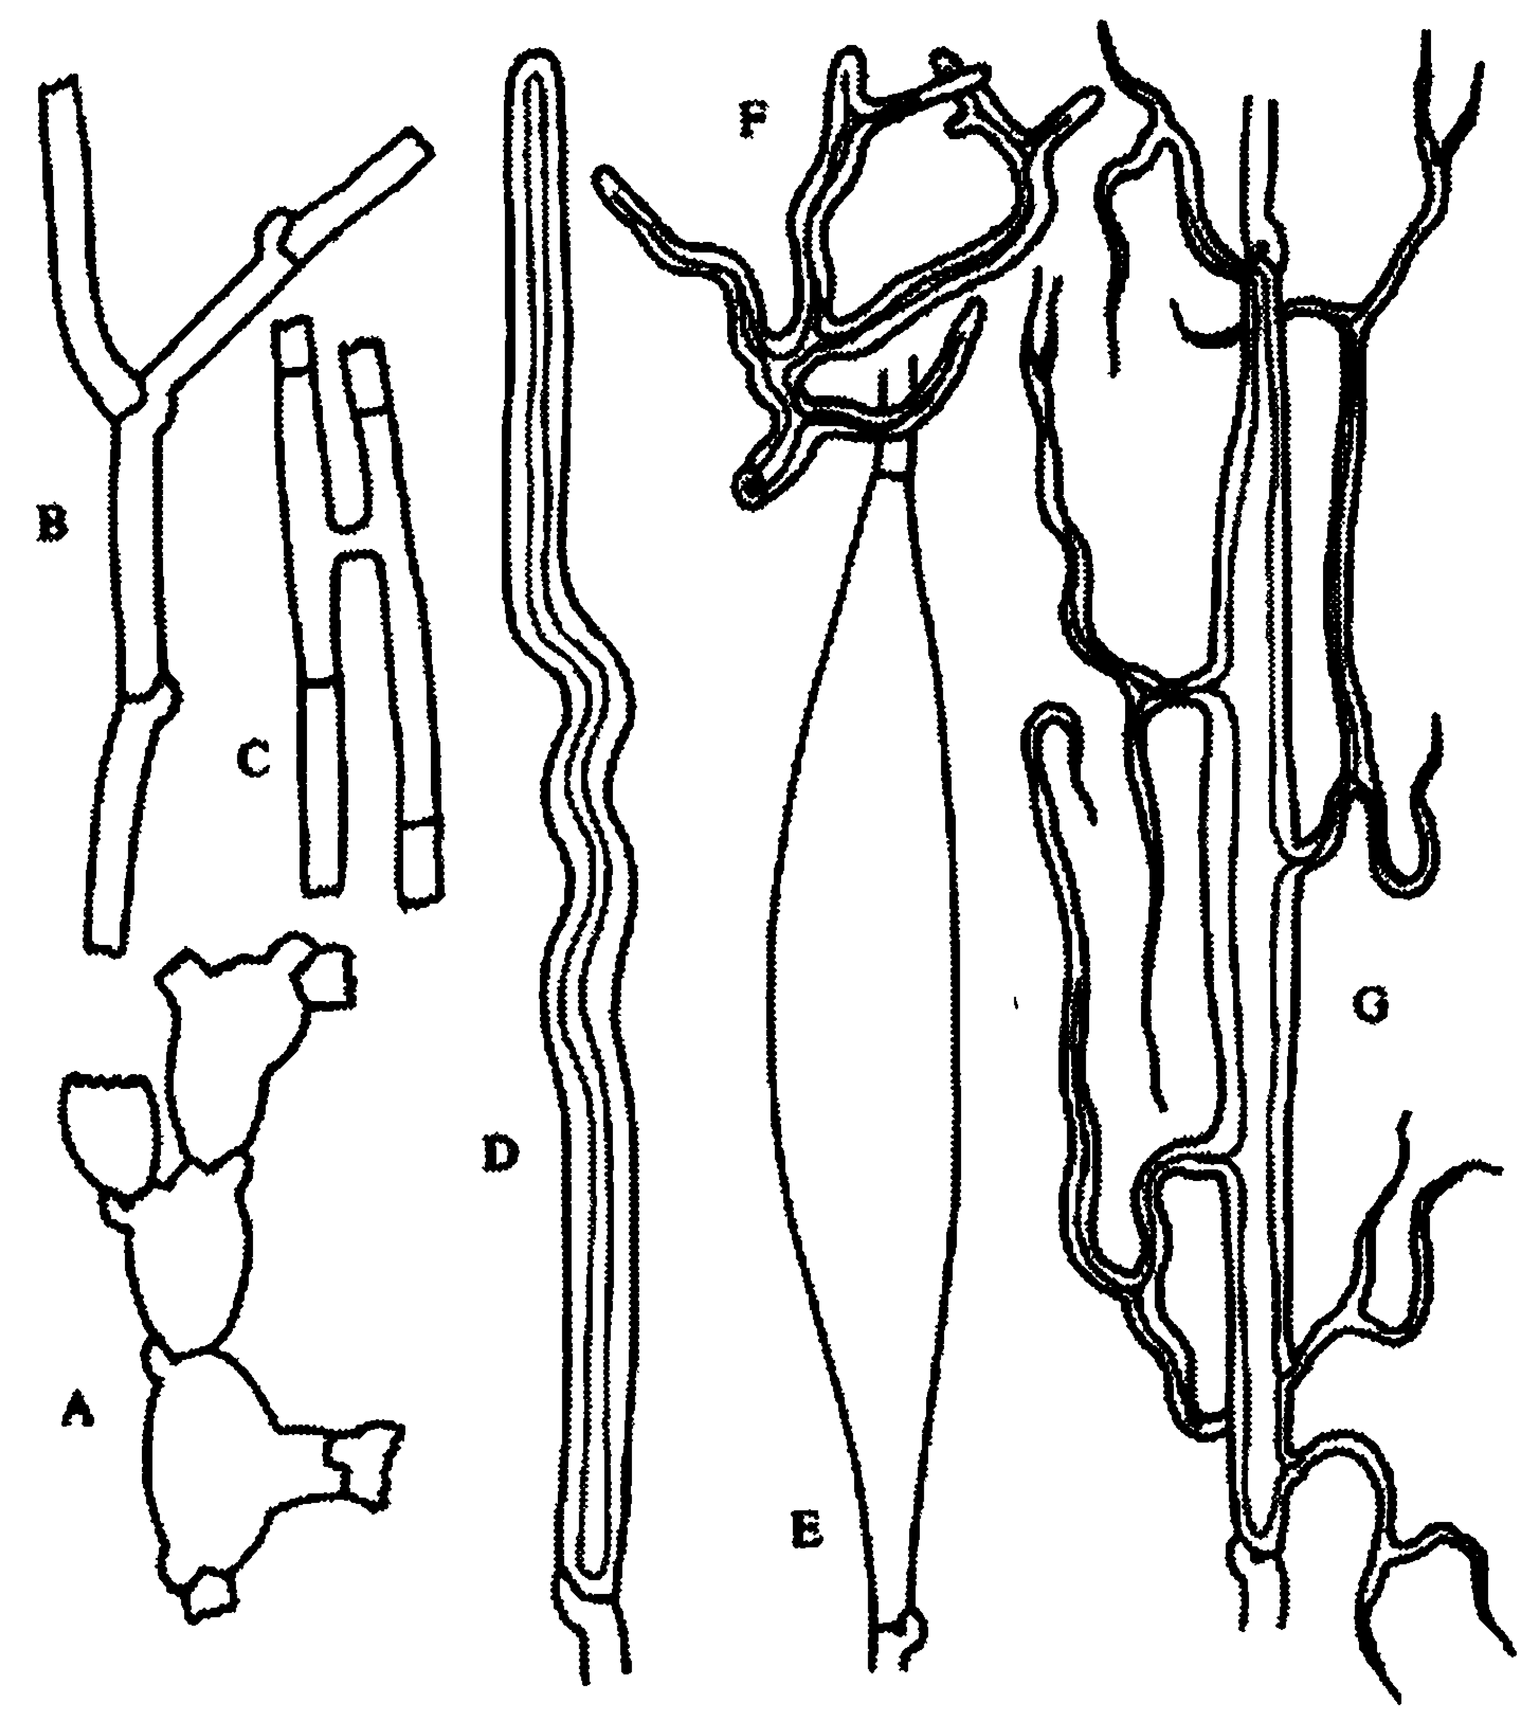

Fig. 16. Hyphal types. A, inflated generative hyphae; B, non-inflated generative hyphae with clamp connexions; C, generative hyphae without clamp connexions; D, unbranched skeletal hypha; E, sarco-hypha; F, highly branched ligative (binding) hypha; G, skeleto-ligative hypha. Not to scale

hypha (pl. **hyphae**), one of the filaments of a mycelium; Vuillemin restricted the term to septate filaments; cf. siphon; **ampoule -**, a swollen hypha as in certain basidiomycetes; **arboriform -**, much branched skeletal - of *Ganoderma*; **ascogenous -**, a dikaryotic hypha from which an ascus develops; **binding -**, see Hyphal analysis; **costiferous -**, transverse ribs (costae) on the inner surface of the hyphal wall of the gill trama in *Paxillus involutus* and *P. filamentosus*, non-amyloid, stained by Congo red and calcofluor but not toluidine blue; **endo-** (intrahyphal -), vegetative or fertile element initiated by the differentiation within a - from the innermost wall layer (Cole & Samson, 1979); **inflated -**, one in which cells behind the growing apex enlarge and cause the apparent rapid rate of growth characteristic of most agaric and gasteromycete basidiocarps; in an **uninflated -** no change of cell size occurs as in most polypores; **mediate -** and **mycelial -**, see Corner (*TBMS* **17**: 54, 1932); **oleiferous -**, do not carry latex (cf. lactifer) but frequently resinous substances (Singer, 1960: 34); **oiliferous -**, a submerged hypha of an endolithic lichen having torulose, guttulate cells; see des Abbayes (*Traité de Lichenologie*, 1951); **racquet -**, one of racket cells (q.v.); **skeletal -**, see Hyphal analysis; **stuffing -**, see Corner (*TBMS* **17**: 54, 1932). See flexuous hypha, hyphal analysis, hyphal peg, textura, Woronin's hypha.

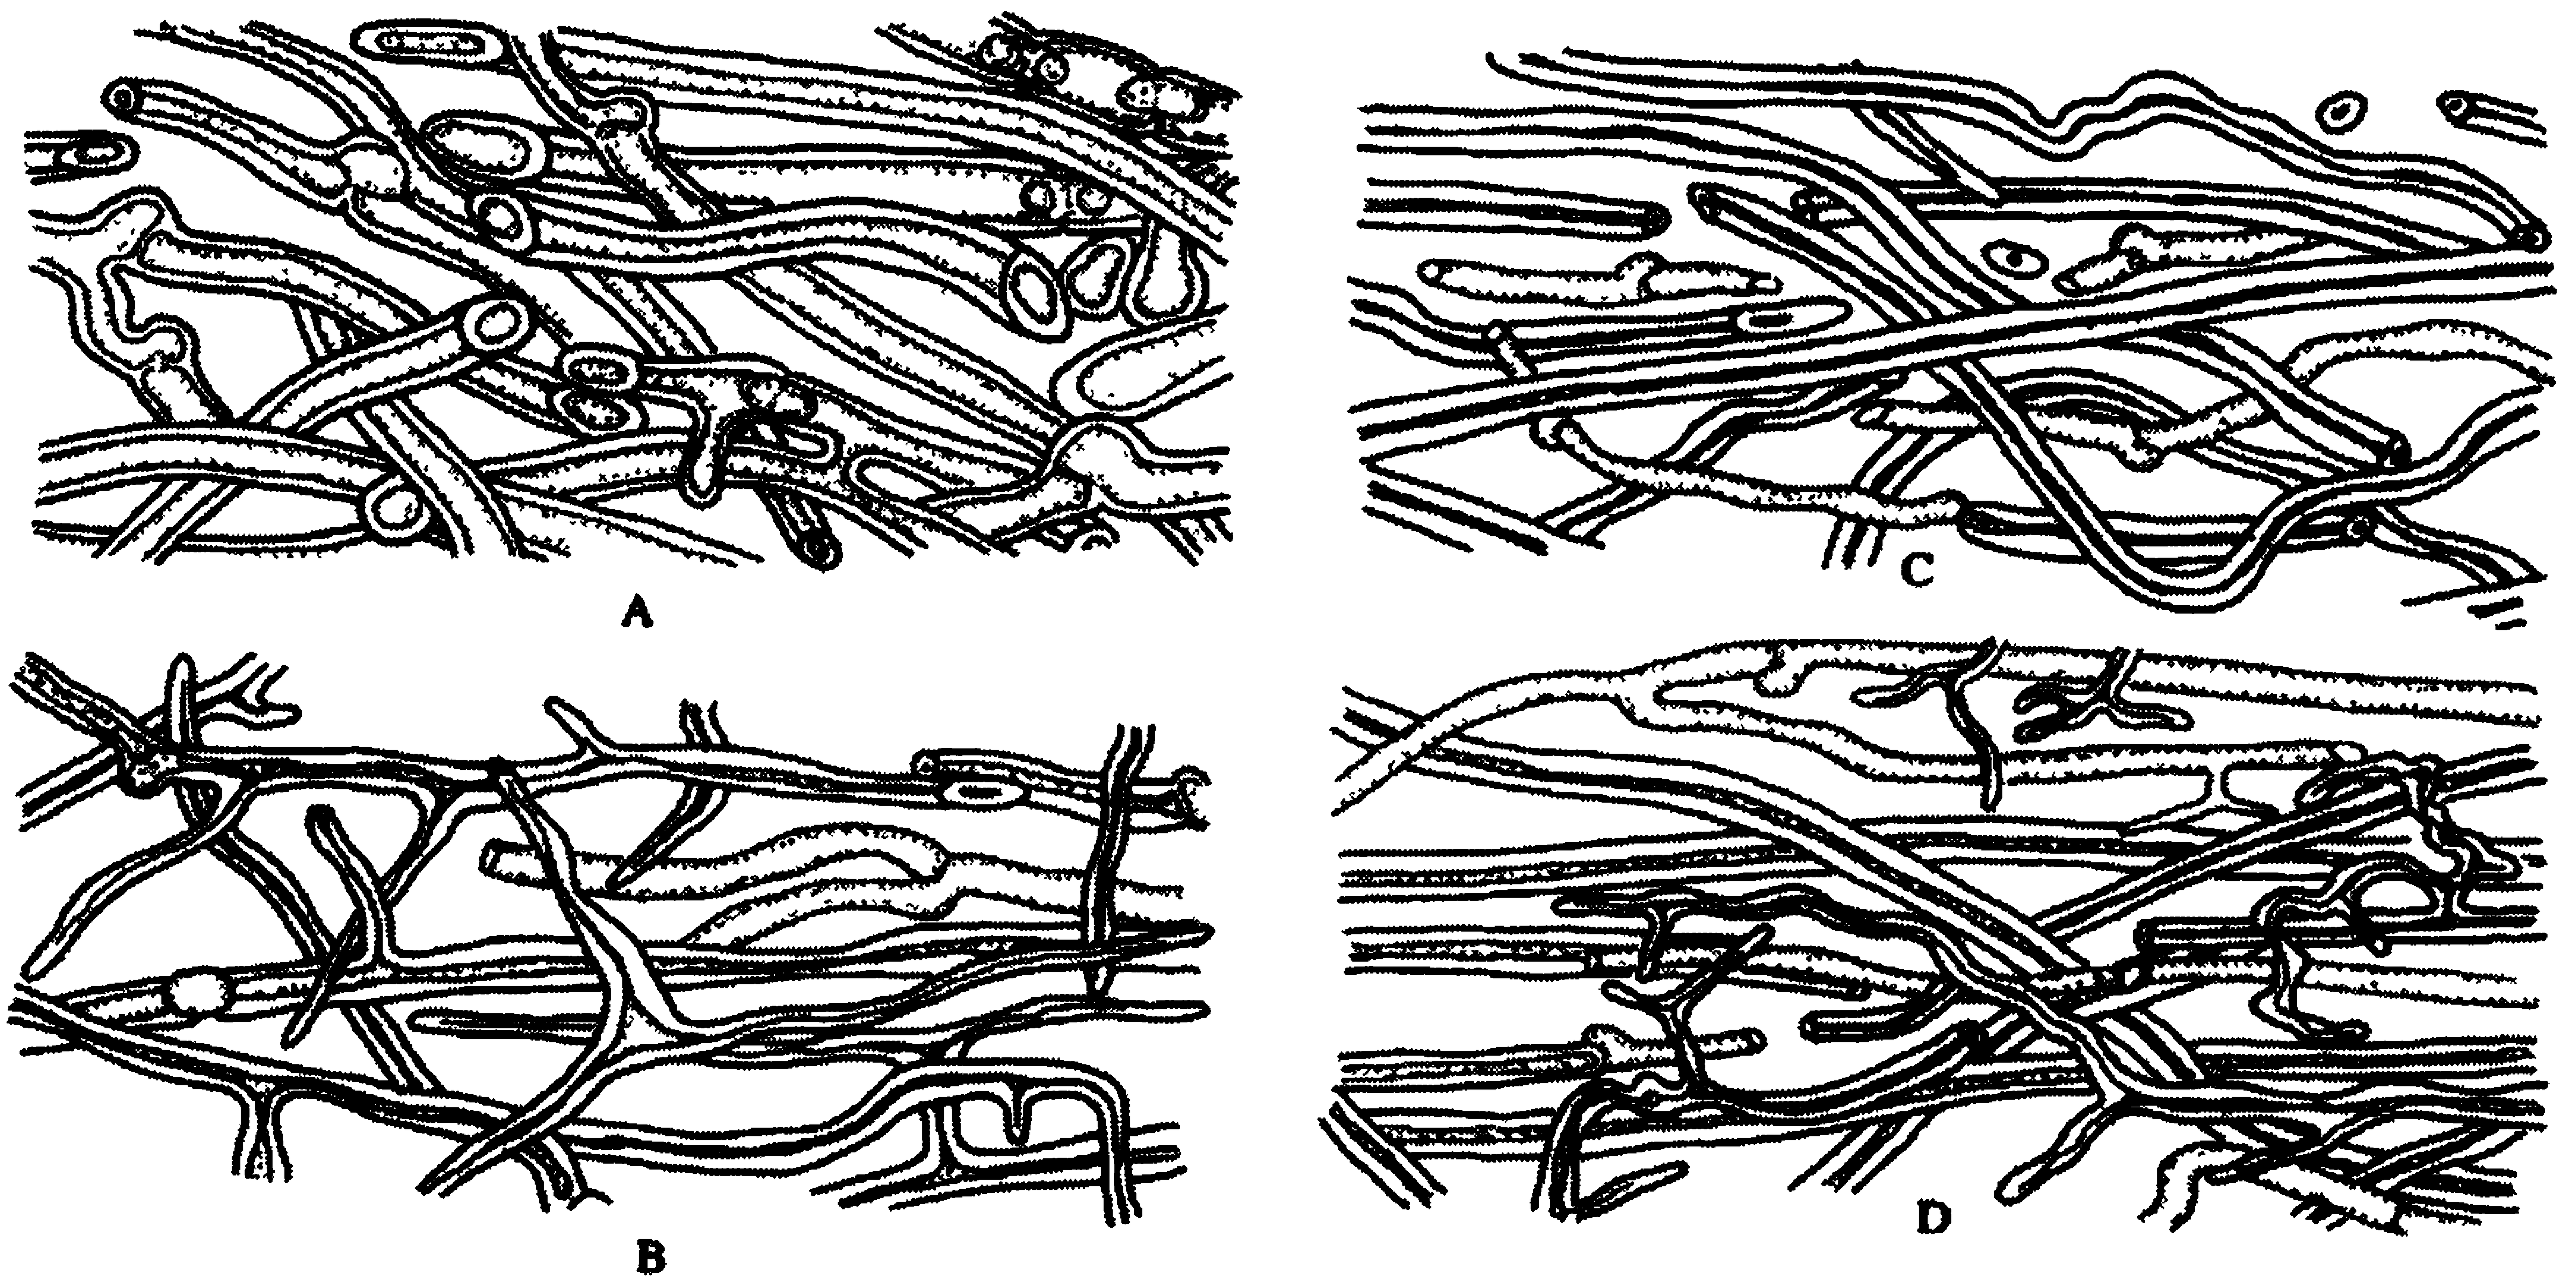

Fig. 17. Hyphal systems. See Pegler (*Bull. BMS* 7(suppl.), 1973). A, monomitic hyphal system, with thick-walled generative hyphae; B, dimitic hyphal system, with generative and ligative (binding) hyphae; C, dimitic hyphal system, with generative and skeletal hyphae; D, trimitic hyphal system, with generative, skeletal and ligative hyphae.

Hyphal analysis. A procedure by which the development and structure of basidiomata can be investigated, providing important taxonomic criteria. Three main types of hyphal systems of increasing complexity were recognized by Corner (*TBMS* **17**: 51, 1932) (Figs 16, 17): **monomitic**, having hyphae of one kind (generative hyphae which are branched, septate, with or without clamp-connexions, thin- to thick-walled, and of unlimited length; they give rise both to other hyphal types and to the hymenium) (Teixeira, *Mycol.* **52**: 30, 1961; gen. hyphae of polypores); **dimitic**, having hyphae of two kinds (generative and skeletal hyphae which are thick-walled, aseptate, and of limited length, with thin-walled apices, generally unbranched but when terminal they can develop arboriform branching or taper) or generative and binding (see below); **trimitic**, having hyphae of three kinds (generative, skeletal and binding (or ligative) hyphae which are aseptate, thick-walled, much branched, either *Bovista*-type with tapering branches or coralloid; they bind the skeletal and generative hyphae together). In *Polyporaceae* and *Lentinaceae*, intercalary skeletal hyphae can give rise to ligative branching, the entire element being termed a skeleto-binding cell (Corner, 1981) or skeleto-ligative hypha (Pegler, 1983). Corner also recognized **sarco-dimitic** (in which the skeletal hyphae are replaced by thick-walled, long, inflating fusiform elements) and **sarco-trimitic** (in which the generative hyphae give both thick-walled inflated elements similar to binding hyphae but septate) types.

Most soft and fleshy basidiomata are monomitic, with hyphae which are generally inflated (most agaricoid and clavarioid fungi). Hard and tough basidiomata may be monomitic with the generative hyphae developing thickened walls, dimitic, with skeletal hyphae (e.g. *Phellinus* spp.) or (esp. when perennial) trimitic (e.g. *Fomes*, *Ganoderma*, *Microporus xanthopus*). Every species has a well-defined and constant construction, which is maintained regardless of changes in the external morphology of the basidioma due to environmental conditions, hence the importance of hyphal analysis in taxonomy.

Lit.: Corner (*Ann. Bot.* **46**: 71, 1932, *Phytomorphology* **3**: 152, 1953, *Beih. Nova Hedw.* **75**: 13, 1983, **78**: 13, 1984), Cunningham (*N. Z. Jl Sci. Tech.* **28**(A): 238, 1946, *TBMS* **37**: 44, 1954), Lentz (*Bot. Rev.* **20**: 135, 1954), Talbot (*Bothalia* **6**: 1, 1951).

hyphal fusions, see anastomosis. Vegetative hyphae of a mycelium may fuse, forming an interconnected network. Fusion between hyphae of different mycelia is controlled by genetic systems which determine sexual (see sex) or vegetative compatibility (q.v.).

hyphal net (**'Hyphenfilz'**), organ of attachment in some squamulose (placodioid) lichens (e.g. *Psora decipiens*) where a delicately branched reticulate net penetrates the substrate (see Poelt & Baumgärtner, *Öst. bot. Z.* **111**: 1, 1964; rhizinose strand).

hyphal peg (of basidiomata), a bunch of somewhat interwoven hyphae extending from the trama (where it originates) to the hymenium from which it may project (Singer, 1960: 47); (of hyphae), projection from a hypha for fusion (Buller, **5**), peg-hypha.

hyphal rhizoid, a hypha acting as a rhizoid.

Hyphal tip growth, Hyphal elongation is mainly by apex-located synthesis, first confirmed by Gooday (q.v.) and expansion of the hyphal tip (*contra* intercalary growth). Plasma membrane (PM) and cell wall are synthesized in a steep tip-high gradient by fusion of precursor vesicles liberating their contents to be incorporated into the wall as they incorporate their membranes into the PM. Fibrillar wall components (e.g. chitin) are synthesized by tip-located PM-inserted enzymes. The wall is plastic when newly formed but as further wall material is built and the tip extends taking the active growing point away, it gradually becomes inextensible and less plastic. The declining gradient of cell surface extensibility yields

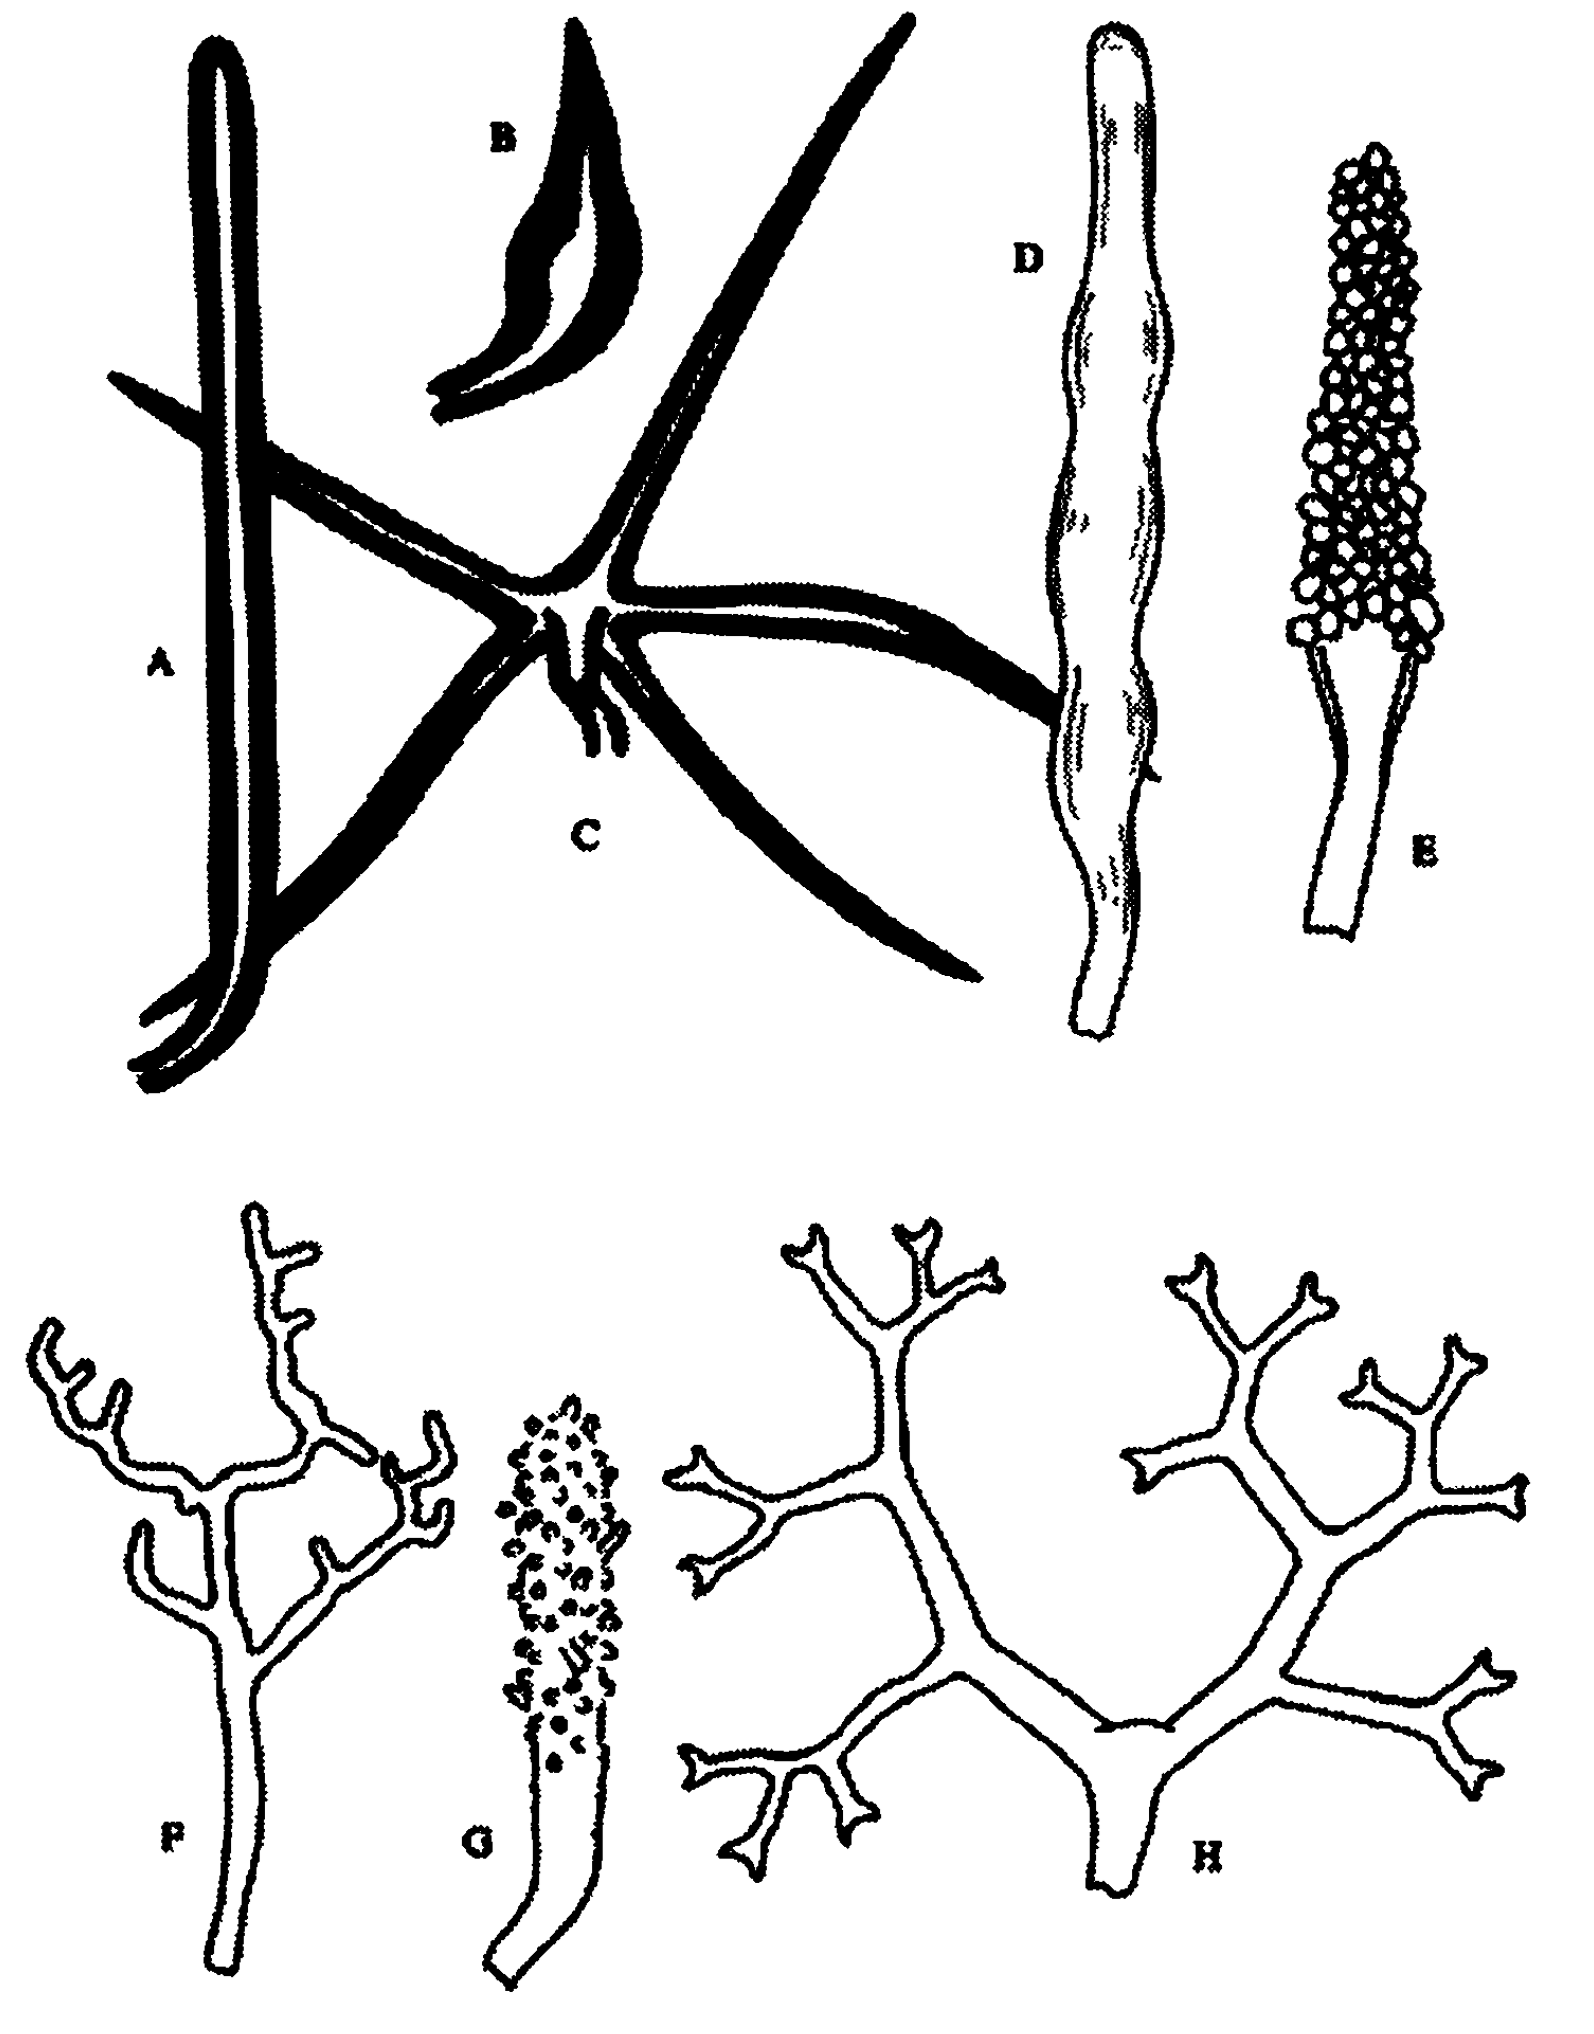

Fig. 18. Hyphidia. A, setal hypha (*Phellinus*); B, seta (*Inonotus*); C, asteroseta (*Asterostroma*); D, gloeohypha (*Gloeocystidiellum*); E, encrusted (*Peniophora*); F, dendrohyphidium (*Cytidia*); G, acanthohyphidium (*Aleurodiscus*); H, dendrohyphidim (*Vararia*). Not to scale

to turgor pressure and is very finely regulated to produce the constant-diameter hypha. Various models have been proposed to help interpret hyphal tip growth. Two models address regulation of extensibility; a) cross-linking of wall polymers, with or without balanced concomitant wall hydrolytic enzyme activity, regulating wall extensibility (Wessels, *in* Heath, *Tip Growth in Plant and Fungal Cells*: 1, 1990) or b) an actin-rich membrane skeleton attached to the inside of the PM regulates extension of the membrane upon which the wall is assembled (Heath, *CJB* **73**(Suppl. 1): S131, 1995). In addition, the gradient of vesicle fusions is postulated to be generated by a 'vesicle supply centre' whose location is coincident with the Spitzenkörper, a labile vesicle- and actin-rich structure present in growing tips of most, but not all, fungi, whose behaviour correlates with tip growth rate and direction (Bartnicki-Garcia, *in* Heath, *Tip Growth in Plant and Fungal Cells*: 211, 1990). Another model attempts to explain the role of calcium gradients in the hyphal tip (Regalado, *Microbiology* **144**: 2771, 1998), while a further model interpret hyphal tip growth in terms of microtubule-based transport (Sugden *et al.*, *Physical Rev. E*, 2007). Current data do not differentiate the relative contributions of these different components, but cellular regulation, possibly involving cytoplasmic Ca^{2+} (Jackson & Heath, *Microbiol. Rev.* **57**: 367, 1993), of each could generate the known diversity of sizes, shapes, branching patterns and directions of growth characteristic of all hyphal structures (see also wall building). See also spitzenkörper).

Hyphasma Rebent. ex Nocca & Balb. (1821) nom. dub., anamorphic *Fungi*. See Donk (*Taxon* **11**: 86, 1962).

Hyphaster Henn. (1903) = Asterostomella fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **119**: 21, 1910).

Hyphelia Fr. (1825) = Trichothecium. Also used for anamorphs of *Corticium*. fide Hughes (*CJB* **36**: 727, 1958), Donk (*Taxon* **11**: 86, 1962), Hennebert (*Persoonia* **7**: 195, 1973).

hyphidium (pl. **-ia**), (paraphysis, pseudoparaphysis, paraphysoid, dikaryoparaphysis, and pseudophysis sensu Singer (1962) are syn. or near syn.), a little, or strongly, modified terminal hypha in the hymenium of hymenomycetes (Fig. 18). Donk (*Persoonia* **3**: 229, 1964) distinguished; **haplo-** (simple -), unmodified, unbranched or little branched; **dendro-** (dendrophysis), irregularly strongly branched; **dicho-** (dichophysis), repeatedly dichotomously branched; **acantho-** (acanthophysis; bottle-brush paraphysis (Burt, 1918)), having pin-like outgrowths near the apex; in *Corticiaceae* may be botryose, clavate, coralloid, or cylindrical. Cf. cystidium.

Hyphobasidiofera K. Matsush. & Matsush. (1996), Agaricomycetes. 1, Malaysia. See Matsushima & Matsushima (*Matsush. Mycol. Mem.* **9**: 33, 1996).

Hyphochlaena Cif. (1962), anamorphic *Pezizomycotina*, Hso.?.?. 1 (sterile mycelium), Dominican Republic. See Ciferri (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **19**: 110, 1962).

hyphocystidium, see cystidium.

Hyphoderma Fr. (1849) ≡ Hyphelia fide Donk (*Taxon* **11**: 88, 1962).

Hyphoderma Wallr. (1833), Meruliaceae. *c.* 95, widespread. s. str. 35 species. See Donk (*Fungus* Wageningen **27**: 13, 1957), Donk (*Persoonia* **2**: 220, 1962), Eriksson & Ryvarden (*Cortic. N. Europ.* **3**: 448, 1975; key 27 Eur. spp.), Wu (*Acta Bot. Fenn.* **142**: 64, 1990; key Taiwan spp.), Gilbertson & Hemmes (*Mem. N. Y. bot. Gdn* **89**: 81, 2004; Hawaii), Larsson (*MR* **111**: 186, 2007; phylogeny).

Hyphodermataceae Jülich (1982) = Meruliaceae.

hyphoid (1) like hyphae; cobwebby; (2) (of aecia of *Dasyspora*), having aeciospores on hyphal projections from stomata (Arthur).

Hypholoma (Fr.) P. Kumm. (1871) = Psilocybe (Fr.) P. Kumm. fide Kuyper (*in litt.*).

Hypholomopsis Earle (1909) = Psathyrella fide Singer (*Agaric. mod. Tax.*, 1951).

Hyphomucor Schipper & Lunn (1986), Mucoraceae. 1, paleotropical. See Schipper (*Mycotaxon* **27**: 83, 1986), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Hyphomyces C.H. Bridges & C.W. Emmons (1961) nom. inval., Fungi.

Hyphomycetes, Anamorphic fungi; widespr. in most ecological niches. This artificial class is traditionally separated into three (or four, if agonomycetes are included) orders, based on the presence or absence of conidia and the degree of aggregation of the conidiophores into more complex structures (conidiomata). An alternative system of classification (now obsol.) for the anamorphic fungi as a whole (including the coelomycetes, q.v.) was advanced by Sutton (1980). The traditional separation is:

(1) **Agonomycetales** (Agonomycetaceae) (Mycelia sterilia, q.v.). No conidia generally produced, but in some genera propagules which are liberated by multicellular secession are formed.

(2) **Hyphomycetales** (= Moniliaceae + Dematiaceae). This group comprises the main body of the hyphomycetes; conidiophores are separate, not organized on synnematal or sporodochial conidiomata. The full range of conidiogenous events occurs.

(3) **Stilbellales** (Coremiales, Synnematomycetes, Stilbellaceae). Conidiophores are aggregated as synnemata, and conidiogenous events are various but the 'basauxic' type is absent. See Morris (*Western Ill. Univ. Ser. biol. Sci.* **3**, 1963; key 54 synnem. gen.), Benjamin (*Taxon* **17**: 521, 1968; typification), Seifert (*Stud. Mycol.* **27**, 1985; *Stilbella* and related genera).

(4) **Tuberculariales** (Tuberculariaceae). Conidiophores are aggregated on sporodochial conidiomata and a wide range of conidiogenous events occurs.

hypocreacous, fleshy and brightly coloured, like *Hypocrea*.

Hypocreales Lindau (1897). Sordariomycetidae. 7 fam., 237 gen., 2647 spp. Ascomata perithecial, rarely cleistothecial, sometimes either in or on a stroma, ± globose, sometimes ornamented, rarely setose, the ostiole periphysate; peridium and stromatal tissues fleshy, usually brightly coloured; interascal tissue of apical paraphyses, often evanescent; asci ± cylindrical, thin-walled, sometimes with a small apical ring or a conspicuous apical cap, not blueing in iodine; ascospores varied, hyaline or pale brown, usually septate, sometimes muriform, sometimes elongate and fragmenting, without a sheath. Anamorphs prominent, hyphomycetous. Saprobes or parasites of plants, often fungicolous or licheni-

colous, rarely coprophilous, cosmop. Fams:
(1) **Bionectriaceae**
(2) **Clavicipitaceae**
(3) **Cordycipitaceae**
(4) **Hypocreaceae**
(5) **Nectriaceae**
(6) **Niessliaceae**
(7) **Ophiocordycipitaceae**

Hypodrys Pers. (1825) ≡ Fistulina.

Hypoflavia Marbach (2000), Caliciaceae (L). 2, S. America. See Marbach (*Biblthca Lichenol.* **74**: 291, 2000).

Hypogaea E. Horak (1964), Agaricaceae. 1, Argentina. Basidioma gasteroid. See Horak (*Sydowia* **17**: 299, 1964).

Hypogaeaceae E. Horak (1964) = Agaricaceae.

Hypogaeum Pers. (1797) = Elaphomyces fide Fries (*Syst. mycol.* **3**: 57, 1829).

hypogean (**hypogeal**, **hypogeic**, **hypogeous**), in the earth; (of fungi) see Hypogeous fungi.

hypogenous, produced lower down.

Hypogeous fungi. Fungi having subterranean sporocarps comprise many taxonomically unrelated species showing remarkable features of convergent evolution as a result of adaptation to this specialized habitat. They include the truffles (q.v.; esp. *Elaphomycetales*, *Pezizales*), false truffles (*Rhizopogon*, *Hymenogaster*, *Gautieria*), various 'gasteromycetes' (*Radiigera*, *Pyrenogaster*) and a few *Zygomycetes* (e.g. *Endogone*). Most are mycorrhizal; many mutualistic relationships have also evolved between hypogeous fungi animals, particularly insects and some mammals; many show considerable variability within a single fruitbody in numbers of spores produced per ascus or basidium, and their fruitbodies are often involuted or convoluted with a strongly reduced hymenium and thought to be derived from epigeous forms; their importance of some species in the food chain of endangered mammals has meant more is known about their conservation needs than for most fungi (e.g. Loeb *et al.*, *Am. Midl. Nat.* **144**: 286, 2000), see Animal mycophagists; some, particularly species of *Elaphomyces* accumulate radionuclides in exceptional quantities (see Air pollution). Their unusual nature has stimulated much folk lore and many

legends about hypogeous fungi including, particularly, a belief that some are aphrodisiacs. See Tulasne (*Fungi hypogaei*, 1851 [reprint 1970]), Hawker (*Biol. Rev.* **30**: 127, 1955), Trappe (*Mycotaxon* **9**: 297, 1979). **Australasia** Trappe *et al.* (*Aust. Syst. Bot.* **5**: 597 & 617, 1992; **9**: 773 & 803, 1996); **British Isles** Hawker (*Phil. Lichen Soc.* **13**: 42, 2006; conservation), McCune *et al.* (*Bryologist* **109**: 80, 2006; N America), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Wei & Wei (*Mycotaxon* **94**: 155, 2005; China).

Hypogymniaceae Poelt ex Elix (1980) = Parmeliaceae.

hypogyny (adj. **hypogynous**), the condition of having the antheridium under the oogonium and on the same hypha.

Hypohelion P.R. Johnst. (1990), Rhytismataceae. 2, Europe; N. America. See Johnston (*Mycotaxon* **39**: 219, 1990), Johnston (*Mycol. Pap.* **176**: 239 pp., 2001).

Hypolepia Raf. (1808) nom. nud., Fungi. See Merrill (*Index Rafinesq.*, 1949).

hypolithic, see endolithic.

Hypolyssus Pers. (1825) nom. conf., Agaricomycetes. sensu Berk. = *Caripia* (Podoscyph.).

Hypomnema Britzelm. (1883) nom. dub., Agaricales.

Hypomyces (Fr.) Tul. (1860), Hypocreaceae. Anamorphs *Cladobotryum, Sibirina, Verticillium*. 53 (mostly on larger fungi), widespread. See Arnold (*Nova Hedwigia* **21**: 529, 1972; classif.), Tubaki (*Rep. Tottori mycol. Inst.* **12**: 161, 1975; Japanese spp.), Arnold (*Bibliogr. Mitteil. Univ.-bibl. Jena* **25**, 1976; bibliogr.), Samuels (*Mem. N. Y. bot. Gdn* **26**, 1976), Rogerson & Samuels (*Mycol.* **77**: 763, 1985; spp. on discomycetes), Rogerson & Samuels (*Mycol.* **81**: 413, 1989; key 10 spp. on *Boletales*), Rogerson & Samuels (*Mycol.* **85**: 231, 1993; spp. on polypores), Rogerson & Samuels (*Mycol.* **86**: 839, 1994; key 13 spp. on agarics), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Põldmaa (*Stud. Mycol.* **45**: 83, 2000), Douhan & Rizzo (*MR* **107**: 1342, 2003; host-parasite rels), Põldmaa (*Mycol.* **95**: 921, 2003; on *Stereaceae*), Põldmaa & Samuels (*Sydowia* **56**: 79, 2004; Thailand), Tokiwa & Okuda (*Mycoscience* **46**: 294, 2005; Japan).

Hypomycetaceae Earle (1901) = Hypocreaceae.

Hypomycetales = Hypocreales.

Hypomycopsis Henn. (1904) = Mycosphaerella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

hyponecral, see necral layer.

Hyponectria Sacc. (1878), Hyponectriaceae. 16 (on dead leaves etc.), widespread. See Barr (*Mycol.* **69**: 952, 1977; key), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Wang & Hyde (*Fungal Diversity* **3**: 159, 1999), Winka & Eriksson (*Mycoscience* **41**: 97, 2000; DNA), Sivanesan & Shivas (*Fungal Diversity* **9**: 169, 2002).

Hyponectriaceae Petr. (1923), Xylariales. 22 gen. (+ 15 syn.), 128 spp.

Lit.: Samuels *et al.* (*Mycotaxon* **28**: 473, 1987), Barr (*Indian Journal of Mycology and Plant Pathology*, 1994). The affinities are still uncertain pending further molecular analysis, see also Hyde *et al.* (*Sydowia* **50**: 21, 1998), Mahuku *et al.* (*MR* **102**: 559, 1998), Wang & Hyde (*Fungal Diversity* **3**: 159, 1999), Winka & Eriksson (*Mycoscience* **41**: 97, 2000), Jeewon *et al.* (*MR* **107**: 1392, 2003).

Hyponevris Earle (1909) ≡ Schizophyllum.

Hyponevris Paulet (1808) = Merulius Haller ex Boehm. fide Donk (*Taxon* **12**: 167, 1963).

hyponym, a name only; one having no description or reference to a specimen.

hypoparasite, a hidden parasite; a pathogen dispersed along with another pathogen, such as a mycovirus in an *Ophiostoma ulmi* population.

Hypophloeda K.D. Hyde & E.B.G. Jones (1989), Diaporthales. 1 (mangrove roots), Brunei; Seychelles. See Hyde & Jones (*TMSJ* **30**: 61, 1989).

hypophloeodal, under the periderm or bark; endophloeodal; subcutical; within the bark.

hypophyllous, on the under surface of a leaf.

Hypophyllum Earle (1909) = Lactarius fide Singer (*Agaric. mod. Tax.*, 1951).

Hypophyllum Paulet (1808) ≡ Agaricus L.

hypoplasia, the state of having growth less than normal, cf. hyperplasia.

Hypoplasta Preuss (1855) = Cytospora fide Saccardo (*Syll. fung.* **3**: 1, 1884).

Hypoplegma Theiss. & Syd. (1917) = Perisporiopsis Henn. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Hypopteris Berk. (1854) = Apiospora fide Theissen & Sydow (*Annls mycol.* **13**: 419, 1915).

Hyporrhodius (Fr.) Staude (1857) = Pluteus fide Kuyper (*in litt.*).

Hypospila Fr. (1825) nom. dub., Pezizomycotina. See von Arx (*Antonie van Leeuwenhoek* **17**: 257, 1951).

Hypospilina (Sacc.) Traverso (1913), Diaporthales. Anamorph *Asteroma*. 2, Europe. See Barr (*Mycol. Mem.* 7, 1978), Monod (*Beih. Sydowia* **9**: 1, 1983).

Hypostegium Theiss. (1916) = Glomerella fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Hypostigme Syd. (1925) = Parastigmatea fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Hypostomum Vuill. (1896) nom. dub., Fungi.

hypostroma, see stroma.

Hypotarzetta Donadini (1985), Pyronemataceae. 1, Europe. See Donadini (*Docums Mycol.* **15** no. 60: 47, 1985), Fouchier & Neville (*Bulletin Semestriel de la Fédération des Associations Mycologiques Méditerranéennes* **13**: 32, 1998).

hypothallus (1) (of lichens), the first hyphae of the thallus to grow, usually used of a crustaceous lichen which has no photobiont cells or cortex; = prothallus (protothallus), fide Maas Geesteranus (*Blumea* **6**: 47, 1947) who restricts hypothallus to the spongy tissue on the underside of the thallus in *Anzia*, *Pannaria* and *Pannoparmelia*, but see spongiostratum; (2) (of *Mycetozoa*), the thin layer on the surface of the substratum not used up in sporangial development; Ross (*Mycol.* **65**: 477, 1973) distinguished epi- and subhypothallic development.

hypothecium, medullary excipulum; the hyphal layer under the subhymenium in an apothecium; sometimes used indiscriminately for all tissues below the hymenium (including the subhymenium).

Hypothele Paulet (1812) nom. inval. ≡ Hydnum.

hypotonic (of culture media), having an osmotic pressure lower than that of the organism cultured, cf. hypertonic.

Hypotrachyna (Vain.) Hale (1974), Parmeliaceae (L). *c.* 198, widespread (esp. subtropics and montane tropics). See Hale (*Smithson. Contr. bot.* **25**, 1975), Krog & Swinscow (*Norw. Jl Bot.* **26**: 11, 1979; E. Afr.), Eliasaro *et al.* (*Mycotaxon* **69**: 255, 1998; Brazil), Kurokawa & Lai (*Mycotaxon* **77**: 225, 2001; Taiwan), Divakar & Upreti (*Mycotaxon* **86**: 67, 2003), Thell *et al.* (*Mycol. immobolisation, the controlled, intentional, attachment of fungal cells in fermentation technology (Webb, *Mycologist* **3**: 163, 1989). Cf. biomass support particles.
Immotthia M.E. Barr (1987), Pleosporales. Anamorph *Coniothyrium*-like. 1, Europe; N. America. See Barr (*Mycotaxon* **29**: 501, 1987), Jaklitsch *et al.* (*Öst. Z. Pilzk.* **11**: 93, 2002).
immune, the condition of having qualities which do not allow, or not having qualitites which allow, the development of a disease to take place; **natural immunity** is based on qualities natural to the organism, **acquired immunity**, on the development of such qualities in the course of its life-time, generally as a result of taking the disease naturally or experimentally (not certainly present in plants).
immune (from), exempt from infection (*TBMS* **33**: 155, 1950); having immunity.
immunization, the process of increasing the resistance of, or of giving resistance to, a living organism.
immunosuppressant, a substance such as the fungal metabolite cyclosporin (produced by *Tolypocladium inflatum*), which partly or completely suppresses the immune system; used to prevent rejection of transplanted organs.
imperfect state, see States of fungi; Anamorphic fungi.
imperforate, having no opening.
Imprimospora G. Norris (1986), Fossil Fungi. 1 (Eocene), Canada.
impriorable, illegitimate (obsol.).
Impudentia Vujanović (2003), anamorphic *Pezizomycotina*, H?.?.?. 2 (on insects), Canada. See Vujanovic *et al.* (*Mycotaxon* **88**: 234, 2003).
Imshaugia S.L.F. Mey. (1985), Parmeliaceae (L). 3, widespread (northern hemisphere). See Hinds (*Mycotaxon* **72**: 271, 1999; N. Am.), Elix (*Mycotaxon* **90**: 337, 2004; S America), Thell *et al.* (*Symb. bot. upsal.* **34** no. 1: 429, 2004; biogeography), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).
in situ (Lat.), **in-situ** (Engl.) (of an organism), one living in its natural habitat; cf. *ex situ*.
inaequi-hymeniiferous (of hymenial development in agarics), having basidia which mature and shed their spores in zones; the coprinus type (Buller, *Researches* **2**: 19, 1922). cf. aequi-hymeniiferous.
Inapertisporites Hammen ex Rouse (1959), Fossil Fungi. 28 (Jurassic, Cretaceous, Eocene, Tertiary), widespread.
incertae sedis (inc. sed.), of uncertain taxonomic position.
Incertisporites Hammen (1954), Fossil Fungi. 1 (Cretaceous, Tertiary), Colombia.
Inciliaria Fr. (1825) nom. dub., Fungi (L).
incised, as if cut into; esp. of a pileus margin or lobes of a foliose lichen thallus.
Incolaria Herzer (1893), Fossil Fungi ? Fungi. 1 (Carboniferous), N. America.
incompatible (1) (of sex), unable to be cross-mated due to mating type or fertility barriers; (2) (of vegetative mycelia), unable to form a stable heterokaryon due to genetic differences at one or more vegetative compatibility (vc, het) loci. See vegetative compatibility.
incrassate, made thick.
Incrucipulum Baral (1985), Hyaloscyphaceae. *c.* 4, widespread (temperate). See Baral (*Z. Mykol.* **53**: 119, 1987).
Incrupila Raitv. (1970), Hyaloscyphaceae. *c.* 10, Europe; N. America. See Raitviir & Galán (*MR* **98**: 1137, 1994), Raitviir (*Micologia 2000*: 457, 2000), Raitviir (*Scripta Mycol.* **20**, 2004).
Incrupilella Svrček (1986) = Hyphodiscus fide Baral (*SA* **13**: 113, 1994).
incrusted (of hyphae), having matter excreted on the walls (Corner, 1950).
Incrustocalyptella Agerer (1983), Cyphellaceae. 3, Colombia; Papua New Guinea; Hawaiian Is.; Thailand. See Agerer (*Z. Mykol.* **49**: 160, 1983), Desjardin *et al.* (*Fungal Diversity* **4**: 75, 2000; Thailand).
Incrustoporia Domański (1963) = Skeletocutis fide David (*Naturaliste can.* **109**: 235, 1982).
Incrustoporiaceae Jülich (1982) = Polyporaceae.
incubation period, the time between inoculation and the development of visible symptoms.
indefinite, not sharply limited.
indehiscent (of sporocarps, sporangia, etc.), not opening, or with no special method of opening.
indeterminate (1) having the edge not well-defined, esp. of fruit-bodies and leaf-spots; (2) (of conidiophores), continuing growth indefinitely.

Index of Atmospheric Purity (IAP). A numerical estimate of the purity of the air on the basis of the lichens present on trees (LeBlanc & DeSloover, *CJB* **48**: 1485, 1970). See Air pollution, Bioindication.

Index of Ecological Continuity, see RIEC.

Index of Fungi. Produced by CABI, and appearing twice annually since 1940, this lists new and recently published nomenclatural novelties for fungi s.l. This publication provides a present-day continuation of the great mycological catalogues produced by Petrak, Saccardo, and Zahlbruckner. See Literature.

IndexFungorum (www.indexfungorum.org/Names/IndexFungorum Partnership.htm). The *de facto* world mycological nomenclator. Freely available on-line, this resource provides information about scientific names of fungi at species level and below, including, where available, authors and place of publication, with hyperlinks to a scanned image of the main catalogue entry for each name and, where available, the protologue page.

Indian bread, see tuckahoe.

Indian paint fungus, *Echinodontium tinctorium* (q.v.).

Indiella Brumpt (1906) = Madurella fide Ciferri & Redaelli (*Mycopathologia* **3**: 182, 1941).

indigenous, natural to a country or region; native.

indigenous property, see Bioprospecting, Patent protection.

indirect (of fruit-body development), see direct.

individualism in fungi, mechanisms may exist in nature to 'define' individuals involving co-operative (hyphal fusions, heterokaryosis) and individualistic methods. See Todd & Rayner (*Sci. Progr.* **66**: 331, 1980), incompatible.

indumentum, a covering, such as hairs, etc.

indurated, made hard.

Induratia Samuels, E. Müll. & Petrini (1987), Xylariaceae. Anamorph *Nodulisporium*. 1, New Zealand. See Samuels & Rossman (*Mycol.* **84**: 26, 1992).

indusium (1) cover; (2) (of phalloids), a net-like structure hanging from the top of the stipe under the pileus.

Industrial mycology. Fungi are used in many industrial processes. Because of the ease with which many can be grown in pure culture, and the convenience of their single-cell growth, use of yeasts has dominated, but increasing numbers of other fungi are now being used for new processes.

Some of the more important substances produced, frequently from different forms of carbohydrates and starch, are: alcohol (by *Saccharomyces cerevisiae* from sugar or, after hydrolysis, starch, e.g. cereals, potatoes, or cellulose, e.g. wood, waste sulphite liquor); citric acid (*Aspergillus*, *Penicillium*, *Mucor*); enzyme mixtures such as takadiastase (*Aspergillus*); fats (*Penicillium*); fumaric (*Rhizopus*) and gluconic (*Aspergillus*) acids; glycerol (*S. cerevisiae* var. *ellipsoideus* by the sulphite process); riboflavin (various lactose- fermenting yeasts); itaconic acid (*A. terreus*, etc.; used as a copolymer with acrylic resins); kojic acid (*A. flavus* group); lactic acid (*Rhizopus*); lipoids ('fat') (*Endomycopsis vernalis*; also *Geotrichum candidum*); mycoprotein (*Fusarium venenatum*); rennin (*Rhizomucor pusillus*, *Rhizopus oligosporus*, etc.; O'Leary & Fox, *J. Dairy Res.* **41**: 381, 1974); riboflavin (*Eremothecium*).

Steroid transformations are effected by hyphomycetes and other fungi (Peterson, *in* Rainbow & Rose (Eds), *Biochemistry of industrial micro-organisms*: 537, 1963). Ensilage is another fermentation process and the retting of flax, hemp, and other fibres is dependent on pectin-attacking bacteria and fungi, see Thaysen & Bunker (1927). Fungi play a major role in production of many pharmaceutical commodities, including antibiotics, immunosuppressives, statins and vitamins (). More recent developments include 'mycelial paper' (the addition of mycelium of *Phytophthora cinnamomi* and other phycomycetes to wood pulp); see Johnson & Carlson (*Biotechnol. Bioeng.* **20**: 1063, 1978), fuels from biomass (Jefferies *et al.*, *in* Smith *et al.*, 1980), and use of fungal chitin in applications to heal wounds (Hamlyn & Schmidt, *Mycologist* **8**: 147, 1994).

Lit.: An Zhiquiang [ed.] (*Fungal biotechnology: a handbook of industrial mycology*, 2004), Arora (*Handbook of fungal biotechnology*, 2003), Beuchat (*Food and beverage mycology*, 1978), Bracken (*The chemistry of micro-organisms*, 1955), Brian (*TBMS* **58**: 359, 1972; economic value of fungi), Emmons *et al.* (*Henrici's molds, yeasts and actinomycetes*, edn 2, 1947), Foster (*Chemical activities of fungi*, 1949), Fulmer & Werkman (*An index to the chemical action of micro-organisms on the non-nitrogenous compounds*, 1930), Galloway (*Applied mycology and bacteriology*, edn 3, 1950), Gray (*The relation of fungi to human affairs*, 1959), Hansen (*Jørgensen's Micro-organisms and fermentation*, 1948), Lafar (*Technische Mycologie*, 2 vols, 1896-1907 [English transl. 1889-1910], *Handbuch der technischen Mykologie*, 5 vols, 1904-14), Lemke (*J. industrial microbiol. and biotechnol.* **14**: 355, 1995; industrial mycology and genetics), Leong & Berka (*Molecular industrial mycology: systems and applications for filamentous fungi*, 1991), Onions *et al* (*Smith's Introduction to industrial mycology*, edn 7, 1981), Prescott & Dunn (*Industrial microbiology*, 1940; edn 4, 1982), Ramsbottom (*Rep. Br. Ass.* **1936**: 189; uses of fungi), Smith & Berry (Eds) (*The filamentous fungi*, **1**, *Industrial mycology*, 1975), Smith *et al.* (Eds) (*Fungal biotechnology*, 1980), Thaysen & Bunker (*The microbiology of cellulose, hemicellulose, pectins and gums*, 1927).

See also Antibiotics, Biodegradation, Biodeterioration, Biotechnology, Brewing, Cheese, Edible fungi, Fermented food and drinks, Genetic engineering, Lichens (Economics), Metabolic products, Mushroom cultivation, Nutrition, Pigments, Starters, Wine making.

Inermisia Rifai (1968) = Byssonectria fide Pfister (*Mycol.* **85**: 952, 1994).

inermous, having no spines or prickles.

Inesiosporium R.F. Castañeda & W. Gams (1997), anamorphic *Pezizomycotina*, Hso.?.?. 2, Cuba; Hawaii. See Castañeda Ruiz & Gams (*Nova Hedwigia* **64**: 485, 1997).

infarctate, solid; turgid.

infect (of a pathogen), to enter and establish a pathogenic relationship with an organism; to enter and persist in a carrier (*TBMS* **33**: 155, 1950); to make an attack on an organism; (of an agent), to make infection of an organism take place; **-ed** (of an organism), attacked by a pathogen, cf. contaminated; **-ion**, the act of infecting; **-ious** (of diseases), resulting from infection; sometimes used in the sense of able to be handed on by touch (contagious) or by inoculum; **-ive** (of a pathogen), able to make an attack on a living

organism; (of a vector, medium, etc.), having the power of effecting the transmission of a pathogen.
inferior (of an annulus), low down on the stipe.
infested, attacked by animals, esp. insects; sometimes used of fungi in soil or other substrata in the sense of 'contaminated'.
infissitunicate (Dughi, *C. r. hebd. Séanc. Acad. Sci., Paris* **243**: 750, 1956), see ascus.
inflated hypha, see hypha.
Inflatostereum D.A. Reid (1965), Phanerochaetaceae. 2, S. America; Asia. See Reid (*Nova Hedwigia* Beih. **18**: 143, 1965), Welden (*Revta Biol. trop.* **44** Suppl. 4: 91, 1996).
inflexed (of pileus margin), turned down (Fig. 19F).
infra- (prefix), below; **-generic** (of ranks), all those below that of genus; **-specific** (of ranks), all those below that of species; used in a parallel way for other ranks.
Infrafungus Cif. (1951), anamorphic *Pezizomycotina*, Hso.1-≡ eH.?. 1 (on *Cladosporium*), Philippines. See Ciferri (*Mycopath. Mycol. appl.* **6**: 26, 1951).
Infundibulicybe Harmaja (2003), Tricholomataceae. 13, widespread. See Harmaja (*Ann. bot. fenn.* **40**: 215, 2003).
infundibuliform, funnel-like in form.
Infundibulomyces Plaingam, Somrith. & E.B.G. Jones (2003), anamorphic *Pezizomycotina*. 1, Thailand. See Plaingam *et al.* (*CJB* **81**: 732, 2003).
Infundibulum Velen. (1934) = Peziza Fr. fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968), Svrček (*Acta Mus. Nat. Prag.* **32B**: 115, 1976).
Infundibura Nag Raj & W.B. Kendr. (1981), anamorphic *Saccoblastiaceae*. 1, New Zealand; British Isles. See Nag Raj & Kendrick (*CJB* **59**: 544, 1981).
Ingaderia Darb. (1897), Roccellaceae (L). 4, widespread. See Tehler (*CJB* **68**: 2458, 1990; cladistics), Feige & Lumbsch (*Mycotaxon* **48**: 381, 1993), Myllys *et al.* (*Bryologist* **101**: 70, 1998), Follmann (*J. Hattori bot. Lab.* **90**: 251, 2001; S America), Tehler & Irestedt (*Cladistics* **23**: 432, 2007).
ingest, to obtain food by engulfing it; see phagotrophic. Cf. absorb.
Ingoldia R.H. Petersen (1962) = Gyoerffyella fide Marvanová *et al.* (*Persoonia* **5**: 29, 1967), Marvanová & Descals (*TBMS* **89**: 499, 1987).
Ingoldiella D.E. Shaw (1972), anamorphic *Sistotrema*. 3 (with clamp connexions), Australia. See Nawawi & Webster (*TBMS* **78**: 287, 1982).
Ingoldiomyces Vánky (1996), Tilletiaceae. 1 (in seeds of *Poaceae*), N. & S. America. See Castlebury *et al.* (*Mycol.* **97**: 888, 2005; phylog.).
Ingvariella Guderley & Lumbsch (1997), Thelotremataceae (L). 1, widespread (esp. mediterranean). See Guderley *et al.* (*Nova Hedwigia* **64**: 152, 1997).
inhabitant, see symbiosis.
inhibitory substances, see staling substances.
Inifatiella R.F. Castañeda (1985), anamorphic *Pezizomycotina*, Hsy.≡ eP.1. 1, Cuba. See Castañeda (*Deuteromycotina de Cuba* Hyphomycetes **III**: 20, 1985).
ink-caps, basidiomata of *Coprinus*.
innate, bedded in; immersed.
Innatospora J.F.H. Beyma (1929) = Arthrinium fide Ellis (*Mycol. Pap.* **103**, 1965).
Inocephalus (Noordel.) P.D. Orton (1991) = Entoloma fide Kuyper (*in litt.*).
Inocibium Earle (1909) = Inocybe fide Kauffman (*N. Amer. Fl.* **10**, 1924).
inoculate, to put a microorganism, or a substance containing one, into an organism or a substratum.
inoculation, the act of inoculating [of (an organism or substratum)] *with* (the inoculum); *of* (the inoculum) *into* (an organism or substratum); by (an agent or method).
inoculum, the substance, generally a pathogen, used for inoculating.
inoculum potential (of a fungus or other microorganism), the energy of growth available for colonization of a substratum at the surface of the substratum to be colonized (Garrett, 1956).
Inocutis Fiasson & Niemelä (1984), Hymenochaetaceae. 8. See Wagner & Fischer (*Mycol.* **94**: 998, 2002).
Inocybaceae Jülich (1982), Agaricales. 13 gen. (+ 22 syn.), 821 spp.

Lit.: Kupyer (*Persoonia* Suppl. **3**: 1, 1986), Singer (*Agaric. mod. Tax.* 4th ed, 1986), Nordstein (*Syn. Fung.* **2**: 115 pp., 1990), Senn-Irlet (*Persoonia* **16**: 1, 1995), Kropp & Matheny (*Mycol.* **96**: 295, 2004), Aime *et al.* (*Am. J. Bot.* **92**: 74, 2005), Binder *et al.* (*Systematics and Biodiversity* **3**: 113, 2005), Matheny (*Mol. Phylogen. Evol.* **35**: 1, 2005), Matheny & Bougher (*Mycol. Progr.* **5**: 2, 2006).

Inocybe (Fr.) Fr. (1863), Inocybaceae. *c.* 500, widespread (esp. temperate). See Pegler & Young (*Kew Bull.* **26**: 499, 1972; basidiospores, key Br. spp.), Horak (*N.Z. Jl Bot.* **15**: 713, 1977; key 24 NZ spp.), Alessio (*Bres. Icon. Mycol.* **29** Suppl. 3: 1, 1980; col. illustr. & key Eur. spp.), Stangl & Veselský (*Česká Mykol.* **34**: 45, 1980; rough-spored spp.), Kuyper (*Persoonia* Suppl. **3**: 1, 1986).
Inocybella Zerova (1974) = Inocybe fide Kuyper (*in litt.*).
Inocyclus Theiss. & Syd. (1915), Parmulariaceae. 7 (esp. on *Pteridophyta*), widespread (tropical).
Inoderma (Ach.) Gray (1821) = Thrombium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Inoderma Berk. (1881) ≡ Mesophellia.
Inoderma P. Karst. (1879) ≡ Inodermus.
Inodermus Quél. (1886) = Inonotus fide Donk (*Persoonia* **1**: 173, 1960).
Inodosporus Overstreet & Weidner (1974), Microsporidia. 2. See Overstreet & Weidner (*Z. ParasitKde* **44**: 169, 1974).
Inoloma (Fr.) Wünsche (1877) ≡ Cortinarius.
Inonotaceae Fiasson & Niemelä (1984) = Hymenochaetaceae.
Inonotopsis Parmasto (1973), Hymenochaetaceae. 1, widespread (north temperate). See Wagner & Fischer (*Mycol.* **94**: 998, 2002).
Inonotus P. Karst. (1879), Hymenochaetaceae. *c.* 80, widespread. s. str. 30 species. See Pegler (*TBMS* **47**: 175, 1964; key), Gilbertson (*Mem. N. Y. bot. Gdn* **28**: 67, 1976), Wagner & Fischer (*MR* **105**: 773, 2001), Ryvarden (*Syn. Fung.* **15**: 70, 2002; neotropical species), Ryvarden (*Syn. Fung.* **21**: 149 pp., 2005; 101 species).
inoperculate (of an ascus or sporangium), opening by an irregular apical split to discharge the spores, see ascus; cf. operculate.
Inopilus (Romagn.) Pegler (1983) = Entoloma fide Kuyper (*in litt.*).
inordinate, in no order.
inquinant, stained; blackened; dirty (obsol.).
Insecticola Mains (1950) = Akanthomyces fide Samson & Evans (*Acta Bot. Neerl.* **23**: 28, 1974).

Insects (and other invertebrates) and fungi. The relationships between insects and fungi are many and complex: for reviews, see Vega & Blackwell (*Insect-fungal associations*, 2005; ecology, evolution) and Wilding *et al.* (Eds) (*Insect-fungus interactions*, 1989).

Termites, ants (Uphof, *Bot. Rev.* **8**: 563, 1942; Lüscher, *Nature* **167**: 34, 1951; Weber, *Ecology* **38**: 480, 1957; *Lepiota* cultured by *Cyphomyrma*) and ambrosia beetles make 'cultures' of fungi (Bakshi, *TBMS* **33**: 111, 1950). This 'insect agriculture' is highly evolved, often complex and may also involve further species, for example bacteria. The insect may then feed on the resulting cultures directly, or on the fungal substratum after the fungus has made it more digestible (see Termites and fungi). Ambrosia beetles have evolved special structures called *mycangia* which are adaptations for the collection and transport of fungal hyphae or spores (similar structures are also seen in some other beetles and certain mites); each species of ambrosia beetle may have its own specific fungus. 'Ambrosia galls' on plants caused by a mutualistic association between *Cecidomyiidae* flies and anamorphs of *Botryosphaeria* (see galls). Other insects use fungus spores as food (e.g. herbarium beetles, q.v.), and the transmission of fungus spores (esp. slime spores), in addition to pycniospores and other 'diploidizing agents', is frequently effected by insects (see Smell). See Leach (*Insect transmission of plant diseases*, 1940), Carter (*Insects in relation to plant diseases*, 1962; edn 2, 1973); Evans (*Ann. Appl. Biol.* **75**: 331, 1973); also stigmatomycosis. Molluscs such as slugs have also been observed feeding on fungal spores (Buller, *TBMS* **7**: 270, 1922), and some fungi may have evolved mechanisms for deterring this feeding (Wood *et al.*, *Biochemical systematics and ecology* **29**: 531, 2001; Wood & Lefevre, *Biochemical systematics and ecology* **35**: 634, 2007).

Many invertebrates, particularly mites and molluscs, graze on lichens. Mites and ants may be important in the dispersal of soredia and ascospores ingested by rotifers may be viable after excretion. Some lichens have been reported from shells of land snails and some from marine limpets. Some foliose species have been found on *Coleoptera* (see Gressit, *Entom. News* **80**: 1, 1969). Many moths and other insects mimic lichens in larval or adult stages as well as using them for food. Lichen acids do little to deter grazing molluscs and may pass through the gut unchanged (Zopf, *Biol. Zbl.* **16**: 593, 1896). See Lawrey (*Biology of lichenized fungi*, 1984), Richardson (*The vanishing lichens*, 1975), Seaward & Gerson (*in* Seaward (Ed.), *Lichen ecology*: 69, 1977; detailed review), Smith (*Lichens*, 1921 [reprint 1975]); Lichens, soredia.

Certain beetles are frequently associated with myxomycetes, in at least some cases involved with spore dispersal, and there is a growing literature on these associations (e.g. Kotelenets, [*Mikologiya i Fitopatologiya*] **37**: 50, 2003) [in Russian]. Insects, other arthropods, and other invertebrates, including molluscs have been observed to feed on myxomycetes. See reviews by Ing (*Proc. S. Lond. Ent. Nat. Hist. Soc.* **1967**: 18, 1967) and the reports of Keller & Snell (*Mycol.* **94**: 757, 2002) and Waggoner & Poinar (*J. eucaryotic microbiology* **39**: 639, 1992; fossil records of myxomycetes and associated beetles).

See Biological control, Co-evolution, Entomogenous fungi, Symbiosis.

Insiticia Earle (1909) = Mycena fide Singer (*Agaric. mod. Tax.*, 1951).

insititious, of inserted nature, introduced from without.

Insolibasidium Oberw. & Bandoni (1984), Platygloeaceae. 1, N. America; Australia. See Cunnington & Pascoe (*Australas. Pl. Path.* **32**: 433, 2003; Australia).

inspissate, made thick.

Institale Fr. (1829) = Hypoxylon Bull. fide Læssøe (*SA* **13**: 43, 1994).

integrated (of conidiogenous cells), incorporated in the main axis or branches of the conidiophore; cf. discrete.

intellectual property, see Bioprospecting, Patent protection.

inter- (prefix), between; among.

interascal tissue, see hamathecium.

interascicular parenchyma, the paraphysis-like hyphae or paraphysoidal interthecial fibres (Stevens) (obsol.).

interbiotic, living as a parasite on or near one or more living organisms, as certain rhizoidal chytrids.

Intercalarispora J.L. Crane & Schokn. (1983), anamorphic *Pezizomycotina*, Hso.#eP.1. 1 (aquatic), USA. See Crane & Schoknecht (*CJB* **61**: 2243, 1983), Mercado-Sierra *et al.* (*Mycotaxon* **67**: 417, 1998).

intercalary (1) (of growth), between the apex and the base; (2) (of cells, spores, etc.), between two cells.

intercellular, between cells.

International Mycological Association. Founded in 1971; recognized as the Section for General Mycology within the International Union of Biological Societies; objective is to encourage all aspects of mycology; structure comprises individual and corporate members, an elected executive, with regional committees for Africa (see African Mycological Association), Asia (see IMA Committee for Asia), Australasia (see Australasian Mycological Association), Europe (see European Mycological Association), Latin America (see Asociación Latino-americana de Micología) and North America (see Mycological Society of America); organizes International Mycological Congresses (q.v.). Website: www.ima-mycology.org.

International Mycological Congresses (arranged by the International Mycological Association, see Societies and organizations). (1) Exeter, UK (1971; *TBMS* **58**(2), Suppl.: 1-40, 1972); (2) Tampa, USA (1977; *Mycol.* **70**: 253-265, 1978); (3) Tokyo, Japan (1983); (4) Regensberg, Germany (1990); (5) Vancouver, Canada (1994); (6), Jerusalem, Israel (1998); (7), Oslo, Norway (2002); (8), Cairns, Australia (2006). The next congress is scheduled for Edinburgh, UK in 2010.

Internet. Since the previous edn of this *Dictionary*, the internet has become a huge resource for mycological information. Resources available on the internet are developing very rapidly, but individual websites are notoriously ephemeral. As a result, search engines such as Baidu (www.baidu.com), Google (www.google.com), Guruji (www.guruji.com), Naver (www.naver.com) and Yahoo (www.yahoo.com) are essential tools, and collaborative projects such as Hoodong (www.hoodong.com) and Wikipedia (www.wikipedia.org) provide ingress to a vast amount of information, some truly authoritative.

Most (but far from all) mycological information on the internet is in the English language. There is a strong movement among mycologists and other life scientists to make information about scientific names of fungi, distributional (biodiversity) information about living organisms, and taxonomic publications freely and openly available on-line. A selection of non-commercial English language websites which provide free and open information specifically about fungi, are listed below (those also functioning in other languages are marked with an asterisk).

Text of international code governing nomenclature of fungi (http://ibot.sav.sk/icbn/main.htm).

interspace (of a pileus), the space between the lamellae.

interthecial, between asci.

intervenose (of a pileus), veined in the interspaces.

Intexta J.I.R. Larsson, Steiner & Bjørnson (1997), Microsporidia. 1. See Larsson *et al.* (*Acta Protozool.* **36**: 295, 1997).

Intextomyces J. Erikss. & Ryvarden (1976), Agaricomycetes. 4, widespread. See Eriksson & Ryvarden (*Cortic. N. Europ.* **4**: 735, 1976).

intra- (prefix), within; inside.

intracellular, within the cell.

intrahyphal, see hypha.

Intralichen D. Hawksw. & M.S. Cole (2002), Pezizomycotina. 3, widespread. See Hawksworth & Cole (*Fungal Diversity* **11**: 88, 2002).

intramatrical, living in the matrix or substratum.

intramatrical spores, an alternative name for vesicles produced in host roots by most endomycorrhizal fungi.

intraparietal, within a wall or walls (e.g. of crystals amongst the tissues of an exciple).

Intrapes J.F. Hennen & Figueiredo (1979), anamorphic *Pucciniales*. 1 (on *Couepia* (*Chrysobalanaceae*)), Brazil. Anamorph name for (II). See Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Intrapredatorus W.J. Chen, T.L. Kuo, S.T. Wu (1998), Microsporidia. 1. See Chen *et al.* (*Parasitol. Internat.* **47**: 183, 1998).

Intraspora Oehl & Sieverd. (2006) = Archaeospora fide Schüssler & Walker (*in litt.*) but see, Oehl & Sieverding (*J. Appl. Bot. Food Quality* Angew. Botan. **80**: 77, 2006).

Intrasporangium Kalakout., Kirillova & Krassiln. (1967), Actinobacteria. q.v.

intricate cortex (of lichen thalli), made up of hyphae twisted together; cf. textura intricata.

introrse, in the direction of the central axis; inwards.

intumescence, a swelling.

invaginated, covered by a sheath.

Inventories. Assessments of Biodiversity (q.v.) within specific areas, with the aim of cataloguing what is there and valuing its presence. The most prominent inventorying activity to date is the proposed All-Taxa Biodiversity Inventory (ATBI) of the Guanacaste Conservation Area, Costa Rica (Janzen & Hallwachs, *Draft report of an NSF Workshop, Philadelphia*, 1993). Inventories of fungi have been made for various small areas on the initiative of various largely unsupported individuals, classic examples being Esher Common and Slapton Ley, both in the UK, and both with thousands of fungi recorded from a few square km. After many years study of those sites, there is no evidence that the numbers of species new to each site are tailing off. To make an inventory of fungi, even in a small area, thus clearly requires long-term financial investment at a level few if any governments are as yet prepared to contemplate. See Hawksworth *et al.* (*in* Janardhanan *et al.* (Eds), *Tropical mycology*, 1998), Mueller *et al.* (*Biodiversity of fungi - inventory and monitoring methods*, 2004), Rossman (*in* Peng & Chou (Eds), *Biodiversity and terrestrial ecosystems*: 169, 1994), Rossman *et al.* (*Protocols for an All Taxa Biodiversity Inventory of Fungi.*, 1998). See also: Biodiversity, Collection.

involucrellum, tissue forming the upper part of a perithecioid ascoma surrounding the true exciple, not involving host or substrate materials (cf. clypeus) and generally dimidiate (e.g. *Verrucaria*).

Involucrocarpon Servít (1953) = Catapyrenium fide Santesson (*Lichens and lichenicolous fungi of Sweden and Norway*, 1993).

Involucropyrenium Breuss (1996), Verrucariaceae (L). 4, widespread (temperate). See Breuss (*Annln naturh. Mus. Wien* Ser. B, Bot. Zool. **98**: 37, 1996).

Involucroscypha Raitv. (2002), Helotiales. 1. See Raitviir (*Mycotaxon* **81**: 46, 2002).

Involucrothele Servít (1953) = Thelidium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

involute, rolled in (Fig. 19I).

Involutisporonites R.T. Clarke (1965), Fossil Fungi. 4 (Cretaceous, Paleocene, Tertiary), China; USA.

Inzengaea Borzí (1885) = Emericella fide von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981).

iodine (I, J), used as Lugol's solution (I 0.5g, KI 1.5 g, water 100 ml), in potassium iodide (**IKI**; I 1%, KI 3%), and formerly often Melzer's reagent (see Stains) giving blue, red, lavender or violet colours seen best after pre-treatment with potassium hydroxide in spores, asci, hymenial tissues, etc. Reactions can vary according to the kind of iodine solution used, its concentration, the age of the material, and the nature of any pretreatment; all need to be reported when referring to such tests. Extensively used in the systematics of lichenized and non-lichenized fungi since Nylander (*Flora, Jena* **48**: 465, 1865). See Baral (*Mycotaxon* **29**: 399, 1987; caution in use), Common (*Mycotaxon* **41**: 67, 1991; review I+ materials), Kohn & Korf (*Mycotaxon* **3**: 165, 1975; pre-treatment), Nannfeldt (*TBMS* **67**: 283, 1976; ascus plugs), amylomycan, amyloid, dextrinoid.

Iodophanaceae Prokhorov (1993) = Pezizaceae.

Iodophanus Korf (1967), Pezizaceae. Anamorph *Oedocephalum*. 16 (coprophilous), widespread. See Kimbrough *et al.* (*Am. J. Bot.* **56**: 1187, 1969), Thind & Kaushal (*Indian Phytopath.* **31**: 343, 1979), Valadon *et al.* (*TBMS* **74**: 187, 1980; carotenoids, taxonomy), Kimbrough & Curry (*Mycol.* **77**: 219, 1985; posn), de Cachi & Ranalli (*Nova Hedwigia* **49**: 59, 1989; ontogeny), Kimbrough *et al.* *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269** **269**: 398, 1994), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Prokhorov (*Mikol. Fitopatol.* **31**: 27, 1997; key), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).

Iodosphaeria Samuels, E. Müll. & Petrini (1987), Iodosphaeriaceae. Anamorphs *Ceratosporium*, *Selenosporella*-like. 2 (from leaves), widespread. See Samuels *et al.* (*Mycotaxon* **28**: 473, 1987), Barr (*Mycotaxon* **39**: 43, 1990; posn), Kang *et al.* (*Fungal Diversity* **2**: 135, 1999; posn), Taylor & Hyde (*Sydowia*

51: 127, 1999; on palms), Hilber & Hilber (*The genus Lasiosphaeria and Allied Taxa*, 2002), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004).

Iodosphaeriaceae O. Hilber (2002), Xylariales. 1 gen., 2 spp.

Lit.: Hilber & Hilber (*Genus Lasiosphaeria and Allied Taxa*, 2002).

Iodowynnea Medel, Guzmán & S. Chacón (1996), Pezizaceae. 1, widespread (tropical). See Medel *et al.* (*Mycotaxon* **59**: 127, 1996), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Van Vooren & Moyne (*BSMF* **122**: 137, 2006; France).

Iola, see *Jola*.

Ionaspis Th. Fr. (1871), Hymeneliaceae (L). 7, widespread. See Magnusson (*Acta horti gotoburg.* **8**: 1, 1933), Jørgensen (*Graphis Scripta* **2**: 118, 1989; key 11 spp. Scandinavia), Lutzoni & Brodo (*Syst. Bot.* **20**: 224, 1995).

ionomidotic reaction, release of a dark pigment into aqueous potassium hydroxide (KOH) mounts; an important taxonomic criterion in some dark coloured *Leotiales* apothecia (e.g. *Claussenomyces*; Oullette & Korf, *Mycotaxon* **10**: 255, 1979).

Ionomidotis E.J. Durand ex Thaxt. (1923) ? = Ameghiniella fide Zhuang (*Mycotaxon* **31**: 261, 1988; key), Gamundí (*MR* **95**: 1131, 1991), Gamundí & Romero (*Fl. criptog. Tierra del Fuego* **10**, 1998).

Ionophragmium Peres (1961), anamorphic *Pezizomycotina*, Cpt.≡ eP.?. 1, Brazil. See Peres (*Publções Inst. Micol. Recife* **317**: 11, 1961).

Ioplaca Poelt (1977), Teloschistaceae (L). 2, Nepal. See Poelt & Hinteregger (*Biblthca Lichenol.* **50**, 1993; Himalaya).

Iotidea Clem. (1909) = Peziza Fr. fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

ipomoearone, a phytoalexin (q.v.) from sweet potato (*Ipomoea batatas*).

Iraniella Petr. (1949), Pezizomycotina. 1, Iran.

Irene Theiss. & P. Syd. (1917) = Asteridiella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Irenina F. Stevens (1927) = Appendiculella fide Hansford (*Beih. Sydowia* **2**, 1961).

Irenopsis F. Stevens (1927), Meliolaceae. 70, widespread (tropical). See Hosagoudar (*Meliolales of India*: 363 pp., 1996; India), Mibey & Hawksworth (*Mycol. Pap.* **174**: 108 pp., 1997; Kenya).

Iridinea Velen. (1934), ? Helotiales. 2, former Czechoslovakia.

Iridionia Sacc. (1902) ≡ Irydyonia.

Irpex Fr. (1828), Meruliaceae. 6, Europe; N. America. See Maas Geesteranus (*Persoonia* **7**: 443, 1974), Buzina *et al.* (*J. Clin. Microbiol.* **43**: 2009, 2005; clinical).

Irpicaceae Spirin & Zmitr. (2003) = Steccherinaceae.

Irpiciochaete, see *Irpicochaete*.

Irpiciporus Murrill (1905) = Spongipellis fide Pegler (*The polypores [Bull. BMS Suppl.]*, 1973).

Irpicium Bref. (1912) nom. dub. = Abortiporus fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Irpicochaete Rick (1940) nom. dub., ? Polyporales.

Irpicodon Pouzar (1966), Amylocorticiaceae. 1, Europe. See Wojewoda (*Acta Mycologica* Warszawa **38**: 3, 2003; Poland).

irpicoid, having teeth, or becoming toothed, as in *Irpex*.

Irpicomyces Deighton (1969), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 2 (on *Schiffnerula*), Malaysia; Japan. See Deighton (*Mycol. Pap.* **118**: 24, 1969), Watanabe & Narita (*Mycoscience* **35**: 105, 1994).

Irydyonia Racib. (1900), ? Rhytismatales. 1, Java.

Isaria Pers. (1794), anamorphic *Cordycipitaceae*, Hsy.0eH.10. 7 (entomogenous), widespread. See Petch (*TBMS* **19**: 34, 1934; spp. on insects), de Hoog (*Stud. Mycol.* **1**, 1972; descr. spp., nomencl.), Luangsa-ard *et al.* (*Mycol.* **96**: 773, 2004; phylogeny), Gams *et al.* (*Taxon* **54**: 537, 2005; nomencl.), Hodge *et al.* (*Taxon* **54**: 485, 2005; typification), Luangsa-ard *et al.* (*MR* **109**: 581, 2005; phylogeny), Sung *et al.* (*Stud. Mycol.* **57**, 2007).

Isariaceae Link (1826) = Cordycipitaceae.

Isariella Henn. (1908), anamorphic *Pezizomycotina*, Hsp.0eH.?. 2, C. & S. America. See Seifert (*Mem. N. Y. bot. Gdn* **49**: 202, 1989).

Isariopsella Höhn. (1929) = Ramularia Unger fide Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 316, 1998).

Isariopsis Fresen. (1863) ≡ Phacellium fide Braun (*Nova Hedwigia* **47**: 335, 1989; reassessment of spp.).

Ischnochaeta Sawada (1959) = Erysiphe fide Zheng (*Mycotaxon* **22**: 209, 1985).

Ischnoderma P. Karst. (1879), Fomitopsidaceae. 10, widespread (temperate). See Pouzar (*Česká Mykol.* **25**: 15, 1971), Jahn (*Westf. Pilzber.* **9**: 99, 1973), Corner (*Beih. Nova Hedwigia* **97**: 77, 1989), Roberts & Ryvarden (*Kew Bull.* **61**: 55, 2006; Cameroon).

Ischnodermataceae Jülich (1982) = Hapalopilaceae.

Ischnostroma Syd. & P. Syd. (1914), anamorphic *Pezizomycotina*, Cpt.0fH.?. 1, Philippines.

ISHAM, see Societies and organizations.

Ishwaramyces Hosag. (2004), Asterinaceae. 1, India. See Hosagoudar *et al.* (*J. Econ. Taxon. Bot.* **28**, 2004).

Isia D. Hawksw. & Manohar. (1978), Sordariomycetes. 2, India; Nepal; New Caledonia. See Hawksworth & Manoharachary (*TBMS* **71**: 332, 1978).

Isidiaceae Rchb. (1841) = Pertusariaceae.

isidiate, having isidia.

isidiiferous, of a lichen thallus bearing isidia.

Isidium (Ach.) Ach. (1803) nom. rej. = Pertusaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

isidium (pl. **isidia**), a photobiont-containing protuberance of the cortex in lichens which may be warty, cylindrical, clavate, scale-like, coralloid, simple, or branched (Fig. 22D); occurring directly on the thallus (e.g. *Peltigera praetextata*, *Pseudevernia furfuracea*); may become sorediate (e.g. *Lobaria pulmonaria*). See Bailey (*in* Brown *et al. Lichenology: progress and problems*: 214, 1976; review), Du Rietz (*Svensk bot. Tidskr.* **18**: 141, 1924; classification), Kershaw & Millbank (*Lichenologist* **4**: 214, 1970; rôle), Puymaly (*Botaniste* **48**: 237, 1965).

Isipinga Doidge (1921) = Symphaster fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

islandicin, toxins of *Penicillium islandicum*; a cause of hepatitis (yellow rice disease) in humans. See also luteoskyrin.

islanditoxin, see islandicin.

iso- (prefix), equal.

isoenzyme, see isozyme.

isogamete, one of two sex cells like in form.

isogamy, the conjugation of isogametes.

isohaplont, a haplont of cells having genotypically like nuclei (Kniep, 1928), cf. miktohaplont.
isokont (isokontous) (of cilia and flagella), of equal length. Cf. heterokont.
isolate (v.), (1) to make an isolation; (n), (2) the culture itself, esp. the first 1-spore or pure isolation of a fungus from any place; Lotsy's 'species' (Brierley, *Ann. appl. Biol.* **18**: 420, 1931).
isolation (1) the process of getting a fungus or other organism into pure culture; (2) the culture itself.
Isolation methods. *Aquatic and marine fungi*: Couch (*J. Elisha Mitch. Scientific. Soc.* **55**: 208, 1939; chytrids), Fuller *et al.* (*Mycol.* **56**: 745, 1964; marine 'phycomycetes'), Fuller & Jaworski (*Zoosporic fungi in teaching and research*, 1987), Jones (Ed.) (*Recent advances in aquatic mycology*, 1976), Sparrow (*Aquatic phycomycetes*, edn 2, 1960). *Single spore isolation*: See Hildebrand (*Bot. Rev.* **4**: 627, 1938; **16**: 181, 1950), Badry (*Micromanipulators and micromanipulation*, 1963).

Soil fungi: Gams (*in* Winterhoff (Ed.), *Fungi in vegetation science*: 183, 1992; review); see also Soil fungi.

Spore trapping: See spora.

Use of antibiotics: Georg *et al.* (*Science* **114**: 387, 1951) advocate penicillin 20 units/ml + streptomycin 40 units/ml to suppress unwanted bacteria when isolating fungi (see also cycloheximide); use of rose bengal in isolation media (Ottow, *Mycol.* **64**: 304, 1972).

Isolation media: When isolating fungi, use of translucent media enables developing colonies to be clearly visible. On standard nutrient-rich media e.g. Malt Agar or Potato Dextrose Agar, fungal growth can be rapid. To facilitate separation of colonies, growth rate can be reduced by preparing standard media at quarter or half-strength. Tap Water Agar is an effective isolation medium since it restricts development of fast-growing fungi and discourages bacterial growth. Antibiotics added to media to eliminate bacterial contamination include penicillin G, streptomycin and chloramphenicol (see Media). Bacteria can also be eliminated by lowering the pH of the medium. Selective media are used to obtain particular fungi and exclude others. Many recipes for selective media have been published. See Singleton *et al.* (Eds) (*Methods for research on soilborne phytopathogenic fungi*, 1992), Davet & Rouxel (*Detection and isolation of soil fungi*, 2000), Tuite (*Plant pathological methods. Fungi & bacteria*, 1969). Selective methods often involve the addition of chemical inhibitors to isolation media. See Vaartja (*Phytopathology* **50**: 870, 1960), Edgington (*Phytopathology* **61**: 42, 1971). Broad spectrum growth inhibitors include Cyclosporin A, Cycloheximide, Dichloran and Rose Bengal. See Hocking & Pitt (*Applied and Environmental Microbiology* **39**: 488, 1980), Bills & Polishook (*CJB* **69**: 1477, 1991). Pentachloronitrobenzene (PCNB) can be used to select for basidiomycetes and *Fusarium* (Singleton *et al.*, 1992). Antibiotics of the polyene group, nystatin and pimaricin are also used in selective media for isolating *Pythium* and *Phytophthora*. See Eckert. & Tsao (*Phytopathology* **52**: 771, 1962). Methylbezimidazone carbamate (Benomyl) is selective for some *Oomycota* and *Zygomycota*. At low concentrations, it is also used to select for basidiomycetes. See Hunt & Cobb (*CJB* **49**: 2064, 1971). Selective media for conidial fungi is discussed by Jong (*in* Cole & Kendrick (Eds), *Biology of conidial fungi* **2**, 1981). For selective media used in food-borne fungi, see Samson *et al.* (*Introduction to food-borne fungi*edn 5, 1996).

See also entries on particular habitats, and Culture, and Preservation.
isolichenin, see lichenin.
isomorphic, like in form but unlike in structure.
Isomunkia Theiss. & Syd. (1915), Fungi. 1, Ecuador. See Petrak (*Sydowia* **5**: 337, 1951).
Isomyces Clem. (1931) ≡ Debaryomyces Lodder & Kreger ex Kreger.
isonym, a homotypic synonym; see basionym.
isoplanogamete, one of two motile sex cells like in form.
Isosoma Svrček (1989) = Cudoniella fide Baral (*SA* **13**: 113, 1994).
isospory, see homospory.
Isotexis Syd. (1931) = Elsinoë fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Isothea Fr. (1849), Phyllachoraceae. 4 (from living leaves), widespread (arctic-alpine). See Cannon (*MR* **100**: 1409, 1996), Chlebicki & Suková (*Mycotaxon* **90**: 153, 2004; Carpathians).
isotomic dichotomous branching, branching in which both dichotomies are about the same thickness and length so that the dichotomic pattern is visible even in older parts of the thallus, as in *Cladonia evansii*, cf. anisotomic dichotomic branching.
isotype, see type.
isozyme (isoenzyme), one of a family of enzymes with different molecular weights and electron charges and so separating in electrophoresis (q.v.).
Issatchenkia Kudrjanzev (1960) = Pichia fide Kurtzman *et al.* (*Int. J. Syst. Bacteriol.* **30**: 503, 1980), Peterson & Kurtzman (*Antonie van Leeuwenhoek* **58**: 235, 1990; molec. phylogeny), Yamada *et al.* (*Biosc., Biotechn., Biochem.* **61**: 577, 1996; phylogeny), Kurtzman *et al.* *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 221, 1998), Thanh *et al.* (*FEMS Yeast Res.* **4**: 113, 2003; Vietnam), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006).
Issia J. Weiser (1977), Microsporidia. 3.
Isthmiella Darker (1967), Rhytismataceae. 4 (on conifers), N. America; Asia. See Darker (*CJB* **45**: 1419, 1967), Hou *et al.* (*CJB* **83**: 37, 2005; China).
Isthmolongispora Matsush. (1971), anamorphic *Pezizomycotina*, Hso.≡ eH.10. 5, Papua New Guinea. See de Hoog & Hennebert (*Proc. K. ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **86**: 343, 1983).
Isthmophragmospora Kuthub. & Nawawi (1992), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 1 (aquatic), Malaysia. See Kuthubutheen & Nawawi (*CJB* **70**: 101, 1992).
Isthmospora F. Stevens (1918), anamorphic *Trichothyrium*, Hso.0bP.1. 1, widespread (tropical).
isthmospore, a spore comprising two or more cells interconnected by a much narrower region, as in the ascospores of *Vialaea* (Cannon, *MR* **99**: 367, 1995); a conidium composed of four more thick-walled cells separated by thin-walled cells as in *Isthmospora* (Hughes, *Mycol. Pap.* **50**, 1953).
Isthmosporella Shearer & J.L. Crane (1999), Phaeosphaeriaceae. 1 (freshwater), USA. See Shearer & Crane (*Mycol.* **91**: 141, 1999).
Isthmotricladia Matsush. (1971), anamorphic *Pezizomycotina*, Hso.1bH.10. 1, Papua New Guinea. See Matsushima (*Bull. natn. Sci. Mus.* Tokyo, B **14**: 478,

1971), Roldan (*Mycotaxon* **42**: 297, 1991; culture).

isthmus (1) the narrower or thinner-walled portion of an isthmospore (q.v.); (2) the thickened medial perforated septum of a polarilocular ascospore.

isthmus disarticulation, protoplasmic retraction during spore formation, with the secretion of an endosporic wall membrane.

Isuasphaera H.D. Pflug (1978), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (*c.* 3800 million yr old Isua quartzite), Greenland.

Itajahya Möller (1895), Phallaceae. 1, widespread (tropical; subtropical). See Ahmad (*Lloydia* **8**: 238, 1945), Malençon (*BSMF* **100**: Atlas pl. 238, 1984).

italicization (of scientific names), see Classification.

Itersonia Rippel & Flehmig [not traced] nom. dub., ? Myxobacteria.

Itersonilia Derx (1948), anamorphic *Cystofilobasidiaceae*. 2, widespread (temperate). See Sowell & Korf (*Mycol.* **52**: 934, 1960), Channon (*Ann. appl. Biol.* **51**: 1, 1963; leaf spot and canker of parsnip by *I. pastinacae*), Webster *et al.* (*TBMS* **82**: 13, 1984; ballistospore discharge), Yamada & Konda (*J. gen. appl. Microbiol.* Tokyo **30**: 313, 1984; significance of coenzyme Q system in classification), Webster *et al.* (*TBMS* **91**: 193, 1988; ballistospore discharge), Boekhout (*MR* **95**: 135, 1991; phenetic systematics), Boekhout & Jille (*Syst. Appl. Microbiol.* **14**: 117, 1991; mitosis and DNA content in *I. perplexans*), Boekhout *et al.* (*Can. J. Microbiol.* **37**: 188, 1991; genomic characterization), Ingold (*Mycologist* **5**: 35, 1991; development), Horita & Yasuoka (*Journal of General Plant Pathology* **68**: 277, 2002; *Itersonilia perplexans* in Japan).

Ithyphallus Gray (1821) nom. rej. ≡ Mutinus.

ITS, see Molecular biology.

Ityorhoptrum P.M. Kirk (1986), anamorphic *Pezizomycotina*, Hso.#eP.19. 1, British Isles. See Kirk (*TBMS* **86**: 417, 1986).

IUBS, see Societies and organizations.

IUCN, International Union for the Conservation of Nature and Natural Resources; the World Conservation Union. See Conservation.

IUMS, see Societies and organizations.

iwatake, see rock tripe.

Iwilsoniella E.B.G. Jones (1991), Halosphaeriaceae. 1 (cooling tower water), British Isles. See Jones (*SA* **10**: 7, 1991).

Ixechinaceae Guzmán (1974) = Boletaceae.

Ixechinus R. Heim (1968) = Fistulinella fide Guzmán (*Boln. Soc. mex. Micol.* **8**: 53, 1974).

ixo- (prefix), sticky.

Ixocomus Quél. (1888) ≡ Suillus Gray.

ixocutis (of a pileus), a slimy cuticle.

Ixodopsis P. Karst. (1870) ≡ Sordaria.

ixotrichoderm (ixotrichodermium) (of a pileus), a trichodermium composed of gelatinized hyphae (Snell, 1939; for a discussion, see Shaffer, *Mycol.* **58**: 486, 1966).

Iyengarina Subram. (1958), anamorphic *Pezizomycotina*, Hso.0bP.1. 1, India. See Subramanian (*J. Indian bot. Soc.* **37**: 406, 1958).

J, see iodine.

Jaapia Bres. (1911), Boletales. 2, widespread. See Nannfeldt & Eriksson (*Svensk bot. Tidskr.* **47**: 177, 1953).

Jaapia Kirschst. (1938) ≡ Keisslerina.

Jack o'lantern, the basidioma of the luminous *Clitocybe illudens*.

jack-in-the-box discharge, see ascus.

Jacksonia J.C. Lindq. (1970) [non *Jacksonia* R. Br. ex Aiton 1811, *Papilionaceae*] ≡ Dietelia fide Lindquist (*Rev. Fac. Agron., Univ. Nac. La Plata* **47**: 303, 1972).

Jacksoniella J.C. Lindq. (1972) = Dietelia fide Sathe (*Indian Phytopath.* **27**: 617, 1974), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983) See.

Jacksoniella Kamat & Sathe (1972) = Dietelia fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Jacksonomyces Jülich (1979), Meruliaceae. 10, widespread. See Wu & Chen (*Bull. natn. Sci. Mus.* Tokyo, B **3**: 260, 1977).

Jackya Bubák (1902) [non *Jackia* Wall. 1823, *Rubiaceae*] = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Jacobaschella Kuntze (1891) ≡ Diplosporium.

Jacobia Arnaud (1952) nom. inval., anamorphic *Agaricomycetes*, Hso.0eH.?. 1 (with clamp connexions), Europe.

Jacobia Contu (1998) ≡ Contumyces fide Kuyper (*in litt.*).

Jacobsonia Boedijn (1935), Helotiaceae. 1, Sumatra.

Jaculispora H.J. Huds. & Ingold (1960), anamorphic *Classiculaceae*, Hso.0eH.1. 1 (aquatic), Jamaica. See Hudson & Ingold (*TBMS* **43**: 475, 1960).

Jaczewski (Arthur Louis Arthurovič de; 1863-1932; Russia). Studied under Fischer (q.v.), Berne (1889-1894); founded the laboratory of mycology and plant pathology (1896) then the Central Laboratory for Plant Pathology (1901) then the Bureau for Mycology and Phytopathology (1907), St Petersburg Botanic Garden; first Director, Bureau of Mycology and Phytopathology [later renamed the Jaczewski Institute], St Petersburg (1907-1932). A pioneer of mycology in Russia and, perhaps, the greatest Russian mycologist, with a prolific scientific output; his outstanding managerial skills enabled him to realize remarkable results during very difficult years of revolution and war. *Publs.* [*Key to the Fungi*] (1913-1917), [*Fundamentals of mycology*] (1933) [in Russian]; also numerous other works on mycology and plant pathology. *Biogs, obits etc.* Grummann (1974: 548); Jones (*Phytopathology* **23**: 111, 1933) [portrait]; Stafleu & Cowan (*TL-2* **2**: 413, 1979).

Jaczewskia Mattir. (1912) = Phallus fide Vasil'kov (*Bot. Zh. SSSR* **40**: 596, 1955).

Jaczewskiella Murashk. (1926) = Stigmina fide Sutton (*Mycol. Pap.* **141**, 1977).

Jaffuela Speg. (1921), ? Dothioraceae. 1 (on *Puya*), Chile.

Jafnea Korf (1960), Pyronemataceae. 2, widespread. See Berthet & Korf (*Nat. can.* **96**: 247, 1969), Schumacher (*Mycotaxon* **33**: 149, 1988), Benkert & Klofac (*Öst. Z. Pilzk.* **13**: 55, 2004; Europe), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Jafneadelphus Rifai (1968) = Aleurina Massee fide Zhuang & Korf (*Mycotaxon* **26**: 361, 1986).

Jahniella Petr. (1921), anamorphic *Pezizomycotina*, Cpd.0fH.1. 3, former Czechoslovakia.

Jahnoporus Nuss (1980), Albatrellaceae. 2, widespread (north temperate). See Nuss (*Hoppea* **39**: 176, 1980).

Jahnula Kirschst. (1936), Aliquandostipitaceae. 10 (on submerged wood), widespread. See Hawksworth (*Sydowia* **37**: 43, 1984), Hyde & Wong (*Nova Hedwigia* **68**: 489, 1999; Australia), Pang *et al.* (*MR* **106**:

1031, 2002), Raja & Shearer (*Mycol.* **98**: 319, 2006), Campbell *et al.* (*CJB* **85**: 873, 2007; phylogeny).

Jahnulales K.L. Pang, Abdel-Wahab, El-Shar., E.B.G. Jones & Sivichai (2002). Dothideomycetes. 1 fam., 6 gen., 25 spp. Fam.:
Aliquandostipitaceae
For *Lit.* see under fam.

Jainesia Gonz. Frag. & Cif. (1925), anamorphic *Pezizomycotina*, Hso.≡ eP.?. 1, West Indies.

Jamesdicksonia Thirum., Pavgi & Payak (1961), Georgefischeriaceae. 23 (on *Cyperaceae*, *Poaceae*), S. Asia; N.; C. & S. America; Australia. See Bauer *et al.* (*MR* **105**: 416, 2001), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002; New Zealand).

Jamesiella Lücking, Sérus. & Vězda (2005), Gomphillaceae (L). 1, widespread. See Lücking *et al.* (*Lichenologist* **37**: 165, 2005), Lücking *et al.* (*Lichenologist* **38**: 131, 2006; Costa Rica).

Janacekia J.I.R. Larsson (1983), Microsporidia. 3.

Janannfeldtia Subram. & Sekar (1993), Nitschkiaceae. 2, India. See Subramanian & Sekar (*Kavaka* **18**: 19, 1993), Huhndorf *et al.* (*MR* **108**: 1384, 2004).

Janauaria Singer (1986), Agaricaceae. 1, Brazil. See Singer (*Agaric. mod. Tax.* 4th ed: 495, 1986).

Janetia M.B. Ellis (1976), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 17, widespread. See Sutton & Pascoe (*Aust. Syst. Bot.* **1**: 127, 1988), Sivanesan (*MR* **94**: 566, 1990; synnematous spp.), Calduch *et al.* (*Mycol.* **94**: 355, 2002; Spain), Xu & Guo (*Nova Hedwigia* **75**: 201, 2002; China).

Janospora (Starbäck) Höhn. (1923) = Stilbospora fide Sutton (*Mycol. Pap.* **141**, 1977).

Janseella Henn. (1899) = Phaeotrema fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Jansia Penz. (1899) = Mutinus fide Dring *in* Ainsworth *et al.* (Eds) (*The Fungi* **4B**: 458, 1973).

Jansoniisporites Kalgutkar (1997), Fossil Fungi. 1, Canada. See Kalgutkar (*Review of Palaeobotany and Palynology* **97**: 216, 1997).

Japanese mushroom, see matsu-take.

Japewia Tønsberg (1990), Ramalinaceae (L). 3, widespread (north temperate). See Tønsberg (*Lichenologist* **22**: 205, 1990), Printzen (*Bryologist* **102**: 714, 1999).

Japewiella Printzen (1999), Ramalinaceae (L). 4, Mexico. See Printzen (*Bryologist* **102**: 714, 1999).

Japonia Höhn. (1909), anamorphic *Yoshinagaia*, Cpd.1eH.1. 1, Japan.

Japonogaster Kobayasi (1989), Agaricaceae. 1, Japan. ? A monstrosity of *Lycoperdon*.

Jarmania Kantvilas (1996), Ramalinaceae (L). 1, Australia. See Kantvilas (*Lichenologist* **28**: 230, 1996).

Jarxia D. Hawksw. (1989), Naetrocymbaceae. 1, C. America; Florida. See Hawksworth (*Stud. Mycol.* **31**: 93, 1989), Harris (*More Florida Lichens*, 1995).

Jattaea Berl. (1900), Calosphaeriaceae. Anamorphs *Stachybotrys*-like, *Phialophora*-like. 8, widespread. See Barr (*Mycol.* **77**: 549, 1985), Romero & Samuels (*Beih. Sydowia* **43**: 228, 1991), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006), Damm *et al.* (*Persoonia* **20**: 39, 2008; asci, relns).

Jattaeolichen Tomas. & Cif. (1952) = Arthopyrenia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Jattaeomyces Cif. & Tomas. (1953) ≡ Jattaeolichen.

Javaria Boise (1986), ? Melanommataceae. 2 (on *Palmae*), N. & S. America. See Boise (*Acta Amazon. Supl.* **14**: 49, 1986), Hyde & Fröhlich (*Sydowia* **50**: 81, 1998; synonym of *Astrosphaeriella*).

Javonarxia Subram. (1995), anamorphic *Pezizomycotina*, Hso.≡ eP.19. 2, Malaysia. See Subramanian (*Kavaka* **20/21**: 57, 1995).

Jeaneliomyces Lepesme (1945) = Dimeromyces fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

jelly fungi, a term sometimes applied to the *Tremellales* s.l.

Jenmania W. Wächt. (1897), Lichinaceae (L). 2, S. America. See Henssen (*Lichenologist* **5**: 444, 1973; key), Schultz & Büdel (*Lichenologist* **35**: 151, 2003; phylogeny).

Jenmaniomyces Cif. & Tomas. (1953) ≡ Jenmania.

Jerainum Nawawi & Kuthub. (1992), anamorphic *Pezizomycotina*, Hso.#eP.1. 1 (aquatic), Malaysia. See Nawawi & Kuthubutheen (*Mycotaxon* **45**: 409, 1992).

Jew's ear, the basidioma of *Auricularia auricula-judae*.

Jirovecia J. Weiser (1977), Microsporidia. 3.

Jiroveciana J.I.R. Larsson (1981), Microsporidia. 1.

Jobellisia M.E. Barr (1993), ? Diaporthales. 2 (from wood), widespread. See Barr (*Mycotaxon* **46**: 45, 1993), Huhndorf *et al.* (*Sydowia* **51**: 183, 1999; DNA, posn), Kang *et al.* (*Mycoscience* **40**: 151, 1999; posn), Réblová *et al.* (*Stud. Mycol.* **50**: 533, 2004), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006).

Joerstadia Gjaerum & Cummins (1982), Phragmidiaceae. 4 (on *Alchemilla* (*Rosaceae*)), Africa; Madagascar. See Gjaerum & Cummins (*Mycotaxon* **15**: 420, 1982).

Johansonia Sacc. (1889), Saccardiaceae. *c.* 11, widespread (tropical).

Johansoniella Bat., J.L. Bezerra & Cavalc. (1966) = Johansonia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Johenrea C.E. Langeb, J.J. Becnel, E. Razafindratiana, J. Przybyszewski & H. Razafindrafara (1996), Microsporidia. 1. See Langeb *et al.* (*J. Invert. Path.* **68**: 28, 1996).

Johncouchia S. Hughes & Cavalc. (1983), anamorphic *Septobasidium*, Hso.0bP.1. 1, widespread. See Hughes & Cavalcanti (*CJB* **61**: 2226, 1983).

Johnkarlingia Pavgi & S.L. Singh (1979), Synchytriaceae. 1 (on *Brassica* roots), India. See Pavgi & Singh (*Mycopathologia* **69**: 53, 1979).

Johnstonia M.B. Ellis (1971) [non *Johnstonia* Walkom 1925, fossil] ≡ Neojohnstonia.

Jola Möller (1895), Eocronartiaceae. 1 (on *Musci*), widespread (tropical). See Martin (*Mycol.* **31**: 239, 1939), Frieders & McLaughlin (*MR* **105**: 734, 2001; cytol., ultrastr., anam.).

Jonaspis, see *Ionaspis*.

Jongiella M. Morelet (1971) = Camillea fide Læssøe *et al.* (*MR* **93**: 121, 1989), Læssøe (*SA* **13**: 43, 1994; ? synonym of *Xylaria*).

Jopex, see *Irpex*.

jordanon, Brierley's (*Ann. app. Biol.* **18**: 420, 1931) application of Lotsy's term for a group of isolates constituting a race or strain, with similar cultural characters and behaviour (obsol.).

Josefpoeltia S.Y. Kondr. & Kärnefelt (1997), Teloschistaceae (L). 3, S. America. See Kondratyuk & Kärnefelt (*Progr. Probl. Lichenol. Nineties. Proc.*

Third Symp. Intern. Assoc. Lichenol. [*Biblthca Lichenol.* **68**]: 22, 1997), Frödén & Lindblom (*Bryologist* **106**: 447, 2003).

Jove's beard, the basidioma of *Odontia barba-jovis*.

Jrpex, see *Irpex*.

Jubispora B. Sutton & H.J. Swart (1986), anamorphic *Pezizomycotina*, St.≡ eP.19. 1, Africa. See Sutton & Swart (*TBMS* **87**: 97, 1986).

Jugglerandia Lloyd (1923) ≡ Holwaya.

Jugulospora N. Lundq. (1972), Lasiosphaeriaceae. 1 (on burnt soil), Europe; N. America. See Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972), Barr (*Mycotaxon* **39**: 43, 1990; posn), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005; phylogeny).

Julella Fabre (1879), Thelenellaceae (±L). 3 or 18, widespread. See Barr (*Sydowia* **38**: 11, 1986), Aptroot & van den Boom (*Mycotaxon* **56**: 1, 1995), Kohlmeyer *et al.* (*Bot. Mar.* **40**: 291, 1997), Tam *et al.* (*Bot. Mar.* **46**: 487, 2003; phylogeny), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Juliohirschhornia Hirschh. (1986), Ustilaginaceae. 1 (on *Paspalum*), S. America. See Vánky (*in litt.*; ? syn. of *Ustilago*), Hirschhorn (*Las Ustilaginales de la Flora Argentina*, 1986).

Jumillera J.D. Rogers, Y.M. Ju & F. San Martín (1997), Xylariaceae. Anamorphs *Geniculosporium*-like, *Libertella*-like. 7, widespread. See Rogers *et al.* (*Mycotaxon* **64**: 39, 1997), Rogers & Ju (*CJB* **80**: 478, 2002; Hawaii).

Juncigena Kohlm., Volkm.-Kohlm. & O.E. Erikss. (1997), Hypocreomycetidae. Anamorph *Cirrenalia*. 1 (stems of *Juncus*), N. America. See Kohlmeyer *et al.* (*Bot. Mar.* **40**: 291, 1997), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny).

Junctospora Minter & Hol.-Jech. (1981), anamorphic *Pezizomycotina*, Hso.0eH.4. 1, former Czechoslovakia. See Minter & Holubová-Jechová (*Folia geobot. phytotax.* **16**: 202, 1981).

Junewangia W.A. Baker & Morgan-Jones (2002), anamorphic *Pezizomycotina*, H?.?.?. 1, widespread. See Baker *et al.* (*Mycotaxon* **81**: 307, 2002).

Junghuhnia Corda (1842), Meruliaceae. *c.* 20, widespread. See Ryvarden (*Persoonia* **7**: 17, 1972), Pouzar (*Czech Mycol.* **55**: 1, 2003; Cuba), Ipulet & Ryvarden (*Syn. Fung.* **20**: 87, 2005; Uganda).

Jungkultur, see Normkultur.

Junia Dumort. (1822) [non *Junia* Adans. 1763, *Clethraceae*] = Phallus fide Stalpers (*in litt.*).

juvenescence, the process of maturing at a stage of development normally immature.

K (1) see Metabolic products; (2) Royal Botanic Gardens (Kew, Surrey, UK); founded 1841; managed by a Board of Trustees and mainly funded by the UK Ministry of Agriculture, Fisheries and Food (MAFF); most lichen material transferred to **BM** (q.v.); see Blunt (*In for a penny*, 1978), Hepper (Ed.) (*Royal Botanic Gardens, Kew: gardens for science and pleasure*, 1982); (3) see Sörensen coefficient.

Kamatella Anahosur (1969), anamorphic *Pezizomycotina*, Cpd.1eP.1. 1, S. Africa; India. See Anahosur (*Bull. Torrey bot. Club* **96**: 207, 1969).

Kamatia V.G. Rao & Subhedar (1976) = Pseudodictyosporium fide Kendrick *in* Carmichael *et al.* (*Gen-

era of Hyphomycetes, 1980), Tsui et al. (*Fungal Diversity* **21**: 157, 2006).

Kamatomyces Sathe (1966) = Masseeëlla fide Berndt (*in litt.*).

kamé, truffle (Arabic); **black -**, **brown -**, the edible *Terfezia boudieri* and *T. claveryi*, respectively, of the Middle East (Awameh & Alsheikh, *Mycol.* **72**: 50, 494, 1980).

kames, see terfas.

Kameshwaromyces Kamal, R.K. Verma & Morgan-Jones (1986), anamorphic *Pezizomycotina*, Hso.#eP.1. 1, India. See Kamal et al. (*Mycotaxon* **25**: 247, 1986).

Kananascus Nag Raj (1984), Sordariomycetes. Anamorph *Koorchaloma*. 2, widespread. See Nag Raj (*Mycotaxon* **19**: 167, 1984), Treigiene (*Mycotaxon* **96**: 173, 2006; Lithuania).

Kanousea Bat. & Cif. (1962) = Microcallis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Kantvilasia P.M. McCarthy, Elix & Sérus. (2000), Ectolechiaceae. 1, Tasmania; S. America. See McCarthy *et al.* (*Lichenologist* **32**: 317, 2000), Lücking (*Cryptog. Mycol.* **27**: 121, 2006; French Guiana).

Kapooria J. Reid & C. Booth (1989), Diaporthales. 1, India. See Reid & Booth (*CJB* **67**: 879, 1989).

Kappamyces Letcher & M.J. Powell (2005), Kappamycetaceae. 1, USA. See Letcher & Powell (*Nova Hedwigia* **80**: 115, 2005).

Kappamycetaceae Letcher (2006), Rhizophydiales. 1 gen., 1 spp.

Karakulinia N.P. Golovina (1964) = Fusicladium fide Deighton (*Mycol. Pap.* **112**, 1967), Schubert *et al.* (*Schlechtendalia* **9**, 2003).

Karlingia A.E. Johanson (1944) nom. illegit. ≡ Rhizophlyctis fide Blackwell & Powell (*Mycotaxon* **70**: 213, 1999; nomencl.).

Karlingiomyces Sparrow (1960), Chytridiaceae. 5, widespread. See Karling (*Sydowia* Beih. **6**: 58, 1966), Dogma (*Nova Hedwigia* **24**: 393, 1973), Blackwell *et al.* (*Mycotaxon* **89**: 259, 2004; monogr., key) = Karlingia (Chytrid.) fide.

Karoowia Hale (1989), Parmeliaceae (L). 18, widespread. See Elix (*Flora of Australia* **55**: 62, 1994), Elix (*Australasian Lichenology* **46**: 18, 2000; Australia), Blanco *et al.* (*Taxon* **53**: 959, 2004; phylogeny), Thell *et al.* (*Mycol. Progr.* **3**: 297, 2004; phylogeny), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny).

Karschia Körb. (1865), Dothideomycetes. 4 (on lichens), Europe. See Hafellner (*Beih. Nova Hedwigia* **62**, 1979; key, disp. excl. spp.).

Karsten (Petter Adolf; 1834-1917; Finland). PhD, Helsinki (1859); schoolteacher, Wasa Gymnasium (1862-1864); Lecturer in botany (1864-1900) then Professor (1900-1908), Agricultural and Dairy Institute, Mustiala. Pioneer in Finnish mycology, describing many new species. Collections mostly in Helsinki (**H**). *Publs. Mycologia Fennica* (1871-1878) [reprint 1967]; *Symbolae ad Mycologiam Fennicam* 33 parts (1870-1895) [reprint 1967]; *Rysslands, Finlands och den Skandinaviska Halföns Hattsvampar* (1879-82); *Kritisch Öfversigt af Finlands Basidsvampar (Basidiomycetes; Gastero- et Hymenomycetes)* (1889); also collected mycological papers (1859-1909) [reprint 4 vols, 1973]. *Biogs, obits etc.* Grummann (1974: 609); Hintikka (*Karstenia* **1**: 5, 1950, portrait) [in Finnish]; Lowe (*Mycol.* **48**: 99, 1956) [polypore types]; Stafleu & Cowan (*TL-2* **2**: 505, 1979).

Karstenella Harmaja (1969), Karstenellaceae. 1, Finland. See Harmaja (*Karstenia* **9**: 20, 1969), Harmaja (*Karstenia* **14**: 109, 1974).

Karstenellaceae Harmaja (1974), Pezizales. 1 gen., 1 spp.

Lit.: Harmaja (*Karstenia* **9**: 20, 1969), Harmaja (*Karstenia* **14**: 109, 1974), Kimbrough (*Mem. N. Y. bot. Gdn* **49**: 326, 1989).

Karstenia Britzelm. (1897) [non *Karstenia* Göpp. 1836, fossil *Polypodiaceae*] ≡ Prillieuxia.

Karstenia Fr. (1885) nom. cons., ? Rhytismatales. 9, Europe; America. See Sherwood (*Mycotaxon* **5**: 1, 1977), Sherwood (*Occ. Pap. Farlow Herb. Crypt. Bot.* **15**, 1980), Wilberforce (*Mycologist* **13**: 149, 1999).

Karsteniomyces D. Hawksw. (1980), anamorphic *Pezizomycotina*, Cpd.1eH.1. 1 (on lichens, esp. *Peltigera*), Europe. See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 22, 1981), Boqueras & Diederich (*Mycotaxon* **47**: 425, 1993).

Karstenula Speg. (1879), Melanommataceae. Anamorph *Microdiplodia*. 16, widespread (temperate). See Munk (*Dansk bot. Ark.* **17**, 1957), Eriksson & Hawksworth (*SA* **10**: 140, 1991), Constantinescu (*MR* **97**: 377, 1993; anamorph), Yuan & Mohammed (*Mycotaxon* **63**: 9, 1997).

karyochorisis, somatic nuclear division resulting from a constriction of the nuclear membrane (Moore, *Z. Zellforsch.* **63**: 921, 1964).

karyogamy, the fusion of two sex nuclei after cell fusion, i.e. after plasmogamy.

karyotype, the size and number of chromosomes in an organism. Generally determined by deduction from mating studies, microscopically or from specialized electrophoresis methods. See McCluskey & Mills (*Mol. Pl.-Microbe Interactions* **3**: 366, 1990), pulsed field gel-electrophoresis.

Kaskaskia Born & J.L. Crane (1972) = Gyrostroma fide Bedker & Wingfield (*TBMS* **81**: 179, 1983).

Kathistaceae Malloch & M. Blackw. (1990), Sordariomycetes (inc. sed.). 4 gen. (+ 1 syn.), 8 spp.

Lit.: Malloch & Blackwell (*CJB* **68**: 1712, 1990), Blackwell & Jones (*Biodiv. Cons.* **6**: 689, 1997), Blackwell *et al.* (*Mycol.* **95**: 987, 2003).

Kathistes Malloch & M. Blackw. (1990), Kathistaceae. 3 (coprophilous), widespread (north temperate). See Malloch & Blackwell (*CJB* **68**: 1712, 1990), Blackwell *et al.* (*Mycol.* **95**: 987, 2003; phylogeny).

katothecium, see catathecium.

katsuobushi, a Japanese food obtained by fermenting cooked bonito fish (*Sarda sarda*) with *Aspergillus* spp.

Katumotoa Kaz. Tanaka & Y. Harada (2005), Phaeosphaeriaceae. 1, Japan. See Tanaka & Harada (*Mycoscience* **46**: 313, 2005).

Kauffman (Calvin Henry; 1869-1931; USA). School teacher (1895-1901). Student, University of Wisconsin (1901-1902); Assistant, Cornell University, New York (1902-1904); Instructor (1904-1912) then Assistant Professor (1912-1920 then Associate Professor (1920-1923) then Professor (1923-1931) and Director of Herbarium (1921-1931), Michigan University. Contributed to the knowledge of the *Agaricaceae* particularly in Michigan, the Rocky Mountains and the Pacific Northwest. *Publs. Agaricaceae of Michigan* (1918); also other books and papers on the *Agaricaceae* (q.v.). *Biogs, obits etc.* Mains (*Phytopa-*

thology **22**: 271, 1932); Mains (*Mycol.* **24**: 265, 1932) [portrait]; Stafleu & Cowan (*TL-2* **2**: 507, 1979).

Kineosporia Pagani & Parenti (1978), Actinobacteria. q.v.

kinetid, flagellar apparatus including kinetosomes and their associated tubules and fibres.

kinetosome, intracellular, non-membrane bound organelles; microtubular cylinders (0.2 µm diam.) organized in the 9 (A, B C- microtubules) + 0 pattern and with axoneme extensions in the 9 (A, B- microtubules) + 2 pattern.

KINGDOMS OF FUNGI, In the seventh edition of this *Dictionary*, the fungi were accepted as a single kingdom along with bacteria (*Monera*), plants (*Plantae*), animals (*Animalia*) and protists (*Protista*) according to the five-kingdom scheme of Whittaker (*Science* **163**: 160, 1969). However, with advances in ultrastructural, biochemical, and especially molecular biology, the treatment of the fungi as one of the five kingdoms of life has become increasingly untenable (see Phylogeny). The organisms studied by mycologists are now established as polyphyletic (i.e. with different phylogenies) and have to be referred to at least three different kingdoms as previously adopted in the 8th and 9th editions of this *Dictionary*.

This situation has arisen because of similarities in biology and structure. Essentially, 'fungi', pragmatically defined as organisms studied by mycologists, are eukaryotic, heterotrophic, develop branching filaments (or are more rarely single-celled), and reproduce by spores. Where it is useful to speak of fungi in this polyphyletic sense, the name can be used non-italicized and not capitalized to differentiate this from the kingdom *Fungi*; it is also possible to use other informal names for 'fungi', e.g. eumycotan or protoctistan fungi if considered desirable (Kendrick, 1992), but their replacement by scientific names that could imply either a common ancestry (cf. *Panomycetes*) or more formal rank (e.g. union; Barr, 1992) is not advocated here. Retention of the fungal phylum termination **-mycota** regardless of the kingdom to which the 'fungal' phyla are refered fulfills the same purpose. However, for this edition of the *Dictionary* zoological orthography is adopted for most of the suprafamilial ranks of the 'protozoan fungi'.

The three kingdoms of 'fungi' accepted in this edition of the *Dictionary* are:

(1) **Chromista**
(2) **Fungi**
(3) **Protozoa**

Their distinguishing features and names are discussed under the entries for each of the kingdoms. In recognition of their distinct evolutionary origins, organisms from these three kingdoms which are tradi-

tionally studied by mycologists, are now listed separately in this *Dictionary*. Some authors unite the *Chromista* and *Protozoa* into a single highly polyphylectic kingdom *Protoctista* (syn. *Protista*), but that conclusion is not supported by molecular, biochemical, and other evidence (see under kingdom entries). Cavalier-Smith (1993) and Corliss (1994) both retain *Chromista* and *Protozoa* as separate kingdoms. Dick (2001) segregates the *Straminipila* as a kingdom separate from the *Chromista* and including the fungal phyla of that kingdom.

Koordersiella Höhn. (1909), Dothideomycetes. Anamorph *Hansfordiellopsis*. 3 (on lichens), widespread (tropical). See Eriksson & Hawksworth (*SA* **6**: 133, 1987).

Koralionastes Kohlm. & Volkm.-Kohlm. (1987), Koralionastetaceae. 5 (marine), widespread (tropics). See Kohlmeyer & Volkmann-Kohlmeyer (*CJB* **68**: 1554, 1990), Volkmann-Kohlmeyer & Kohlmeyer (*Mycotaxon* **44**: 417, 1992).

Koralionastetaceae Kohlm. & Volkm.-Kohlm. (1987), Pezizomycotina (inc. sed.). 1 gen., 5 spp.

Lit.: Kohlmeyer & Volkmann-Kohlmeyer (*Mycol.* **79**: 764, 1987), Kohlmeyer & Volkmann-Kohlmeyer (*CJB* **68**: 1554, 1990).

Körber (Gustav Wilhelm; 1817-1885; Germany). Born in Schlesien; studied in Breslau (now Wrocław, Poland) and Berlin; lecturer and later Professor at the University of Wrocław. An outstanding lichenologist who made major contributions to understanding the nature of lichen-forming fungi and to the systematics of crustose genera using microscopic features. Although his work was often eclipsed by the more prolific Nylander (q.v.), many genera Körber recognized in the 1850s-1860s came into use again in the 1980s (e.g. *Lecidella*, *Porpidia*, *Pyrrhospora*). Main collections in Leiden (**L**; incl. 'Typenherbar'); other material in Wrocław (**WRSL**). *Publs. De Gonidiis Lichenum* (1840); *Systema Lichenum Germaniae* (1854-55); *Parerga Lichenologica* (1859-65). *Biogs, obits etc.* Grummann (1974: 23); Stafleu & Cowan (*TL-2* **2**: 603, 1979).

Kordyana Racib. (1900), Brachybasidiaceae. 5 (parasites esp. of *Commelinaceae*), widespread (tropical). See Gäumann (*Annls mycol.* **20**: 257, 1922), Donk (*Reinwardtia* **4**: 117, 1956).

Bull. Acad. sin.* Taipei **45**: 165, 2004; on carabids, Taiwan), Terada (*Mycoscience* **46**: 215, 2005; on carabid beetles, Asia), Rossi & Santamaria (*Nova Hedwigia* **82**: 189, 2006).

Laboulbeniaceae G. Winter (1886), Laboulbeniales. 126 gen. (+ 32 syn.), 1931 spp.

Lit.: Bánhegyi *et al.* (*Magyarország Mikroszkopikus Gombáinak Határozókönyve* 2. Kötet Eumycotina (Ascomycetes: A Discomycetestől, Basidiomycetes, Deuteromycetes): 635 pp., 1985), Huldén (*Karstenia* **25**: 1, 1985), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Lee (*Korean J. Pl. Taxon.* **16**: 1, 1986), Santamaría (*Nova Hedwigia* **63**: 63, 1996), Weir & Beakes (*Mycol.* **88**: 677, 1996), Weir & Hammond (*Biodiv. Cons.* **6**: 701, 1997), Santamaría & Rossi (*Pl. Biosystems* **133**: 163, 1999), Rossi & Santamaria (*Mycol.* **92**: 786, 2000), Weir & Hughes (*Mycol.* **94**: 483, 2002), Hughes *et al.* (*Mycol.* **96**: 834, 2004).

Laboulbeniales Lindau (1898). Laboulbeniomycetidae. 4 fam., 146 gen., 2050 spp. Stromata usually present, composed of a basal black haustorium and a dark cellular thallus, formed under tight developmental control. Ascomata perithecial, often surrounded by complex appendages, translucent, ovoid, thin-walled. Interascal tissue absent. Asci few, clavate, thin-walled, evanescent, usually 4-spored. Ascospores hyaline, elongate, 1-septate. Anamorph hyphomycetous, spermatial, fleeting. Ectocommensalists of *Insecta* (few on *Arachnida* and *Diplopoda*), cosmop.

The 'host' is only rarely seriously damaged by the fungus, which generally does not extend below the chitin. Tavares (*Mycol. Mem.* **9**, 1985; key gens., illustr.) is largely followed for generic and family concepts here. Fams:

(1) **Ceratomycetaceae**
(2) **Euceratomycetaceae**
(3) **Herpomycetaceae**
(4) **Laboulbeniaceae**

Biol. **50**: 215, 2001), Wagner (*Mycotaxon* **79**: 235, 2001), Larsson & Larsson (*Mycol.* **95**: 1037, 2003), Larsson (*MR* **111**: 1058, 2007; syn. of *Peniophoraceae*).

Lachnocladiales = Russulales.

Lachnocladium Lév. (1846) nom. cons., Lachnocladiaceae. 5, widespread. See Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**: 416, 1950), Stalpers (*Stud. Mycol.* **40**: 85, 1996; key), Larsson & Larsson (*Mycol.* **95**: 1037, 2003; phylogeny).

Lachnodochium Marchal (1895), anamorphic *Pezizomycotina*, Hsp.0eH.10. 1, Europe.

Lachnum Retz. (1795), Hyaloscyphaceae. *c.* 251, widespread. See also *Dasyscyphus*. See Haines & Dumont (*Mycotaxon* **19**: 1, 1984; key 9 long-spored spp.), Raitviir (*Eesti NSV Tead. Akad. Toim.* Biol. seer **36**: 313, 1987; concept), Spooner (*Biblthca Mycol.* **116**, 1987; 37 spp. Australasia), Raitviir & Sacconi (*Mycol. Helv.* **4**: 161, 1991), Haines (*Nova Hedwigia* **54**: 97, 1992; key 13 spp. Guayana), Galán & Raitviir (*Nova Hedwigia* **58**: 453, 1994), Verkley (*Nova Hedwigia* **63**: 215, 1996; ultrastr.), Cantrell & Haines (*MR* **101**: 1081, 1997; trop. spp.), Cantrell & Hanlin (*Mycol.* **89**: 745, 1997; phylogeny), Wu & Haines (*Mycotaxon* **67**: 341, 1998), Zhuang (*Mycotaxon* **69**: 359, 1998; spp. trop. China), Leenurm *et al.* (*Sydowia* **52**: 30, 2000; ultrastr.), Tanaka & Hosoya (*Mycoscience* **42**: 597, 2001; Japan), Zhuang & Hyde (*Mycol.* **93**: 606, 2001; key long-spored spp.), Ye & Zhuang (*Mycosystema* **21**: 340, 2002; phylogeny), Zhuang (*Mycotaxon* **86**: 375, 2003; key Chinese spp.), Zhuang (*Nova Hedwigia* **78**: 425, 2004; on bamboo), Suková (*Czech Mycol.* **57**: 183, 2005; Czech Republic), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

lacinia, a delicate branch of a foliose lichen thallus having an anatomical structure typical of foliose lichens.

laciniate (of an edge, etc.), as if cut into delicate bands (Fig. 23.47).

Laciniocladium Petri (1917), anamorphic *Pezizomycotina*, Hso.0eH.?15. 1, Europe.

Lacrimasporonites R.T. Clarke (1965), Fossil Fungi. 9 (Cretaceous, Paleocene, Tertiary), widespread.

lacrimiform (lacrimoid), like a tear drop.

Lacrymaria Pat. (1887), Psathyrellaceae. 14, widespread. See Hopple & Vilgalys (*Mol. Phylogen. Evol.* **13**: 1, 1999; phylogeny), Cortez & Coelho (*Mycotaxon* **93**: 129, 2005).

Lacrymospora Aptroot (1991), Requienellaceae. 1 (on lichens), Madagascar. Placed in the *Pyrenulaceae* by Eriksson (*in litt.*).

Lactarelis Earle (1909) = Russula fide Singer (*Agaric. mod. Tax.*, 1951).

Lactaria Pers. (1797) [non *Lactaria* Rafin. 1838, *Apocynaceae*] ≡ Lactarius.

Lactariaceae Gäum. (1926) = Russulaceae.

Lactariella J. Schröt. (1889) = Lactarius fide Singer (*Agaric. mod. Tax.*, 1951).

Lactariopsis Henn. (1901) = Lactarius fide Singer (*Agaric. mod. Tax.*, 1951).

Lactarius Pers. (1797), Russulaceae. *c.* 450, widespread (esp. temperate). The milk-caps, *L. deliciosus* (saffron milk cap) and other spp. are edible. The genus is expanded and includes gastroid taxa although requires a split in two genera. See Hesler & Smith (*North American species of Lactarius*, 1979; key North American spp.), Korhonen (*Suomen rouskut*, 1984; key Europ. spp.), Thiers (*Sydowia* **37**: 296, 1984; key spp. W. USA), Verbeken (*Mycotaxon* **66**: 363, 1998; keys African spp.), Hutchison (*Lactarius – Ectomycorrhizal fungi, key genera in profile*, 1999; ecology), Lebel & Trappe (*Mycol.* **92**: 1188, 2000; type studies, gasteroid forms), Miller *et al.* (*Mycol.* **93**: 344, 2001; phylogeny), Péter *et al.* (*MR* **105**: 1231, 2001; molecular phylogeny, ectomycorrhiza), Verbeken & Horak (*Aust. Syst. Bot.* **13**: 649, 2001; Papua New Guinea), Lebel (*Australasian Mycologist* **21**: 4, 2002; Australia sp.), Van Rooij *et al.* (*Nova Hedwigia* **77**: 721, 2003; Benin), Nuytinck *et al.* (*Belg. Jl Bot.* **136**: 145, 2003; European spp.), Nuytinck & Verbeken (*Mycotaxon* **92**: 125, 2005; sect. *Deliciosi* in Europe), Rayner *et al.* (*British Fungus Flora. Agarics and Boleti* **9**: 203 pp., 2005; key Brit. spp.), Nuytinck *et al.* (*Fungal Diversity* **22**: 171, 2006; sect. *Deliciosi* in Asia), Nuytinck *et al.* (*Mycotaxon* **96**: 261, 2006; sect. *Deliciosi* in N & C America), Buyck *et al.* (*MR* **111**: 787, 2007; Madagascar), Le *et al.* (*Fungal Diversity* **24**: 61, 2007; Thailand), Le *et al.* (*Fungal Diversity* **24**: 173, 2007; Thailand), Buyck *et al.* (*Fungal Diversity* **28**: 15, 2008; phylogeny; two monophyletic clades).

lacteous, like milk.

lactescent, becoming like milk.

lactifer, a latex-carrying hypha (Singer, 1960: 33).

lactiferous, having a milk-like juice.

lactiferous hypha, see hypha.

Lactifluus (Pers.) Roussel (1806) ≡ Lactarius.

Lactocollybia Singer (1939), ? Marasmiaceae. 17, widespread (tropical). See Singer (*Fl. Neotrop.* **3**: 55, 1970), Singer *et al.* (*Butlletí. Societat Catalana de Micologia, Barcelona* **13**: 67, 1990; Spain), Reid & Eicker (*Mycotaxon* **66**: 153, 1998; key South African spp.), Contu (*Bollettino dell'Associazione Micologica ed Ecologica Romana* **16**: 9, 2000; Sardegna).

Lactomyces Boulanger (1899) ? = Mucor Fresen. fide Foster (*Chemical activities of fungi*, 1949).

Lactydina Subram. (1978), anamorphic *Pezizomycotina*, Hso.≡ eH.1. 1 (on amoebae), USA. See Subramanian (*Kavaka* **5**: 95, 1977), Rubner (*Stud. Mycol.* **39**, 1996).

lacuna, a hole or hollow.

lacunose, having lacunae.

Lacunospora Cailleux (1969) ? = Apiosordaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lacustromyces Longcore (1993), Cladochytriaceae. 1, USA. See Longcore (*CJB* **71**: 415, 1993).

Ladrococcus Locq. (1985), Fossil Fungi. 1, Sahara.

Laestadia Auersw. (1869) [non *Laestadia* Kunth ex Less. 1832, *Compositae*] = Plagiostoma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Laestadiella Höhn. (1918) = Guignardia fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Laestadites Mesch. (1892), Fossil Fungi. 1 (Pliocene, Pleistocene), Japan.

Laeticorticium Donk (1956) ≡ Corticium Pers.

Laetifomes Hattori (2001), Polyporaceae. 1, Solomon Is. See Hattori (*Mycoscience* **42**: 26, 2001).

Laetinaevia Nannf. (1932) nom. cons., Helotiales. Anamorph *Eriosporella*. 13, Europe. See Hein (*Willdenowia* Beih. **9**, 1976; key), Nauta & Spooner (*Mycologist* **13**: 65, 1999; Brit. spp.).

Laetiporaceae Jülich (1982) = Polyporaceae.

Laetiporus Murrill (1904), Fomitopsidaceae. 5, widespread. *L. sulphureus* on oak. See Corner (*Beih. Nova Hedwigia* **78**: 181, 1984), Burdsall & Banik (*Harvard Pap. Bot.* **6**: 43, 2001; N. Am.).
Laetisaria Burds. (1979), Corticiaceae. 3, widespread. See Burdsall (*TBMS* **72**: 420, 1979).
laevigate, smooth (Fig. 20.1).
Laeviomeliola Bat. (1960), Meliolaceae. 1, Brazil. See Batista (*Atas Inst. Micol. Univ. Recife* **1**: 224, 1960).
Laeviomyces D. Hawksw. (1981), anamorphic *Pezizomycotina*, Cpd.0eP.19. 2 (on lichens), Europe; N. America. See Hawksworth (*Bull. Br. Mus. nat. Hist.* Bot. **9**: 26, 1981).
Lagarobasidium Jülich (1974), Schizoporaceae. 1, Europe. See Langer (*Biblthca Mycol.* **154**, 1994), Larsson *et al.* (*Mycol.* **98**: 926, 2007).
lageniform, swollen at the base, narrowed at the top; like a Florence flask (Fig. 23.28).
Lageniformia Plunkett (1925) ? = Eutypa fide Petrak (*Sydowia* **5**: 169, 1951).
Lagenomyces Cavalc. & A.A. Silva (1972), anamorphic *Pezizomycotina*, St.0eH.?. 1, Brazil. See Cavalcanti & Silva (*Publicações. Instituto de Micologia da Universidade de Pernambuco* **647**: 28, 1972), Lücking *et al.* (*Lichenologist* **30**: 121, 1998; non-lichenized status).
Lagenula G. Arnaud (1930) [non *Lagenula* Lour. 1790, *Vitaceae*] = Caliciopsis fide Fitzpatrick (*Mycol.* **34**: 464, 1942).
Lagenulopsis Fitzp. (1942), Coryneliaceae. 1 (on *Podocarpus*), widespread (pantropical). See Benny *et al.* (*Bot. Gaz.* **146**: 431, 1985).
lager, see beer, brewing.
Lagerbergia J. Reid (1971) = Ascocalyx fide Müller & Dorworth (*Sydowia* **36**: 193, 1983).
Lagerheima Sacc. (1892), Helotiaceae. 3 or 4, widespread. See Gamundí (*Sydowia* **34**: 82, 1981).
Lagerheimina Kuntze (1891) = Diploschistes fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
lagynocarpus ascomycetes, Pyrenomycetes (Moreau, 1953).
Lagynodella Petr. (1922) = Cryptosporiopsis fide Wollenweber (*Arb. Biol. Reichsans. Berl.* **22**: 521, 1938).
Lahmia Körb. (1861), Lahmiaceae. 1 (from bark), widespread (north temperate). See Eriksson (*Mycotaxon* **27**: 347, 1986).
Lahmiaceae O.E. Erikss. (1986), Lahmiales. 1 gen. (+ 1 syn.), 1 spp.
Lit.: Eriksson (*Mycotaxon* **27**: 347, 1986), Ostry (*CJB* **64**: 1834, 1986).
Lahmiales O.E. Erikss. (1986). Pezizomycotina. 1 fam., 1 gen., 1 spp. Fam.:
Lahmiaceae
For *Lit.* see under fam.
Lahmiomyces Cif. & Tomas. (1953), Patellariaceae. 1, Italy. See Eriksson (*Mycotaxon* **27**: 347, 1986; posn).
Lalaria R.T. Moore (1990), anamorphic *Taphrina*, Hso.0eH.10. 23, widespread. Yeast phase anamorphs. See Moore *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 582, 1998).
Lamb (Ivan Mackenzie; 1911-1990; England, later Argentina, Canada, USA). Assistant for Lichens, British Museum (Natural History), London (1935-1946); Professor of Cryptogams, Tucumán University (1947) [after expedition to Antarctica and the Falklands / Malvinas]; Curator of Cryptogams, Canadian National Museum, Ottawa (1950); Director, Farlow Herbarium, Cambridge, Massachusetts (1954-1974). Noted for his studies on *Stereocaulon*; also for his catalogue of lichen names. Collections are in **BM, FH, CAN, LIL**. *Publs. Index Nominum Lichenum inter Annos 1932 et 1960 Divulgatorum* (1963). *Biogs, obits etc.* Ainsworth (*Brief Biographies of British Mycologists* p. 106, 1996); Stafleu & Cowan (*TL-2* **2**: 735, 1979).
Lambdasporium Matsush. (1971), anamorphic *Pezizomycotina*, Hso.1bH.10. 2, S.E. Asia. See Matsushima (*Bull. natn. Sci. Mus.* Tokyo, B **14**: 467, 1971), Chen *et al.* (*Bot. Bull. Acad. sin.* Taipei **41**: 81, 2000; Taiwan).
Lambertella Höhn. (1918), ? Rutstroemiaceae. Anamorph *Helicodendron*. 63, widespread. See Dumont (*Mem. N. Y. bot. Gdn* **33**, 1971; monogr.), Korf & Zhuang (*Mycotaxon* **24**: 361, 1985; key), Korf & Zhuang (*Mycotaxon* **39**: 477, 1990), Korf & Zhuang (*Mycosystema* **8-9**: 15, 1996; 15 spp. China), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny, polyphyly), Zhuang & Zhang (*Taxon* **51**: 769, 2002; China), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).
Lambertellinia Korf & Lizoň (1994), Sclerotiniaceae. Anamorph *Idriella*. 3, Japan. See Korf & Lizoň (*Mycotaxon* **50**: 167, 1994).
Lambiella Hertel (1984) = Rimularia fide Hertel (*Mitt. bot. StSamml., München* **23**: 321, 1987).
Lambinonia Sérus. & Diederich (2005), anamorphic *Pezizomycotina*. 1 (lichenicolous), widespread. See Sérusiaux & Diederich (*Lichenologist* **37**: 500, 2005).
Lambottiella (Sacc.) Sacc. (1913) = Lophiostoma fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Lambro Racib. (1900), Diaporthales. 1, Indonesia. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Monod (*Beih. Sydowia* **9**: 1, 1983).
lamella (pl. **lamellae**) (of an agaric), one of the characteristic hymenium-covered vertical plates on the underside of the pileus (Fig. 4B); gill.
lamellate (1) having lamellae; (2) made up of thin plates.
Lamelloporus Ryvarden (1987), Meruliaceae. 1, America (tropical). See Ryvarden (*Mycotaxon* **28**: 529, 1987).
lamellula (pl. **lamellulae**), a small lamella which runs from the edge of the pileus towards the stipe, as in *Russula*.
Lamia Nowak. (1884) = Entomophthora Fresen. fide Remaudière & Keller (*Mycotaxon* **11**: 323, 1980).
lamina (pl. **laminae**), (1) blade; (2) the main part of the thallus in foliose lichens; (3) epithecium + hymenium + subhymenium in an apothecium (Hertel, *Beih. Nova Hedw.* **24**, 1967); (4) (of leaves) the flat surface; **-l**, on the lamina.
Lamproconium (Grove) Grove (1937), anamorphic *Pezizomycotina*, ?.0eP.19. 1, Europe. See Scheuer *et al.* (*Fritschiana* **24**: 36, 2001).
lamprocystidium, see cystidium.
Lamprospora De Not. (1863), Pyronemataceae. *c.* 46 (many bryophilous), widespread (north temperate). See Benkert (*Z. Mykol.* **53**: 195, 1987; 29 spp.), Caillet & Moyne (*Bull. Soc. Hist. nat. Doubs* **84**: 9, 1991; keys), Schumacher (*Sydowia* **45**: 307, 1993; key 13 arctic-alpine spp.), Yao & Spooner (*MR* **99**: 1521, 1995; Brit. spp.), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Lampteromyces Singer (1947), Marasmiaceae. 1 (poisonous), Japan; China. See Mo *et al.* (*Mycosystema* **19**: 529, 2000; China), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000; phylogeny).
Lamyella Berl. (1899) ≡ Neolamya.
Lamyella Fr. (1849) = Cytospora fide Clements & Shear (*Gen. Fung.*, 1931).
Lamyxis Raf. (1820) nom. dub., ? Boletales. See Donk (*Persoonia* **1**: 173, 1960).
lanate, like wool; covered with short hair-like processes.
Lanatonectria Samuels & Rossman (1999), Nectriaceae. Anamorph *Actinostilbe*. 4 (twigs and old fungi etc.), widespread (pantropical). See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Samuels *et al.* (*CBS Diversity Ser.* **4**, 2006; USA), Zhang & Zhuang (*Mycosystema* **25**: 15, 2006; phylogeny).
Lanatosphaera Matzer (1996), Dothideomycetes. 2, Costa Rica. See Matzer (*Mycol. Pap.* **171**: 129, 1996).
Lanatospora Voronin (1986), Microsporidia. 2.
Lanceispora Nakagiri, Okane, Tad. Ito & Katum. (1997), Xylariales. 2, E. Asia; Australia. Perhaps close to *Ceriospora* and *Urosporellopsis*. See Nakagiri *et al.* (*Mycoscience* **38**: 207, 1997), Sarma & Hyde (*Mycoscience* **42**: 97, 2001; Singapore), Jeewon *et al.* (*MR* **107**: 1392, 2003; phylogeny).
Lancisporomyces Santam. (1997), Legeriomycetaceae. 4 (in *Plecoptera*), widespread. See Santamaría (*Mycol.* **89**: 639, 1997), Strongman & White (*CJB* **84**: 1478, 2006; Canada), White *et al.* (*Mycol.* **98**: 333, 2006; USA), Valle *et al.* (*Mycol.* **100**: 149, 2008; Mexico).
Lange (Jakob Emanuel; 1864-1941; Denmark). Teacher, Agricultural Folk High School, Dalum (1888-1918); Principal, Smallholders Agricultural School, Odense (1918-1934). Agaricologist. *Publs.* Studies on the agarics of Denmark I-XII. *Dansk Botanisk Arkiv* (1914-1938) [see M. Lange, *Friesia* **9**: 121, 1969]; *Flora Agaricina Danica* 5 vols (1935-1940). *Biogs, obits etc.* Buchwald (*Botanisk Tidsskrift* **46**: 81, 1942) [portrait]; Pearson (*Mycol.* **39**: 1, 1947) [portrait]; Stafleu & Cowan (*TL-2* **2**: 745, 1979).
Langermannia Rostk. (1838) nom. rej., Agaricaceae. 3, widespread. The basidioma of *L. gigantea* (giant puff-ball) may be 120 cm across and have 10^{13} spores (see record fungi). See Kreisel (*Persoonia* Supplement **14**: 431, 1992), Coetzee & Van Wyk (*Bothalia* **33**: 156, 2003; *Calvatia* sect. *Macrocalvatia*), Coetzee & Van Wyk (*Taxon* **54**: 541, 2005; nomencl.) Nom. rej. vs. *Calvatia* s.l. (q.v.) but used for segregate of it.
Langeron (Maurice Charles Pierre; 1874-1950; France). Doctor of medicine, botanist, parasitologist, and mycologist, Institut de Parasitologie, Paris (1903-1950). Made many important contributions to medical and general mycology. *Publs. Précis de Microscopie* (1913) [edn 7, 1949]; *Précis de Mycologie* (1945) [edn 2, by Vanbreuseghem, 1952]. *Biogs, obits etc.* Vanbreuseghem (*Mycopathologia et Mycologia Applicata* **6**: 58, 1951) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **2**: 750, 1979).
Langeronia Vanbreus. (1950) = Trichophyton fide Ajello (*Sabouraudia* **6**: 153, 1968).
Langloisula Ellis & Everh. (1889) nom. conf., Fungi. See Rogers & Jackson (*Farlowia* **1**: 263, 1943) and, Donk (*Fungus* Wageningen **26**: 3, 1956).

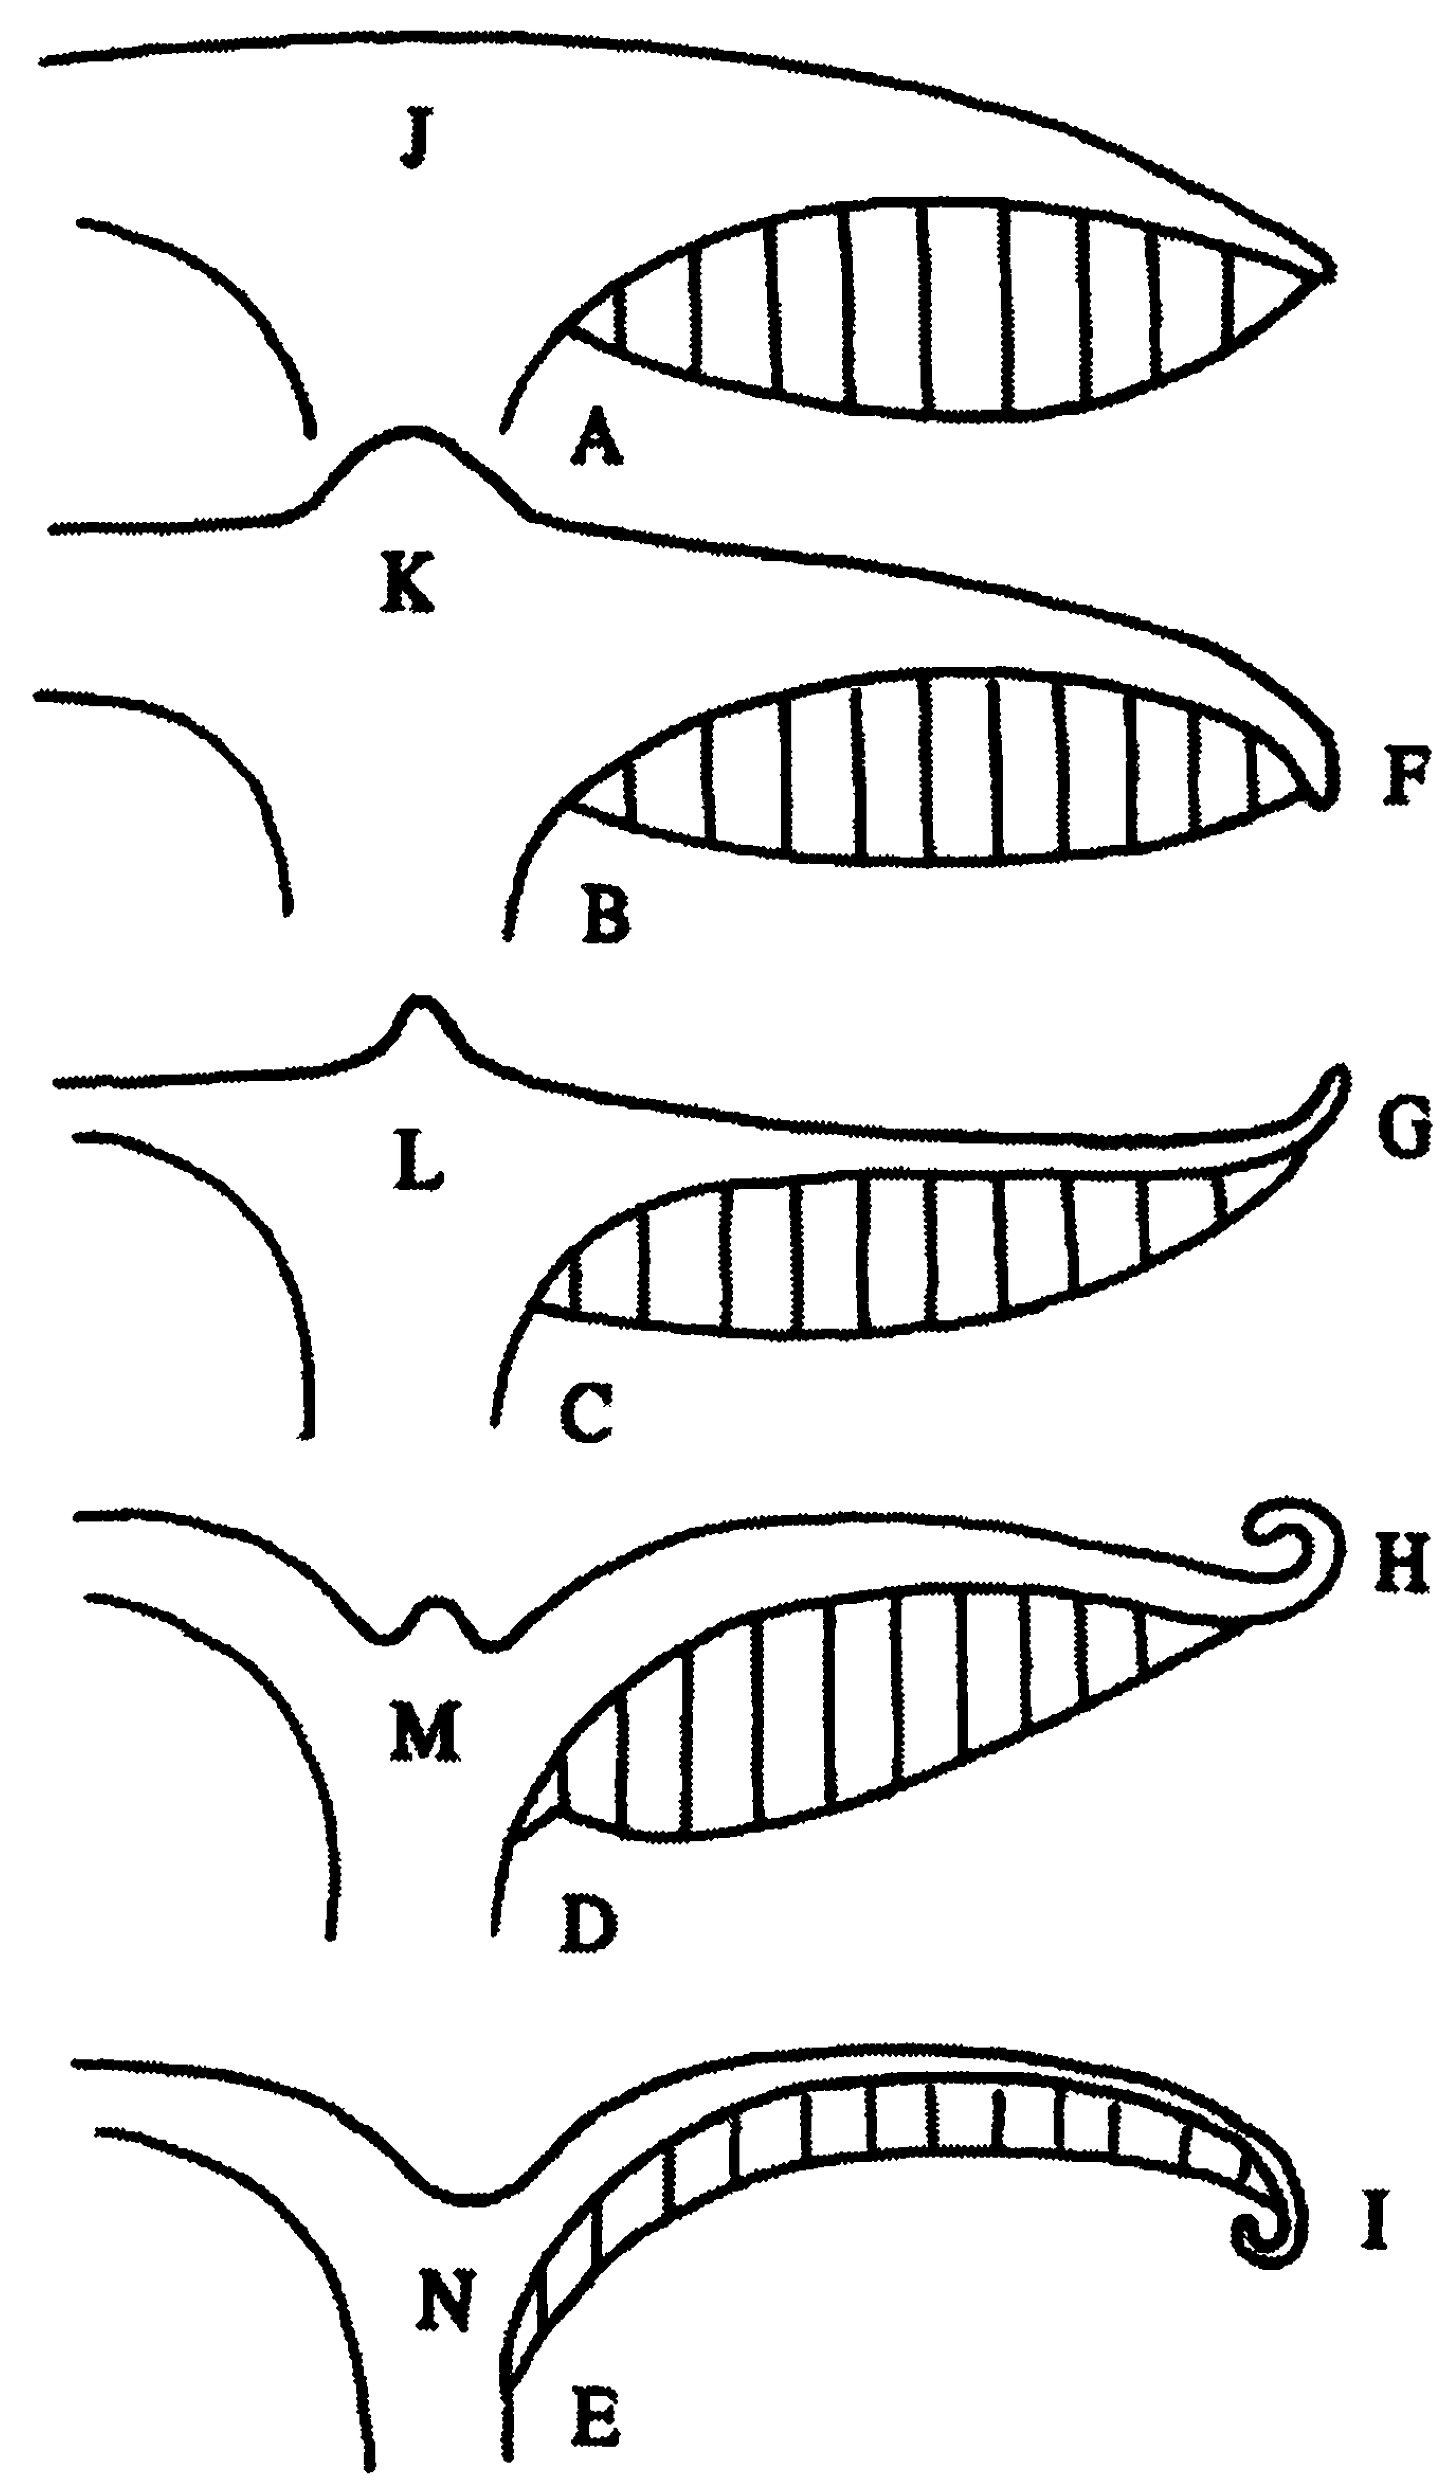

Fig. 19. A-E. Insertion of lamellae (gills). A, free; B, adnexed; C,adnate; D, sinuate; E, decurrent. F-I. Margin of pileus (cap). F, inflexed; G, reflexed; H, revolute; I, involute. J-N. Pileus. J, plano-convex; K, bullate; L, umbonate; M, umbilicate; N, depressed.

languid, feeble; hanging down.
Lanolea Nieuwl. (1916) ≡ Entoloma.
Lanomyces Gäum. (1922) = Cystotheca fide Katumoto (*Rep. Tottori mycol. Inst.* **10**: 437, 1973).
Lanopila Fr. (1848) nom. rej. prop. = Langermannia fide Demoulin & Dring (*Bull. Jard. bot. nat. Belg.* **45**: 361, 1975).
Lanosa Fr. (1825) nom. dub., ? Fungi.
lanose, see lanate.
Lanspora K.D. Hyde & E.B.G. Jones (1986), Halosphaeriaceae. 1 (marine), Seychelles. See Hyde & Jones (*CJB* **64**: 1581, 1986), Hyde & Jones (*Bot. Mar.* **32**: 205, 1989).
lanuginose, see lanate; see also nematogenous.
Lanzia Sacc. (1884), Rutstroemiaceae. Anamorph *Myrioconium*. *c.* 54, widespread. See Sharma & Sharda (*Int. J. Mycol. Lichenol.* **2**: 95, 1985; key 15 spp., India), Spooner (*Biblthca Mycol.* **116**, 1987; 7 spp. Australasia), Baral (*SA* **13**: 113, 1994; synonymy with *Rutstroemia*), Zhuang (*Mycosystema* **8-9**: 15, 1996; 5 spp. China), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Zhuang (*Mycotaxon* **72**: 325, 1999; spp. trop. China), Simpson & Grgurinovic

(*Australas. Mycol.* **22**: 11, 2003; Australia), Zhuang & Liu (*Mycotaxon* **99**: 123, 2007; phylogeny).

lao-chao, see Fermented food and drinks.

Laocoön J.C. David (1997), anamorphic *Mycosphaerellaceae*, Hso.?.?. 1, Colombia. See David (*Mycol. Pap.* **172**: 116, 1997).

Lappodochium Matsush. (1975), anamorphic *Pezizomycotina*, Hsp.0eH.10. 1, Brazil. See Matsushima (*Icon. microfung. Matsush. lect.*: 91, 1975).

lapsus (Lat.), a slip; **-calami**, a slip of the pen.

Laquearia Fr. (1849), ? Rhytismatales. 1, Europe.

Larger fungi, see Macromycetes.

largest fungi, see longevity, record fungi.

Laricifomes Kotl. & Pouzar (1957) ≡ Fomitopsis fide Ryvarden (*Syn. Fung.* **5**: 171, 1991).

Laricifomitaceae Jülich (1982) = Fomitopsidaceae.

Laricina Velen. (1934), ? Helotiales. 1, former Czechoslovakia.

Laridospora Nawawi (1976) = Monacrosporium fide Nawawi (*TBMS* **66**: 344, 1976), Rubner (*Stud. Mycol.* **39**, 1996).

Larseniella Munk (1942) = Neorehmia fide Barr (*Mycotaxon* **39**: 43, 1990), Samuels & Barr (*CJB* **75**: 2165, 1998).

Larssonia Vidtmann & Sokolova (1994), Microsporidia. 1.

Larssoniella J. Weiser & David (1997), Microsporidia. 2.

Lasallia Mérat (1821), Umbilicariaceae (L). 12, widespread (esp. temperate). See Llano (*A monograph of the lichen family Umbilicariaceae in the Western Hemisphere*, 1950), Llano (*Hvalråd. Skr.* **48**: 112, 1965), Dombrovskaya (*Bot. Zh. SSSR* **63**: 233, 1978), Blum (*Dokl. Akad. Nauk. Ukr. SSR* B **12**: 58, 1986; DNA homology, status), Krog & Swinscow (*Nordic Jl Bot.* **6**: 75, 1986; E. Afr.), Sancho & Balaquer (*An. Jard. bot. Madr.* **46**: 273, 1989; anatomy 4 spp.), Wei & Jiang (*Mycosystema* **2**: 135, 1989; key 8 spp. China), Posner *et al.* (*Z. Lasiosphaeris Clem. (1909), Sordariales. 2, widespread (temperate). See Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lasiostemma Theiss., Syd. & P. Syd. (1917), Pseudoperisporiaceae. Anamorph *Chaetosticta*. *c.* 15, widespread (tropical). See Farr (*Mycol.* **71**: 243, 1979; sects.), Barr (*Mycotaxon* **64**: 149, 1997).

Lasiostemmella Petr. (1950) = Epipolaeum fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Lasiostictella Sherwood (1986), Rhytismatales. 1, France. See Candoussau *et al.* (*Sydowia* **38**: 28, 1986).

Lasiostictis (Sacc. & Berl.) Sacc. (1889) = Naemacyclus fide Di Cosmo *et al.* (*Eur. J. For. Path.* **13**: 206, 1983).

Lasiostroma Griffon & Maubl. (1911) = Phomopsis (Sacc.) Bubák. fide Sutton (*Mycol. Pap.* **141**, 1977).

Lasiothelebolus Kimbr. & Luck-Allen (1974) = Thelebolus fide Lundqvist (*SA* **7**: 77, 1988), van Brummelen (*Persoonia* **16**: 425, 1998).

Lasiothyrium Syd. & P. Syd. (1913), anamorphic *Pezizomycotina*, Cpt.0fP.?. 1, Philippines.

Lasmenia Speg. (1886), anamorphic *Pezizomycotina*, St.0eP.1. 5, S. America; Philippines.

Lasmeniella Petr. & Syd. (1927), anamorphic *Pezizomycotina*, St.0eP.19. 13, widespread (esp. tropical). See Bhat & Hedge (*Acta Bot. Indica* **19**: 90, 1991).

Lasseria Dennis (1960), ? Helotiales. 1, Venezuela. See Dennis (*Kew Bull.* **14**: 434, 1960).

lateral, at the side.

Latericonis G.V. Rao, K.A. Reddy & de Hoog (1984), anamorphic *Pezizomycotina*, Hsp.#eP.10. 1, India. See Rao *et al.* (*Mycotaxon* **19**: 409, 1984).

Lateriramulosa Matsush. (1971), anamorphic *Pezizomycotina*, Hso.1bH.10. 1, Japan; Australasia. See Matsushima (*Microfungi of the Solomon Islands and Papua-New Guinea*: 34, 1971), Matsushima (*Matsush. Mycol. Mem.* **6**, 1989).

Laterispora Uecker, W.A. Ayers & P.B. Adams (1982), anamorphic *Pezizomycotina*, Hso.0fP.1. 1 (on sclerotia), USA. See Uecker *et al.* (*Mycotaxon* **14**: 492, 1982).

lateritiin, see enniatin A.

Laternea Turpin (1822), Phallaceae. 2, America (tropical).

Lateropeltis Shanor (1946) = Kiehlia fide Farr (*Mycol.* **60**: 924, 1968).

Laterotheca Bat. (1963) = Acrogenotheca fide Hughes (*Mycol.* **68**: 693, 1976).

Laterradea Raspail (1824) nom. dub., Agaricales.

latex, a milk-like juice, as in *Lactarius*.

Lathagrium (Ach.) Gray (1821) = Collema F.H. Wigg. fide Degelius (*Symb. bot. upsal.* **13** no. 2, 1954).

Lathraeodiscus Dissing & Sivertsen (1989), Pyronemataceae. 1, Svalbard. See Dissing & Sivertsen (*Mycol.* **80**: 832, 1989).

Latin. Acquaintance with Latin is an asset to any biologist and a working knowledge of the language is particularly useful to systematists because scientific names of all taxa are latinized. Latin descriptions or diagnoses are currently required under the international code governing the naming of fungi (see Nomenclature) to validate the names of fungi at all formal ranks, and many early works on systematic mycology are in Latin, as are descriptions in Saccardo's *Sylloge Fungorum*. Botanical Latin is derived from the classical language with liberal borrowing from

Greek, but with a simplified syntax. Although not generally spoken, differences in stress and pronunciation of latinized names may cause confusion: guidance can be found at the start of Latin dictionaries or in Allen (Ed.) (*Vox Latina*, 1978).

Stearn (*Botanical Latin*, 1966 [edn 4, 1992]) provides an excellent introduction to grammar, syntax, and vocabulary and gives much helpful guidance together with examples of mycological descriptions. This work may be supplemented by Cash (A mycological English-Latin glossary. *Mycol. Mem.* **1**, 1965); Baranov (*Botanical Latin for Plant Taxonomists*, 1968) [reprint 1971]; Borror (*Dictionary of Word Roots and Combining Forms*, 1960) [11th print, 1971]; Clements & Shear (*The Genera of Fungi*, 1931) [useful Latin/English glossary]. Nybakken (*Greek and Latin in Scientific Terminology*, 1960), gives much information on derivation of scientific and medical terms.

Further articles which may be consulted for guidance on the correct formulation of Latin names are Zabinkova (*Taxon* **17**: 19, 1968) [generic stems ending in **-is**]; Nicholson (*Taxon* **43**: 97, 1994) [gender of generic names, particularly those ending in **-ma**]; Manara (*Taxon* **41**: 52, 1992) [geographical epithets]; Manara (*Taxon* **40**: 301, 1991) [gender of generic names]; Nicholson & Brooks (*Taxon* **23**: 163, 1974) [orthography, stems and compounds].

See Classification, Colour, Nomenclature.

latticed, cross-barred; like a network.

lattice-work fungus, basidioma of *Clathrus* spp.

Latzeiia, see *Latzelia*.

Lecanoraceae Körb. (1855), Lecanorales (L). 23 gen. (+ 26 syn.), 766 spp.

Lit.: Hafellner (*Nova Hedwigia* Beih. **79**: 241, 1984), Gargas *et al.* (*Mol. Biol. Evol.* **12**: 208, 1995), Kärnefelt (*Abstracta Botanica* **21**: 21, 1997), Lumbsch *et al.* (*Symb. bot. upsal.* **32** no. 1: 131, 1997), Ryan & Nash (*Nova Hedwigia* **64**: 393, 1997), Arup & Grube (*Lichenologist* **30**: 415, 1998), Rambold & Hagedorn (*Lichenologist* **30**: 473, 1998), Arup & Grube (*CJB* **78**: 318, 2000), Ekman & Wedin (*Pl. Biol.* **2**: 350, 2000), Grube *et al.* (*MR* **108**: 506, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Arup *et al.* (*Mycol.* **99**: 42, 2007; phylogeny), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny).

lecanoralean (1) (of asci), of asci which are essentially bitunicate in structure, generally thick-walled with an especially strongly thickened apex, and in which discharge is by a rostrate eversion of the endoascus; see ascus; (2) (of apothecioid ascomata), see lecanorine.

Lecanorales Nannf. (1932), (±L). Lecanoromycetidae. 26 fam., 269 gen., 5695 spp. Thallus very varied. Ascomata apothecial, with or without a thalline margin, rarely mazaedial. Interascal tissue of paraphyses, usually branched and swollen at the apices, often with a pigmented epithecium, rarely absent. Hymenial gel often prominent. Asci with a single wall layer visible in LM but thick-walled, almost always with a conspicuous thick cap-like apical part, often with an internal beak (ocular chamber) and sometimes also

with complex apical structures, ascus walls and/or apical structures often J+; rarely thin-walled and evanescent. Ascospores very varied. Anamorphs pycnidial, poorly known. Mainly lichen-forming (almost all with protococcoid green photobionts), some lichenicolous or saprobes (then esp. on wood in xeric situations).

Probably still the largest order of the *Ascomycota*, but many groups have been removed in recent years. An extended subordinal classification was proposed by Rambold & Triebel (*Bibl. Lich.* **48**, 1992) which recognized 6 suborders, but much of this research has been superseded by sequence-based studies.The following fams are accepted here; all are exclusively lichen-forming unless otherwise indicated. Not all have been studied using molecular methods, and the order may contract further. Fams:

(1) **Aphanopsidaceae**
(2) **Biatorellaceae**
(3) **Brigantiaeaceae**
(4) **Cladoniaceae**
(5) **Crocyniaceae**
(6) **Dactylosporaceae**
(7) **Ectolechiaceae**
(8) **Gypsoplacaceae**
(9) **Haematommataceae**
(10) **Helocarpaceae**
(11) **Lecanoraceae**
(12) **Megalariaceae**
(13) **Miltideaceae**
(14) **Mycoblastaceae**
(15) **Parmeliaceae** (syn. *Hypogymniaceae*, *Usneaceae*)
(16) **Pilocarpaceae** (syn. *Micareaceae*)
(17) **Psoraceae**
(18) **Ramalinaceae** (syn. *Bacidiaceae*, *Megalariaceae*)
(19) **Sphaerophoraceae**
(20) **Stereocaulaceae**
(21) **Tephromelataceae**
(22) **Vezdaeaceae** (±L)

Further references to family treatments are included in the fam. entries and under the type genera.

Lecanorella Frey (1926) = Koerberiella fide Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1984).

lecanorine (of an apothecium), having an excipulum (q.v.) thallinum (e.g. *Lecanora*, *Parmelia*) (Fig. 20A); lecanoroid.

Lecanoromyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Lecanora.

Lecanoromycetes O.E. Erikss. & Winka (1997), Pezizomycotina. 12 ord., 77 fam., 630 gen., 14199 spp. The largest and most varied group of lichenized *Ascomycota*. Subcl.:

(1) **Acarosporomycetidae**
(2) **Lecanoromycetidae**
(3) **Ostropomycetidae**

Lit.: Hofstetter *et al.* (*Mol. Phylogenet. Evol.* **44**: 412, 2007), Lumbsch *et al.* (*Mol. Phylogenet. Evol.* **31**: 822, 2004), Lutzoni *et al.* (*Am. J. Bot.* **91**: 1446, 2004), Miądlikowska *et al* (*Mycol.* **98**: 1088, 2006), Wedin *et al.* (*MR* **109**: 159, 2005).

Lecanoromycetidae P.M. Kirk, P.F. Cannon, J.C. David & Stalpers ex Miądl., Lutzoni & Lumbsch (2007), Lecanoromycetes. Thallus very varied. Ascomata almost always apothecial, flat to strongly cup-shaped, with or without a thalline margin, rarely mazaedial. Interascal tissue of paraphyses, usually branched and swollen at the apices, often with a pigmented or J+ epithecium, rarely absent. Asci typically with a single wall layer visible in LM but thick-walled, almost always with a conspicuous thick cap-like apical part, often with complex apical structures, often J+, rarely thin-walled and evanescent. Ascospores very varied. Mainly lichen-forming (with protococcoid green or cyanobacterial photobionts), some lichenicolous or saprobes (then esp. on wood in xeric situations). Ords:

(1) **Lecanorales**
(2) **Peltigerales**
(3) **Teloschistales**

The *Umbilicariales* may belong in this order, along with the *Catillariaceae* and *Rhizocarpaceae*, but relative positions are still uncertain.

Lecythea Lév. (1847) = Phragmidium fide Dietel (*Nat. Pflanzenfam.* **6**, 1928) Anamorph name for (II).

lecythiform, like a stoppered bottle; ninepin-shaped (Fig. 23.13).

Lecythispora Chowdhry (1985), anamorphic *Pezizomycotina*. 1. See Chowdhry (*Curr. Sci.* **54**: 469, 1985).

Lecythium Zukal (1893), Sordariomycetes. 1, Austria. Type material is missing and identity is obscure. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Lecythophora Nannf. (1934), Coniochaetaceae. 1 (on

wood or dung), widespread. See Goidanich (*Ent. naz. Cell. e Cart., Roma* **112**, 1938), Weber (*Nova Hedwigia* **74**: 159, 2002; morphology), Weber *et al.* (*Nova Hedwigia* **74**: 187, 2002; phylogeny), García *et al.* (*MR* **110**: 1271, 2006; phylogeny).

Lecythothecium Réblová & Winka (2001), ? Chaetosphaeriaceae. Anamorph *Ellisembia*-like. 1, Europe (central). See Réblová & Winka (*Mycol.* **93**: 478, 2001), Shenoy *et al.* (*MR* **110**: 916, 2006; anamorph).

Leeina Petr. (1923), anamorphic *Pezizomycotina*, St.0eH.?. 1, Philippines.

Legerioides M.M. White (1999), Legeriomycetaceae. 1 (in *Caecidotea*), USA. See White (*Mycol.* **91**: 1022, 1999).

Legeriomyces Pouzar (1972), Legeriomycetaceae. 5 (in *Ephemeroptera*), Canada; Spain; USA. See Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), Williams & Lichtwardt (*CJB* **71**: 1109, 1993), White (*MR* **110**: 1011, 2006; phylogeny), Strongman (*CJB* **85**: 949, 2007; Canada), Valle (*Mycol.* **99**: 442, 2007; Spain).

Legeriomycetaceae Pouzar (1972), Harpellales. 31 gen. (+ 5 syn.), 158 spp.

Lit.: Moss (*TBMS* **65**: 115, 1975), Moss & Young (*Mycol.* **70**: 944, 1978), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*: 343 pp., 1986), Lichtwardt (*Fourth International Mycological Congress Abstracts*, 1986), Lichtwardt *et al.* (*TMSJ* **28**: 376, 1987), Longcore (*Mycol.* **81**: 482, 1989), Lichtwardt & Williams (*CJB* **68**: 1045, 1990), Peterson *et al.* (*Mycol.* **83**: 389, 1991), Lichtwardt & Williams (*CJB* **70**: 1196, 1992), Williams & Lichtwardt (*CJB* **71**: 1109, 1993), Benny *in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **7A**: 147, 2001), Lichtwardt (*Cellular Origin and Life in Extreme Habitats* **4**: 577, 2002), Beard & Adler (*Mycol.* **95**: 317, 2003), Valle & Santamaría (*Mycol.* **96**: 682, 2004).

Legeriosimilis M.C. Williams, Lichtw., M.M. White & Misra (1999), Legeriomycetaceae. 2 (in *Ameletus*), Europe; N. America. See Williams & Lichtwardt (*Mycol.* **91**: 400, 1999), White & Lichtwardt (*Mycol.* **96**: 891, 2004; Norway), White *et al.* (*Mycol.* **98**: 333, 2006; USA).

legitimate (1) (of validly published names or epithets), in accordance with the *Code*, priorable; **illegitimate**, contrary to the *Code*, impriorable. A recognized taxon of uncertain taxonomic position may have more than one legitimate name according to the position or rank given to it; (2) (of mating types), compatible. See Nomenclature.

Leifia Ginns (1998) = Odonticium fide Zmitrovich & Spirin (*Mycena* **6**: 4, 2006).

Leifidium Wedin (1993), Sphaerophoraceae (L). 1, Australia; S. America. See Wedin (*Nord. J. Bot.* **10**: 539, 1991; spore, ascoma ontogeny), Wedin (*Pl. Syst. Evol.* **187**: 213, 1993), Wedin (*Symb. Bot. Upsal.* **31** no. 1, 1995; key, monograph), Tibell (*Symb. bot. upsal.* **32**: 291, 1997; anamorphs), Wedin *et al.* (*Pl. Syst. Evol.* **209**: 75, 1998; DNA).

Leightonia Trevis. (1853) = Endocarpon fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Leightonia Trevis. (1861) = Trypethelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Leightoniella Henssen (1965), Collemataceae (L). 1, Sri Lanka. See Henssen (*Lichenologist* **3**: 39, 1965).

Leightoniomyces D. Hawksw. & B. Sutton (1977), anamorphic *Pezizomycotina*, Hso.0eP.19. 1 (on lichens), Azores; British Isles. See Hawksworth & Sutton (*J. Linn. Soc.* Bot. **75**: 199, 1977).

Leioderma Nyl. (1888), Pannariaceae (L). 9, mostly southern hemisphere. See Galloway & Jørgensen (*Lichenologist* **19**: 345, 1987), Jørgensen & Galloway (*Lichenologist* **21**: 295, 1989; key), Jørgensen & Galloway (*J. Jap. Bot.* **69**: 383, 1994; Japan), Ekman & Jørgensen (*CJB* **80**: 625, 2002; phylogeny), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Wedin & Wiklund (*Symb. bot. upsal.* **34** no. 1: 469, 2004; phylogeny), Jørgensen (*Lichenologist* **37**: 369, 2005; Malaysia), Jørgensen & Tønsberg (*Bryologist* **108**: 412, 2005; USA).

leiodisc (of an apothecium), having a smooth glazed disc.

Leiogramma Eschw. (1833) ≡ Leiorreuma.

Leiophallus (Fr.) Nees (1858) = Phallus fide Stalpers (*in litt.*).

Leiophloea (Ach.) Gray (1821) = Arthopyrenia fide Riedl (*Sydowia* **15**: 257, 1961), Riedl (*Sydowia* **16**: 263, 1962).

Leiophloea Trevis. (1860) ≡ Leiophloea (Ach.) Gray.

Leiopoda Velen. (1947) ? = Mycena fide Singer (*Agaric. mod. Tax.*, 1951).

Leiorreuma Eschw. (1824), Graphidaceae (L). 1, pantropical. See Archer (*Biblthca Lichenol.* **94**, 2006; Australia), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is).

Leiosepium Sacc. (1900) = Sepedonium fide Damon (*Mycol.* **44**: 95, 1952).

Leiosphaerella Höhn. (1919), Xylariales. Anamorph *Beltraniella*. 9, widespread. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Samuels & Rossman (*Mycotaxon* **28**: 461, 1987), Kang *et al.* (*Mycoscience* **40**: 151, 1999), Jeewon *et al.* (*MR* **107**: 1392, 2003; phylogeny).

leiosporous, having smooth spores.

Leiostigma Kirschst. (1944) = Sordaria fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Leiothecium Samson & Mouch. (1975), Eurotiales. 1, Greece. See Samson & Mouchaca (*CJB* **53**: 1364, 1975).

Lejophallus, see *Leiophallus*.

Lejophlea, see *Leiophloea* (Ach.) Gray.

Lejosphaerella, see *Leiosphaerella*.

Lelum Racib. (1900) ? = Kordyana fide Donk (*Reinwardtia* **4**: 117, 1956; affinities).

Lemalis Fr. (1825), ? Helotiales. 3, widespread.

Lemania Bory (1824), Algae. Algae.

Lembidium Körb. (1855) nom. rej. prop. = Anisomeridium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lembopodia Bat. (1960) = Cirsosia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lembosia Lév. (1845), Asterinaceae. *c.* 60, widespread (esp. warmer areas). See Mibey & Hawksworth (*Mycol. Pap.* **174**, 1997; Kenya), Sivanesan & Shivas (*Fungal Diversity* **11**: 159, 2002; Australia), Song & Li (*Mycotaxon* **84**: 401, 2002; China).

Lembosiaceae Höhn. (1918) = Asterinaceae.

Lembosidium Speg. (1923) = Lembosia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lembosiella Sacc. (1891), ? Microthyriaceae. 1, Africa.

Lembosiellina Bat. & H. Maia (1960) = Lembosia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lembosina Theiss. (1913), ? Asterinaceae. 21, wide-

spread. See Mibey & Hawksworth (*Mycol. Pap.* **174**, 1997; Kenya), Sivanesan & Shivas (*Fungal Diversity* **11**: 159, 2002; Australia).

Lembosiodothis Höhn. (1917) = Echidnodes fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lembosiopeltis Bat. & J.L. Bezerra (1967) = Uleothyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lembosiopsis Theiss. (1918), ? Asterinaceae. 1, N. America. See Farr (*Sydowia* **38**: 65, 1986).

Lembuncula Cif. (1954), anamorphic *Pezizomycotina*, Cpt.0eP.?. 1, Santo Domingo. See Ciferri (*Sydowia* **8**: 259, 1954).

Lemkea Morgan-Jones & R.C. Sinclair (1983), anamorphic *Pezizomycotina*, Hso.0eP.1. 1, S. Africa; N. America. See Morgan-Jones & Sinclair (*Mycol.* **75**: 159, 1983), Chamuris *et al.* (*Mycotaxon* **24**: 319, 1985).

Lemmopsis (Vain.) Zahlbr. (1906), Lichinaceae (L). 3, Europe. See Ellis (*Lichenologist* **13**: 123, 1981; key), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Lemniscium Wallr. (1827) = Leptogium fide Jørgensen (*Op. Bot.* **45**, 1978).

Lemonniera De Wild. (1894), anamorphic *Helotiales*, Hso.1bH.15. 6 (aquatic), widespread. See Descals *et al.* (*TBMS* **69**: 89, 1977; key), Campbell *et al.* (*MR* **110**: 1025, 2006; phylogeny, polyphyly).

Lempholemma Körb. (1855), Lichinaceae (L). *c.* 33, widespread. See Schiman-Czeika (*Pl. Syst. Evol.* **158**: 283, 1988), Kantvilas & Jørgensen (*Muelleria* **11**: 45, 1998; Australia), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key), Schultz (*Biblthca Lichenol.* **86**: 155, 2003; Socotra), Schultz (*Lichenologist* **37**: 227, 2005; Yemen).

Lennisia Nieuwl. (1916) ≡ Monochaetia fide Sutton (*Mycol. Pap.* **141**, 1977).

Lenormandia Delise (1841) [non *Lenormandia* Sond. 1845, nom. cons., *Rhodophyceae*] = Normandina fide Aptroot (*Lichenologist* **30**: 501, 1998).

Lentaria Corner (1950), Lentariaceae. 17, widespread. See Sharda (*Biovigyanam* **10**: 131, 1984; Himalayan spp.), Govorova (*Mikol. Fitopatol.* **36**: 24, 2002; Far East of Russia), Dentinger & McLaughlin (*Mycol.* **98**: 746, 2006; phylogeny).

Lentariaceae Jülich (1982), Gomphales. 3 gen., 23 spp.

Lentescospora Linder (1944) nom. dub., Pezizomycotina. See Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979).

lenthionine, an odorous metabolic product of *Lentinula edodes* (Nishikawa, *Chem. Pharm. Bull., Tokyo* **15**: 756, 1967).

lentic, habitat still water (lakes). Cf. lotic.

lenticular, like a double convex lens in form (Fig. 23.5*c*).

lentiginose (**lentiginous**), having very small spots as though freckled.

Lentinaceae Jülich (1982) = Polyporaceae. *Lentinaceae* is listed as nom. rej. against *Tricholomataceae*.

Lentinaria Pilát (1941) nom. nud. = Lentinellus fide Stalpers (*in litt.*).

Lentinellaceae Locq. (1972) = Auriscalpiaceae.

Lentinellus P. Karst. (1879), Auriscalpiaceae. 15, widespread. See Miller & Stewart (*Mycol.* **63**: 333, 1971; key), Printz (*Svampe* **14**: 59, 1986; key), Stalpers (*Stud. Mycol.* **40**: 88, 1996; key), Miller & Methven (*Mycol.* **92**: 792, 2000; taxonomy), Hughes & Petersen (*Biblthca Mycol.* **198**: 249, 2004; phylogeny), Petersen (*Biblthca Mycol.* **198**: 181, 2004; types), Petersen & Hughes (*Biblthca Mycol.* **198**: 1, 2004; monograph).

Lentinopanus Pilát (1941) = Panus fide Singer (*Agaric. mod. Tax.*, 1951).

Lentinula Earle (1909), Marasmiaceae. 8, widespread (tropical). *L. edodes* is the edible shii-take mushroom. See Pegler (*Kew Bull.* Addit. Ser. **6**, 1977), Pegler (*Sydowia* **36**: 227, 1983; key), Mata & Petersen (*Mycotaxon* **79**: 217, 2001; New World types), Mata & Petersen (*Mycol.* **93**: 1102, 2001; Americas), Zhang *et al.* (*Mycosystema* **24**: 517, 2005; molecular typing).

Lentinus Fr. (1825), Polyporaceae. 40, widespread (esp. subtropical). Wood (e.g. railway sleepers) is attacked by *L. lepideus*. See Pegler (*Kew Bull.* Addit. Ser. **10**: 1, 1983; monogr. s.l.), Hibbett & Vilgalys (*Mycol.* **83**: 425, 1991; s.str.), Hibbett & Vilgalys (*Syst. Bot.* **18**: 409, 1993) Not all species treated by Pegler have been reclassified.

Lentispora Fayod (1889) = Coprinopsis P. Karst. fide Redhead *et al.* (*Mycotaxon* **50**: 203, 2001).

Lentodiellum Murrill (1915) = Lentinus fide Kuyper (*in litt.*).

Lentodiopsis Bubák (1895) = Pleurotus fide Singer (*Agaric. mod. Tax.*, 1951).

Lentodium Morgan (1895) = Lentinus. Abnormal variants of *L. tigrinus*, with which it is sexually intercompatible. fide Rosinsky & Robinson (*Am. J. Bot.* **55**: 242, 1968; arising under the absence of light), Hibbett (*Am. J. Bot.* **81**: 466, 1994; developmental variant with a recessive allele at a single locus).

Lentomita Niessl (1876) = Chaetosphaeria fide Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979).

Lentomitella Höhn. (1906), Sordariomycetes. 1, widespread (temperate). See Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Réblová (*Mycol.* **98**: 68, 2006; phylogeny).

Lentus Lloyd ex Torrend (1920) ≡ Polyporus P. Micheli ex Adans. fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Lenzitella Ryvarden (1991) = Lenzitopsis fide Stalpers (*Stud. Mycol.* **35**: 168 pp., 1993).

Lenzites Fr. (1836), Polyporaceae. 6, widespread. *L. sepiaria* causes timber rot. See Gilbertson & Ryvarden (*N. Amer. Polyp.* **1**: 424, 1987).

Lenzitina P. Karst. (1889) ≡ Gloeophyllum fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Lenzitites Mesch. (1892), Fossil Fungi. 1 (Miocene), Italy.

Lenzitopsidaceae Jülich (1982) = Thelephoraceae.

Lenzitopsis Malençon & Bertault (1963), Thelephoraceae. 1, Morocco; Spain. See Stalpers (*Stud. Mycol.* **35**: 43, 1993; key).

Leohumicola N.L. Nickers. (2005), anamorphic *Leotiomycetes*. 4, Canada; Chile. See Nickerson (*Stud. Mycol.* **53**: 41, 2005).

Leolophia Klotzsch (1836) nom. inval., Basidiomycota.

Leotia Pers. (1794), Leotiaceae. 4, widespread (temperate). See Tai (*Lloydia* **7**: 146, 1944), Honegger (*Lichenologist* **15**: 57, 1983; TEM), Verkley (*Persoonia* **15**: 405, 1994; asci), Döring & Triebel (*Cryptog. Bryol.-Lichénol.* **19**: 123, 1998; DNA), Landvik *et al.* (*Mycoscience* **39**: 49, 1998), Lizoň *et al.* (*Mycotaxon* **67**: 73, 1998; posn), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Korf & Lizon (*Czech Mycol.* **52**: 255, 2001; nomencl.), Zhong & Pfister (*Mycol. Progr.* **3**: 237, 2004; phylogeny), Wang *et al.*

(*Mycol.* **98**: 1065, 2006; phylogeny).

Leotiaceae Corda (1842), Leotiales. 7 gen. (+ 11 syn.), 34 spp. The family is much more restricted in extent than in previous editions of this *Dictionary*; see also *Helotiaceae*.

Lit.: Verkley (*Persoonia* **15**: 405, 1994; asci), Gargas & Taylor (*Exp. Mycol.* **19**: 7, 1995), Döring & Triebel (*Cryptog. Bryol.-Lichénol.* **19**: 123, 1998), Gamundí & Romero (*Fl. criptog. Tierra del Fuego* **10**: 130 pp., 1998), Landvik *et al.* (*Mycoscience* **39**: 49, 1998), Lizoň *et al.* (*Mycotaxon* **67**: 73, 1998), Korf (*Mycotaxon* **73**: 493, 1999), Liu *et al.* (*Mol. Biol. Evol.* **16**: 1799, 1999), Zhong & Pfister (*Mycol. Progr.* **3**: 237, 2004), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006).

Leotiales Korf & Lizoň (2001). Leotiomycetidae. 2 fam., 11 gen., 41 spp. Fams:
(1) **Bulgariaceae**
(2) **Leotiaceae**
For *Lit.* see under fam.

Leotiella Plöttn. (1900) ? = Cudonia fide Clements & Shear (*Gen. Fung.*, 1931), Nannfeldt (*Nova Acta R. Soc. Scient. Upsal.* IV **8**, 1932).

Leotiomycetes O.E. Erikss. & Winka (1997), Pezizomycotina. 5 ord., 19 fam., 641 gen., 5587 spp. The inoperculate discomycetes as traditionally circumscribed, but with the inclusion of the powdery mildews. Ords.:
(1) **Cyttariales**
(2) **Erysiphales**
(3) **Helotiales**
(4) **Leotiales**
(5) **Rhytismatales**
Lit.: Wang *et al.* (*Mycol.* **98**: 1065, 2006).
Still in need of major revision; the *Thelebolales* may belong here also.

Leotiomycetidae, see *Leotiomycetes*.

Lepadolemma Trevis. (1853) = Haematomma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lepidella E.-J. Gilbert (1925) [non *Lepidella* Tiegh. 1911, *Loranthaceae*] = Amanita Adans. fide Bas (*Persoonia* **5**: 285, 1969).

Lepidocollema Vain. (1890) = Collema F.H. Wigg. fide Swinscow & Krog (*Lichenologist* **18**: 309, 1986), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lepidogium Clem. & Shear (1931) ≡ Lepidoleptogium.

Lepidoleptogium A.L. Sm. (1922) = Pannaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lepidoma (Ach.) Gray (1821) ≡ Lecidoma.

Lepidoma Link (1809) ≡ Rhizocarpon.

Lepidomyces Jülich (1979), Pterulaceae. 2, Europe. See Jülich (*Persoonia* **10**: 330, 1979).

Lepidonectria Speg. (1910) ? = Ijuhya fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Lepidophyton Trib. (1899) nom. dub., anamorphic *Pezizomycotina*. No spp. Described.

Lepidopterella Shearer & J.L. Crane (1980), Argynnaceae. 1 (aquatic), USA. See Shearer & Crane (*TBMS* **75**: 194, 1980).

Lepidosphaeria Parg.-Leduc (1970), Testudinaceae. 1, Sahara. See Hawksworth (*CJB* **57**: 91, 1979), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Lepidostroma Mägd. & S. Winkl. (1967), Polyporales (L). 1, Europe. See Oberwinkler (*Dtsch. bot. Ges.* N.F. **4**: 139, 1970).

lepidote, covered with small scales.

Lepidotia Boud. (1885), Pezizaceae. 1, USA. See Korf (*Persoonia* **7**: 205, 1973), Norman & Egger (*Mycol.* **91**: 820, 1999; phylogeny), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny).

Lepidotus Clem. (1902) ≡ Lepiota.

lepiochlorin, an antibacterial antibiotic from *Lepiota* cultivated by the gardening ant (*Cyphomyrmex costatus*); see Hervey & Nair (*Mycol.* **71**: 1064, 1979).

Lepiota (Pers.) Gray (1821), Agaricaceae. Anamorph *Coccobotrys*. *c.* 400, widespread. *L. scobinella* and several pink, red or orange spp. are very poisonous. See Kauffman (*Pap. Mich. Acad. Sci.* **4**: 311, 1924; N. Am. spp.), Beeli (*Bull. Soc. Bot. Belg.* **64**: 206, 1931), Beeli (*Fl. Icon. Champ. Congo* **2**: 29, 1936; Congo spp.), Dennis (*Kew Bull.* **7**: 459, 1952; W. Indian spp.), Aberdeen (*Kew Bull.* **16**: 129, 1962; Australian type studies), Pegler (*Kew Bull.* **27**: 155, 1972; key 34 Sri Lanka spp.), Pegler (*Kew Bull.* Addit. Ser. **6**, 1977; key 30 E. Afr. spp.), Candusso & Lanzoni (*Lepiota s.l.*, 1990; key Europ. spp.), Johnson & Vilgalys (*Mycol.* **90**: 971, 1998; phylogeny), Johnson (*Mycol.* **91**: 443, 1999; phylogeny), Vellinga (*Mycol. Progr.* **2**: 305, 2003; phylogeny), Vellinga (*MR* **108**: 354, 2004; phylogeny).

Lepiotasporites T.C. Huang (1981), Fossil Fungi. 1 (Miocene), Taiwan.

Lepiotella (E.-J. Gilbert) Konrad (1934) = Chamaemyces fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

Lepiotella Rick (1938) ≡ Volvolepiota.

Lepiotophyllum Locq. (1942) nom. inval. [as subgenus?] = Leucocoprinus fide Kirk (*in litt.*).

Lepiotula (Maire) Locq. ex E. Horak (1968) = Lepiota fide Kuyper (*in litt.*).

Lepista (Fr.) W.G. Sm. (1870), Tricholomataceae. *c.* 50, widespread. Blewits. See Bigelow & Smith (*Brittonia* **21**: 144, 1969; as *Clitocybe*), Harmaja (*Karstenia* **14**: 82, 1974), Pegler & Young (*Kew Bull.* **29**: 659, 1974; basidiospore form), Harmaja (*Karstenia* **18**: 49, 1978; gen. division), Chiari (*Bollettino del Circolo Micologico 'Giovanni Carini'* **42**: 38, 2001), Consiglio & Contu (*Rivista di Micologia* **46**: 131, 2003; Italy), Stott *et al.* (*MR* **109**: 205, 2005; molec. analysis of Australian and European isolates).

Lepistella T.J. Baroni & Ovrebo (2007), Tricholomataceae. 1, C. America. See Ovrebo & Baroni (*Fungal Diversity* **27**: 157, 2007).

Lepocolla Eklund (1883) nom. dub., ? Actinobacteria. or anamorphic fungi.

Lepolichen Trevis. (1853) = Coccotrema fide Henssen *in* Brown *et al.* (Eds) (*Lichenology: progress and problems*: 107, 1976), Galloway & Watson-Gandy (*Bryologist* **95**: 227, 1992), Schmitt *et al.* (*Lichenologist* **33**: 315, 2001; phylogeny).

Leporina Velen. (1947) = Coprotus fide van Brummelen *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 400, 1994).

Lepra Chevall. (1826) nom. dub., anamorphic *Pezizomycotina*.

Lepra Scop. (1777) nom. rej. = Pertusaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lepra Willd. (1787) = Illosporium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Leprantha Dufour ex Körb. (1855) = Arthonia fide

Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lepraria Ach. (1803) nom. cons., anamorphic *Stereocaulaceae*, ?.?.? (L (sterile)). *c.* 71, widespread. See Laundon (*Lichenologist* **24**: 315, 1992; key 9 Br. spp.), Lohtander (*Ann. bot. fenn.* **31**: 223, 1994; key 11 spp. Finland), Leuckert *et al.* (*Biblthca Lichenol.* **58**: 245, 1995; chemistry), Orange (*British Lichen Society Bulletin* **74**: 1, 1995; UK), Saag & Saag (*Folia cryptog. Estonica* **34**: 55, 1999; Estonia), Kukwa (*Biblthca Lichenol.* **82**: 67, 2001; Poland), Ekman & Tønsberg (*MR* **106**: 1262, 2002; phylogeny), Kukwa (*Ann. bot. fenn.* **39**: 225, 2002), Kukwa *et al.* (*Botanica Lithuanica* **9**: 259, 2003; Russia), Elix & Tønsberg (*Graphis Scripta* **16**: 43, 2004; chemistry), Sipman (*Herzogia* **17**: 23, 2004; tropical spp.), Myllys *et al.* (*Taxon* **54**: 605, 2005; phylogeny), Baruffo *et al.* (*Nova Hedwigia* **83**: 387, 2006; Italy), Kukwa (*Lichenologist* **38**: 293, 2006; Poland), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Slavíková-Bayerová & Orange (*Lichenologist* **38**: 503, 2006), Flakus & Kukwa (*Lichenologist* **39**: 463, 2007; S America), Nelsen & Gargas (*Nova Hedwigia* **86**: 115, 2008; chemistry, phylogeny).

Leprariaceae Rchb. (1841) = Stereocaulaceae.

Leprieuria Laessøe, J.D. Rogers & Whalley (1989), Xylariaceae. Anamorph *Geniculosporium*. 1, C. & S. America (tropical). See Læssøe *et al.* (*MR* **93**: 152, 1989), San Martín & Rogers (*Mycotaxon* **48**: 179, 1993; Mexico), González *et al.* (*Mycol.* **96**: 675, 2004).

Leprieurina G. Arnaud (1918), anamorphic *Pezizomycotina*, Cpt.0eP.1. 1, S. America; Vietnam. See Reynolds (*Gdns' Bull.* Singapore **51**: 71, 1999).

Leprieurinella Bat. & H. Maia (1961), anamorphic *Pezizomycotina*, Cpt.?.?. 1, Brazil. See Batista & Maia (*Publções Inst. Micol. Recife* **338**: 18, 1961).

Leprocaulon Nyl. (1878), anamorphic *Lecanorales*, ?.?.? (L (sterile)). 10, widespread. See Lamb & Ward (*J. Hattori bot. Lab.* **38**: 499, 1974; key), Marcano *et al.* (*Trop. Bryol.* **13**: 47, 1997; Venezuela), Ekman & Tønsberg (*MR* **106**: 1262, 2002; phylogeny).

Leprocollema Vain. (1890), Lichinaceae (L). 3, widespread. See Magnusson (*Hedwigia* **78**: 219, 1938), Henssen (*SA* **5**: 137, 1986), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Leproloma Nyl. ex Cromb. (1883), Stereocaulaceae (L (sterile)). 6, widespread. See Laundon (*Lichenologist* **21**: 1, 1989; key), Leuckert & Kümmerling (*Nova Hedwigia* **52**: 17, 1991; chemotax.), Jørgensen *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 392, 1994; posn), Leuckert *et al.* (*Biblthca Lichenol.* **58**: 245, 1995; chemistry), Lohtander (*Ann. bot. fenn.* **32**: 49, 1995; Finland), Tønsberg & Jørgensen (*Lichenologist* **29**: 597, 1997; comments on alleged ascoma), Kukwa (*Biblthca Lichenol.* **82**: 67, 2001; Poland), Ekman & Tønsberg (*MR* **106**: 1262, 2002; phylogeny), Kukwa (*Ann. bot. fenn.* **39**: 225, 2002), Myllys *et al.* (*Taxon* **54**: 605, 2005; phylogeny).

Leproncus Vent. (1799) nom. rej. = Pertusaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lepropinacia Vent. (1799) = Buellia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Leproplaca (Nyl.) Nyl. ex Hue (1888) = Caloplaca fide Jørgensen & Tønsberg (*Nordic Jl Bot.* **8**: 293, 1988), Kärnefelt (*Cryptog. Bot.* **1**: 147, 1989), Hafellner & Vězda (*Nova Hedwigia* **55**: 183, 1992).

leprose (of lichens), having the surface or the whole thallus entirely dissolved into soredia (e.g. *Lepraria*) (Fig. 21A).

Leprosis Neck. ex Kremp. (1869) nom. dub., Fungi (L).

Leptascospora Speg. (1918), Meliolaceae. 1, Java.

Leptasteromella Petr. (1968) ? = Leptodothiorella Höhn. fide Sutton (*Mycol. Pap.* **141**, 1977).

Lepteutypa Petr. (1923), Amphisphaeriaceae. Anamorph *Seiridium*. 10, widespread. See Shoemaker & Müller (*CJB* **43**: 1459, 1965), von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981), Nag Raj & Kendrick (*Sydowia* **38**: 178, 1986; key), Kang *et al.* (*Fungal Diversity* **1**: 147, 1998; DNA), Kang *et al.* (*MR* **103**: 53, 1999), Dulymamode *et al.* (*MR* **105**: 247, 2001; key), Jeewon *et al.* (*MR* **107**: 1392, 2003; phylogeny).

Lepteutypella Petr. (1925) = Lepteutypa fide Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973).

Leptina Bat. & Peres (1960) ? = Discosia fide Sutton (*Mycol. Pap.* **141**, 1977).

Leptinia Juel (1897) = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Leptobelonium Höhn. (1924) = Strossmayeria fide Iturriaga (*Mycotaxon* **20**: 169, 1984), Iturriaga & Korf (*Mycotaxon* **36**: 383, 1990).

Leptocapnodium (G. Arnaud) Cif. & Bat. (1963) = Scorias fide Reynolds (*Bull. Torrey bot. Club* **98**: 157, 1971).

Leptochaete Lév. (1846) ≡ Hymenochaete.

Leptochaete Zmitr. & Spirin (2006), Agaricomycetes. 5, widespread.

Leptochidium M. Choisy (1952), Massalongiaceae (L). 2, Europe; N. America. See Choisy (*Bull. mens. Soc. linn. Lyon* **21**: 165, 1952), Burgaz & Martínez (*Nova Hedwigia* **73**: 381, 2001; Iberian peninsula), Jørgensen (*Graphis Scripta* **18**: 19, 2006), Wedin *et al.* (*Lichenologist* **39**: 61, 2007; n. fam.).

Leptochlamys Died. (1921), anamorphic *Pezizomycotina*, St.0fH.10. 1 (on *Musci*), Europe.

Leptocladia Marvanová & Descals (1985) [non *Leptocladia* J. Agardh 1892, *Rhodophyta*] ≡ Stenocladiella.

Leptocorticium Hjortstam & Ryvarden (2002), Corticiaceae. 5, widespread. See Hjortstam & Ryvarden (*Syn. Fung.* **15**: 23, 2002), Nakasone (*Mycol. Progr.* **4**: 251, 2005).

Leptocoryneum Petr. (1925) = Seimatosporium fide Sutton (*Mycol. Pap.* **141**, 1977).

Leptocrea Syd. & P. Syd. (1916) ? = Stigmatula fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Leptocucurthis Aptroot (1998), Dacampiaceae (L). 1, Papua New Guinea. See Aptroot & van Iperen (*Nova Hedwigia* **67**: 481, 1998).

leptocystidium, see cystidium.

Leptodendriscum Vain. (1890) = Polychidium fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

leptodermatous (of hyphae), having the outer wall thinner than the lumen; cf. mesodermatous.

Leptodermella Höhn. (1915), anamorphic *Pezizomycotina*, Cac.0eH.1. 1, Europe.

Leptodermopsis Speg. ex Höhn. (1923) nom. dub., anamorphic *Pezizomycotina*. See Falk (*Mykol. Unters.* **1**: 331, 1923), Sutton (*Mycol. Pap.* **141**, 1977).

Leptodiscella Papendorf (1969), anamorphic *Pezizo-*

mycotina, Hsp/Cac.1eH.10. 1, S. Africa; Japan. See Papendorf (*TBMS* **53**: 146, 1969), Udagawa & Toyazaki (*Mycotaxon* **22**: 407, 1985).
Leptodiscus Gerd. (1953) [non *Leptodiscus* Hertwig 1877, *Algae*] ≡ Mycoleptodiscus.
Leptodon Quél. (1886) [non *Leptodon* D. Mohr 1803, nom. cons., *Musci*] ≡ Mycoleptodon.
Leptodontidium de Hoog (1979), anamorphic *Helotiales*, Hso.0eH.10. 10, widespread. See de Hoog (*Taxon* **28**: 347, 1979), Tsuneda *et al.* (*Mycotaxon* **60**: 485, 1996), Tsuneda *et al.* (*CJB* **75**: 1649, 1997; antagonism to *Lentinula*), Grünig *et al.* (*CJB* **80**: 1239, 2002; phylogeny).
Leptodontium de Hoog (1977) [non *Leptodontium* (Müll. Hal.) Hampe ex Lindb. 1864, *Musci*] ≡ Leptodontidium.
Leptodothiora Höhn. (1918) = Dothiora Fr. (1849) fide Froidevaux (*Nova Hedwigia* **23**: 679, 1973).
Leptodothiorella Aa (1973) = Leptodothiorella Höhn. fide Sutton (*Mycol. Pap.* **141**, 1977).
Leptodothiorella Höhn. (1918), anamorphic *Guignardia*, Cpd.0eH.15. 6, widespread (tropical).
Leptodothis Theiss. & Syd. (1914) nom. dub., Fungi. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).
lepto-form, see *Pucciniales*.
Leptogiaceae Körb. (1855) = Collemataceae.
Leptogidiomyces Cif. & Tomas. (1953) ≡ Leptogidium.
Leptogidium Nyl. (1873) = Polychidium fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).
Leptogiomyces E.A. Thomas ex Cif. & Tomas. (1953) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Leptogiopsis Müll. Arg. (1882) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Leptogiopsis Nyl. (1884) = Mastodia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Leptogiopsis Trevis. (1880) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Leptogium (Ach.) Gray (1821), Collemataceae (L). *c.* 189, widespread. See Sierk (*Bryologist* **67**: 245, 1964; N. Am.), Jørgensen (*Svensk bot. Tidskr.* **67**: 53, 1973; *Mallotium*), Jørgensen *in* Poelt & Vězda (*Best. europ. Flecht.*, 1977; Eur.), Awasthi (*Geophytology* **8**: 189, 1979; India), Poelt & James (*Lichenologist* **15**: 109, 1983; W. Eur.), Jørgensen (*Lichenologist* **26**: 1, 1994; key small spp. Eur.), Jørgensen (*Symb. bot. upsal.* **32** no. 1: 113, 1997; key hairy spp.), Galloway (*Nova Hedwigia* **69**: 317, 1999; NZ), Jørgensen & Tønsberg (*Bryologist* **102**: 412, 1999; Pacific NW), Guttová (*Lichenologist* **32**: 291, 2000; Europe), Martin *et al.* (*Bryologist* **105**: 358, 2002; Pacific NW), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Aragón & Otálora (*Nova Hedwigia* **78**: 353, 2004; Iberian peninsula), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny), Aragón *et al.* (*Nova Hedwigia* **80**: 199, 2005; Iberian peninsula), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Stenroos *et al.* (*Cladistics* **22**: 230, 2006; phylogeny, photobiont association), Lindström (*Biblthca Lichenol.* **95**: 405, 2007; neotropics), Jørgensen & Kashiwadani (*Lichenologist* **40**: 123, 2008; key, Papua New Guinea).
Leptoglossum (Cooke) Sacc. (1884) = Microglossum Gillet fide Maas Geesteranus (*Persoonia* **3**: 89, 1964).
Leptoglossum P. Karst. (1879) = Arrhenia fide Redhead (*CJB* **62**: 865, 1984).
leptogonidium, a photobiont consisting of small-sized cells (obsol.); cf. gonidium.
Leptographa (Th. Fr.) M. Choisy (1950) = Ptychographa fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Leptographa Jatta (1892) = Toninia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Leptographium Lagerb. & Melin (1927), anamorphic *Ophiostoma*, Hso.0eH.21. *c.* 68, widespread (temperate). See Shaw & Hubert (*Mycol.* **44**: 693, 1952), Wingfield (*TBMS* **85**: 81, 1985; gen. relationships), Harrington & Cobb (*Leptographium Root Diseases on Conifers*, 1988), Ayer *et al.* (*J. Nat. Prod.* **52**: 119, 1989; metabolites from *L. wageneri* var. *pseudotsugae*), Zambino & Harrington (*Mycol.* **81**: 122, 1989; isozyme variation), Zambino & Harrington (*Mycol.* **84**: 12, 1992; isozyme characterization), Wingfield *in* Wingfield *et al.* (Eds) (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 43, 1993; anamorphs), Strydom *et al.* (*Syst. Appl. Microbiol.* **20**: 295, 1997; ribosomal DNA), Jacobs *et al.* (*CJB* **76**: 1660, 1998), Jacobs *et al.* (*CJB* **76**: 1660, 1998; on conifers), Jacobs *et al.* (*S. Afr. J. Bot.* **65**: 388, 1999; Congo), Jacobs *et al.* (*MR* **104**: 1524, 2000; Russia), Jacobs *et al.* (*Mycoscience* **41**: 595, 2000; Indonesia, N America), Masuya *et al.* (*Mycoscience* **41**: 425, 2000; Japan), Zhou *et al.* (*Mycoscience* **41**: 573, 2000; China), Jacobs & Wingfield (*Leptographium Species: Tree Pathogens, Insect Associates, and Agents of Blue-stain*, 2001), Jacobs *et al.* (*Mycol.* **93**: 380, 2001; Europe), Jacobs *et al.* (*CJB* **79**: 719, 2001; phylogeny), Jacobs *et al.* (*MR* **105**: 490, 2001; on pine), Six *et al.* (*Mycol.* **95**: 781, 2003; associations with bark beetles), Jacobs *et al.* (*MR* **108**: 411, 2004; introduction to N America), Kim *et al.* (*MR* **108**: 699, 2004; on *Pinus*), Masuya *et al.* (*Mycol.* **96**: 548, 2004; on *Prunus*, Japan), Jacobs *et al.* (*MR* **109**: 1149, 2005; phylogeny), Kim *et al.* (*MR* **109**: 275, 2005; Korea), Alamouti *et al.* (*Mycol.* **98**: 149, 2006; Canada), Jacobs *et al.* (*CJB* **84**: 759, 2006; N America).
Leptoguignardia E. Müll. (1955), Botryosphaeriaceae. Anamorph *Dothichiza*-like. 1, France. See Barr (*Prodr. Cl. Loculoasc.*, 1987).
Leptogydiomyces, see *Leptogidiomyces*.
Leptojum Beltr. (1858) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Leptokalpion Brumm. (1977), Thelebolaceae. 2, Asia. See Wang (*Bull. natn. Sci. Mus.* Tokyo, B **7**: 131, 1996), van Brummelen (*Persoonia* **16**: 425, 1998; posn), Hoog *et al.* (*Stud. Mycol.* **51**: 33, 2005).
Leptomassaria Petr. (1914), Xylariaceae. 2, Europe. See Læssøe (*SA* **13**: 43, 1994; ? synonym of *Anthostomella*), Rappaz (*Mycol. Helv.* **7**: 99, 1995).
Leptomelanconium Petr. (1923), anamorphic *Pezizomycotina*, Cac.0-1eP.15. 5, widespread. See Sutton (*The Coelomycetes*, 1980), Hunt (*CJB* **63**: 1157, 1985), Vujanovic & St-Arnaud (*Mycol.* **93**: 212, 2001; on *Abies*).
Leptomeliola Höhn. (1919), Parodiopsidaceae. Anamorph *Ophiotrichum*. 9, widespread (tropical). See Hughes (*Mycol. Pap.* **166**, 1993), Thaung (*Australas. Mycol.* **25**: 5, 2006; Burma).
Leptomyces Mont. (1856) nom. dub. ? = Mycena fide Kuyper (*in litt.*).
Leptomycorhaphis Cif. & Tomas. (1953) nom. rej.

prop. = Leptorhaphis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Leptonema J. Sm. Dalry (1896), Fossil Fungi (mycel.) Fungi. 1 (Carboniferous), British Isles. See Smith (*Trans. Geol. Soc. Glasgow* **10**: 321, 1896).

Leptonia (Fr.) P. Kumm. (1871) = Entoloma fide Kuyper (*in litt.*).

Leptoniella Earle (1909) ≡ Entoloma.

Leptopeltella Höhn. (1917) = Leptopeltis fide Holm & Holm (*Bot. Notiser* **130**: 215, 1977), Shoemaker *et al.* (*Sydowia* **41**: 308, 1989).

Leptopeltidaceae Höhn. ex Trotter (1928), Microthyriales. 6 gen. (+ 8 syn.), 14 spp.

Lit.: von Arx (*Acta Bot. Neerl.* **13**: 182, 1964), Holm & Holm (*Bot. Notiser* **130**: 215, 1977), Eriksson (*Op. Bot.* **60**, 1981), Spooner & Kirk (*MR* **94**: 223, 1990), Cannon (*SA* **15**: 121, 1997).

Leptopeltina Petr. (1947) ≡ Leptopeltinella.

Leptopeltina Speg. (1924) = Stomiopeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Leptopeltinella Petr. (1951) ≡ Leptopeltis.

Leptopeltis Höhn. (1917), Leptopeltidaceae. Anamorph *Leptothyrium*-like. 7 or 9, widespread (north temperate). See Holm & Holm (*Bot. Notiser* **130**: 215, 1977; key), Eriksson (*Op. Bot.* **no. 60**: 1, 1981; posn), Cannon (*SA* **15**: 121, 1997).

Leptopeltopsis Petr. (1947) = Leptopeltis fide Holm & Holm (*Bot. Notiser* **130**: 215, 1977).

Leptoperidia Rappaz (1987), Diatrypaceae. 4, widespread. See Rappaz (*Mycol. Helv.* **2**: 285, 1987), Rappaz (*Mycol. Helv.* **3**: 281, 1989), Chacón Zapata (*Brenesia* **62**: 41, 2004; key, Mexico).

Leptopeza G.H. Otth (1871) = Plicaria fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Leptopeziza Rostr. (1888) ? = Pyrenopeziza fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Leptophacidium Höhn. (1918) = Guignardia fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Leptophoma Höhn. (1915) = Phoma Sacc. fide Sutton (*Mycol. Pap.* **141**, 1977).

Leptophrys Hertwig & Lesser (1885), Cercozoa. q.v.

Leptophyllosticta I.E. Brezhnev (1939), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, former USSR.

Leptophyma Sacc. (1889) = Helostroma fide Moore (*Mycotaxon* **14**: 13, 1982).

Leptopodia Boud. (1885) = Helvella fide Seaver (*North American Cup Fungi* (Operculates), 1928).

Leptopora Raf. (1808) = Perenniporia fide Merrill (*Index Rafinesq.*, 1949).

Leptoporellus Spirin (2001), Polyporaceae. 5, widespread. See Spirin (*Mycena* **1**: 69, 2001).

Leptoporus Quél. (1886), Polyporaceae. 1, widespread (north temperate). See Ryvarden & Gilbertson (*Europ. Polyp.* **1**: 281, 1993), Yu *et al.* (*Mycosystema* **23**: 596, 2004; China).

Leptopterygium Zahlbr. (1930) = Zahlbrucknerella fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

Leptopuccinia (G. Winter) Rostr. (1902) = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

lepto-Puccinia, a *Puccinia* of lepto-form; see *Pucciniales*.

Leptorhaphiomyces Cif. & Tomas. (1953) = Leptorhaphis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Leptorhaphis Körb. (1855) nom. cons., ? Naetrocymbaceae (±L). 15, widespread (northern hemisphere). See Aguirre-Hudson (*Bull. Br. Mus. nat. hist.* Bot. **21**: 85, 1991; key), Aguirre-Hudson & Fiol (*Lichenologist* **25**: 207, 1993; Balearic Is).

Leptosacca Syd. (1928), Pezizomycotina. 1, Chile.

Leptosillia Höhn. (1928), Diaporthales. Anamorph *Harpostroma*. 1, Europe. See Hawksworth (*SA* **6**: 136, 1987).

Leptosphaerella (Sacc.) Hara (1913) = Phaeosphaeria fide Shoemaker & Babcock (*CJB* **67**: 1500, 1989), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Leptosphaerella Speg. (1909), Pezizomycotina. 7, S. America.

Leptosphaeria Ces. & De Not. (1863) nom. cons., Leptosphaeriaceae. Anamorphs *Coniothyrium*, *Phoma*. *c.* 134, widespread. *L. bondari* (areolate spot of citrus in S. Am.), *L. coniothyrium* (rose stem canker, raspberry cane blight), *L. maculans* (anamorph *Phoma lingam*; dry rot of turnips, canker of crucifers). At one time a much more widely circumscribed genus, see segregates esp. *Phaeosphaeria*, many pathogens of grasses. See Müller (*Sydowia* **4**: 185, 1950), Müller (*Sydowia* **5**: 49, 1951; Swiss spp.), Wehmeyer (*Mycol.* **44**: 621, 1952), Holm (*Symb. bot. upsal.* **14** no. 3: 1, 1957), Holm (*Taxon* **24**: 475, 1975; nomencl.), Shoemaker (*CJB* **62**: 2688, 1984; key 64 spp.), Crane & Shearer (*Illinois nat. Hist. Bull.* **34**, 1991; disposition 1689 names), Huhndorf (*Illinois nat. Hist. Bull.* **34**: 479, 1992; spp. on *Rosaceae*), Ahn & Shearer (*CJB* **73**: 573, 1995), Khashnobish *et al.* (*Mycotaxon* **54**: 91, 1995), Morales *et al.* (*MR* **99**: 593, 1995), Khashnobish & Shearer (*MR* **100**: 1341, 1996), Khashnobish & Shearer (*MR* **100**: 1355, 1996; phylogeny), Ahn & Shearer (*CJB* **76**: 258, 1998), Dong *et al.* (*MR* **102**: 151, 1998; DNA), Voigt *et al.* (*J. Leptosphaeriopsis Berl. (1892) = Ophiobolus fide Walker (*Mycotaxon* **11**: 1, 1980).

Leptosphaerites Richon (1885), Fossil Fungi. 2 (Tertiary), France; former USSR.

Leptosphaerulina McAlpine (1902), Pleosporales. Anamorph *Pithoascus*. 27, widespread (temperate). See Graham & Luttrell (*Phytopathology* **51**: 680, 1961; key), Crivelli (*Über die heterogene Ascomycetengattung Pleospora Rbh.*, 1983; key), Irwin & Davis (*Aust. J. Bot.* **33**: 233, 1985; Australia), Roux (*TBMS* **86**: 319, 1986; anamorph), Wu & Hanlin (*Mycol.* **84**: 241, 1992; ontogeny), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999; DNA), Kodsueb *et al.* (*Mycol.* **98**: 571, 2006; phylogeny).

Leptospora Rabenh. (1857), Dothideomycetes. 1, Europe; N. America. See Walker (*Mycotaxon* **11**: 1, 1980).

Leptospora Raf. (1808) nom. dub., Fungi. See Donk (*Persoonia* **1**: 173, 1960).

leptospore (of *Pucciniales*), a teliospore (q.v.) adapted for immediate germination without a dormant period.

Leptosporella Penz. & Sacc. (1897), Sordariomycetes. 2, Java; S. America. See Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny).

Leptosporina Chardón (1939), Pezizomycotina. 1, S. America.

Leptosporium (Sacc.) Höhn. (1923) = Fusicolla fide Clements & Shear (*Gen. Fung.*, 1931).

Leptosporium Bonord. (1857) = Vibrissea fide Sánchez & Korf (*Mycol.* **58**: 733, 1966).

Leptosporomyces Jülich (1972), Atheliaceae. 11, widespread (north temperate). See Greslebin & Rajchenberg (*N.Z. Jl Bot.* **41**: 437, 2003; Patagonia).

Leptosporopsis Höhn. (1920) = Leptosphaeria fide Walker (*Mycotaxon* **11**: 1, 1980).

Leptostroma Fr. (1815), anamorphic *Lophodermium*, St.0eH.10. *c* 200, widespread. See Minter (*CJB* **58**: 906, 1980; spp. on *Pinus*), Sieber-Canavesi *et al.* (*Mycol.* **83**: 89, 1991; ecology endophytic spp.), Guo *et al.* (*MR* **107**: 680, 2003; endophytes), Ortiz-García *et al.* (*Mycol.* **95**: 846, 2003; phylogeny).

Leptostromataceae Sacc. (1884) = Rhytismataceae.

Leptostromella (Sacc.) Sacc. (1884), anamorphic *Pezizomycotina*, St.0e-fH.?. 20, widespread (temperate).

Leptostromites Poinar (2003), Fossil Fungi. 1, Dominican Republic. See Poinar (*MR* **107**: 121, 2003).

Leptoteichion Kleb. (1933) = Phacidiopycnis fide Rupprecht (*Sydowia* **13**: 10, 1959).

Leptothyrella Sacc. (1885), anamorphic *Pezizomycotina*, Cpt.1eH.?. 10, widespread.

Leptothyrina Höhn. (1915), anamorphic *Pezizomycotina*, St.0eH.10. 1, Switzerland.

Leptothyriomyces Kräusel (1929), Fossil Fungi, Asterinaceae. 2 (Miocene), Sumatra.

Leptothyrites Poinar (2003), Fossil Fungi. 1, Dominica. See Poinar (*MR* **107**: 121, 2003).

Leptothyrium Kunze (1823), anamorphic *Pezizomycotina*, Cpt.0eH.15. 2, widespread. See Sutton (*Mycol. Pap.* **141**, 1977).

leptotichous (of tissue), thin-walled.

Leptotrema Mont. & Bosch (1855), Thelotremataceae (L). 1, pantropical. See Hale (*Bull. Br. Mus. nat. hist.* Bot. **8**: 227, 1981), Matsumoto & Deguchi (*Bryologist* **102**: 86, 1999; anamorph), Matsumoto (*J. Hattori bot. Lab.* **88**: 1, 2000; Japan), Kalb (*Mycotaxon* **79**: 319, 2001; Australia), Frisch (*Biblthca Lichenol.* **92**: 3, 2006; monograph).

Leptotrichum Corda (1842) nom. dub., anamorphic *Pezizomycotina*. See Holubová-Jechová (*Sydowia* **45**: 95, 1993).

Leptotrimitus Pouzar (1966) = Incrustoporia fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Leptotrochila P. Karst. (1871), ? Dermateaceae. Anamorph *Sporonema*. 16, widespread. See Schüepp (*Phytopath. Z.* **36**: 236, 1959; key), Romaszewska-Salata & Salata (*Scripta Mycologica* Tartu **17**: 102, 1989; Poland), Nauta & Spooner (*Mycologist* **14**: 65, 2000; key British spp.).

Leptotus P. Karst. (1879) = Arrhenia fide Redhead (*CJB* **62**: 865, 1984).

Leptoxyphium Speg. (1918), anamorphic *Aithaloderma*, Hsy.0-1eH-P.15. 2, widespread (tropical). See Hughes (*Mycol.* **68**: 693, 1976), Roquebert & Bury (*CJB* **66**: 2265, 1988; ultrastr. conidiomata), Olejnik & Ingrouille (*MR* **103**: 333, 1999; numerical taxonomy), Reynolds & Faull (*Taxon* **50**: 1183, 2001; nomencl.).

Leptuberia Raf. (1808), Fungi (L). 1, N. America.

Le-Ratia Pat. (1907) [non *Le-Ratia* Broth. & Paris 1909, *Musci*] = Leratiomyces fide Heim (*Revue Mycol.* Paris **33**: 137, 1968).

Leratiomyces Bresinsky & Binder ex Bridge, Spooner, Beever & Park (2008), Strophariaceae. 4, New Caledonia. Basidioma gasteroid. See Bresinsky & Binder (*Z. Mykol.* **64**: 79, 1998; phylogeny).

Lesdainea Harm. (1910) nom. dub., ? Verrucariaceae. 1, France. See Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Ertz & Diederich (*Mycol. Progr.* **3**: 229, 2004).

lesion, a wound; a well-marked but limited diseased-area.

Lespiaultinia Zobel (1854) = Tuber fide Trappe (*Mycotaxon* **9**: 247, 1979), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Letendraea Sacc. (1880), Pleosporales. 2, Europe; Africa. See Samuels (*CJB* **51**: 1275, 1973), Rossman (*Mycol. Pap.* **157**, 1987; key), Lumbsch & Lindemuth (*MR* **105**: 901, 2001; phylogeny), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006; phylogeny, morphology).

Letendraeopsis K.F. Rodrigues & Samuels (1994), ? Tubeufiaceae. 1, Brazil. See Rodrigues & Samuels (*Mycol.* **86**: 254, 1994), Crane *et al.* (*CJB* **76**: 602, 1998), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006).

Lethagrium A. Massal. (1853) ≡ Lathagrium.

Letharia (Th. Fr.) Zahlbr. (1892) nom. cons., Parmeliaceae (L). 2, widespread. See Schade (*Ber. bayer. bot. Ges.* **30**: 108, 1954), Schade (*Feddes Repert.* **58**: 179, 1955), Kroken & Taylor (*Mycol.* **93**: 38, 2001; phylogeny), Högberg *et al.* (*Mol. Ecol.* **11**: 1191, 2002; genetic variation), Arnerup *et al.* (*MR* **108**: 311, 2004; population structure), Thell *et al.* (*Symb. bot. upsal.* **34** no. 1: 429, 2004; biogeography).

Lethariella (Motyka) Krog (1976), Parmeliaceae (L). 10, widespread. See Obermayer (*Biblthca Lichenol.* **68**: 45, 1997), Obermayer (*Biblthca Lichenol.* **78**: 321, 2001), Niu *et al.* (*Lichenologist* **39**: 549, 2007; chemistry, China).

Lethariicola Grummann (1969) = Odontotrema fide Lumbsch & Hawksworth (*Biblthca Lichenol.* **38**: 325, 1990; key), Diederich *et al.* (*Lichenologist* **34**: 479, 2002).

Lethariopsis Zahlbr. (1926) = Caloplaca fide Eriksson & Hawksworth (*SA* **10**: 141, 1991).

Letrouitia Hafellner & Bellem. (1982), Letrouitiaceae (L). 15, widespread. See Hafellner (*Nova Hedwigia* **35**: 645, 1983; key), Awasthi & Srivastava (*Proc. Indian Acad. Sci.* Pl. Sci. **99**: 165, 1989; India), Johansson *et al.* (*Mycol. Progr.* **4**: 139, 2005; chemistry), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Letrouitiaceae Hafellner & Bellem. (1982), Teloschistales (L). 1 gen., 15 spp.

Lit.: Hafellner & Bellemère (*Nova Hedwigia* **35**: 263, 1982), Awasthi & Srivastava (*Proc. Indian Acad. Sci.* Pl. Sci. **99**: 165, 1989), Kärnefelt (*Cryptog. bot.* **1**: 147, 1989), Kärnefelt (*Lichenologist* **22**: 307, 1990), Kasalicky *et al.* (*CJB* **78**: 1580, 2000), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Lettauia D. Hawksw. & R. Sant. (1990), ? Fuscideaceae. 1 (on lichens, esp. *Cladonia*), Europe. See Ihlen & Tønsberg (*Bryologist* **99**: 32, 1996), Etayo (*Biblthca Lichenol.* **84**, 2002; Colombia).

Leucangium Quél. (1883), ? Helvellaceae. 1 (hypogeous), widespread (temperate). Clusters close to *Fischerula* and is perhaps related to *Morchellaceae*. See Li (*Int. J. Pl. Sci.* **158**: 189, 1997; ultrastr.), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Leucinocybe, see *Leucoinocybe*.

Leucoagaricus Locq. ex Singer (1948), Agaricaceae. Anamorph *Attamyces*. *c.* 90, widespread. The genus as presently circumscribed is paraphyletic. See Heinemann (*Fl. Illustr. Champ. Afr. Centr.* **2**: 30, 1973; key 18 Afr. spp.), Johnson (*Mycol.* **91**: 443, 1999), Vellinga (*Mycotaxon* **76**: 429, 2000; type studies), Hausknecht & Pidlich-Aigner (*Öst. Z. Pilzk.* **13**: 1, 2004; Austria), Consiglio & Contu (*Bollettino del Circolo Micologico 'Giovanni Carini'* **48**: 16, 2004), Consiglio *et al.* (*Micologia e Vegetazione Mediterranea* **19**: 131, 2004; Italy).

Leucobolbitius (J.E. Lange) Locq. (1952) nom. inval. = Leucocoprinus fide Kuyper (*in litt.*).

Leucobolites Beck (1923) = Gyroporus fide Kuyper (*in litt.*).

Leucocarpia Vězda (1969), Verrucariaceae (L). 1, Europe; Papua New Guinea. See Vězda (*Herzogia* **1**: 188, 1969).

Leucocarpopsis G. Salisb. (1975) = Verrucaria Schrad. fide Purvis *et al.* (*Lichen Flora of Great Britain and Ireland*, 1992).

Leucocintractia M. Piepenbr., Begerow & Oberw. (1999), Anthracoideaceae. 4 (on *Cyperaceae*), widespread. See Pérez *et al.* (*IMI Descr. Fungi Bact.* **153**, 2002), Piepenbring (*Caldasia* **24**: 103, 2002; Colombia), Pérez & Minter (*IMI Descr. Fungi Bact.* **164**, 2005).

Leucoconiella Bat., H. Maia & Peres (1960), Pezizomycotina. 1, Paraguay. See Batista *et al.* (*Brotéria* Sér. Ci. Nat. **29**: 130, 1960).

Leucoconis Theiss. & Syd. (1918), Pezizomycotina. 1, India.

Leucoconius Beck (1923) ≡ Gyroporus.

Leucocoprinaceae Jülich (1982) = Agaricaceae.

Leucocoprinus Pat. (1888), Agaricaceae. *c.* 40, widespread (esp. tropical; in greenhouses in temperate regions). See Johnson (*Mycol.* **91**: 443, 1999; phylogeny), Hausknecht & Pidlich-Aigner (*Öst. Z. Pilzk.* **13**: 1, 2004; Austria), Kumar & Manimohan (*Mycotaxon* **90**: 393, 2004; India).

Leucocortinarius (J.E. Lange) Singer (1945), Tricholomataceae. 1, Europe.

Leucocrea Sacc. & P. Syd. ex Lindau (1900) = Balzania fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Leucocytospora (Höhn.) Höhn. (1927) = Cytospora fide Petrak (*Annls mycol.* **19**: 17, 1921), Adams *et al.* (*Mycol.* **94**: 947, 2002; phylogeny, teleomorph), Adams *et al.* (*Stud. Mycol.* **52**: 146 pp., 2005; phylogeny, morphology).

Leucodecton A. Massal. (1860), Thelotremataceae (L). 1, pantropical. See Thor (*Op. Bot.* **103**, 1990), Frisch (*Biblthca Lichenol.* **92**: 3, 2006; revision), Frisch *et al.* (*Biblthca Lichenol.* **92**: 517, 2006; phylogeny).

Leucodiaporthe M.E. Barr & Lar.N. Vassiljeva (2008), Diaporthaceae. 1, N. America; E. Asia. See Vasilyeva *et al.* (*Mycol.* **99**: 916, 2007).

Leucodochium Syd. & P. Syd. (1917), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Philippines.

Leucofomes Kotl. & Pouzar (1957) = Rigidoporus fide Pegler (*The polypores [Bull. BMS Suppl.]*, 1973).

Leucogaster R. Hesse (1882), Albatrellaceae. 20, widespread (north temperate). See Fogel (*CJB* **57**: 1718, 1979), Francis & Bougher (*Australasian Mycologist* **21**: 81, 2002).

Leucogastraceae Moreau ex Fogel (1979) = Albatrellaceae.

Leucogastrales = Boletales. See also under gasteromycetes.

Leucogloea R. Kirschner (2004), anamorphic *Atractiellales*. 1. See Kirschner (*Frontiers in Basidiomycote Mycology*: 177, 2004).

Leucoglossum S. Imai (1942), ? Geoglossaceae. 1, Japan. See Rifai (*Lloydia* **28**: 113, 1965).

Leucogomphidius Kotl. & Pouzar (1972) ≡ Gomphidius.

Leucogramma A. Massal. (1860) = Hemithecium fide Staiger (*Biblthca Lichenol.* **85**, 2002).

Leucogramma G. Mey. (1825) nom. rej. prop. = Graphina fide Staiger (*Biblthca Lichenol.* **85**, 2002).

Leucographa Nyl. (1857) nom. nud., Dothideomycetes (L).

Leucogymnospora Fink (1930), ? Ostropales (L). 1, Puerto Rico.

Leucogyrophana Pouzar (1958), Hygrophoropsidaceae. 13, widespread. See Ginns & Weresub (*Mem. N. Y. bot. Gdn* **28**: 86, 1976; sclerotial spp.), Ginns (*CJB* **56**: 1953, 1978; key), Jarosch & Besl (*Pl. Biol.* **3**: 443, 2001).

Leucogyroporus Snell (1942) = Tylopilus fide Singer (*Farlowia* **2**: 223, 1945).

Leucoinocybe Singer (1943), ? Tricholomataceae. 1, Europe.

Leucolenzites Falck (1909) ≡ Lenzites.

Leucoloma Fuckel (1870) [non *Leucoloma* Brid. 1827) nom. cons., *Musci*] ≡ Octospora.

Leucomyces Earle (1909) = Amanita Pers. fide Singer (*Agaric. mod. Tax.*, 1951).

Leuconectria Rossman, Samuels & Lowen (1993), Nectriaceae. Anamorph *Gliocephalotrichum*. 1 (from leaves and in soil), widespread. See Rehner & Samuels (*CJB* **73** Suppl. 1: S816, 1995; phylogeny), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Schoch *et al.* (*Stud. Mycol.* **45**: 45, 2000), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny), Decock *et al.* (*Mycol.* **98**: 488, 2006; French Guiana).

Leuconeurospora Malloch & Cain (1970), ? Pseudeurotiaceae. 2, Europe; Asia. See Udagawa *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 225, 1978), von Arx *et al.* (*Beih. Nova Hedwigia* **94**, 1988; posn), Suh & Blackwell (*Mycol.* **91**: 836, 1999; phylogeny), Sogonov *et al.* (*Mycol.* **97**: 695, 2005; phylogeny).

Leucopaxillaceae Jülich (1982) nom. rej. = Tricholomataceae.

Leucopaxillus Boursier (1925), Tricholomataceae. *c.* 15, widespread (temperate; subtropical). See Singer & Smith (*Pap. Mich. Acad. Sci.* **28**: 85, 1943; key 12 spp.), Singer & Smith (*Mycol.* **39**: 725, 1947), Guzmán & Escalona (*Docums Mycol.* **33** no. 132: 37, 2004; *Leucopaxillus gracillimus* variation and distribution).

Leucopenicillifer G.R.W. Arnold (1971), anamorphic *Pezizomycotina*, Hso.0eH.15. 1 (on myxomycete), Russia. See Carmichael *et al.* (*Genera of Hyphomycetes*, 1980; ? = *Paecilomyces*).

Leucopezis Clem. (1909) ? = Humaria Fuckel fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Leucophellinus Bondartsev & Singer (1944), Schizoporaceae. 1, Europe. See Parmasto (*Eesti NSV Tead. Akad. Toim.* Biol. seer **32**: 269, 1983).

Leucophlebs, see *Leucophleps*.

Leucophleps Harkn. (1899), Albatrellaceae. 4, widespread (north temperate). See Fogel (*CJB* **57**: 1718, 1979), Montecchi & Sarasini (*Funghi Ipogei d'Europa*: 714 pp., 2000).

Leucopholiota (Romagn.) O.K. Mill., T.J. Volk & Bessette (1996), Tricholomataceae. 1, USA. See Miller *et al.* (*Mycol.* **88**: 138, 1996), Vellinga (*MR* **108**: 354, 2004; posn.).

Leucophomopsis Höhn. (1917) = Phomopsis (Sacc.) Bubák. fide Clements & Shear (*Gen. Fung.*, 1931).

Leucoporus Quél. (1886) ≡ Polyporellus.

Leucopus P. Kumm. (1871) = Cortinarius fide Donk (*Bull. Jard. Bot. Buitenzorg* Sér. 3 **18**: 271, 1949).

Leucorhizon Velen. (1925) = Gastrosporium fide Pilát (*Fl. ČSR* B **1**: 227, 1958).

Leucoscypha Boud. (1885), Pyronemataceae. 10, widespread (temperate). See Svrček (*Česká Mykol.* **28**: 129, 1974), Harmaja (*Karstenia* **17**: 73, 1977), Yao & Spooner (*MR* **99**: 1513, 1995; Brit. spp.), Benkert (*Z. Mykol.* **66**: 181, 2000; typification), Wang & Zhong (*Fungal Science* Taipei **16**: 17, 2001; China), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Leucosphaera Arx, Mukerji & N. Singh (1978) [non *Leucosphaera* Gilg 1897, *Spermatophyta*] ≡ Leucosphaerina.

Leucosphaerina Arx (1987), ? Bionectriaceae. Anamorphs *Acremonium*-like, *Sporothrix*. 1 (coprophilous), India; USA. See Malloch (*Stud. Mycol.* **31**: 107, 1989), Suh & Blackwell (*Mycol.* **91**: 836, 1999; phylogeny), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny).

Leucosporidiaceae Jülich (1982), Leucosporidiales. 3 gen., 8 spp.
Lit.: Joo (*Korean J. Mycol.* **19**: 258, 1991), Suh & Sugiyama (*J. gen. appl. Microbiol.* Tokyo **39**: 257, 1993), Statzell-Tallman & Fell *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 670, 1998), DePriest *et al.* (*CJB* **78**: 1450, 2000), Sampaio *et al.* (*Mycol. Progr.* **2**: 63, 2003).

Leucosporidiales J.P. Samp., M. Weiss & R. Bauer (2003). Microbotryomycetes. 1 fam., 3 gen., 8 spp. With colacosomes, teliospores, and white cultures. Fam.:
Leucosporidiaceae
For *Lit.* see under fam.

Leucosporidiella Samp. (2003), anamorphic *Leucosporidiaceae*. 4, widespread. See Sampaio *et al.* (*Mycol. Progr.* **2**: 63, 2003), Aime *et al.* (*Mycol.* **98**: 896, 2006; phylogeny).

Leucosporidium Fell, Statzell, I.L. Hunter & Phaff (1970), Leucosporidiaceae. 3 (from sea water), Antarctica. See Yamada & Komagata (*J. gen. appl. Microbiol.* Tokyo **33**: 456, 1987), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Sampaio *et al.* (*Mycol. Progr.* **2**: 53, 2003), Sampaio (*Frontiers in Basidiomycote Mycology*: 49, 2004).

Leucosporium Corda (1833) nom. dub., anamorphic *Pezizomycotina*. See Holubová-Jechová (*Sydowia* **45**: 97, 1993).

leucosporous, having spores white in the mass.

Leucostoma (Nitschke) Höhn. (1917), Valsaceae. Anamorph *Cytospora*. *c.* 13, widespread (temperate). The genus should probably be placed into synonymy with *Valsa*. See also IMI Descriptions of Fungi and Bacteria nos 1363-1635, 1999. See Kern (*Phytopath. Z.* **40**: 303, 1961), Surve-Iyer *et al.* (*Mycol.* **87**: 471, 1995; isozymes), Wang *et al.* (*Phytopathology* **88**: 376, 1998; DNA), Adams *et al.* (*Mycol.* **94**: 947, 2002; phylogeny, paraphyly), Adams *et al.* (*Stud. Mycol.* **52**: 146 pp., 2005; phylogeny, paraphyly), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Leucotelium Tranzschel (1935), Uropyxidaceae. 3 (on *Ranunculaceae* (I); on *Prunus* (II, III) (on *Rosaceae*)), Eurasia (temperate). See Savile (*CJB* **67**: 2983, 1989), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; syn. of *Soratea*), Helfer (*Nova Hedwigia* **81**: 325, 2005; Europ. spp.).

Leucothallia Trevis. (1853) ≡ Sphaerotheca Lév. fide Braun (*SA* **7**: 57, 1988).

Leucothecium Arx & Samson (1973), Gymnoascaceae. 2, Netherlands. See Valldosera *et al.* (*MR* **95**: 243, 1991).

Leucothyridium Speg. (1909) = Cucurbitaria fide Petrak & Sydow (*Annls mycol.* **32**: 1, 1934).

Leucovibrissea (A. Sánchez) Korf (1990), Vibrisseaceae. 1, USA. See Korf (*Mycosystema* **3**: 19, 1990).

Leuliisinea Matsush. (1985), anamorphic *Pezizomycotina*, Hsy.1eH/1eP.19. 1, Taiwan. See Matsushima (*Matsush. Mycol. Mem.* **4**: 11, 1985).

Léveillé (Joseph-Henri; 1796-1870; France). A Parisian medic; Dr med. (1824). Introduced the terms basidium and cystidium; produced an early account of the mycota of large parts of eastern and southeast Europe; early work on powdery mildews. Most collections and papers destroyed during the Franco-Prussian war (1870-1871), but some types in **K**, **L** and [mostly] **PC**. *Publs*. Recherches sur l'hyménium des champignons. *Annales des Sciences Naturelles* Botanique, Série 2 (1837); Observations médicinales et énumerations des plantes recueilliés en Tauride. In

A. Demidoff [ed.], *Voyage dans la Russie Meridionale et la Crimeé, par la Hongrie, la Valachie et la Moldavie* (1842); Organisation et disposition méthodique des espèces qui composent le genre *Erysiphe. Annales des Sciences Naturelles* Botanique, Série 3 (1851); *Iconographie des Champignons de Paulet* (1855). *Biogs, obits etc.* Grummann (1974: 286); Stafleu & Cowan (*TL-2* **2**: 965, 1979).

Leveillea Fr. (1849) [non *Leveillea* Decne. 1839, *Algae*] ? = Phylacia fide Læssøe (*SA* **13**: 43, 1994).

Leveillella Theiss. & Syd. (1915), Asterinaceae. 1, Chile. See Eriksson (*SA* **7**: 78, 1988).

Leveillina Theiss. & Syd. (1915), Dothideomycetes. 2, Africa; S. America.

Leveillinopsis F. Stevens (1924) = Coccostromopsis fide Hyde & Cannon (*Mycol. Pap.* **175**, 1999).

Leveillula G. Arnaud (1921), Erysiphaceae. Anamorph *Oidiopsis*. 23, widespread. See Durrieu & Rostam (*Cryptog. Mycol.* **5**: 279, 1985), Braun (*Beih. Nova Hedwigia* **89**, 1987; key), Gelyuta & Simonian (*Biol. Zh. Armenii* **39**: 20, 1987; subgen. divis.), Palti (*Bot. Rev.* **54**: 423, 1988; monogr.), Cook *et al.* (*MR* **101**: 975, 1997), Takamatsu *et al.* (*Mycoscience* **39**: 441, 1998; phylogeny), Saenz & Taylor (*CJB* **77**: 150, 1999; phylogeny), Khodaparast *et al.* (*MR* **105**: 909, 2001; phylogeny), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Khodaparast *et al.* (*MR* **111**: 673, 2007; on monocots), Takamatsu *et al.* (*MR* **112**: 299, 2008; phylogeny).

Leveillulaceae V.P. Gelyuta (1988) = Erysiphaceae.

Levieuxia Fr. (1848) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

levigate, see laevigate.

Levispora Routien (1957) = Pseudeurotium fide Malloch (*in litt.*).

Lewia M.E. Barr & E.G. Simmons (1986), Pleosporaceae. Anamorph *Alternaria*. 17, widespread. See Simmons (*Mycotaxon* **25**: 287, 1986), Bottalico & Logrieco (*Mycotoxins in Agriculture and Food Safety*: 65, 1998; toxigenic spp.), Dong *et al.* (*MR* **102**: 151, 1998; DNA), Hoog & Horré (*Mycoses* **45**: 259, 2002; from humans), Simmons (*Mycotaxon* **83**: 127, 2002; morphology, anamorphs), Berbee *et al.* (*MR* **107**: 169, 2003; mating types), Kwasna & Kosiak (*MR* **107**: 371, 2003; on *Avena*, key), Kwasna *et al.* (*Mycol.* **98**: 662, 2006; on *Hordeum*), Simmons (*CBS Diversity Ser.* **6**, 2007; revision, nomenclator).

Liaoningnema S.L. Zheng & W. Zhang (1986), Fossil Fungi. 1, China.

Libartania Nag Raj (1979), anamorphic *Helotiales*, St.≡ eH.10. 3, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Lee & Crous (*Sydowia* **55**: 115, 2003).

Libellus Lloyd (1913) [non *Libellus* Cleve 1873, *Algae*] = Hymenogloea fide Singer (*Agaric. mod. Tax.*, 1951).

Libertella Desm. (1830), anamorphic *Xylariales*, St.0fH.10. 20, widespread (temperate). Primarily used for anamorphs of *Diatrypaceae*. See Ju & Rogers (*Mycotaxon* **73**: 343, 1999), Mostert *et al.* (*Mycol.* **93**: 146, 2001; on *Vitis*), Acero *et al.* (*Mycol.* **96**: 249, 2004; phylogeny).

Libertiella Speg. & Roum. (1880), anamorphic *Pezizomycotina*, St.0eH.15. 5 (on *Peltigera*), Europe. See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 30, 1981).

Libertina Höhn. (1920) = Phomopsis (Sacc.) Bubák. fide Sutton (*TBMS* **50**: 355, 1967).

liberty cap, basidioma of the hallucinogenic *Psilocybe semilanceata*.

Licentia Pilát (1940) = Lopharia fide Donk (*Taxon* **5**: 69, 1956).

Lichen L. (1753) nom. rej. ≡ Parmelia.

lichen (pl. lichens; pronounced '*lie'ken*') [Lat. *lichen*, from Gk λειχηυ, tree moss] (cen (Welsh), Flechten (Germ.), gil-i-sang (Persian), huidmos and korsmos (Afrikaans), jäkälä (Finnish), kerpés (Lith.), korstmos (Dutch), lav (Danish, Norweg., Swed.), lichène (Ital.), ligen (Afrikaans), líquen and liquen (Portug., Span., S. Am.), lišaj (Croat.), lišejník (Bohem., Czech. Slovak), liszaj and porost (Pol.), mareru (Kikuyu), лишај (Serb.), лишай (Russian), лишей (Bulgar.), ragu (Old English), フイケン tii (Jap.), 582.29 (Universal Decimal Classification)), one of the Lichens (q.v.); (in Medicine), any of various eruptive skin diseases. **- acids**, see Metabolic products; **- alga**, phycobiont (q.v.); photobiont (q.v.); **-biont interaction** see Ahmadjian (*in* Reisser, *Algae and symbiosis*: 675, 1992); **- desert**, the area in a town or around an air pollution source from which all lichens, or at least all foliose and fruticose lichens are absent (obsol.); see Air pollution; **-icolous**, inhabiting lichens; **-iform**, having the form of a lichen; **-iverous**, lichen-eating; **-oglyph**, a centuries-old picture made by Canadian Indians by scraping lichens off the surface of a large vertical rock face; **-oid**, resembling a lichen; **-ologist**, one engaged in the pursuit of lichenology; **-ology**, the scientific study of lichens; **- products**, **-substances**, see Metabolic products.

Lichenagaricus P. Micheli (1729) nom. inval. = Xylaria Hill ex Schrank fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

lichenen (lichenin), an I+ red linear polymer of β-d-glucose with 1,3 and 1,4 linkages in the ratio 3:2; **isolichenan** (isolichenin), an isomer of lichenan, is I+ lilac or lavender. These carbohydrates occur in the walls of the hyphae of many lichen-forming fungi; lichenan tends to occur in higher concentrations and its presence/absence is taxonomically significant (Common, *Mycotaxon* **41**: 67, 1991). See amylomycan, Iodine.

Lichenes (obsol.). Name of a class for all lichen-forming fungi used when these were regarded as quite separate from *Fungi*; *Mycophycophyta*. **- imperfecti** (obsol.), lichen-forming anamorphic fungi; *Deuterolichenes* (q.v.), often used inclusive of lichen-forming fungi in which the sporocarps are unknown and the position is uncertain.

Lichenicolous fungi. Fungi dwelling on or in lichens as parasites (pathogens), commensals (see also parasymbiont) or saprobes; partly gall-inducing. In the ninth edn of this *Dictionary*, it was estimated that about 300 gen. and 1000 spp. of obligately lichenicolous fungi were known; many of the genera being exclusively lichenicolous. Common saprobic moulds are very scarce on lichens with depsides or depsidones, but a wide range of non-obligate species can be recovered by isolation (Petrini *et al.*, *Mycol.* **82**: 441, 1990; Prillinger *et al.*, *Syst. Appl. Microbiol.* **20**: 572, 1997).

Ascomycota, *Agaricomycetes* and anamorphic fungi all include obligately lichenicolous spp. Some lichenicolous fungi can take over the algae from other lichens and form new thalli (Hawksworth, *Bot. J. Linn. Soc.* **96**: 3, 1988).

Many groups are undergoing a critical re-appraisal in what is proving to be one of the most unexplored of all ecological niches occupied by fungi. Some may affect the host chemistry or produce separate novel metabolites (Feige *et al.*, *Cryptog. Bot.* **3**: 101, 1993; Hawksworth *et al.*, *Bibl. Lich.* **53**: 101, 1993). Cell wall degrading enzymes are found to be active in culture depending on lichen metabolites of a possible host lichen (Torzelli & Lawrey, *Mycol.* **87**: 841, 1995). Host-parasite interfaces of some lichenicolous fungi in the *Dacampiaceae* have been investigated (Rios & Grube, *MR* **104**: 1348, 2000), as has genetic variation in *Marchandiomyces corallinus* (Molina *et al.*, *Mycol.* **97**: 454, 2005).

Lit.: **General**: Clauzade *et al.* (*Bull. Soc. linn. Provence, num.-spéc.* **1**, 1989; keys 682 spp.; amendments in *Bull. Ass. Fr. lichén.* **16**(2): 71, 1991), Diederich (*Bibl. Lich.* **61**, 1996; basidiomycetes), Diederich & Christiansen (*Lichenologist* **26**: 47, 1994; basidiomycetes), Grummann (*Bot. Also often included in fungus and/or lichen catalogues or mycotas. See also Internet. See also Geographical distribution, Lichenicolous lichens, Lichens.

Lichenicolous lichens. Lichens which grow on (or in) other lichens, either as commensals or parasites; 4-biont symbioses (see symbiosis). Each fungal partner in such associations has an independent algal or cyanobacterial partner, whereas no additional photosynthetic partner occurs in the obligately lichenicolous fungi (q.v.). The algae of the lichenicolous lichens occur either inside the host in e.g. *Buellia pulverulenta* on *Physconia distorta* (Hafellner & Poelt, *Phyton* **20**: 129, 1980) or as discrete thalli on its surface as in *Caloplaca epithallina* on 13 host lichens (Poelt, *Bot. Jahrb.* **167**: 457, 1985). Parasitic spp. are known esp. in *Acarospora*, *Diploschistes*, *Rhizocarpon* (Poelt, *Mitt. bot. StSamml., Münch.* **29**: 515, 1990), and *Verrucaria*. See also Poelt & Döbbeler (*Planta* **46**: 467, 1956), Rambold & Triebel (*Bibl. Lich.* **48**, 1992; inter-lecanoralean assocs.).

Lichenobactridium Diederich & Etayo (1995), anamorphic *Pezizomycotina*, Hso.?.?. 1, France. See Etayo & Diederich (*Flechten Follmann* Contributions to Lichenology in Honour of Gerhard Follmann: 212, 1995).

Lichenochora Hafellner (1989) nom. cons. prop., ? Phyllachorales. 25 (lichenicolous), widespread (esp. temperate). See Hafellner (*Nova Hedwigia* **48**: 357, 1992), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000), Hoffmann *et al.* (*Taxon* **55**: 802, 2006; nomencl.).

Lichenoconium Petr. & Syd. (1927), anamorphic *Pezizomycotina*, Cpd.0eP.19. 20 (on lichens), widespread. See Hawksworth (*Persoonia* **9**: 159, 1977), Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 33, 1981), Christiansen (*Graphis Scripta* **5**: 18, 1993; on *Lecanora*), Cole & Hawksworth (*Lichenologist* **36**: 1, 2004; Pacific NW, key).

Lichenodiplis Dyko & D. Hawksw. (1979), anamorphic *Pezizomycotina*, Cpd.1eP.19. 9 (on lichens), Europe; Asia. See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 37, 1981), Berger & Diederich (*Herzogia* **12**: 35, 1996).

Lichenodiplisiella S. Kondratyuk & I. Kudratov (2002), anamorphic *Pezizomycotina*, C?.?.?. 1, Tadzhikistan. See Kondratyuk *et al.* (*Polish Botanical*

Journal **47**: 1, 2002).

Lichenohendersonia Calat. & Etayo (2001), anamorphic *Pezizomycotina*. 3, Spain. See Calatayud & Etayo (*CJB* **79**: 225, 2001).

Lichenoides Hoffm. (1789) ≡ Anaptychia.

Lichenometry. Technique for study of exposure age of rock surfaces based on the size/diameter (proportional to age) of lichen thalli. Pioneered by Beschel in the 1950s (see Raasch (Ed.), *Geology of the arctic* **2**: 1044, 1961) and now used extensively by glaciologists but also applicable to the minimum dating of many stone and other surfaces, and so of value in archaeology. The technique is potentially more precise than radio-carbon dating for exposures less than 500 years old. See Innes (Lichenometry [*Prog. phys. Geogr.* **9**: 187], 1985; *in* Galun, *CRC Handbook of lichenology* **3**: 75, 1988), Luckman (*Can. J. Earth Sci.* **14**: 1804, 1977; Alberta), Matthews (*Norsk geogr. Tidsskr.* **29**: 97, 1975; Jotunheimen), Solomina *et al.* (*Arctic, Antarctic and Alpine Res.* **35**: 129, 2003), Webber & Andrews (*Arctic Alpine Res.* **5**: 293, 1973; review, bibliogr.).

A critical review of the technique is provided by Worsley (*in* Goudie *et al.*, *Geomorphological techniques*: 302, 1981) and a size-frequency approach addressing some criticisms of the technique has been developed by Winchester & Harrison (*Earth surface processes & landforms* **19**: 137, 1994). See Ecology, Growth rates.

Lichenomphalia Redhead, Lutzoni, Moncalvo & Vilgalys (2002), Hygrophoraceae. 8, widespread. See Redhead & Kuyper (*Mycotaxon* **31**: 221, 1978), Redhead & Kuyper (*Arctic Alpine Mycology* **2**: 319, 1987), Lutzoni & Vilgalys (*CJB* **73**: S649, 1995; phylogeny), Lutzoni (*Syst. Biol.* **46**: 373, 1997; phylogeny), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000; phylogeny), Redhead *et al.* (*Mycotaxon* **83**: 38, 2002), Delannoy & Eyssartier (*BSMF* **120**: 403, 2004; *Lichenomphalia* in Svalbard).

Lichenomyces Trevis. (1853) = Plectocarpon fide Hawksworth & Galloway (*Lichenologist* **16**: 85, 1984).

Lichenopeltella Höhn. (1919), Microthyriaceae. *c.* 20 (some on lichens), widespread. See Santesson (*SA* **9**: 15, 1990; nomencl.), Spooner & Kirk (*MR* **94**: 223, 1990; as *Micropeltopsis*), Hariharan *et al.* (*Lichenologist* **28**: 294, 1996; India spp.), Earland-Bennett & Hawksworth (*Lichenologist* **31**: 575, 1999; on *Verrucaria*), Cole & Hawksworth (*Mycotaxon* **83**: 391, 2002; on *Heterodermia*).

Lichenopeziza Zukal (1884), Pezizomycotina (?L). 1, Europe.

Lichenophoma Keissl. (1911) nom. dub., anamorphic *Pezizomycotina*, Cpd.0eH.?. 1 (on lichens), Europe. See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 77, 1981).

Lichenopsis Schwein. (1832) = Stictis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lichenothrix Henssen (1964) = Pyrenothrix fide Eriksson (*Op. Bot.* **60**, 1981).

Lichens. A lichen is a stable self-supporting association of a fungus (mycobiont) and an alga or cyanobacterium (photobiont). More precisely, a lichen is an ecologically obligate, stable mutualism between an exhabitant fungal partner and an inhabitant population of extracellularly located unicellular or filamentous algal or cyanobacterial cells (Hawksworth & Honegger, *in* Williams (Eds) (*Plant galls*: 77, 1994). Many other definitions have been proposed (Hawksworth, *Bot. J. Linn. Soc.* **96**: 3, 1988; review), and Ahmadjian (*The lichen symbiosis*, edn 2, 1993) stresses the formation of a 'thallus or lichenized stroma that may contain unique secondary compounds' as the key feature. The partners may have coevolved (Ahmadjian, *Ann. N.Y. Acad. Sci.* **503**: 307, 1987; Hawksworth, *in* Pirozynski & Hawksworth (Eds), *Coevolution of fungi with plants and animals*: 125, 1988).

Lichens are a biological and not a systematic group, and are unique in that in many (but not all) cases the resulting life form and behaviour differ markedly from that of the isolated components. In most lichens the fungal partners, which do not occur free-living (except in some facultatively lichenized fungi), appear to be responsible for the overall form of the thallus and its fruiting bodies (ascomata), but there is an interplay between both components to produce the final form (see below), and a wide range of biological interactions is involved. These may involve four, five or even more partners (Hawksworth, 1988; review).

Fungal partners: Around 20% of all *Fungi* and 40% of all *Ascomycota* are lichen-forming. Most recent estimates of global diversity suggest that between 17500 and 20000 species are known, with a further 1500 lichenicolous fungi (Feuerer & Hawksworth, *Biodiv. Cons.* **16**: 85, 2007; Galloway, *Biodiv. Conserv.* **1**: 312, 1992, Lawrey & Diederich, *Bryol.* **106**: 80, 2003; Nash & Egan, *Bibl. Lich.* **30**: 11, 1988; Sipman & Aptroot, *MR* **105**: 1433, 2001). Lichens are polyphyletic in origin, as established beyond doubt by molecular methods (Gargas *et al.*, *Science* **269**: 1492, 1995); Hibbett *et al.*, *MR* **111**: 509,

2007). The fungi of most species belong to the *Ascomycota* (q.v.), but only four orders are exclusively lichen-forming. Lichenization also occurs in a few *Basidiomycota* (e.g. *Dictyonema*, *Multiclavula*, *Lichenomphalia*), and also anamorphic fungi (e.g. *Blarneya*, *Cystocoleus*; see Vobis & Hawksworth, *in* Cole & Kendrick (Eds), *The biology of conidial fungi* **1**: 245, 1981; review). However, while many families are exclusively lichen-forming, a mixture of lichen-forming and non-lichen-forming (and also sometimes lichenicolous) species can occur within the same family or even genus (e.g. *Arthonia*, *Arthothelium*, *Mycomicrothelia*, *Toninia*). What is or is not regarded as a 'lichen' is partly a matter of history; for example, *Orbilia*, and *Pezizella* are not usually studied by lichenologists, while some taxa generally regarded as the preserve of lichenologists do not form lichens (e.g. *Arthopyrenia*, *Chaenothecopsis*, *Leptorhaphis*, *Stenocybe*). The existence of genera crossing biological boundaries, and of species which may be viewed as components of primitive lichens (Kohlmeyer & Kohlmeyer, *Marine mycology*, 1979) or facultatively lichen-forming, makes it clear that the lichen method of nutrition (q.v.) is at various stages of evolution in different groups; evolving to be more strongly lichen-forming in some (e.g. some *Leotiomycetes*, *Agaricales*) and less strongly lichen-forming in others (e.g. non-lichen-forming *Arthoniales* and *Lecanorales*). Axenic cultures of the fungal partner can be obtained from ascospores and thallus fragments; Crittenden *et al.* (*New Phytol.* **130**: 267, 1995) had success with 493 spp. (42%) of 1183 attempted. The cultures are generally slow-growing, have little organized structure, and do not produce ascomata (although some form conidiomata).

Algal and cyanobacterial partners: The number of photosynthetic partners involved in lichen formation is relatively small; only 40 genera are represented, 25 algae and 15 cyanobacteria (see Ahmadjian, *Phycologia* **6**: 128, 1967, identification; Ahmadjian, 1993; Hildreth & Ahmadjian, *Lichenologist* **13**: 65, 1981, keys *Trebouxia* spp.; Honegger, *Exper. Phycol.* **1**: 40, 1990; Tschermak-Woess, *in* Galun, *CRC Handbook of lichenology* **1**: 29, 1988). Most belong to genera which are also free-living both in the cyanobacteria (e.g. *Calothrix*, *Gloeocapsa*, *Nostoc*, *Scytonema*, *Stigonema*) and the green algae (*Cephaleuros*, *Coccomyxa*, *Myremecia*, *Trentepohlia*). Only *Trebouxia* (incl. *Pseudotrebouxia*) appears to be primarily lichen-forming, with doubt cast on its free occurrence in nature (Ahmadjian, 1993; Tschermak-Woess, 1988). The same species, but often as different strains, may occur with a very wide range of lichen-forming fungal genera. In addition more than one strain of a single alga (or species of an algal genus) can be involved in the formation of a single lichen thallus. However, the systematics of the algal and cyanobacterial partners of lichens is currently inadequate to make more definite assertions as to specificity. However, in some lichen-forming fungi (e.g. *Lobaria*, *Placopsis*, *Psoroma*, *Stereocaulon*) with an algal partner, cyanobacteria also occur in 'cephalodia' (q.v.) which may, according to the species, be warts on the upper or lower surface or circumscribed areas within the thallus. In some cases cephalodia can be separated and persist as independent lichens (e.g. *Dendriscocaulon*); occasionally, two species with different types of algae previously regarded as distinct have been found joined together as a composite ('chimeroid') thallus showing these 'photomorphs' (q.v.; phycosymbiodemes, photosymbiodeme, phycotypes) are the result of interactions between a single mycobiont and distinct photobionts (Armaleo & Clerc, *Exp. Mycol.* **15**: 1, 1991; James & Henssen, *in* Brown *et al.*, 1976: 27; Stöcker-Wörgötter & Türk, *Crypt. Bot.* **4**: 300, 1994; Tønsberg & Holtan-Hartwig, *Nordic Jl Bot.* **3**: 681, 1983), White & James, *Lichenologist* **20**: 103, 1988).

Nomenclature: Lichens do not have independent scientific names; the fungal and photosynthetic partners each have separate names, and names given to lichens are considered as referring to the fungal partner alone (see Nomenclature). The classification of 'lichens' therefore has to be completely integrated into the system of *Fungi*. The names of lichen-forming fungi have one other special provision in the Code, exemption from the provisions for the naming of pleomorphic fungi. These fungi are covered by the *Index of Fungi* from vol. **5**(4), 1982 onwards. Current nomenclatural practice is consistent with the recognition of lichens as a nutritional rather than a taxonomic group.

Synthesis: Although the bionts can be separated and cultured, resynthesis under laboratory conditions is difficult. Some success has been achieved by lowering the nutrient supply and modifying the moisture requirements, features which suggest that lichens behave as two organisms united in adversity. Synthesis was first achieved experimentally by Stahl in 1877 (repeated by Ahmadjian & Heikkilä, *Lichenologist* **4**: 259, 1970), and has now also been carried out in *Dermatocarpon*, *Usnea* and *Xanthoria* (Ahmadjian, 1993). Novel syntheses have also been attempted; Ahmadjian *et al.* (*Mycol.* **72**: 73, 1980) found that *Cladonia cristatella* could be re-synthesized with 13 different *Trebouxia* isolates, but none of 10 '*Pseudotrebouxia*' isolates or free- living *Pleurastrum*; squamules, pycnidia and short podetia with immature hymenia were obtained and the metabolic products (q.v.) were identical in all cases (Ahmadjian, *The lichen symbiosis*, edn 2, 1993; *in* Cook (Ed.), *Cellular interactions with symbiosis and parasitism*: 3, 1980; *Progress Phycol. Res.* **1**: 179, 1982). Techniques for growing lichens as tissue cultures with intermixed fungi and algae have been developed for about 200 spp. since 1981 (Yamamoto *et al.*, *Bryologist* **96**: 383, 1993).

Structure: The algae or cyanobacteria are either distributed at random, often in a gelatinous matrix, throughout the thallus (**homoiomerous**; unlayered; unstratified), or in a compact layer below the upper or outer cortex (**heteromerous**; layered; stratified). There are a few **filamentous** lichens (*Coenogonium*, *Cystocoleus*, *Racodium*) in which the filamentous form of the alga predominates; in the majority, the fungus forms the outer structure and gives the lichen its shape. Six life-form categories are generally recognized (Fig. 21): shrub- or beard- like (**fruticose**), leaf-like (**foliose**), scale-like (**squamulose**; **placodioid** if rosette-like in surface view with only the tips free), crust-like (**crustose**, **crustaceous**), **filamentous** (see above), and **leprose** (powdery, loose and often powdery aggregations of algal cells entwined with hyphae and with no cortex). Fruticose thalli are the most complex and largest; these may be erect or pendulous, hair- or strap-like and are often richly

branched. They have a radial structure arranged around a central cavity (e.g. *Bryoria*) or a tough axial strand (*Usnea*), and are attached to the substratum by small disc-like holdfasts or clusters of rhizoids. Some *Usnea* spp. on trees attain a length of 10 m. In foliose and crustose thalli the structure is essentially dorsiventral and growth most pronounced at the circumference; the former have a well-developed lower cortex and are attached to the substratum by puckering of the underside (*Hypogymnia*), a fine felted tomentum (*Lobaria*), or by coarse bundles of compacted hyphae or rhizines (*Parmelia*). Crustose lichens may be more or less immersed in the substratum and, like squamules, lack a lower cortex.

The surface of crustose species is often characteristically cracked or warted, and may be bounded by a pale or black marginal **prothallus** which contains no photobiont cells. The gelatinous homoiomerous lichens (*Collema*, *Placynthium*) also occur in similar life forms. Any particular life-form is not necessarily confined to a genus, family, or order (e.g. all except the filamentous life-form occur in *Teloschistales*). In a few genera, such as *Cladonia*, *Pilophorus* and *Stereocaulon*, there is a combination of different growth forms: in many species of *Cladonia*, the basal part of the thallus is squamulose, from which arise fruticose, hollow, simple, or branched structures (podetia; q.v.), often also bearing squamules, the apices of which are either pointed (subulate) or bear terminal cups (**scyphi**) on which are borne the ascocarps. In *Stereocaulon* the basal, peltate, or coralloid phyllocladia give rise to simple or branched pseudopodetia (see podetia), also more or less also covered in phyllocladia. The pseudopodetia bear lateral or terminal ascocarps.

A few genera have additional thalline structures, such as aeration pores in the form of **cyphellae** (*Sticta*) and pseudocyphellae (*Punctelia*, *Pseudocyphellaria*); marginal eye-lash-like cilia occur in *Heterodermia* and in some species of *Physcia* and *Parmotrema*. See Beltmann (*Bibl. Lich.* **11**, 1978; Parmeliaceae), Hannemann (*Bibl. Lich.* **1**, 1973; attachment organs), Henssen & Jahns (1973), Jahns (*in* Galun, *CRC Handbook of lichenology* **1**: 95, 1988), Ozenda (*Handb. Pflanzenanatomie* **6** (9), 1963).

Reproduction: Asexual or vegetative reproduction of lichens involving both partners (dual propagules) may be achieved by a wide range of methods (Fig. 22), including: (1) simple fragmentation, (2) development of delimited or widespread areas of cortical breakdown (**soralia**) which contain minute powdery propagules (**soredia**), and (3) the development of numerous small, simple, or branched-coralloid, corticate papillae (**isidia**). These methods involve the dissemination of the united bionts. The position, shape, and sometimes the colour of the soralia and isidia is often diagnostic and is usually accompanied by a marked suppression of ascomatal development (see Phylogeny).

A number of species also develop innate, flask-shaped **pycnidial conidiomata** in which numerous, often characteristically shaped conidia develop. Although conidia of some species germinate in culture their functional role is not fully understood and may, in some species at least, be sexual. Only the mycobiont reproduces sexually, a process culminating in the development of ascomata. The nature of the ascomata depends on the order to which the fungal partner belongs. However, the ascomata are mainly perennial with serial development of the asci. Two main apothecial types are often distinguished: **lecanorine** with a thalline exciple (containing algae and generally the same colour as the main thallus); and **lecideine** only with a true exciple (lacking algae and usually differing in colour from the thallus). In some asexually reproducing species ascomata can be absent or very rare (and then often with few or no well-formed ascospores); see also species pairs.

Establishment: Where dual propagules are the means of dispersal, locating a compatible partner does not present difficulties. However, where several dual propagules of the same or sometimes different lichens start to grow close together they can become intermixed and form interspecific or even intergeneric **mechanical hybrids** (see hybrid); e.g. *Physcia adscendens* + *P. tenella* (Schuster *et al.*, *Lichenologist* **13**: 247, 1985), *P. tenella* + *Xanthoria parietina* (Ott, *Bibl. Lich.* **25**: 81, 1987). The extent to which 'individual' lichen thalli represent the product of a single propagule and belong to one genotype merits investigation.

Where ascospores are the dispersal agent, various strategies for establishment are documened: the ascospore may land on and re-shape an already growing algal or cyanobacterial colony (e.g. *Collema*), invade an established lichen killing the fungal partner and taking over the algae (e.g. *Diploschistes*), land near and out-compete the fungal partner in a dual propagule derived from another lichen, or persist in a loose unstructured association with other algae until a truely compatible algal species arrives (e.g. *Xanthoria*; Ott, *Nordic Jl Bot.* **7**: 219, 1987). See Spore discharge and dispersal.

Interactions between the bionts: In the early stages of synthesis, the partners can be bound by a common sheath (Ahmadjian *et al.*, *Science* **200**: 1062, 1978); similar ultrastructural-level patterns on the surfaces of both partners can enable them to mesh together (Honegger *et al.*, *Lichenologist* **16**: 111, 1984). The actual nature of the cell-to-cell contact varies in different groups; these range from wall-to-wall apposition to a variety of kinds of intraparietal haustoria (see Honegger, *New Phytol.* **103**: 785, 1986; see haustorium. Intracellular haustoria completely penetrating the walls of healthy algal cells are unusual, but the extent of penetration may vary even within a single thallus (Galun *et al.*, *J. Microscopie* **9**: 801, 1970). Dead algal cells occuring in thalli may be used, leading to suggestions that 'controlled parasitism' may more accurately explain the relationship than 'mutualism' (see above, Ahmadjian, 1993). The fungus obtains from the alga growth substances (thiamine, biotin), and products of its photosynthesis, including simple sugars and polyalcohols. Cyanobacterial partners, whether the main photobiont or in cephalodia, fix atmospheric nitrogen which is passed to the fungus. Some green algae involved may be distingushed from non-lichenized relatives by accelerated leakage of sugars across their cell walls in the presence of a compatible fungus.

Lichinales Henssen & Büdel (1986), (L). Lichinomycetes. 3 fam., 53 gen., 350 spp. Thallus crustose, fruticose or foliose, sometimes peltate, often gelatinous. Ascomata eventually apothecial but initially ± perithecial, often formed from pycnidia, opening by a pore, ± sessile or immersed; peridium often not well-defined. Interascal tissue varied; hymenium often J+. Asci thin-walled, without separable wall layers, without well-defined apical structures, usually with a J+ outer gelatinized layer; sometimes evanescent, sometimes polysporous. Ascospores usually hyaline, aseptate. Anamorphs pycnidial. Lichenized with cyanobacteria, widespr. Fams:

(1) **Gloeoheppiaceae**
(2) **Lichinaceae**
(3) **Peltulaceae**

Lit.: Moreno & Egea (*Biología Taxonomía de la Familia Lichinaceae*, 1991), Henssen (*Symb. bot. upsal.* **18**(1), 1963, *Lichenologist* **27**: 261, 1995).

Lichinella Nyl. (1873), Lichinaceae (L). 11, widespread. See Moreno & Egea (*Cryptog. Bryol.-Lichénol.* **13**: 237, 1992; key 7 spp. Spain & N. Afr.), Schultz *et al.* (*Pl. Biol.* **3**: 116, 2001; phylogeny), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key), Schultz (*Bryologist* **108**: 567, 2005; N America).

Lichingoldia D. Hawksw. & Poelt (1986) nom. rej. = Woessia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lindroth, see Liro.

Lindrothia Syd. (1922) = Puccinia fide Arthur (*Manual Rusts US & Canada*, 1934).

Lindsay (William Lauder; 1829-1880; Scotland). Graduated in medicine, University (1852); resident physician, Murray's Royal Institution for the Insane, Perth (1854-1879). A proponent of non-restraint treatments, he studied the practices of psychiatric hospitals in other countries, and mental aspects of animals (*Mind in the Lower Animals* 2 vols, 1879); he regarded natural history as therapeutic and popularized lichenology in particular; a polymath with a rigorous scientific approach he studied dyeing and chemical variation within lichens, and opened up little explored areas of science, including the diversity of lichenicolous fungi and conidiomata in lichens; visited Otago, New Zealand (1861), thereafter publishing profusely not only on lichens and other fungi but also mineralogy and plants from that country (e.g. *Contributions to New Zealand Botany*, 1868) and

even colonialism. Collections now in E; many new taxa based on specimens loaned from K (now in BM). *Publs. A Popular History of British Lichens* (1856); Memoirs on the spermagones and pycnides of lichens. *Transactions of the Royal Society of Edinburgh* (1859) [macrolichens]; Observations on new lichenicolous microfungi. *Transactions of the Royal Society of Edinburgh* (1869); *Transactions of the Linnean Society* London (1872) [crustose lichens]. *Biogs, obits etc.* Anon. (*Proceedings of the Royal Society of Edinburgh* **1881-1882**: 736, 1882); Grummann (1974: 376); Hawksworth & Seaward (*Lichenology in the British Isles 1568-1975*, 1977); Stafleu & Cowan (*TL-2* 3: 63, 1981).

Lindtneria Pilát (1938), Stephanosporaceae. 8, widespread. See Hjortstam (*Mycotaxon* **28**: 19, 1987; key), Larsen (*Mycotaxon* **75**: 131, 2000; new sp.).

Lindtneriaceae Jülich (1982) = Corticiaceae.

line (as a measure of length), 2.1167 mm ($^1/_{12}$ inch); **Paris -** (Parisier Linie, P.L.), 2.2558 mm; **Paris inch**, 27.9 mm (fide Mason, *Mycol. Pap.* **3**: 24, 1933); 'p.p.' and 'p.p.p.' (parts per Paris inch) are abbreviations used by Corda.

linear, long and narrow.

Linearistroma Höhn. (1910), Clavicipitaceae. Anamorph *Ephelis*. 1 (on grasses), Brazil; India. See Phelps *et al.* (*Mycotaxon* **48**: 165, 1993).

Lineolata Kohlm. & Volkm.-Kohlm. (1990), Dothideomycetes. 1 (marine), pantropical. See Kohlmeyer & Volkmann-Kohlmeyer (*MR* **94**: 687, 1990).

lineolate, marked with lines.

Lineostroma H.J. Swart (1988), ? Venturiaceae. 1, Australia. See Swart (*TBMS* **91**: 453, 1988).

linguiform, see lingulate.

lingulate, tongue-like in form.

Linhartia Sacc. & P. Syd. (1902) = Psorotheciopsis fide Lücking (*Cryptog. Mycol.* **20**: 193, 1999), Henssen & Lücking (*Ann. bot. fenn.* **39**: 273, 2002).

Link (Johann Heinrich Friedrich; 1767-1851; Germany). Born at Hildesheim, and educated there and in Göttingen [obtaining medical degree there in 1789]; Professor, Rostock (1792-1811); Professor of Botany, Breslau (1811-1815); Professor of Botany and Director of the Botanic Garden and Royal Herbarium, Berlin (1815-1851). He provided early accounts of a range of important fungal genera. *Publs. Observationes in Ordines Plantarum Naturales* **1** (1809) and **2** (1815); Hyphomycetes (1824) and Gymnomycetes (1825) in Linné, *Species Plantarum* edn 4 [by Willdenow] **6**; *Handbuch zur Erkennung der.Gewächse* (1831-1833) [Fungi 3: 274-486; = Willdenow, *Grundiss der Kräuterkunde.* 3]. *Biogs, obits etc.* Grummann (1974: 29); Stafleu & Cowan (*TL-2* 3: 65, 1981).

Linkiella Syd. (1921) = Puccinia fide Arthur (*Manual Rusts US & Canada*, 1934).

Linkomyces Golovin (1958) = Erysiphe fide Braun (*Nova Hedwigia* **34**: 689, 1981).

Linkosia A. Hern. Gut. & B. Sutton (1997), anamorphic *Pezizomycotina*, Hso.?.?. 2, Cuba. See Hernández-Gutiérrez & Sutton (*MR* **101**: 208, 1997), Wu & Zhuang (*Fungal Diversity Res. Ser.* **15**, 2005), Shenoy *et al.* (*MR* **110**: 916, 2006; phylogeny, polyphyly).

Linnaeus (Carl; 1707-1778; Carl von Linné; L.; Sweden). Professor of Medicine and Botany at the University of Uppsala (1741-1778). The father of modern taxonomy. Introduced the binomial system of biological nomenclature, but classified fungi as members of the plant kingdom. In *Species Plantarum* (1753), he drew extensively on work of Dillenius (*Historia Muscorum*, 1742) for treatment of lichen-forming fungi, and of Micheli (1729, q.v.) for other fungi, but recognized only about 170 fungal species. Among generic names used were *Agaricus*, *Clathrus*, *Hydnum*, *Mucor*, *Phallus* and *Tremella*; all lichen-forming fungi were placed in the genus *Lichen* (80 species.) except for some inadvertently placed in *Mucor* and *Tremella*. The enormous influence of this work confirmed a tradition in life sciences to treat fungi as plants. *Species Plantarum* is the nomenclatural starting point for plants and, because of that tradition, fungal names are still governed by the botanical code of nomenclature. This continues to affect development of mycology as a separate discipline. His last pupil was Acharius (q.v.). Collections and personal library are at the Linnean Society of London (**LINN**). *Biogs, obits etc.* Blunt (*The Compleat Naturalist*, 1971); Jørgensen *et al.* (*Botanical Journal of the Linnean Society* **115**: 261, 1994) [typification of 109 names of lichen-forming fungi]; Grummann (1974: 477); Ramsbottom (*Proceedings of the Linnean Society of London* **151**: 280, 1941) [Linnaeus' contribution to mycology]; Stafleu (*Linnaeus and the Linnaeans*, 1971); Stafleu & Cowan (*TL-2* 3: 71, 1981); Stearn (*in* Linnaeus, *Species plantarum*, 2 vols, 1753) [reprint 1957, biography, reference collections, history of work, etc.]; Uggla (*Linnaeus*, 1957).

Linobolus Syd. & P. Syd. (1917) ? = Tubeufia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lipospora Arthur (1921) = Tranzschelia fide Arthur (*Manual Rusts US & Canada*, 1934).

lipsanenchyma, primordial tissue of a basidioma, other than the universal veil, covering the hymenium (Reijnders, 1963; Singer, 1962: 29).

lipstick mould, *Sporendonema purpurascens*, an invader of mushroom beds.

liquid nitrogen, see Genetic resource collections.

Lirasporis R. Potonié & Sah (1960), Fossil Fungi ? Fungi. 1 (Miocene), India.

lirella, a long, narrow apothecium as in *Graphis* and *Hysterium*.

Lirellodisca Aptroot (1998), Patellariaceae (L). 1, Papua New Guinea. See Aptroot & Iperen (*Nova Hedwigia* **67**: 485, 1998).

Liro [also 'Lindroth', his step-father's name under which he published up to 1906 when he took the Finnish name Liro] (Johan Ivar; 1872-1943; Finland). First Professor of Plant Biology and Plant Pathology, Helsinki University (1922-1943). A founder of the Vanamo Society (1896). Noted for more than 250 publications on taxonomic mycology and plant pathology, especially on fungi of Finland. *Publs. Die Ustilagineen Finnlands* 2 vols (1924, 1938). *Biogs, obits etc.* Grummann (1974: 620); Jamalainen (*Archivum Societatis Zoologicae Botanicae Fennicae 'Vanamo'* **3**, 1949) [biography, bibliography]; Stafleu & Cowan (*TL-2* **3**: 62, 1981).

Liroa Cif. (1933), Microbotryaceae. 1 (on *Polygonum*), Asia; Indonesia. See Kamat & Viswanathan (*Mycopathologia* **26**: 289, 1965), Vánky (*Illustrated genera of smut fungi*, 1987), Piepenbring (*Fungal Science* **17**: 55, 2002; morphology).

Lirula Darker (1967), Rhytismataceae. 7, widespread. See Darker (*CJB* **45**: 1420, 1967), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Guo *et al.* (*MR* **107**: 680, 2003; endophytes), Kaneko (*Mycoscience* **44**: 335, 2003; Japan), Ortiz-García *et al.* (*Mycol.* **95**: 846, 2003; phylogeny).

Lisea Sacc. (1877) = Gibberella fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Lisiella (Cooke & Massee) Sacc. (1891) = Gibberella fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Lister (Arthur, 1830-1908; England). A London wine merchant; amateur mycologist only in retirement (1887 onwards). Working through collections in the British Museum (Natural History), Royal Botanic Gardens, Kew and of de Bary (q.v.) in Strassburg, produced many early papers on, and a definitive monograph of the *Mycetozoa*, jointly with his daughter, G. Lister (q.v.); Fellow of the Royal Society (1898); President of the British Mycological Society (1906). *Publs. A monograph of the Mycetozoa* (1894) [edn 3, 1925]. *Biogs, obits etc.* Grummann (1974: 377); Hawker (*TBMS* **35**: 177, 1952) [portrait]; Lister (*Proceedings of the Royal Society* B **88**: i, 1915); Stafleu & Cowan (*TL-2* **3**: 118, 120, 1981).

Lister (Gulielma, 1860-1949; England). Daughter of A. Lister (q.v.); *de facto* honorary curator of the *Mycetozoa* collections, British Museum (Natural History) London. An eminent English amateur naturalist, noted for her many publications on the *Mycetozoa* and for her artwork, illustrating not only *Mycetozoa* but also various plants; twice President of the British Mycological Society (1912, 1932); the seventy-four manuscript notebooks she produced with her father were bequeathed to the British Mycological Society are are kept in the British Museum (Natural History) London. *Publs. A monograph of the Mycetozoa* edn 3 (1925). *Biogs, obits etc.* Ainsworth (*TBMS* **35**: 188, 1952) [notebooks]; Ainsworth & Balfour-Browne (*Nature* **188** (4748): 362, 1960); Grummann (1974: 377); Hawker (*TBMS* **35**: 177, 1952); Stafleu & Cowan (*TL-2* **3**: 118, 120, 1981); Wakefield (*TBMS* **33**: 165, 1950) [portrait].

Listeromyces Penz. & Sacc. (1901), anamorphic *Pezizomycotina*, Hsp.≡ eP.1. 1, Java; Hawaii. See Goos (*Mycol.* **63**: 213, 1971).

Literature. Mycological literature is vast. In the ninth edn of this *Dictionary*, it was estimated that there are not fewer than 500000 books and papers, with an annual output of *c.* 5000 items distributed through not less than 3500 publications, approximately half in English. The rate of output of paper publications has not diminished, and electronic publication on-line has grown exponentially since the previous edition.

Most literature is ephemeral, but systematic literature is longer-lived and must be readily available (the valid publication of fungal names dates from 1753,

see Nomenclature). Much of the literature up to 1930 is listed in compilations by Lindau & Sydow (1908-18) and Ciferri (1957-60), see below [freely available on-line through *Cyberliber* (q.v.)]. Current systematic literature is covered in *Bibliography of Systematic Mycology* (1946-; twice-yearly, indexed to genus). In addition to new work, an increasing amount of archivad systematic literature can be found freely available on-line in various digital and downloadable formats. Internet search engines such as Google, and major international resources such as the CAB ABSTRACTS database are now an essential tool in any mycological studies.

Frequent use has been made here of the general works listed below. These are referred to by author and year or part, e.g. Buller (**5**), Clements & Shear (1931). In addition, literature is given under the names of genera and higher ranks, and special topics (e.g. Geographical distribution, Industrial mycology, Lichens, Macromycetes, Nomenclature, Physiology, Plant pathogenic fungi).

Biographies

See under Authors' names.

Catalogues of fungal names. With the exception of names published less than five years before present (for which *Index of Fungi* is the recommended source), virtually all of these names are now freely available on-line through *IndexFungorum* (q.v.), while the catalogues themselves (except recent issues of *Index of Fungi*) are freely available on-line as page images through *Cyberliber* (q.v.).

Index of fungi, 1940-. Catalogue of new fam., gen., spp., vars., ff., comb. novs., nom. novs. publ.; lichens incl. since **4-** (1970-). The *Index* has also published four supplements: *A Supplement to Petrak's lists 1920-1939* (1969), *Lichens 1961-1969* (1972), *Saccardo's omissions* (1985), *Family names* (1989), and *Authors of fungal names* (1992).

Lamb, I.M., *Index nominum lichenum*, 1963. Names publ. 1932-1960.

Petrak, F., Verzeichnis der neuen Arten, Varietäten, Formen, Namen und wichstigsten Synonyme. *Just's bot. Jber.* **48**(3): 184[**1**], **49**(2): 267 [**2**], **56**(2): 291 [**3**], **57**(2): 592 [**4**], **58**(1): 447 [**5**], **60**(1): 449 [**6**], **63**(2): 805 [**7**], 1930- 44; *Index of fungi 1936-1939*,

1950 [**8**]. Usually cited as 'Petrak's lists' nos. **1**- **8**; fungal names 1920-40; all reprinted by CABI.
Saccardo, P.A., *Sylloge Fungorum*, 1882-1972, 26 vols [reprints 1944, 1967; microfiche edn, 1972]. Names gen., spp. with Latin descriptions to 1950.
Phycomycetes, vols 7, 9, 11, 14, 16, 17, 21, 24.
Pyrenomycetes, vols 1, 2, 9, 11, 14, 16, 17, 24.
Discomycetes, vols 8, 10, 11, 14, 16, 18, 22, 24.
Uredinales and Ustilaginales, vols 7, 9, 11, 14, 16, 17, 21, 23.
Hymenomycetes, vols 5, 6, 9, 11, 14, 16. 17. 21. 23.
Gasteromycetes, vols 7, 9, 11, 14, 16, 17, 21.
Coelomycetes, vols 3, 10, 11, 14, 16, 18, 22, 25.
Hyphomycetes, vols 4, 10, 11, 14, 16, 18, 22, 25.
Index, vol. 12; Host index, vol. 13; Synonyms, vol. 15; Index to illustrations, vol. 19; Generic index, vol. 18.
[Reed, C.F. & Farr, D.F., *Index*, 1993 (to scientific names).]
Zahlbruckner, A., *Catalogus lichenum universalis*, 10 vols, 1921- 40. Lichen gen. and infraspecific taxa to 1932; incl. full listings of citations of names by later authors.

Other lists of fungal names.
Clements, F.E. & Shear, C.L., *The genera of fungi*, 1931. [generic names; keys; largely of historical interest]

Steudel, E.G., *Nomenclator botanicus*, **2**, 1824. [especially useful for pre-1821 names].
Catalogues of names of other associated organisms. *Index Kewensis*, 1885-. [seed plants]. See Internet.

Checklists.
Checklists constitute the most basic information about what fungi occur in a particular region, and are essential for all other work with these organisms. Some general checklists are listed here (the list is very incomplete, and some are old). Checklists dealing with individual fungal groups are listed under the appropriate taxon name. Most new fungal checklists are being published digitally. See also Geographical distribution, Internet, Lichens, Macrofungi.

litho- (prefix), pertaining to rocks.

Lithocia Gray (1821) = Verrucaria Schrad. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lithoecis Clem. (1909) = Verrucaria Schrad. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lithoglypha Brusse (1988), Acarosporaceae (L). 1, Natal. See Brusse (*Bothalia* **18**: 89, 1988).

Lithographa Nyl. (1857), Trapeliaceae (L). 10, widespread. See Hertel & Rambold (*Biblthca Lichenol.* **38**: 145, 1990; key), Lumbsch *et al.* (*MR* **105**: 265, 2001; asci), Coppins & Fryday (*Lichenologist* **38**: 93, 2006; Canada), Fryday & Coppins (*Lichenologist* **39**: 245, 2007; Chile), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Lithographomyces Cif. & Tomas. (1953) ≡ Lithographa.

Lithogyalideopsis Lücking, Sérus. & Vězda (2005), Gomphillaceae (L). 1, widespread. See Lücking *et al.* (*Lichenologist* **37**: 165, 2005), Lücking *et al.* (*Lichenologist* **38**: 131, 2006).

Lithomyces Viala & Marsais (1930) = Melanospora Corda fide Udagawa & Cain (*CJB* **47**: 1915, 1969).

lithophyte, a plant living on rocks; see saxicolous.

lithophytic, the habit of a lithophyte (q.v.).

Lithopolyporales R.K. Kar, N. Sharma, A. Agarwal & R. Kar (2003), Fossil Fungi, Polyporaceae. 1, India. See Kar *et al.* (*Curr. Sci.* **85**: 37, 2003).

Lithopythium Bornet & Flahault (1891), ? Dothideomycetes (?L). 1, Europe.

Lithosphaeria Beckh. ex Körb. (1863) = Psoroglaena fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lithothelidium M. Choisy (1954) nom. inval. = Polyblastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lithothelium Müll. Arg. (1885), Pyrenulaceae (L). 30, widespread (tropical). See Singh (*Curr. Sci.* **55**: 198, 1986), Aptroot (*Biblthca Lichenol.* **44**, 1991), McCarthy (*Lichenologist* **28**: 290, 1996), Harada (*Bryologist* **100**: 204, 1997), McCarthy (*Australasian Lichenology* **49**: 7, 2001; Christmas Island), Aptroot (*Lichenologist* **38**: 541, 2006; China, Thailand, key), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

lithotroph, utilizing rocks as nourishment.

Lithouncinula N. Sharma, R.K. Kar, A. Agarwal & R.

Kar (2005), Fossil Fungi. 1 (Maastrichtian).

litmus, a water-soluble mixture of amphoteric dyes obtained from depside-containing lichens, esp. *Roccella montagnei*; the mixture has the property of changing colour at different pH levels, and is widely used as an indicator of acidity. See dyeing.

Litschauerella Oberw. (1966), Hydnodontaceae. 4, widespread. See Eriksson & Ryvarden (*Bot. Notiser* **130**: 461, 1977).

Litschauerellaceae Jülich (1982) = Schizoporaceae.

Litschaueria Petr. (1923) = Helminthosphaeria fide Samuels *et al.* (*Mycol.* **89**: 141, 1997).

Littispora J. Campb., J.L. Anderson & Shearer (2003) = Saagaromyces fide Campbell *et al.* (*Mycol.* **95**: 547, 2003), Pang & Jones (*Nova Hedwigia* **78**: 269, 2004).

littoral, growing on sea or lake shores.

Lituaria Riess (1853) = Helicoma fide Linder (*Ann. Mo. bot. Gdn* **16**: 298, 1929).

lituate, forked, and having the points turned out a little.

liverwort, sometimes used in common names for large foliose lichens, e.g. ash-coloured ground liverwort (*Peltigera canina*).

Livia Velen. (1947), Helotiales. 1, Europe.

Lizonia (Ces. & De Not.) De Not. (1864), Pseudoperisporiaceae. 1, Europe. See Hansford (*Mycol. Pap.* **15**, 1946), Barr (*Mycotaxon* **64**: 149, 1997), Döbbeler (*Nova Hedwigia* **76**: 1, 2003).

Lizoniella Henn. ex Sacc. & D. Sacc. (1905) = Microcyclus fide Barr (*Mycotaxon* **39**: 43, 1990).

Llanoa C.W. Dodge (1968) = Umbilicaria fide Wei & Jiang (*Mycosystema* **2**: 135, 1989).

Llanolichen Tomas. & Cif. (1952) = Placynthium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Llanomyces Cif. & Tomas. (1953) ≡ Llanolichen.

Llimonaea Egea & Torrente (1991), Arthoniales (L). 2, Europe; N. Africa. See Egea & Torrente (*Mycotaxon* **53**: 63, 1995), Grube (*Bryologist* **101**: 377, 1998), Sparrius (*Biblthca Lichenol.* **89**: 141 pp., 2004), Tehler & Irestedt (*Cladistics* **23**: 432, 2007), van den Boom & Brand (*Lichenologist* **39**: 309, 2007; Europe, key).

Llimoniella Hafellner & Nav.-Ros. (1993), Helotiales. 10 (lichenicolous), Europe. See Hafellner & Navarro-Rosinés (*Herzogia* **9**: 769, 1993), Kümmerling *et al.* (*Biblthca Lichenol.* **53**: 147, 1993), Diederich & Etayo (*Lichenologist* **32**: 423, 2000), Kondratyuk *et al.* (*Mycol. Balcanica* **3**: 95, 2006; on *Caloplaca*).

Lloyd (Curtis Gates; 1859-1926; USA). A businessman and amateur mycologist. Noted for his studies on the *Gasteromycetes*, *Xylariaceae* etc. Founded, with his brothers, the Lloyd Library and Museum, Cincinnati (see *Lloydia* **27**: 141, 1964); he poked fun at 'name changers' by marking comments with the icon of a small smiling buddha-like figure and by making certain taxonomic and nomenclatural proposals under the name of a hypothetical 'Professor N.J. McGinty'; such proposals are generally attributed to Lloyd without comment, perhaps wrongly (Donk, *Reinwardtia* **1**: 205, 1951); these robust and interesting views led some, particularly nomenclaturalists, to consider him eccentric. Collections in **BPI** (*Mycol.* **24**: 247, 1932). *Publs. Mycological Notes* 7 vols (1898-1925) [in these privately produced volumes he published results of his mycological investigations; the volumes were indexed, *Bulletin of the Lloyd Library* **32** (mycological series 7): 64 pp., 1932; the new names proposed by Lloyd were indexed by Stevenson & Cash, *Bulletin of the Lloyd Library* **35** (mycological series 8): 209 pp., 1936)]. *Biogs, obits etc.* Fitzpatrick (*Mycol.* **19**: 153, 1927, portrait), Simons (*John Uri Lloyd, His life and works, 1849-1936, with a history of the Lloyd Library*, 1972); Stafleu & Cowan (*TL-2* **3**: 123, 1981).

Lloydella Bres. (1901) = Lopharia fide Donk (*Taxon* **5**: 69, 1956).

Lloydellopsis Pouzar (1959) ≡ Amylostereum.

Lloydia C.H. Chow (1935) [non *Lloydia* Salisb. 1812, *Liliaceae*] ≡ Sinolloydia fide Dring (*Kew Bull.* **35**: 68, 1980).

LN, liquid nitrogen; see Genetic resource collections.

LO-analysis (L, lux [light]; O, obscuritas [darkness]). A method introduced by Erdtman (see *An introduction to pollen analysis*, 1943; edn 2, 1954) for pollen, and used by Payak (*Nature* **184**: 738, 1959, *Mycopath.* **16**: 70, 1962, *Recent advances in palynology*: 27, 1964) for fungus spores, by which different types of surface ornamentation may be distinguished microscopically by the differences in appearance of the spore surface at upper and lower focus. See ornamentation, Fig. 20.

Lobaca Vězda (1983) nom. inval. = Fellhanera fide Vězda (*Folia geobot. phytotax.* **21**: 199, 1986).

Lobaria (Schreb.) Hoffm. (1796), Lobariaceae (L). *c.* 67, widespread. See Hale (*Bryologist* **60**: 35, 1957), Hakulinen (*Ann. bot. fenn.* **1**: 202, 1964), Jordan (*Bryologist* **73**: 669, 1970; internal cephalodia), Yoshimura (*J. Hattori bot. Lab.* **34**: 231, 1971), Jordan (*Bryologist* **76**: 225, 1973; N. Am. spp.), Wei *et al.* (*Acta Mycol. Sin.* Suppl. **1**: 363, 1989; 17 spp. China), Burgaz & Martínez (*Botanica Complutensis* **23**: 59, 1999; Iberian peninsula), Zoller *et al.* (*Mol. Ecol.* **8**: 2049, 1999; genetic diversity), Thomas *et al.* (*Biblthca Lichenol.* **82**: 123, 2001; phylogeny), Hallingbäck (*Svensk bot. Tidskr.* **97**: 26, 2002; conservation), Stenroos *et al.* (*CJB* **81**: 232, 2003; photobionts), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny), Sipman (*Biblthca Lichenol.* **88**: 573, 2004; New Guinea), Walser *et al.* (*Heredity* **93**: 322, 2004; recombination), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Lobariaceae Chevall. (1826), Peltigerales (L). 7 gen. (+ 21 syn.), 370 spp.

Lit.: Yoshimura & Hurutani (*Bull. Kochi Gakuen Coll.* **18**: 345, 1987; SEM), Galloway (*Bull. Br. Mus. nat. Hist.* Bot. **17**: 1, 1988), Galloway (*Symbiosis* **11**: 327, 1991), Galloway *et al.* (*Fl. criptog. Tierra del Fuego* **13**, 1995), Galloway *et al.* (*Fl. criptog. Tierra del Fuego* **13**: 78 pp., 1995), Galloway (*Trop. Bryol.* **15**: 117, 1998), Sillet & Goward (*Lichenogr. Thomsoniana* North American Lichenology in Honor of John W. Thomson: 377, 1998), Zoller *et al.* (*Mol. Ecol.* **8**: 2049, 1999), McDonald *et al.* (*Bryologist* **106**: 61, 2003), Stenroos *et al.* (*CJB* **81**: 232, 2003), Walser *et al.* (*Fungal Genetics Biol.* **40**: 72, 2003), Wiklund & Wedin (*Cladistics* **19**: 419, 2003), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny), Jørgensen & Tønsberg (*Nordic Lichen Flora* **3**: Cyanolichens: 77, 2007).

Lobariella Yoshim. (2002), Lobariaceae. 3, widespread. See Nash *et al.* (*Lichen Flora of the Greater Sonoran Desert Region* **1**: 270, 2002), Miądlikowska

et al. (*Mycol.* **98**: 1088, 2006; phylogeny).

Lobarina Nyl. ex Cromb. (1894), Lobariaceae (L). 1, temperate. See Yoshimura *in* Marcelli & Ahti (Eds) (*Recollecting Edvard August Vainio*: 85, 1998), Stenroos *et al.* (*CJB* **81**: 232, 2003; photobionts).

Lobariomyces E.A. Thomas (1939) nom. inval. ≡ Lobaria.

lobate, lobed.

Lobatopedis P.M. Kirk (1979), anamorphic *Pezizomycotina*, Hso.≡ eP.3. 3, Europe; E. Africa. See Kirk (*TBMS* **73**: 75, 1979), Treigiene & Markovskaja (*Botanica Lithuanica* **9**: 285, 2003; Lithuania).

Lobiolataceae C. Agardh (1821) = Peltigeraceae.

Lobiona H. Kilias & Gotth. Schneid. (1978) = Toninia fide Timdal (*Op. Bot.* **110**, 1991).

Loboa Cif., P.C. Azevedo, Campos & Carneiro (1956) = Paracoccidioides fide Taborda *et al.* (*J. Clin. Microbiol.* **37**: 2031, 1999; synonymy with *Paracoccidioides*).

Lobodirina Follmann (1967) = Roccellina fide Tehler (*Op. Bot.* **70**, 1983).

Lobomyces Borelli (1968) nom. inval. = Lacazia fide Grigoriu *et al.* (*Medical Mycol.*, 1987), Taborda *et al.* (*J. Clin. Microbiol.* **37**: 2031, 1999).

lobomycosis, keloidal blastomycosis caused by *Lacazia loboi*.

Loborhiza A.M. Hanson (1944), Chytridiaceae. 1 (on *Volvox*), USA.

Lobosporangium M. Blackw. & Benny (2004), Mortierellaceae. 1, Mexico; USA. See Malloch (*Mycol.* **59**: 326, 1967), Ranzoni (*Mycol.* **60**: 356, 1968), Benny & Blackwell (*Mycol.* **96**: 144, 2004), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

Lobothallia (Clauzade & Cl. Roux) Hafellner (1991), Megasporaceae (L). 4, widespread (northern hemisphere). See Hafellner (*Acta Bot. Malac.* **16**: 138, 1991), Lumbsch (*Bryologist* **100**: 180, 1997; ontogeny), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**: 753, 2006; phylogeny).

Lobularia Velen. (1934), ? Helotiales. 1, former Czechoslovakia.

lobulate, having small lobes.

Lobulicium K.H. Larss. & Hjortstam (1982), Atheliaceae. 1, Europe. See Larsson & Hjortstam (*Mycotaxon* **14**: 69, 1982).

Locelliderma Tehon (1935) = Hypoderma De Not. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Locellina Gillet (1876) nom. dub. ? = Cortinarius fide Kuyper (*in litt.*).

Lockerbia K.D. Hyde (1994), Sordariomycetes. 1, Australia. See Hyde (*Prodr. fl. neomarch.* **46**: 23, 1994).

locule (**loculus**), a cavity, esp. one in a stroma.

Loculistroma F. Patt. & Charles (1910), Hypocreales. 1 (on *Phyllostachys*), China. Type material is lost; possibly a synonym of *Aciculisporium*. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Loculoascomycetes Ainsw. (1966) (syn. Ascoloculares, Bitunicatae). This taxon was first proposed by Luttrell (*Mycol.* **47**: 511, 1955), as a subclass for *Ascomycota* with fissitunicately discharging asci, producing ascospores which are generally septate, and borne in unwalled locules (pseudothecia) in ascostromatic ascomata with an ascolocular ontogeny. Orders commonly recognized included the *Myriangiales* (asci globose), *Pleosporales* (asci clavate; pseudoparaphyses present), *Hysteriales* (ascocarp opening by a longitudinal split), *Dothideales* (asci clavate; pseudoparaphyses absent), *Capnodiales* (sooty-moulds; q.v.) and *Microthyriales* (ascomata shield-shaped). This class is not accepted in this edition of the *Dictionary*.

See Barr (*Prodromus to class Loculoascomycetes*, 1987), Lumbsch & Huhndorf (*MR* **111**: 1064, 2007).

Loculohypoxylon M.E. Barr (1976), Dothideomycetes. 1, N. America. See Barr (*Mycotaxon* **3**: 326, 1976), Barr (*Mycotaxon* **82**: 373, 2002; poss. affinities with *Teichospora*).

Loculomycetes. Class introduced by Gorovii (*Dopov. Akad. Nauk. ukr. RSR* B 1977(8): 742) for *Zerovaemyces* (q.v.), an agaric similar to *Coprinus* but in which the gills are replaced by spherical multiloculate structures containing spores; each chamber contains one **loculospore**. Considered to be a new type of sexual sporulation in fungi.

loculospore, a spore of *Loculomycetes*, q.v.

Loculotuber Trappe, Parladé & I.F. Alvarez (1993), ? Tuberaceae. 1, Europe (southern); N. Africa. See Alvarez *et al.* (*Mycol.* **84**: 926, 1993), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Lodderomyces Van der Walt (1966), Saccharomycetales. Anamorph *Candida*. 1, USA; S. Africa. Utilizes higher alkanes. See James *et al.* (*Lett. Appl. Microbiol.* **19**: 308, 1994), Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 254, 1998), Fitzpatrick *et al.* (*BMC Evolutionary Biology* **6**: 99, 2006; phylogeny), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Loflammia Vězda (1986), Ectolechiaceae (L). 4 (on leaves), widespread (tropical). See Vězda (*Folia geobot. phytotax.* **21**: 211, 1986), Aptroot *et al.* (*Mycotaxon* **88**: 41, 2003; China, Taiwan).

Loflammiopsis Lücking & Kalb (2000), Ectolechiaceae (L). 1, Brazil. See Lücking & Kalb (*Bot Jahrb. Syst.* **122**: 1, 2000; Brazil).

Logilvia Vězda (1986), Ectolechiaceae (L). 1 (on leaves), widespread (tropical). See Vězda (*Folia geobot. phytotax.* **21**: 211, 1986).

Lohwagia Petr. (1942), ? Phyllachoraceae. 3 (from living leaves and stems), C. & S. America. See von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Lohwagiella Petr. (1970) = Niesslia fide Samuels & Barr (*CJB* **75**: 2165, 1998).

Lojkania Rehm (1905), Fenestellaceae. 10, widespread (temperate). See Barr (*Mycotaxon* **20**: 1, 1984), Yuan & Barr (*Sydowia* **46**: 338, 1995; key 4 spp. China), Lumbsch & Lindemuth (*MR* **105**: 901, 2001; phylogeny), Chen & Hsieh (*Fungal Science* Taipei **18**: 119, 2003; Taiwan).

Loliomyces Maire (1937), anamorphic *Pezizomycotina*. 1, Morocco.

Lolium endophyte. see endophyte.

Lollipopaia Inderbitzin (2001), Diaporthales. 1, Thailand. See Inderbitzin & Berbee (*CJB* **79**: 1100, 2001), Pinruan *et al.* (*Mycol.* **96**: 1163, 2004; phylogeny).

Loma Morrison & Sprague (1981), Microsporidia. 11.

Lomaantha Subram. (1954), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 1, India. See Subramanian (*J. Indian bot. Soc.* **33**: 31, 1954), Wu & Zhuang (*Fungal Diversity Res. Ser.* **15**, 2005).

Lomachashaka Subram. (1956), anamorphic *Pezizomycotina*, Hsp.0eH/1eP.15. 4, W. Africa; India. See Nag Raj (*Mycotaxon* **53**: 311, 1995).

lomasome, a vesicle derived from an intracytoplasmic membrane (Marchant *et al.*, *New Phytol.* **66**: 623, 1967). Cf. plasmalemmasome.

Lomatia (Fr.) P. Karst. (1889) [non *Lomatia* R. Br. 1810, *Proteaceae*] ≡ Lomatina.

Lomatina P. Karst. (1892) = Cytidia fide Cooke (*Beih. Sydowia* **4**: 1, 1961).

Lomentospora Hennebert & B.G. Desai (1974) = Scedosporium fide Hennebert & Desai (*Mycotaxon* **1**: 45, 1974), Lennon *et al.* (*J. Clin. Microbiol.* **32**: 2413, 1994).

Lonchospermella Speg. (1908) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Longevity. The life-span of an individual fungus in nature is difficult to ascertain. Mycorrhizal and other soil-dwelling fungi whose mycelia radiate out for huge distances may in general live longer than other other groups; it has been claimed that an 'individual' *Armillaria bulbosa* thallus in Michigan weighs in excess of 10,000 kg, occupies 15 ha, and has been genetically stable for over 1,500 yrs (Smith *et al.*, *Nature* **356**: 428, 1992; see critique by Brasier, *Nature* **356**: 382, 1992). The oldest viable fungi known were isolated from the inner portions of Greenland glacier ice cores, including glacial ice estimated as 140,000 yrs old (Ma *et al*, *Mycol.* **92**: 286, 2000). Some crustose lichens have been claimed to be older than 1,500 yrs, and 3,700 yrs has been presumed for a *Rhizocarpon geographicum* thallus in Alaska (Denton & Karlén, *Arctic Alp. Res.* **5**: 347, 1973). However, the tendency of individuals of some lichen species to coalesce into larger thalli makes such conclusions suspect. Studies on historical surfaces do, however, leave no doubt that some crustose lichens can live several centuries, e.g. a 620 yr *Aspicilia calcarea* thallus in Oxfordshire (Winchester, *Bot. J. Linn. Soc.* **96**: 57, 1988). In contrast, some lichens may exist for a few months or be seasonal (Poelt & Vězda, *Bibl. Lich.* **38**: 377, 1990). Fungal spores, sclerotia and other vegetative structures may retain their viability under natural conditions for periods of minutes or up to 50 years or more. With freeze drying or liquid nitrogen preservation, lyophilization and other culture collection techniques, they may retain viability in the laboratory for a period which, barring accidents and radiation-induced mutations, may be theoretically without limit. See Sussman (*in* Ainsworth & Sussman (Eds), *The Fungi* **3**: 447, 1968; review, refs.), Ellis & Roberson (*Mycol.* **60**: 399, 1968; lyophilized cultures), Hwang *et al.* (*Mycol.* **68**: 377, 1976; at ultra low temp.). See also Fairy rings, Genetic resource collections, Lichenometry, Record fungi.

Longia Syd. (1921) = Haploravenelia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Longia Zeller (1943) ≡ Longula.

longicollous, having long beaks or necks.

longiseptum, see septum.

Longoa Curzi (1927) = Togninia fide Eriksson (*SA* **5**: 139, 1986), Mostert *et al.* (*Mycol.* **95**: 646, 2003).

longuinose, see lanate.

Longula Zeller (1945) = Agaricus L. fide Harding (*Mycol.* **49**: 273, 1957), Vellinga (*MR* **108**: 354, 2004; basidioma gasteroid) See also.

Lopacidia Kalb (1984), Lecideaceae (L). 2, S. America. See Kalb (*Lichenes Neotropici* Fascicle **VIII** (nos 301-350) **8**: 2, 1984).

Lopadiaceae Hafellner (1984) = Ectolechiaceae.

Lopadiomyces Cif. & Tomas. (1953) nom. illegit. ≡ Lopadium.

Lopadiopsidomyces Cif. & Tomas. (1953) ≡ Lopadiopsis.

Lopadiopsis Vain. (1896) = Gyalectidium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Lopadium Körb. (1855) nom. cons., ? Ectolechiaceae (L). *c*. 50, widespread. See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952), Patwardhan & Makhija (*Indian J. Bot.* **4**: 20, 1981; 10 spp.).

Lopadostoma (Nitschke) Traverso (1906), Xylariaceae. Anamorph *Libertella*-like. 6, Europe. See Eriksson (*Svensk bot. Tidskr.* **60**: 315, 1966), Rappaz (*Mycol. Helv.* **7**: 99, 1995), Granmo & Petrini (*Mycol. Helv.* **8**: 43, 1996).

Lopezaria Kalb & Hafellner (1990), Ramalinaceae (L). 1, S. America. See Kalb & Hafellner (*Lichenes Neotropici* Fascicle **XI** (nos 451-475): 2, 1990), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Lopharia Kalchbr. & MacOwan (1881), Polyporaceae. 13, widespread. See Hjortstam & Ryvarden (*Syn. Fung.* **4**: 19, 1990; key), Boidin & Gilles (*BSMF* **118**: 91, 2002).

Lophariaceae Boidin, Mugnier & Canales (1998) = Phanerochaetaceae.

Lophiaceae H. Zogg ex Arx & E. Müll. (1975) = Mytilinidiaceae.

Lophidiopsis Berl. (1890) = Lophiostoma fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lophidium P. Karst. (1873) [non *Lophidium* Rich. 1792, *Schizaeaceae*] = Lophium fide Zogg (*Beitr. Kryptfl. Schweiz* **11** no. 3, 1962).

Lophidium Sacc. (1878) ≡ Platystomum.

Lophiella Sacc. (1878), Lophiostomataceae. 1, Europe. See Parbery (*Aust. J. Bot.* **15**: 271, 1967).

Lophionema Sacc. (1883), Lophiostomataceae. 2 or 3, widespread. See Chesters & Bell (*Mycol. Pap.* **120**, 1970).

Lophiosphaera Trevis. (1877) = Lophiostoma fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lophiosphaerella Hara (1948), ? Dothideomycetes. 1, Asia.

Lophiostoma Ces. & De Not. (1863) nom. cons., Lophiostomataceae. Anamorph *Pleurophomopsis*-like. 83, widespread. See Chesters & Bell (*Mycol. Pap.* **120**, 1970; key 23 spp.), Leuchtmann (*Sydowia* **38**: 158, 1986; anamorph), Holm & Holm (*Symb. bot. upsal.* **28** no. 2: 1, 1988; keys 28 spp.), Hyde & Aptroot (*Nova Hedwigia* **66**: 489, 1998; tropical freshwater spp.), Hyde *et al.* (*Nova Hedwigia* **70**: 143, 2000; on palms), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; phylogeny), Hyde *et al.* (*Fungal Diversity Res. Ser.* **7**: 93, 2002; marine taxa), Liew *et al.* (*Mycol.* **94**: 803, 2002; phylogeny), Tanaka & Harada (*Mycoscience* **44**: 85, 2003; Japan), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Kodsueb *et al.* (*Botanical Journal of the Linnean Society* **155**: 283, 2007; descr.).

Lophiostomataceae Sacc. (1883), Pleosporales. 15 gen. (+ 13 syn.), 138 spp. Paraphyletic as currently circumscribed.

Lit.: Chesters & Bell (*Mycol. Pap.* **120**, 1970), Holm (*Windahlia* **16**: 49, 1986), Kohlmeyer (*CJB* **64**: 3036, 1986), Holm & Holm (*Symb. bot. upsal.* **28**: 50 pp., 1988), Holm & Holm (*Symb. bot. upsal.* **28** no. 2, 1988; keys 28 spp.), Barr (*N. Amer. Fl.* ser. 2 **13**: 129 pp., 1990), Barr (*Mycotaxon* **45**: 191, 1992), Yuan & Zhao (*Symbiosis* **46**: 112, 1994; China), Ber-

bee (*Mol. Biol. Evol.* **13**: 462, 1996), Checa (*Mycotaxon* **63**: 467, 1997; Iberian spp.), Aptroot (*Nova Hedwigia* **66**: 89, 1998), Hyde *et al.* (*Nova Hedwigia* **70**: 143, 2000), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000), Liew *et al.* (*Mycol.* **94**: 803, 2002), Eriksson & Hawksworth (*Mycol.* **95**: 426, 2003), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Wang *et al.* (*MR* **111**: 1268, 2007; phylogeny).

Lophiotrema Sacc. (1878), Lophiostomataceae. 12, widespread. See Holm & Holm (*Symb. bot. upsal.* **28** no. 2, 1988), Tanaka & Harada (*Mycoscience* **44**: 115, 2003; Japan), Tang *et al.* (*Persoonia* **18**: 265, 2003; Hong Kong).

Lophiotricha Richon (1885) = Lophiostoma fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Lophium Fr. (1823), Mytilinidiaceae. Anamorph *Papulaspora*-like. 4 (on conifers), Europe; America. See Zogg (*Beitr. Kryptfl. Schweiz* **11** no. 3, 1962), Vasil'eva (*Mikol. Fitopatol.* **35**: 15, 2001; Russia), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Lophoderma Chevall. (1822) nom. rej. prop. ≡ Hypoderma DC.

Lophodermella Höhn. (1917), Rhytismataceae. 9, widespread. See Millar *in* Peterson (*Recent Research in Conifer Needle Diseases*: 45, 1986), Minter (*Mycopathologia* **121**: 51, 1993).

Lophodermellina Höhn. (1917) = Lophodermium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Johnston (*Mycol. Pap.* **176**: 239 pp., 2001).

Lophodermina Höhn. (1917) = Lophodermium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Johnston (*Mycol. Pap.* **176**: 239 pp., 2001).

Lophodermium Chevall. (1826) nom. cons., Rhytismataceae. Anamorph *Leptostroma*. 145, widespread. *L. seditiosum* (needle cast of *Pinus sylvestris*. See Darker (*Contr. Arnold Arbor.* **1**: 65, 1932), Tehon (*Ill. biol. Monogr.* **13**, 1935), Darker (*CJB* **45**: 1399, 1967), Morgan-Jones & Hulton (*Mycol.* **71**: 1043, 1979; ontogeny), Minter (*Mycol. Pap.* **147**, 1981; monogr. 16 spp. on pines, key), Cannon & Minter (*Taxon* **30**: 572, 1983; gen. nomencl.), Johnston (*N.Z. Jl Bot.* **27**: 243, 1989; key 21 spp.), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Johnston (*Aust. Syst. Bot.* **14**: 377, 2001; Australasia), Johnston (*Mycol. Pap.* **176**, 2001; spp. on monocots), Ortiz-García *et al.* (*Mycol.* **95**: 846, 2003; on pines), Hou *et al.* (*CJB* **83**: 37, 2005; on *Juniperus*, China), Lin *et al.* (*Mycosystema* **24**: 1, 2005; China), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Lophodermopsis Speg. (1910) nom. dub., Pezizomycotina. See Petrak & Sydow (*Annls mycol.* **34**: 29, 1936).

Lophodiscella Tehon (1933) = Colletotrichum fide Sutton (*Mycol. Pap.* **141**, 1977).

Lopholeptosphaeria Sousa da Câmara (1932) nom. dub., Dothideomycetes. No spp. Included.

Lophomerum Ouell. & Magasi (1966), Rhytismataceae. 6, widespread. See Johnston (*Mycotaxon* **33**: 423, 1988; gen. concept).

Lophophacidium Lagerb. (1949), Phacidiaceae. Anamorph *Apostrasseria*. 2, widespread (north temperate). See Corlett & Shoemaker (*CJB* **62**: 1836, 1984).

Lophophyton Matr. & Dassonv. (1899) = Trichophyton fide Carmichael *et al.* (*Genera of Hyphomycetes*, 1980).

Lophothelium Stirt. (1887) = Polycoccum fide Hawksworth (*Notes R. bot. Gdn Edinb.* **36**: 181, 1978).

Lophotrichaceae Seth (1971) = Microascaceae.

lophotrichous (lophotrichate), having several flagella at one or both ends.

Lophotrichus R.K. Benj. (1949), Microascaceae. Anamorph *Humicola*-like. 4 (coprophilous), widespread. See von Arx *et al.* (*Beih. Nova Hedwigia* **94**, 1988; key), Lee & Hanlin (*Mycol.* **91**: 434, 1999; DNA).

Loramyces W. Weston (1929), Loramycetaceae. Anamorph *Anguillospora*-like. 2, USA; Europe. See Ingold & Chapman (*TBMS* **35**: 268, 1952), Digby & Goos (*Mycol.* **79**: 821, 1988; posn), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny, links with *Mollisia*).

Loramycetaceae Dennis ex Digby & Goos (1988), Helotiales. 1 gen., 2 spp. Perhaps the most appropriate placement for *Mollisia* and its relatives.

Lit.: Digby & Goos (*Mycol.* **79**: 821, 1987), Gernandt *et al.* (*Mycol.* **93**: 915, 2001), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006).

Loranitschkia Lar.N. Vassiljeva (1990), Nitschkiaceae. 1 (from wood), Sakhalin. See Vasil'eva (*Mikol. Fitopatol.* **24**: 207, 1990).

Loranthomyces Höhn. (1909) = Actinopeltis fide Spooner & Kirk (*MR* **94**: 223, 1990).

lorate, like a narrow band; strap-like in form; ligulate.

Loratospora Kohlm. & Volkm.-Kohlm. (1993), Planistromellaceae. 1, USA. See Kohlmeyer & Volkmann-Kohlmeyer (*SA* **12**: 7, 1993), Barr (*Mycotaxon* **60**: 433, 1996).

lorchel (false morel, lorel), the ascoma of *Gyromitra esculenta*, which is poisonous; see gyromitrin.

lorel, see lorchel.

Loreleia Redhead, Moncalvo, Vilgalys & Lutzoni (2002), Agaricomycetes. 3, Europe; N. America. *Hymenochaetales* or *Agaricales* (*Rickenella* clade). See Redhead *et al.* (*Mycotaxon* **82**: 162, 2002).

Loricella Velen. (1934), Helotiales. 2, former Czechoslovakia.

Loten Adans. (1763) nom. dub., ? Pezizomycotina.

lotic, habitat running water (streams). Cf. lentic.

Loweomyces (Kotl. & Pouzar) Jülich (1982), Meruliaceae. 2, widespread. See Jülich (*Persoonia* **11**: 424, 1982).

Loweporus J.E. Wright (1976) = Perenniporia fide Decock (*in litt.*) See, Ryvarden & Eriksson (*Prelim. Polyp. Fl. E. Afr.*: 410, 1980).

lower fungi, *Chytridiomycota*, *Hyphochytriomycota*, *Mycetozoa*, *Oomycota*, *Plasmodiophoromycota* and *Zygomycota*. See also phycomycetes.

Loxophyllum Klotzsch (1831) [non *Loxophyllum* Blume 1826, *Scrophulariaceae*] = Cyclomyces fide Saccardo (*Syll. fung.* **5**: 1, 1887).

Loxospora A. Massal. (1852), Sarrameanaceae (L). *c.* 5, widespread. See Staiger & Kalb (*Biblthca Lichenol.* **59**: 3, 1995), Kantvilas (*Herzogia* **14**: 35, 2000; S hemisphere), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Nelsen *et al.* (*Lichenologist* **38**: 251, 2006; Costa Rica), Lumbsch *et al.* (*Lichenologist* **39**: 509, 2007; Australia), Lumbsch *et al.* (*Nova Hedwigia* **86**: 105, 2008; phylogeny, chemistry).

Loxosporaceae Kalb & Staiger (1995) = Sarrameanaceae. See Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Lumbsch *et al.* (*Nova Hedwigia* **86**: 105, 2008; phylogeny, chemistry).

Loxosporopsis Henssen (1995), Pertusariaceae (L). 1, USA. See Brodo & Henssen (*Biblthca Lichenol.* **58**: 27, 1995), Schmitt & Lumbsch (*Mol. Phylogen. Evol.* **33**: 43, 2004; chemistry, phylogeny), Lumbsch *et al.* (*Biol. J. Linn. Soc.* **89**: 615, 2006; evolution, chemistry), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**: 753, 2006; phylogeny).

LPS, Instituto de Botánica C. Spegazzini (q.v.; La Plata, Argentina); founded 1935; a part of the Museo de La Plata.

LSD, see lysergic acid.

Luciotrichus R. Galán & Raitv. (1995), Pyronemataceae. 1, Spain. See Galán & Raitviir (*Czech Mycol.* **47**: 271, 1995).

Leeuwenh.* **91**: 327, 2007).

Lulworthiales Kohlm., Spatafora & Volkm.-Kohlm. (2000). Spathulosporomycetidae. 3 fam., 11 gen., 40 spp. Fams:

(1) **Hispidicarpomycetaceae**
(2) **Lulworthiaceae**
(3) **Spathulosporaceae**

The *Hispidicarpomycetaceae* may also belong here, but molecular data are inadequate at present. *Lit.*: Kohlmeyer *et al.* (*Mycol.* **92**: 453, 2000; morphol., DNA), Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979), Nakagiri (*TMSJ* **25**: 377, 1984; morphol.), Spatafora *et al.* (*Am. J. Bot.* **85**: 1569, 1998; DNA).

lumen, the central cavity of a cell or other structure.

Luminescent fungi. Some fungi (40 listed by Wassink, 1979), such as species of *Panus* and *Pleurotus*, *Clitocybe illudens* (also mycelium; see Carey, *Mycol.* **66**: 951, 1974), *Armillaria mellea* (mycelium in wood exposed to air), and *Xylaria hypoxylon* (mycelium) and certain bacteria, give out light, sometimes causing the attacked wood or leaves to become luminous. See Berliner (*Mycol.* **53**: 84, 1962), Buller (*Researches* **3**, **6**), Calleja & Reynolds (*TBMS* **55**: 149, 1970), Corner (*Mycol.* **42**: 423, 1950; *TBMS* **37**: 256, 1954), Glawe & Solberg (*Mycol.* **81**: 296, 1989; early records), Murrill (*Mycol.* **7**: 131, 1915), Ramsbottom (*Mushrooms and toadstools*, 1953), Wassink (*Meded. Landbouwhogeschool Wageningen* **79** (5), 1979; review, incl. physiol. basis).

lunate, like a new moon; crescentic (Fig. 23.9).

Lundquistia Vánky (2001) = Sporisorium fide Cunnington *et al.* (*Mycol. Balcanica* **2**: 95, 2005).

lungwort, the lichen *Lobaria pulmonaria* from its external resemblance to a human lung; lung lichen; lungs of oak. Formerly used in folk-lore as a cure for pulmonary diseases.

Lunospora Frandsen (1943) = Pseudoseptoria fide Sutton (*Mycol. Pap.* **141**, 1977).

Lunulospora Ingold (1942), anamorphic *Pezizomycotina*, Hso.0fH.11. 1 (aquatic), widespread.

lupinosis, a mycotoxicosis of sheep, caused by *Phoma leptostromiformis*; see van Warmelo & Marasas (*Mycol.* **64**: 316, 1972); teleomorph *Diaporthe* (q.v.).

luteoskyrin, a carcinogenic toxin of *Penicillium islandicum*; a cause of hepatitis (yellow rice disease) in man. See also islandicin; cf. skyrin.

luteous, yellow.

Luttrell (Everett Stanley, 1916-1988; USA). PhD, Duke University (1940); Mycologist and plant pathologist, Georgia Experiment Station (1942-1944, 1949-1966); University of Georgia (1966-1986) where he was later D.W. Brooks Distinguished Professor of Plant Pathology. His *Taxonomy of Pyrenomycetes* (1951) was a major advance in ascomycete systematics, linking the bitunicate ascus to ascolocular ontogeny the importance of which had been stressed by Nannfeldt (q.v.). *Publs.* Loculoascomycetes. *in* Ainsworth, Sparrow & Sussman [eds] *The Fungi* **4A**: 133 (1973) [the first critical keys to all non-lichen-forming loculoascomycete genera]; also detailed accounts of many *Helminthosporium*-like fungi and plant pathogenic ascomycetes. *Biogs, obits etc.* Hanlin & Garrett (*Phytopathology* **78**: 1388, 1988) [portrait]; Hanlin & Mims (*Mycol.* **82**: 9, 1990) [bibliography, portrait]: Glenn (*Inoculum* **45**: 1, 1998) [portrait].

Luttrellia Khokhr. & Gornostaĭ (1978) nom. rej. = Exserohilum fide Kirk (*in litt.*).

Luttrellia Shearer (1978), Halosphaeriaceae. 4 (marine), USA. See Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991), Ferrer & Shearer (*Mycol.* **99**: 144, 2007; freshwater spp.).

Lutypha Khurana, K.S. Thind & Berthier (1977), Typhulaceae. 1, India. See Khurana *et al.* (*TBMS* **68**: 480, 1977).

Lutziomyces O.M. Fonseca (1939) ≡ Paracoccidioides.

Luxuriomyces R.F. Castañeda (1988) = Diplococcium fide Sutton (*in litt.*).

Luykenia Trevis. (1860) = Thelenella fide Mayrhofer & Poelt (*Herzogia* **7**: 13, 1985), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Luzfridiella R.F. Castañeda & W.B. Kendr. (1991), anamorphic *Pezizomycotina*, Hsy.1eP.24/27. 1, Cuba. See Castañeda Ruiz & Kendrick (*Univ. Waterloo Biol. Ser.* **35**: 69, 1991).

Lycogalopsis E. Fisch. (1886), Agaricaceae. 1, widespread (tropical). See Martin (*Lilloa* **4**: 69, 1939).

lycomarasmin, a dipeptide wilt toxin from *Fusarium bulbigenum* f.sp. *lycopersici* (Gäumann *et al.*, *Phytopath. Z.* **16**: 257, 1950, **30**: 87, 1957); **lycomarasmic acid** is a derivative (Gäumann & Naef-Roth, *Phytopath. Z.* **34**: 426, 1959). Cf. fusaric acid.

Lycoperdaceae Chevall. (1826) = Agaricaceae.

Lycoperdales = Agaricales.

Lycoperdastrum Haller ex Kuntze (1891) = Elaphomyces fide Dodge (*Ann. Myc.* **27**: 145, 1929).

Lycoperdastrum P. Micheli (1729) nom. inval. = Scleroderma fide Stalpers (*in litt.*).

Lycoperdellon Torrend (1913) = Ostracoderma fide Hennebert (*Persoonia* **7**: 200, 1973).

Lycoperdites Poinar (2001), Fossil fungi. 1.

Lycoperdodes Haller ex Kuntze (1891) = Pisolithus fide Fischer (*Nat. Pflanzenfam.* **5b**: viii, 1938).

Lycoperdoides, see *Lycoperdodes*.

Lycoperdon Pers. (1801), Agaricaceae. *c.* 50, widespread. The common Puff Balls. See Kreisel (*Khumbu Himal.* [*Ergebn. ForschUnte rnehmens Nepal Himalaya*] **6**: 32, 1969; key spp. pedicellate spores), Ponce de Leon (*Fieldiana, Bot.* **32**: 109, 1970; key (as *Vascellum*)), Smith (*Bull. mens. Soc. linn. Lyon* Num. Spéc. **43**: 407, 1974; N. Am. (as *Vascellum*)), Demoulin (*Mycotaxon* **3**: 275, 1976; key spp. peridial spherocysts), Demoulin (*Revista Biol.* **12**: 65, 1983; key S. Eur.), Homrich & Wright (*CJB* **66**: 1285, 1988; S. Am. (as *Vascellum*)), Kreisel (*Blyttia* **51**: 125, 1993; key (as *Vascellum*)), Kreisel & Calonge (*Mycotaxon* **48**: 13, 1993; as *Bovistella*), Kasuya (*Mycoscience* **45**: 298, 2004; Japan), Baseia (*Mycotaxon* **91**: 81, 2005; Brazil), Blaschke (*Mycologia Bavarica* **7**: 21, 2005; as *Bovistella*), Larsson & Jeppson (*MR* **112**: 4, 2008; phylogeny).

Lycoperdopsis Henn. (1899), Agaricaceae. 1, Asia (tropical). See Pegler & Young (*MR* **98**: 904, 1994).

Lylea Morgan-Jones (1975), anamorphic *Pezizomycotina*, Hso.≡ eP.3. 3, widespread (esp. north temperate). See Holubová-Jechová (*Folia geobot. phytotax.* **13**: 437, 1978), Chang (*Bot. Bull. Acad. sin.* Taipei **40**: 247, 1999).

lymabiont, an organism only found in sewage.

lymaphile, an organism commonly found in sewage (Cooke, *Sydowia, Beih.* **1**, 1957).

lymaphobe, an organism never found in sewage (Cooke, *Sydowia, Beih.* **1**, 1957).

lymaxene, an organism rarely found in sewage (Cooke, *Sydowia, Beih.* **1**, 1957).

Lymphocystidium Weiser (1943), ? Fungi. 1, Europe. or Protozoa. See Weiser (*Zool. Anzeiger* **142**: 200, 1943).

Lyoathelia Hjortstam & Ryvarden (2004), ? Atheliaceae. 1, Canada. See Hjortstam & Ryvarden (*Syn. Fung.* **18**: 10, 2004).

lyocystidium, see cystidium.

Lyomices, see *Lyomyces P. Karst. (1881).*

Lyomyces P. Karst. (1881) nom. rej. = Hyphoderma Wallr. fide Donk (*Taxon* **5**: 69, 1956).

Lyomyces P. Karst. (1882) = Laeticorticium fide Donk (*Persoonia* **3**: 199, 1964).

Lyonella Syd. (1925), Pezizomycotina. 1, Hawaii.

Lyonomyces T.N. Taylor, Hass & W. Remy (1993), Fossil Fungi. 1 (Devonian), British Isles. See Taylor *et al.* (*Mycol.* **84**: 906 and fig. 19, 1992).

lyophilization, freeze-drying, a technique used to preserve fungal cultures in a state of suspended animation. See Genetic resource collections.

Lyophyllaceae Jülich (1982), Agaricales. 8 gen. (+ 6 syn.), 157 spp.

Lyophyllopsis Sathe & J.T. Daniel (1981), ? Lyophyllaceae. 1, India. See Sathe & Daniel (*Maharashtra Assoc. Cult. Sci.* Monogr. **1**: 87, 1980).

Lyophyllum P. Karst. (1881) nom. cons. prop., Lyophyllaceae. *c.* 40, widespread (north temperate). See Clemençon (*Mycotaxon* **15**: 67, 1982; staining spp.), Consiglio & Contu (*Rivista di Micologia* **45**: 99, 2002; Italy), Hofstetter *et al.* (*MR* **106**: 1043, 2002; phylogeny), Kalamees (*Folia cryptog. Estonica* **40**: 15, 2003; Nordic spp.), Consiglio & Contu (*Micologia e Vegetazione Mediterranea* **20**: 143, 2005; European collybioid spp.).

Lyromma Bat. & H. Maia (1965), anamorphic *Pyrenulales*, St.0fH.? (L). 3, widespread (tropical). See Aptroot *et al.* (*Biblthca Lichenol.* **64**, 1997), Lücking *et al.* (*Lichenologist* **30**: 121, 1998), Lücking & Kalb (*Bot. Jb.* **122**: 1, 2000; Brazil, key).

Lyrommotheca Bat. & T. Herrera (1972) nom. inval. ≡ Lyromma fide Aptroot (*in litt.*), Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

lysergic acid, and derivatives, some of which are hallucinogenic (e.g. lysergic acid diethylamide; LSD) occur in *Claviceps* sclerotia and are the cause of paspalum staggers (q.v.); see also hallucinogenic fungi.

lysigenous, formed by the breaking down of cells. Cf. schizogenous.

Lysipenicillium Bref. (1908) = Roumegueriella fide Malloch & Cain (*CJB* **50**: 61, 1972), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

lysis (1) dissolution of a cell, e.g. by a lysin, see antigen; (2) (of conidial liberation), secession by the dissolution of the wall of the adjacent cell; cf. fission, fracture.

Lysospora Arthur (1906) = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Lysotheca Cif. (1962), anamorphic *Pezizomycotina*, Cpd.0fH.?. 1 (on *Balladynella*), Dominican Republic. See Ciferri (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **19**: 112, 1962).

Lysuraceae Corda (1842) = Phallaceae.

Lysurus Fr. (1823), Phallaceae. 5, widespread (esp. tropical). See Kasuya (*Nippon Kingakukai Kaiho* **45**: 39, 2004; Japan).

M, Botanischen Staatssammlung München (Munich, Germany); founded 1813; funded by the State of Bavaria; see Hertel & Schreiber (*Mitt. Bot. StSamml., Münch.* **28**: 81, 1988; history, collectors index).

MA, see Media.

Maasoglossum K.S. Thind & R. Sharma (1985), ? Geoglossaceae. 1, Himalaya. See Thind & Sharma (*Kavaka* **12**: 37, 1985).

Macabuna Buriticá & J.F. Hennen (1994), anamorphic *Phakopsoraceae*. 11, widespread. Anamorph name for (II). See Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; syn. of *Calidion*).

macaedium, see mazaedium.

Macalpinia Arthur (1906) = Uromycladium fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).
Macalpinomyces Langdon & Full. (1977), ? Ustilaginaceae. 44 (on *Poaceae*), widespread. See Vánky (*Mycotaxon* **59**: 115, 1996; monogr.), Vánky (*Mycotaxon* **62**: 128, 1997; emend.), Vánky (*Mycotaxon* **69**: 112, 1998; key), Shivas & Vánky (*Mycol. Balcanica* **2**: 101, 2005; Austral.), Vánky (*Mycotaxon* **95**: 1, 2006).
Macbridella Seaver (1909) = Byssosphaeria fide Samuels (*CJB* **51**: 1275, 1973), Barr (*Mycotaxon* **20**, 1984).
Maccagnia Mattir. (1922), ? Hydnangiaceae. 1, Italy.
Macentina Vězda (1973) = Psoroglaena fide Aptroot (*in litt.*), Coppins & Vězda (*Lichenologist* **9**: 47, 1977), Orange (*Lichenologist* **23**: 15, 1991; key), Matzer (*Mycol. Pap.* **171**: 202, 1996), Aragón & Sarrión (*Nova Hedwigia* **77**: 169, 2003; Spain).
Macilvainea Nieuwl. (1916) ≡ Drudeola fide Sutton (*Mycol. Pap.* **141**, 1977).
Mackenziea Yanna & K.D. Hyde (2002), anamorphic *Pezizomycotina*, H?.?.?. 1, Australia. See Yanna & Hyde (*Aust. Syst. Bot.* **15**: 757, 2002).
Mackintoshia Pacioni & Sharp (2000), Cortinariaceae. 1, Zimbabwe. See Pacioni & Sharp (*Mycotaxon* **75**: 225, 2000), Verbeken & Walleyn (*Boll. Gruppo Micol. 'G. Bresadola'* **46**: 87, 2003).
Macmillanina Kuntze (1898) = Disculina fide Sutton (*Mycol. Pap.* **141**, 1977).
Macowania Kalchbr. ex Berk. (1876) [non *Macowania* Oliv. 1870, *Compositae*] ≡ Macowanites.
Macowaniella Doidge (1921), Asterinaceae. 2, S. Africa.
Macowanites Kalchbr. (1882) = Russula.
Macraea Subram. (1953) [non *Macraea* Lindl. 1828, *Geraniaceae*] ≡ Prathigada.
macro- (prefix), long, but commonly used in the sense of mega- (q.v.).
Macroallantina Speer (1987), anamorphic *Delpinoina*, St.0eH.1. 1, France. See Speer (*BSMF* **103**: 14, 1987).
Macrobasis Starbäck (1893) = Leptosphaeria fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Macrobiotophthora Reukauf (1912), Ancylistaceae. 2, Germany; Australia. See Reukauf (*Centralbl. Bakt.* Abt. Orig. **63**: 390, 1912), McCulloch (*TBMS* **68**: 173, 1977), Tucker (*Mycotaxon* **13**: 481, 1981; emend., key).
macrocephalic, see septum.
Macrochytrium Minden (1902), ? Chytridiaceae. 1, Europe; N. America.
macroconidium (1) the larger, and generally more diagnostic conidium of a fungus which has microconidia (and sometimes also mesoconidia) in addition; (2) (infrequent), a long large conidium.
Macrocybe Pegler & Lodge (1998), Tricholomataceae. 7, widespread (tropics). See Pegler *et al.* (*Mycol.* **90**: 496, 1998), Stijve (*AMK Mededelingen*: 93, 2004).
macrocyclic, see *Pucciniales* and Table 5.
macrocyst, see cyst.
Macrocystidia Joss. (1934), Marasmiaceae. 5, widespread. See Capellano (*BSMF* **92**: 221, 1971; basidiospore structure), Kühner (*Hyménomycètes agaricoïdes*: 428, 1980), Anderson *et al.* (*Mycologist* **15**: 132, 2001).
Macrocystidiaceae Kühner (1979) = Marasmiaceae.
Macrocystis R. Heim (1931) [non *Macrocystis* C. Agardh 1820, *Algae*] ≡ Macrocystidia.
Macrodendrophoma T. Johnson (1904) nom. inval., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).
Macroderma Höhn. (1917), Rhytismataceae. 2, N. America; Brazil.
Macrodiaporthe Petr. (1920), Melanconidaceae. Anamorph *Melanconium*. 2, Europe; N. America. See Barr (*Mycol. Mem.* **7**, 1978).
Macrodictya A. Massal. (1852) ≡ Lasallia.
Macrodiplis Clem. & Shear (1931) ≡ Macrodiplodiopsis.
Macrodiplodia Sacc. (1884), anamorphic *Pezizomycotina*, C?.1eP.?. 2, Europe. See Sutton (*Mycol. Pap.* **141**, 1977).
Macrodiplodina Petr. (1962) = Ascochyta fide Punithalingam (*Mycol. Pap.* **142**, 1979).
Macrodiplodiopsis Petr. (1922), anamorphic *Pezizomycotina*, St.≡ -#eP.19. 1, Europe; N. America. See Glawe (*Mycol.* **77**: 880, 1985).
macrofungi, see Macromycetes.
macrogonidium, a large gonidium (obsol.); megalogonidium (obsol.).
Macrohilum H.J. Swart (1988), anamorphic *Diaporthales*, Cpd.1eP.19. 1, Australasia. See Swart (*TBMS* **90**: 288, 1988), Crous *et al.* (*Stud. Mycol.* **55**: 53, 2006; phylogeny).
Macrohyporia I. Johans. & Ryvarden (1979), Polyporaceae. 3, widespread (tropical). See Johansen & Ryvarden (*TBMS* **72**: 192, 1979).
Macrolepiota Singer (1948), Agaricaceae. *c.* 30, widespread. *M. procera*, the edible parasol mushroom. See Heinemann (*Bull. Jard. bot. nat. Belg.* **39**: 201, 1969; key 11 Congo spp.), Pegler (*Kew Bull.* Addit. Ser. **6**, 1977; E. Afr. spp.), Candusso & Lanzoni (*Lepiota s.l.*, 1990; key Europ. spp.), Johnson (*Mycol.* **91**: 443, 1998; phylogeny), Johnson & Vilgalys (*Mycol.* **90**: 971, 1998; phylogeny), Vellinga (*Aust. Syst. Bot.* **16**: 361, 2003; Australia), Vellinga (*Coolia* **46**: 177, 2003; The Netherlands), Vellinga *et al.* (*Mycol.* **95**: 442, 2003; phylogeny and taxonomy), Hausknecht & Pidlich-Aigner (*Öst. Z. Pilzk.* **13**: 1, 2004; Austria), Vellinga (*MR* **108**: 354, 2004; phylogeny).
macrolichen, one of the larger lichens of squamulose, foliose, or fruticose habit incl. spp. *Cladonia*, *Parmelia*, *Usnea*, etc.
Macrometrula Donk & Singer (1948), Psathyrellaceae. 1 (in glasshouse), British Isles (introduced).
Macromycetes. Fungi having large (macroscopic) sporocarps; larger fungi. This is an arbitrary division of the fungi which includes most (but far from all) basidiomycetes (mushrooms, puffballs, stinkhorns, toadstools etc.), and a small number of other fungi, mostly ascomycetes (cup fungi, cyttarias, morels, truffles etc.). Although in popular use, it is not always advantageous to apply the term: in conservation, for example, the result is that those working for ascomycete conservation tend to be deprived of their flagship species. Because of the interest shown by amateur mycologists, mycophagists, and others in macrofungi there are for many countries popular or semi-popular texts covering macromycetes. These works, which are appearing for an increasing number of countries, are frequently of a high mycological standard and are useful both to amateur and professional mycologists. They include:

Regional: **Africa. General**, Ryvarden *et al.* (*An introduction to the larger fungi of south central Africa*,

1994), Zoberi (*Tropical macrofungi*, 1972). **Benin**, De Kessel *et al.* (*Guide des champignons comestibles du Bénin*, 2002). **Burundi**, Buyck (*Ubwoba: les champignons comestibles de l'ouest de Burundi*, 1994). **Malawi**, Morris (*Common mushrooms of Malawi*, 1987; *Checklist of the macrofungi of Malawi* [*Kirkia* **13**: 323, 1990]). **Morocco**, Malençon & Bertault (*Flore des champignons supérieures du Maroc*, 2 vols, 1975). **Tanzania**, Härkönen *et al.* (*Tanzanian mushrooms: edible, harmful and other fungi*, 2003). **Asia**. **China**, Pfister (*Champignons du Tonkin*, 1985), Yuan & Sun (*中國蕈菌原色圖集* [*Coloured atlas of mushrooms (macrofungi) in China*, in Chinese], 2007). **Japan**, Imazeki *et al.* (*Fungi of Japan* [in Japanese], 1998). **South Korea**, Kim & Kim (*Illustrated Korean mushrooms* [in Korean], 1990), Park & lee (*Korean mushrooms* [in Korean], 1999). **Sri Lanka**, Pegler (*Kew Bull. Addn. Ser.* **12**, 1986). **Australasia**. **Australia**, Aberdeen (*Introduction to the mushrooms. of Queensland*, 1979; *Field companion to Australian fungi*, 1985; *A field guide to Australian fungi*, 2005), Shepherd & Totterdell (*Mushrooms and toadstools of Australia*, 1988), Young (*Common Australian fungi*, 1982), Young *et al.* (*A field guide to the fungi of Australia*, 2005). **New Zealand**, Taylor (*Mushrooms and toadstools in New Zealand*, 1970). **Caribbean**. **Dominican Republic**, Perdomo *et al.* (*Hongos comestibles de la República Dominicana, guía de Campo*, 2007). **Central America**. **Costa Rica**, Halling & Mueller (*Common mushrooms of the Talamanca mountains, Costa Rica*, 2005), Mata (*Macrohongos de Costa Rica* vol. 1, 1999), Mata *et al.* (*Macrohongos de Costa Rica* vol. 2, 2003). **Europe**. **General**, Hansen & Knudsen (*Nordic macromycetes*, 2 vols, 1992-3; Scandinavia only), Gams (*Kleine Kryptogamenflora* Band IIa, Julich, *Nichtblatterpilze, Gallertpilze und Bauchpilze*, Band IIb2, Lange (*Guía de campo de los hongos de Europa*, 1981), Moser, *Phycomyceten und Ascomyceten*, 1963, Bd IIb1, Moser, *Rohrlinge und Blatterpilze*, edn 5, 1983 [English edn, Phillips, 1978]), Pegler *et al.* (*Fungi of Europe*, 1993), Peter (*Das grosse Pilzbuch. Eine Pilzkunde Mitteleuropas*, 1964), *Fungi Europaei*, **1** Cappelli, *Agaricus*, 1984, **2** Alessio, *Boletus*, 1985, suppl. 1991, **3** Riva, *Tricholoma*, 1988, **4** Candusso & Lanzoni, *Lepiota*, 1990, **5** Noordeloos, *Entoloma*, 1992). **British Isles**, Buczacki (*Fungi of Britain and Europe*, 1989), Hofmann (*Field guide to mushrooms and other fungi of Britain and Europe*, 2006), Pegler (*Field guide to mushrooms and toadstools of Britain and Europe*, 1990), Wakefield & Dennis (*Common British fungi*, 1950; edn 2, 1981), Watling (*Identification of larger fungi*, 1973), see also Holden, *Guide to the literature for the identification of British fungi*, edn 4, 1982. **Bulgaria**, Sechanov ([*Fungi of Bulgaria*] edn 2, 1957). **Czech Republic**, Papoušek (*Velký fotoatlas hub* [in Czech], 2004). **Denmark**, Lange (*Illustreret svampeflora*, 1961 [also English, French and German versions]; *Soppflora*, 1991). **France**, Costantin & Dufour (*Nouvelle flore des champignons*, 1891 [and later editions]), Rolland (*Atlas des champignons de France, Suisse et Belgique*, 1910), Heim (*Les champignons d'Europe*, 2 vols, 1957 [edn 2 (1 vol.), 1969]), Maublanc (*Les champignons comestibles et veneneux de France*, edn 6 [by Viennot-Bourgin], 2 vols, 1971), Romagnesi (*Petit atlas des champignons*, 3 vols, 1962-63; *Nouvelle atlas des champignons*, 4 vols, edn 2, 1970), Marchand (*Champignons de Nord et du Midi*, 9 vols, 1972-86), Moreau (*Larousse des champignons*, 1978; *Guide des champignons comestibles et vénéneux*, 1984). **former Czechoslovakia**, Pilát (*Nase Houby*, 1952 [English transl., *Mushrooms*, 1954]; *Houby Ceskoslovenska*, 1969; spp. grouped ecologically). **Germany**, Ricken (*Die Blatterpilze (Agaricaceae) Deutschlands*, 1915), Gerhardt (*Pilze*, 2 vols, 1984-5), Hennig (*Taschenbuch fur Pilzefreunde*, 1964 [Aufl. 2, 1966]), Michael & Hennig (*Handbuch fur Pilzfreunde*, 6 vols, 1964-75 [and later edns by Kreisel]), Kreisel (Ed.) (*Pilzflora der DDR*, 1987). **Greece**, Diamandis (*Τα μανιτάρια της Ελλάδος* [*Fungi of Greece*, in Greek], 1992, edn 2 expected late 2008), Pantidou (*Mushrooms in the forests of Greece*, 1991). **Italy**, Cetto (*Enzyklopadie der Pilze*, 4 vols, 1987-8), Goidanich & Govi (*Funghi e ambiente*, 1982), Pacioni (*I funghi nostrani*, 1980), Venturella (*Funghi di Sicilia*, 1997). **Netherlands**, Arnolds *et al.* (*List of fungi in the Netherlands*, 1989), Arnolds & Veerkamp (*Gids voor de paddestoelen in het meetnet*, 1999), Bas *et al.* (*Flora Agaricina Neerlandica*, 1988-). **Spain**, Calonge (*Setas (Hongos), guía ilustrada*, 1990), Calonge & Reche (*Las setas de la Comunidad de Madrid*, 1991), Llamas Frade & Terrón Alfonso (*Guía de hongos de la península Ibérica*, 2005). **Sweden**, Cortin (*Svampplockarens handbok*, 1942), Nilsson & Persson (*Svampar i naturen*, 2 vols, 1977), Ryman & Holmåasen (*Svampar*, 1984). **Switzerland**, Breitenbach & Kranzlin (*Fungi of Switzerland* **1** Ascomycetes, 1981, **2** Non-gilled fungi, 1986, **3** Boletes and agarics, 1991 [English, French and German edns]), Clémençon (*Les quatre saisons des champignons*, 2 vols, 1980). **Middle East**. **Israel**, Wasser (*Edible and poisonous mushrooms of Israel*, 1995). **N. America**. **General**, Phillips (*Mushrooms of North America*, 1991). **Canada**, Barron (*Mushrooms of Ontario and eastern Canada*, 1999), Groves (*Edible and poisonous mushrooms of Canada*, 1979), Pomerleau (*Mushrooms of eastern Canada and the United States*, 1951; *Flore des champignons de Quebec*, 1980), Schalkwijk-Barendsen (*Mushrooms of western Canada*, 1991). **Mexico**, Blanco *et al.*, in Vega & Bousquets (Eds) (*Hongos Macroscopicos*, 1993). **USA**, Atkinson (*Studies of American fungi: mushrooms, edible, poisonous, etc.*, 1903 [reprint 1961], Christensen (*Common fleshy fungi*, 1946 [edn 3, 1965]), Krieger (*The mushroom handbook*, edn 2, 1936 [reprint 1967]), Lincoff (*Audubon field guide to North American mushrooms*, 1981), Metzler & Metzler (*Texas mushrooms*, 1992), Miller (*Mushrooms of North America*, 1974), Phillips (*Mushrooms of North America*, 1991), Smith (*The mushroom hunter's field guide*, 1958 [edn 3, 1980], *Field guide to western mushrooms*, 1975), States (*Mushrooms and truffles of the south-west*, 1990). **South America**. **Argentina**, Gamundí & Horak (*Hongos de los bosques Andino=Patagónicos*, 1993). **Chile**, Furci & Nascimento (*Fungi austral, guía de campo de los hongos más vistosos de Chile*, 2007). **Colombia**, Franco *et al.* (*Setas de Colombia, Agaricales, Boletales y otros hongos, guía de campo*, 2000).

Coloured plates. The following are important series of coloured reference plates (mostly of agarics but other groups sometimes included): Fries (*Icones selectae Hymenomycetum*, 1867- 84), Cooke (*Illustrations of British fungi* (*Hymenomycetes*), 8 vols,

1881-1891; index, *TBMS* **20**: 33, 1935), Konrad & Maublanc (*Icones selectae fungorum*, 6 vols, 1924-36), *BSMF* **41-** (1925-) includes supplementary coloured plates constituting an Atlas), Bresadola (*Iconographia mycologica*, 28 vols, 1927-60; vol. 2 by Gilbert, + 3 suppl.), Cetto (*Der Grosse Pilzfuhrer*, 3 vols, 1979), Dahncke & Dahncke (*700 Pilze in Farbfotos*, 1980), Lange (*Flora agaricina danica*, 5 vols, 1935-41), Romagnesi (*Nouvelle atlas des champignons*, 4 vols, edn 2, 1970), Reid *et al.* (*Fungorum rariorum icones coloratae*, 1966-), Phillips (*Mushrooms and other fungi of Great Britain and Europe*, 1981), Moser & Julich (*Coloured atlas of Basidiomycetes*, 1986-). See further Bolton, Boudier, Bulliard, Greville and Sowerby. See also Watling & Watling (*A literature guide for identifying mushrooms*, 1980; by fam., gen. and geogr. region), Moser & Jülich (*Farbatlas der Basidiomyceten*, 1985). There is an increasing number of guides becoming available on the internet, although quality is more variable.

macronematous (of conidiophores), morphologically different from vegetative hyphae (cf. micronematous).

Macronemeae, hyphomycetes having conidia unlike the hyphae and the conidiophores. Cf. Micronemeae.

Macronodus G.F. Orr (1977) = Gymnoascus fide von Arx (*Persoonia* **9**: 393, 1977).

Macroön Corda (1833) ? = Helminthosporium fide Saccardo (*Syll. fung.* **4**: 403, 1886). Synonymy is doubtful *fide* Sutton (*in litt.*).

Macrophoma (Sacc.) Berl. & Voglino (1886), Botryosphaeriaceae. See Petrak & Sydow (*Beih. Rep. spec. nov. regn. veg.* **42**, 1927; redispositions into *Diplodia*), Phillips & Lucas (*Sydowia* **49**: 150, 1997), Denman *et al.* (*Stud. Mycol.* **45**: 129, 2000; phylogeny), Slippers *et al.* (*Mycol.* **96**: 83, 2004; *Botryosphaeria dothidea* aggregate), Phillips *et al.* (*Mycopathologia* **159**: 433, 2005; phylogeny).

Macrophomella Died. (1916) = Lasiodiplodia fide Petrak & Sydow (*Feddes Repert.* **42**: 1, 1927).

Macrophomina Petr. (1923), anamorphic *Botryosphaeriaceae*, Cpd.0eH.15. 2, widespread. *M. phaseolina* (syn. *Rhizoctonia bataticola*), an important root-parasite in warmer regions. See Goidànich (*Ann. Sper. agr.* N.S. **1**: 449, 1947), Dhingra & Sinclair (Eds) (*An annotated bibliography of Macrophomina phaseolina, 1905-1976*, 1977; 904 refs.), Punithalingam (*Nova Hedwigia* **38**: 339, 1983; cytology), Jones *et al.* (*CJB* **76**: 694, 1998; minichromosomes), Harrington *et al.* (*Pl. Dis.* **84**: 83, 2000; diagnostics), Mena-Portales *et al.* (*Boln Soc. Micol. Madrid* **25**: 265, 2000; Mexico), Vandemark *et al.* (*Mycol.* **92**: 656, 2000; genetic variation), Almeida *et al.* (*Fitopatol. Brasil* **28**: 279, 2003; Brazil, genetic variation), Jana *et al.* (*Can. J. Microbiol.* **51**: 159, 2005; genetic differentiation), Jana *et al.* (*MR* **109**: 81, 2005; population studies), Crous *et al.* (*Stud. Mycol.* **55**: 235, 2006; phylogeny), Reyes-Franco *et al.* (*J. Phytopath.* **154**: 447, 2006; pathogenicity, genetic variation), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Macrophomopsis N.E. Stevens & Baechler (1926) = Lasiodiplodia fide Petrak & Sydow (*Feddes Repert.* **42**: 1, 1927).

Macrophomopsis Petr. (1924) = Fusicoccum fide Pennycook & Samuels (*Mycotaxon* **24**: 445, 1985).

macrophylline (of foliose lichens), having large lobes (obsol.).

Macrophyllosticta Sousa da Câmara (1929) = Phyllosticta fide Sutton (*Mycol. Pap.* **141**, 1977).

macroplasmodium, used for the large plasmodium of *Physarum polycephalum*.

Macroplodia Westend. (1857) nom. rej. = Sphaeropsis Sacc. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Macroplodiella Speg. (1908) = Phoma Sacc. fide Clements & Shear (*Gen. Fung.*, 1931).

Macropodia Fuckel (1870) = Helvella fide Dissing (*Dansk bot. Ark.* **25** no. 1, 1966).

Macropyrenium Hampe ex A. Massal. (1860) = Ocellularia fide Hale (*Bull. Br. Mus. nat. hist.* Bot. **8**: 227, 1981).

Macrorhabdus Tomasz., Logan, Snowden, Kurtzman & Phalen (2003), anamorphic *Saccharomycetales*, H?.?.?. 1 (in bird guts), widespread. See Tomaszewski *et al.* (*Int. J. Syst. Evol. Microbiol.* **53**: 1204, 2003), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

macroscopic, visible without a lens.

Macroscyphus Nees ex Gray (1821) = Helvella fide Dissing (*Dansk bot. Ark.* **25** no. 1, 1966), Rifai (*Reinwardtia* **7**: 376, 1968).

Macroseptoria Petr. (1923) = Trichoseptoria fide Clements & Shear (*Gen. Fung.*, 1931).

Macrospora Fuckel (1870), Pleosporaceae. Anamorph *Nimbya*. 3, Europe. See Simmons (*Sydowia* **41**: 314, 1989; anamorph), Shoemaker & Babcock (*CJB* **70**: 1617, 1992), Barr (*SA* **12**: 27, 1993; posn), Fallah & Shearer (*Mycotaxon* **67**: 85, 1998), Johnson *et al.* (*Mycotaxon* **84**: 413, 2002; N America).

macrospore, a large spore when there are spores of two sizes.

Macrosporiaceae Nann. (1934) = Pleosporaceae.

Macrosporites Renault (1899), Fossil Fungi. 3 (Carboniferous), Germany.

Macrosporium Fr. (1832) nom. rej. prop. = Alternaria fide Hughes (*CJB* **36**: 727, 1958).

Macrostilbum Pat. (1898) nom. dub., anamorphic *Pezizomycotina*, Hsy.0eH.?. 1, Java. See Seifert (*TBMS* **85**: 123, 1985).

Macrothelia M. Choisy (1949) = Amphisphaeria fide Santesson (*Bull. Soc. linn. Lyon* **23**: 103, 1954).

Macrotrichum Grev. (1825), anamorphic *Pezizomycotina*, Hso.0eH/≡ eH.?. 2, British Isles.

Macrotyphula R.H. Petersen (1972), Typhulaceae. 6, widespread. See Berthier (*Bull. mens. Soc. linn. Lyon* Num. Spéc. **46**: 213, 1976), Dentinger & McLaughlin (*Mycol.* **98**: 746, 2006; phylogeny).

Macrovalsaria Petr. (1962), Dothideomycetes. 1, widespread (tropical). See Sivanesan (*TBMS* **65**: 395, 1975), Barr (*Mycotaxon* **49**: 129, 1993; posn).

Macroventuria Aa (1971), Pleosporales. 2, Africa; USA. See Aa (*Persoonia* **6**: 359, 1971), Kodsueb *et al.* (*Mycol.* **98**: 571, 2006; phylogeny).

Macruropyxis Azbukina (1972), Uropyxidaceae. 1 (on *Fraxinus* (*Oleaceae*)), former USSR. See Azbukina (*Komarovskie Ctenija (Moscow & Leningrad)* **19**: 20, 1972).

maculate, spotted; blotched.

Maculatifrondes K.D. Hyde (1996), ? Phyllachorales. Anamorph *Cyclodomus*. 1 (on *Palmae* fronds), Ecuador. See Hyde *et al.* (*MR* **100**: 1509, 1996), Hyde & Cannon (*Mycol. Pap.* **175**: 114, 1999).

Maculatipalma J. Fröhl. & K.D. Hyde (1995), Diaporthales. 1 (on *Palmae*), Australia. See Fröhlich &

Hyde (*MR* **99**: 727, 1995).

maculicole (adj. **-icolous**), an organism living on spots, e.g. leaf spots.

Madura foot, see mycetoma.

maduramycosis, see mycetoma.

Madurella Brumpt (1905), anamorphic *Sordariales*, Hsy.0eP.?. 10 (on humans causing mycetoma, q.v.), widespread (esp. tropical). See Ciferri & Redaelli (*Mycopathologia* **3**: 182, 1941), Ahmed *et al.* (*J. Clin. Microbiol.* **40**: 1031, 2002; Sudan), Ahmed *et al.* (*J. Clin. Microbiol.* **41**: 4537, 2003; clonality), Ellabib *et al.* (*Mycoses* **46**: 321, 2003; Libya), Hoog *et al.* (*Mycoses* **47**: 121, 2004; phylogeny, typification, exclusion of *M. grisea*), Vilela *et al.* (*Mycopathologia* **158**: 415, 2004; Brazil), Sande *et al.* (*J. Clin. Microbiol.* **43**: 4349, 2005; population biology).

Magdalaenaea G. Arnaud (1952), anamorphic *Pezizomycotina*, Hso.1bH.?. 1, Europe; Asia. See Arnaud (*BSMF* **68**: 209, 1952), Sati *et al.* (*Mycotaxon* **81**: 445, 2002; India).

magic mushrooms, typically hallucinogen-containing species of *Psilocybe*, and also *Gymnopilus*, *Panaeolus*, *Conocybe*, and *Amanita muscaria*; hallucinogenic fungi (q.v.).

Magmopsis Nyl. (1875) = Arthopyrenia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Magnaporthaceae P.F. Cannon (1994), Sordariomycetidae (inc. sed.). 13 gen. (+ 14 syn.), 93 spp.

Lit.: Bunting *et al.* (*Phytopathology* **84**: 1097, 1994), Cannon (*SA* **13**: 25, 1994), Augustin *et al.* (*J. Phytopath.* **147**: 109, 1999), Bryan *et al.* (*MR* **103**: 319, 1999), Chen *et al.* (*Mycol.* **91**: 84, 1999), Kumar *et al.* (*Genetics* Bethesda **152**: 971, 1999), Ward & Bateman (*New Phytol.* **141**: 323, 1999), Kusaba *et al.* (*Ann. phytopath. Soc. Japan* **65**: 588, 1999), Ulrich *et al.* (*New Phytol.* **145**: 127, 2000), Winka & Eriksson (*Mycoscience* **41**: 97, 2000), Bussaban *et al.* (*Mycol.* **97**: 1002, 2005), Réblová (*Mycol.* **98**: 68, 2006).

Magnaporthe R.A. Krause & R.K. Webster (1972), Magnaporthaceae. Anamorph *Pyricularia*. 5, widespread (esp. tropical). *M. grisea* (rice blast; anamorph *Pyricularia oryzae*. See Barr (*Mycol.* **69**: 952, 1977), Tsuda & Ueyama (*TMSJ* **19**: 425, 1978; teleomorph formation), Kato (*Ann. phytopath. Soc. Japan* **60**: 266, 1994; *M. grisea* phylogeny), Kato *et al.* (*Ann. phytopath. Soc. Japan* **60**: 175, 1994; *M. grisea* microconidia), Zeigler *et al.* (*Rice blast disease*, 1994), Bunting *et al.* (*Phytopathology* **86**: 398, 1996; ITS), Roumen *et al.* (*Eur. J. Pl. Path.* **103**: 363, 1997; Europ. pops.), George *et al.* (*Phytopathology* **88**: 223, 1998; PCR), Kusaba *et al.* (*Ann. phytopath. Soc. Japan* **64**: 125, 1998; host range), Viji & Gnanamanickam (*Pl. Dis.* **82**: 36, 1998; India), Kumar *et al.* (*Genetics* Bethesda **152**: 971, 1999; population biology, India), Kim *et al.* (*Molecules and Cells* **10**: 127, 2000; microsatellites), Couch & Kohn (*Mycol.* **94**: 683, 2002; differentiation of *M. oryzae*), Farman (*Phytopathology* **92**: 245, 2002; on *Lolium*), Ikeda *et al.* (*Molecular Microbiology* **45**: 1355, 2002; genetics), Gilbert *et al.* (*Applied Mycology and Biotechnology* **4**: [331, 2004; functional genomics), Javan-Nikkhah *et al.* (*Eur. J. Pl. Path.* **110**: 909, 2004; Iran), Rathour *et al.* (*J. Phytopath.* **152**: 304, 2004; India, population structure), Tosa *et al.* (*Phytopathology* **94**: 454, 2004; on *Lolium*), Consolo *et al.* (*Mycopathologia* **160**: 285, 2005; mating types, Argentina), Couch *et al.* (*Genetics* Bethesda **170**: 613, 2005; evolution), Dean (*Nature* Lond. **434** no. 7036: 980, 2005; whole genome), Farman & Kim (*Molecular Plant Pathology* **6**: 287, 2005; telomeres), Piotti *et al.* (*J. Phytopath.* **153**: 80, 2005; Italy), Bussaban *et al.* (*Mycol.* **97**: 1002, 2005; anamorph), Ninh Thuan *et al.* (*Eur. J. Pl. Path.* **114**: 381, 2006; Vietnam), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny), Ebbole (*Ann. Rev. Phytopath.* **45**: 437, 2007; model organism).

Magninia M. Choisy (1929) = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Magnisphaera J. Campb., J.L. Anderson & Shearer (2003), Halosphaeriaceae. 2, widespread. See Campbell *et al.* (*Mycol.* **95**: 546, 2003), Pang & Jones (*Nova Hedwigia* **78**: 269, 2004).

Magnosporites Rouse (1962), Fossil Fungi ? Fungi. 1 (Paleogene), Canada.

Magnusia Sacc. (1878) [non *Magnusia* Klotzsch 1854, *Begoniaceae*] ≡ Kernia Nieuwl.

Magnusiella Sadeb. (1893) = Taphrina fide Mix (*Kansas Univ. Sci. Bull.* **33**: 1, 1949).

Magnusiomyces Zender (1925), Dipodascaceae. Anamorph *Saprochaete*. 1, widespread. See de Hoog *et al.* (*Stud. Mycol.* **29**, 1986), Hoog & Smith (*Stud. Mycol.* **50**: 489, 2004).

Magnusson (Adolf Hugo; 1885-1964; Sweden). School teacher, Gothenburg (1909-1948). Devoted spare time to lichenology making invaluable contributions to knowledge of the lichens of China, Hawaii (partly with Zahlbruckner, q.v.) and Scandinavia, and to the genera *Acarospora*, *Caloplaca*, *Lecidea* and *Lecanora*. He described about 900 new species in *c.* 150 papers. *Publs.* A monograph of the genus Acarospora. *Kungliga Svenska Vetenskapsakademiens Handlingar* (1929); Acarosporaceae und Thelocarpaceae. *Rabenhorst?s Kryptogamen-Flora von Deutschland, Oesterreich und der Schweiz* (1935). Collection of *c.* 70,000 specimens in Uppsala (**UPS**). *Biogs, obits etc.* Almborn (*Botaniska Notiser* **117**: 428, 1964); Degelius (*Svensk Botanisk Tidskrift* **59**: 393, 1965); Grummann (1974: 478); Stafleu & Cowan (*TL-2* **3**: 247, 1981).

Magnussoniolichen Tomas. & Cif. (1952) = Polyblastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Magnussoniomyces Cif. & Tomas. (1953) ≡ Magnussoniolichen.

Magoderna Steyaert (1973) = Amauroderma Murrill fide Ryvarden (*Syn. Fung.* **5**: 180, 1991).

Mahabalella B. Sutton & S.D. Patil (1966), anamorphic *Pezizomycotina*, Hso.0eH.15. 3, India; Europe. See Sutton & Patil (*Nova Hedwigia* **11**: 203, 1966), Mel'nik *et al.* (*Mikol. Fitopatol.* **37**: 54, 2003; Austria).

Mahanteshamomyces Hosag. (2004), anamorphic *Asterinaceae*. 1, India. See Hosagoudar (*J. Econ. Taxon. Bot.* **28**, 2004).

Mahevia Lagarde (1917) = Hirsutella fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Mainsia H.S. Jacks. (1931) = Gerwasia fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Maire (René Charles Joseph Ernest; 1878-1949; France, later Algeria). Professor of Botany, University of Algiers (1911-1949). Noted for his contributions to fungal cytology, the anatomy of *Russula*, and biodiversity studies of the fungi of north Africa, Catalonia and Greece. *Publs.* Fungi Catalaunici. Se-

ries altera. Contributions a la flore mycologique de la Catalogne. *Publicaciones. Junta de Ciències Naturals de Barcelona* (1933); (with Werner) Fungi Maroccani. *Mémoires de la Société des Sciences Naturelles du Maroc* (1937); (with J. Politis) Fungi Hellenici. Catalogue raisonné des champignons connus jusqu?ici en Grèce. *Actes de l?Institut Botanique de l?Université d?Athènes* (1940). *Biogs, obits etc.* Feldmann & Guinier (*Bulletin de la Société d'Histoire Naturelle de l'Afrique de Nord* **41**: 65, 1952, bibliography); Grummann (1974: 336); Kühner (*BSMF* **69**: 7, 1953) [portrait]; Stafleu & Cowan (*TL-2* **3**: 257, 1981).

Maireella Syd. ex Maire (1908) = Gibbera fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Maireina W.B. Cooke (1961) = Cyphellopsis fide Donk (*Reinwardtia* **1**, 1951).

Maireomyces Feldmann (1941) nom. dub., ? Fungi. See Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979).

Majewskia Y.B. Lee & K. Sugiy. (1986), Laboulbeniaceae. 1, Japan. See Lee & Sugiyama (*Mycol.* **78**: 289, 1986).

Malacaria Syd. (1930), Tubeufiaceae. 2 (on *Meliola* etc.), pantropical. See Rossman (*Mycol. Pap.* **157**, 1987; key), Johnston (*N.Z. Jl Bot.* **37**: 289, 1999).

malaceoid venation, see veins.

Malacharia Fée (1843) ? = Cerebella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Malacodermis Bubák & Kabát (1912) = Glutinium fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **125**: 27, 1916).

Malacodermum Marchand (1896) nom. dub., Fungi. See Donk (*Taxon* **6**: 84, 1957).

Malacodon Bataille (1923) nom. dub., Cantharellales. See Donk (*Taxon* **5**: 102, 1956).

malacoid, like mucilage.

Malacosphaeria Syd. (1924) = Eriosphaeria fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Malacostroma Höhn. (1920) [non *Malacostroma* Gürich 1906, fossil ? *Algae*] = Phomopsis (Sacc.) Bubák. fide Petrak (*Annls mycol.* **19**: 176, 1921).

Malajczukia Trappe & Castellano (1992), Mesophelliaceae. 8, Australia; New Zealand. See Trappe *et al.* (*Aust. Syst. Bot.* **5**: 618, 1992).

Malassezia Baill. (1889), anamorphic *Malasseziales*. 7 (on humans), widespread. See Anthony *et al.* (*Microb. Ecol. Health Dis.* **7**: 161, 1994; epidemiology), Guillot & Guého (*Antonie van Leeuwenhoek* **67**: 297, 1995; mol. phylogeny), Guillot *et al.* (*Antonie van Leeuwenhoek* **67**: 173, 1995; nomencl.), Guillot *et al.* (*Antonie van Leeuwenhoek* **69**: 337, 1996; taxonomy), Boekhout *et al.* (*Medical Mycol.* **36**: 365, 1998; PFGE, RAPD), Guillot *et al.* (*Medical Mycol.* **36**: 220, 1998; review), Guillot & Bond (*Medical Mycol.* **37**: 295, 1999; review *M. pachydermatis*), Begerow *et al.* (*MR* **104**: 53, 2000; mol. phylogeny), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Morishita *et al.* (*Mycopathologia* **161**: 61, 2006; molecular analysis), Xu *et al.* (*Proc. natn Acad. Sci. U.S.A.* **104**: 18730, 2007; phylogeny). See pityriasis versicolor.

Malasseziales R.T. Moore (1980). Ustilaginomycotina. 1 gen., 7 spp. Causing pityriasis versicolor (q.v.) of humans. No families recognized.

Lit. Moore (*Bot. Mar.* **23**: 361, 1980; used for all *Basidioblastomycetes* lacking ballistospores (e.g. *Cryptococcus, Rhodotorula, Schizoblastosporon, Trichosporon, Vanrija*), Begerow *et al.* (*MR* **104**: 59, 2000; emend. to those belonging in *Ustilaginomycetes*), Begerow *et al.* (*Mycol.* **98**: 906, 2006; phylogeny).

Malbranchea Sacc. (1882), anamorphic *Myxotrichum*, Hso.0eH.40. 18, widespread. Also anamorphic *Onygenaceae*; teleomorphs *Auxarthron, Uncinocarpus*. See Sigler & Carmichael (*Mycotaxon* **4**: 412, 1976; key), Currah (*Mycotaxon* **24**: 1, 1985), Martínez *et al.* (*TBMS* **86**: 490, 1986; conidiogenesis), Sigler *et al.* (*Mycotaxon* **28**: 119, 1987; synanamorph), Okada *et al.* (*Mycoscience* **36**: 385, 1995; ubiquinones, biochemistry), Sugiyama *et al.* (*Mycoscience* **40**: 251, 1999; phylogeny), Sigler *et al.* (*Stud. Mycol.* **47**: 111, 2002; teleomorphs).

Malenconia Bat. & H. Maia (1960) = Coccomyces fide von Arx (*in litt.*).

malformin, a plant-malforming cyclic pentapeptide from *Aspergillus niger* (Takahashi & Curtis, *Plant Physiol.* **36**: 30, 1961).

Malinvernia Rabenh. (1857) = Podospora fide Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972).

Malleomyces Hallier (1870) nom. dub., anamorphic *Pezizomycotina*. See Rivolta (*Parass. Veg.*, 1884).

Mallochia Arx & Samson (1986), ? Onygenaceae. 1, paleotropical. See von Arx & Samson (*Persoonia* **13**: 185, 1986), Solé *et al.* (*MR* **106**: 388, 2002; phylogeny), Udagawa & Uchiyama (*Stud. Mycol.* **47**: 181, 2002; revision).

Mallotium (Ach.) Gray (1821) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Malmella C.W. Dodge (1933) = Erioderma fide Galloway & Jørgensen (*Lichenologist* **7**: 139, 1975).

Malmeomyces Starbäck (1899), Niessliaceae. 1 (on bamboo), Brazil. See Rossman (*Mycotaxon* **8**: 537, 1979), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Malmgrenia Vain. (1939) = Cryptothele fide Jørgensen & Henssen (*Taxon* **39**: 343, 1990).

Malmia M. Choisy (1931) = Rinodina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Malotium Velen. (1934), Helotiales. 9, former Czechoslovakia.

Malthomyces K.D. Hyde & P.F. Cannon (1999), ? Phyllachoraceae. 2 (on *Palmae* fronds), India; Sri Lanka. See Hyde & Cannon (*Mycol. Pap.* **175**: 114, 1999).

malting, see brewing.

maltoryzine, a metabolite of *Aspergillus oryzae* var. *microsporus*; toxic for cattle (Iizuka & Iida, *Nature* **196**: 681, 1962).

Malupa Y. Ono, Buriticá & J.F. Hennen (1992), anamorphic *Pucciniales*. 15, widespread (tropical). Anamorph name for (II). See Ono *et al.* (*MR* **96**: 828, 1992).

Malustela Bat. & J.A. Lima (1960) = Curvularia fide Ellis (*Mycol. Pap.* **106**, 1966).

Malvinia Döbbeler (2003), ? Ostropales. 1, Falkland Islands. See Döbbeler (*Nova Hedwigia* **76**: 19, 2003).

Mamiania Ces. & De Not. (1863), Diaporthales. 3, widespread (north temperate). See Barr (*Mycol. Mem.* **7**, 1978), Monod (*Beih. Sydowia* **9**: 1, 1983).

Mamianiella Höhn. (1917), Diaporthales. Anamorph *Mazzantiella*. 1 (on *Corylus*), Europe; N. America. See Barr (*Mycol. Mem.* **7**, 1978).

Mamillisphaeria K.D. Hyde, S.W. Wong & E.B.G.

Jones (1996), ? Massariaceae. 1, Australia. See Hyde *et al.* (*Nova Hedwigia* **62**: 513, 1996).

Mammaria Ces. ex Rabenh. (1854), anamorphic *Pseudocercophora*, Hso.0eP.10. 1, Europe; N. America. See Hughes (*Beih. Sydowia* **1**: 359, 1957), Park (*TBMS* **60**: 351, 1973), Subramanian & Sekar (*Journal of the Singapore National Academy of Science* **15**: 58, 1986; teleomorph).

Mammariopsis L.J. Hutchison & J. Reid (1988), anamorphic *Pezizomycotina*, Hso.0eH.38; Hso.0-1eH.1/10; Hso.0eH.15. 1, New Zealand. See Hutchison & Reid (*N.Z. Jl Bot.* **26**: 94, 1988).

mammiform, breast-like in form.

Manaustrum Cavalc. & A.A. Silva (1972) = Strigula fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Manginella Bat. & H. Maia (1961), anamorphic *Pezizomycotina*, Cpt.0eP.?. 2, Brazil. See Batista & Maia (*Publçöes Inst. Micol. Recife* **338**: 23, 1961), Farr (*Mycol.* **78**: 269, 1986).

Manginia Viala & Pacottet (1904) = Sphaceloma fide Jenkins & Bitancourt (*Mycol.* **33**: 338, 1941).

Manginiella, see *Mauginiella*.

Manginula G. Arnaud (1918) nom. dub., anamorphic *Pezizomycotina*. 5 (recent & fossil), N. America; Australia. See Lange (*Aust. J. Bot.* **17**: 565, 1969), Sutton (*Mycol. Pap.* **141**, 1977).

Marcosia Syd. & P. Syd. (1916) = Stigmina fide Sutton (*TBMS* **58**: 164, 1972).

Margaretbarromyces Mindell, Stockey, Beard & Currah (2007), Fossil Fungi ? Pleosporales. 1 (Eocene). See Mindell *et al.* (*MR* **111**: 680, 2007).

Margarinomyces Laxa (1930), anamorphic *Pezizomycotina*. 1, widespread. See Schol-Schwarz (*Persoonia* **6**: 63, 1970), Cole & Kendrick (*Mycol.* **65**: 682, 1973), Gams (*Stud. Mycol.* **45**: 187, 2000; links with *Phialophora*), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006; key).

Margaritispora Ingold (1942), anamorphic *Helotiales*, Hso.≡ eH.15. 2 (aquatic), Europe. See Marvanová & Descals (*J. Linn. Soc.* Bot. **41**: 1, 1985), Campbell *et al.* (*MR* **110**: 1025, 2006; phylogeny).

marginal frill (of a conidium), the periclinal wall left attached to a spore after secession. Cf. basal frill.

marginal veil (of agarics), an incurving proliferation of the margin of the pileus which protects the developing hymenium. Cf. partial veil.

marginate (1) having a well-marked edge; (2) (of basal bulb of agaric stipe), having a gutter-like rim as in *Leucocortinarius bulbiger*.

margo proprius, see excipulum proprium, proper margin.

margo thallinus, see excipulum thallinum, thalline margin.

Mariaella Šutara (1987) = Suillus Gray fide Kuyper (*in litt.*).

Mariannaea G. Arnaud ex Samson (1974), anamorphic *Nectriaceae*, Hso.0eH.15. 4, widespread. See Samson (*Stud. Mycol.* **6**: 74, 1974), Samuels & Seifert (*Beih. Sydowia* **43**: 264, 1991), Okuda & Yamamoto (*Mycoscience* **41**: 411, 2000; Japan), Luangsa-ard *et al.* (*Mycol.* **96**: 773, 2004; phylogeny), Samuels *et al.* (*CBS Diversity Ser.* **4**, 2006; USA).

Marielliottia Shoemaker (1999), anamorphic *Pleosporaceae*, Hso.?.?. 3, widespread. See Shoemaker (*CJB* **76**: 1559, 1998).

Marine fungi. Fungi are of widespread occurrence in the sea, with over 1500 spp. (excluding coastal lichen-forming fungi) known from this habitat (Hyde *et al.*, *Biodiversity and Conservation* **7**: 1147, 1998). These parasitize marine algae or animals or are saprobes on timber, algae (Kohlmeyer, *Veroeff. Inst. Merresforsch. Bremerhaven* Suppl. **5** 339, 1974, Nakagiri, *Mycologia* **85**: 638, 1993), sea grasses (Cuomo *et al.*, *Prog. Oceanogr.* **21**: 189, 1988), protozoal cysts and corals (Kohlmeyer & Volkmann-Kohlmeyer, *CJB* **68**: 1554, 1990, Raghukumar & Ragukumar, *Mar. Ecol.* **12**: 251, 1991), sea foam (Nakagiri, *IFO Res. Comm.* **14**: 52, 1989) and other substrata; spores of many (esp. *Halosphaeriales*) have special appendages for attachment (Hyde & Jones, *Bot. Mar.* **32**: 205, 1989; 10 types).

Other fungi occur in brackish water (Tubaki & Ito, *Rep. Tottori mycol. Inst.* **10**: 523, 1973), salt marshes (Bayliss Elliott, *Ann. appl. biol.* **17**: 284, 1930; Apinis & Chesters, *TBMS* **47**: 419, 1964), mangrove swamps (Hyde & Jones, *Marine Ecology* **9**: 15, 1988, Tan Leong & Jones, *CJB* **67**: 2686, 1989), in the salt of salt pans (Quinta, *Food Technol.* **22**: 102, 1968) and on sand (Rees, *Bot. Mar.* **23**: 375, 1980, Nakagiri & Tokura, *Trans. mycol. Soc. Japan* **28**: 413, 1987); 27-36 spp. exclusively tropical (Kohlmeyer, *Marine Ecology* **5**: 329, 1984).

A very diverse range of unusual secondary metabolites are produced by marine fungi (San-Martín *et al.*, *J. Chil. Chem. Soc.* **53**: 1377, 2008), including potential herbicides (Motti *et al.*, *Appl. Environ. Microbiol.* **73**: 1921, 2007), and several have shown great potential for use in bioremediation, particularly in decolourizing effluents (Raghukumar, *MR* **104**: 1222, 2000). Marine fungi appear to play an important role in decomposition of organic matter on sandy beaches (Steinke & Lubke, *South African J. Bot.* **69**: 540, 2003) and have the potential to be used as pollution indicators (Taboski *et al.*, *FEMS Microbiol. Ecol.* **53**: 445, 2006).

Lichens form distinctive band-like zones on siliceous rocky shores (Fletcher, *Lichenologist* **5**: 368, 401, 1973, terminology of zones; *in* Brown *et al.*, *Lichenology: progress and problems*: 359, 1976, nutrition; *in* Price *et al.*, *The shore environment* **2**: 789, 1980, compr. review).

Martella Endl. (1836) = Hericium Pers. fide Donk (*Taxon* **5**: 103, 1955).

Martellia Mattir. (1900) = Russula fide Kuyper (*in litt.*).

Martensella Coem. (1863), Kickxellaceae. 1, Europe; N. America. See Jackson & Dearden (*Mycol.* **40**: 168, 1948), Benjamin (*Aliso* **4**: 321, 1959).

Martensiomyces J.A. Mey. (1957), Kickxellaceae. 1, Congo. See Benjamin (*Aliso* **4**: 321, 1959).

Marthamyces Minter (2003), ? Rhytismataceae. 9, widespread. See Minter (*Mycotaxon* **87**: 50, 2003), Johnston (*Aust. Syst. Bot.* **19**: 135, 2006; Australia).

Marthanella States & Fogel (1999), ? Boletales. 1, USA. See States & Fogel (*Mycotaxon* **71**: 424, 1999).

Martin (George Willard; 1886-1971; USA). Professor of Botany, University of Iowa (1929-1955). Noted for studies on the *Tremellales* (q.v.) and *Mycetozoa* (q.v.). He contributed keys to families of fungi for the first five editions of this *Dictionary*. *Publs*. The Tremellales of the north central United States and adjacent Canada. *University of Iowa Studies in Natural History* (1940); (with C.J. Alexopoulos, q.v.) *The Myxomycetes* (1969). *Biogs, obits etc*. Stafleu & Cowan (*TL-2* **3**: 320, 1981); Wells & Lentz (*Mycol.* **65**: 985, 1973, bibliography, portrait).

Martindalia Sacc. & Ellis (1885) = Phleogena fide Barr & Bigelow (*Mycol.* **60**: 456, 1968).

Martinella (Cooke) Sacc. (1892) nom. dub., Fungi. See Sutton (*Mycol. Pap.* **141**, 1977).

Martinellisia V.G. Rao & Varghese (1977), anamorphic *Pezizomycotina*, Hso.1eP.10. 1, India. See Rao & Varghese (*Norw. Jl Bot.* **24**: 279, 1977).

Martinia Whetzel (1942) [non *Martinia* Vaniot 1903, *Compositae*] ≡ Martininia.

Martininia Dumont & Korf (1970), Sclerotiniaceae. Anamorph *Myrioconium*. 1, widespread. See Dumont (*Mycol.* **65**: 175, 1973), Zhuang (*Mycotaxon* **29**: 393, 1987).

Mason (Edmund William; 1890-1975; England). Wounded in the Somme (1916); Mycologist, IMI (1921-1960). His organization of the IMI fungal reference collection set new standards, showing a profound understanding of how mycological information should be handled, amounting almost to prescience of how it should be structured for digitized databases. Noted for his catalytic ideas on use of conidial development to classify hyphomycetes, publishing little himself, he strongly influenced Hughes and M.B. Ellis (q.v.). *Publs. Mycological Papers* **1-3** (1925-1941). *Biogs, obits etc.* Booth (*Bulletin of the British*

Mycological Society **9**: 114, 1975); Ellis & Hughes (*TBMS* **66**: 371, 1976) [portrait].

Masonhalea Kärnefelt (1977), Parmeliaceae (L). 1, Arctic. See Kärnefelt *et al.* (*Pl. Syst. Evol.* **183**: 113, 1992), Thell *et al.* (*Mycol. Progr.* **1**: 335, 2002; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Masonia G. Sm. (1952) ≡ Masoniella.

Masonia Hansf. (1944) = Dictyonella fide von Arx (*Persoonia* **2**: 421, 1963).

Masoniella G. Sm. (1952) = Scopulariopsis fide Morton & Smith (*Mycol. Pap.* **86**, 1963).

Masoniomyces J.L. Crane & Dumont (1975), anamorphic *Pezizomycotina*, Hso.0eH.10. 1, Mexico; Caribbean. See Crane & Dumont (*CJB* **53**: 847, 1975).

Massalongia Körb. (1855), Massalongiaceae (L). 3, Europe; N. America. See Henssen (*CJB* **41**: 1331, 1963), Jørgensen *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 390, 1994; posn), Burgaz & Martínez (*Nova Hedwigia* **73**: 381, 2001; Iberian peninsula), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Wedin *et al.* (*Lichenologist* **39**: 61, 2007; n. fam.).

Massalongiaceae Wedin, P.M. Jørg. & Wiklund (2007), Peltigerales. 3 gen. (+ 9 syn.), 11 spp.

Lit.: Henssen (*CJB* **41**: 1331, 1963), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004), Wedin & Wiklund (*Symb. bot. upsal.* **34** no. 1: 469, 2004), Jørgensen (*Nordic Lichen Flora* **3**: Cyanolichens: 87, 2007), Wedin *et al.* (*Lichenologist* **39**: 61, 2007).

Massalongiella Speg. (1880) = Enchnoa fide Petrak & Sydow (*Annls mycol.* **34**: 11, 1936).

Massalongina Bubák (1916), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Massalongo (Abramo Bartolommeo; 1824-1860; Italy). Professor at the University of Verona. Palaeobotanist and lichenologist, renowned for his contribution to understanding the systematics of lichen-forming fungi with crustose thalli through use of microscopic characters, introducing 114 genera of which many have since been consistently used (e.g. *Arthopyrenia*, *Catillaria*, *Haematomma*, *Pyrenula*, *Solenopsora*) or recently reintroduced (e.g. *Bactrospora*, *Celothelium*, *Psilolechia*). Often involved in controversies with Trevisan (q.v.). Main collections in Verona (**VER**). *Publs. Ricerche sull'Autonomia dei Licheni Crustosi* (1852); *Systema Lichenum Novorum* (1855) [a selection of these works have been reprinted (Lazzarini, *Selezione di Lavori Lichenologici di A.B. Massalongo*, 1991)]. *Biogs, obits etc.* De Toni (*L'Opera Lichenologica di Abramo Massalongo*, 1933); Grummann (1974: 518); Poelt (*in* Lazzarini, 1991: 13); Stafleu & Cowan (*TL-2* **3**: 349, 1981).

Massalongomyces Cif. & Tomas. (1953) ≡ Massalongia.

Massaria De Not. (1844), Massariaceae. Anamorphs *Myxocyclus*, *Neohendersonia*, *Macrodiplodia*. 22, widespread. See Wehmeyer (*Revision of Melanconis*, 1941), Shoemaker & Le Clair (*CJB* **53**: 1568, 1975; type studies), Barr (*Mycotaxon* **9**: 17, 1979; key 4 N. Am. spp.), Barr (*N. Amer. Fl.* ser. 2 **13**: 129 pp., 1990; N America), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; phylogeny), Treigiene & Rukšeniene (*Botanica Lithuanica* **11**: 55, 2005; Lithuania), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Massariaceae Nitschke (1869), Pyrenulales. 6 gen. (+ 3 syn.), *c.* 41 spp.

Lit.: Barr (*Sydowia* **38**: 11, 1985), Eriksson (*SA* **5**: 140, 1986), Barr (*N. Amer. Fl.* ser. 2 **13**: 129 pp., 1990), Hyde (*MR* **96**: 1044, 1992), Hyde *et al.* (*Nova Hedwigia* **62**: 513, 1996), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000).

Massariella Speg. (1880) = Amphisphaeria fide Dzagania (*BSMF* **102**: 199, 1986), Eriksson & Hawksworth (*SA* **7**: 80, 1988).

Massariellops Curzi (1927) = Didymosphaeria fide Aptroot (*Nova Hedwigia* **60**, 1995).

Massarina Sacc. (1883), Massarinaceae. Anamorphs *Acrocalymma*, *Ceratophoma*, *Tetraploa*. 125, widespread. See Bose (*Phytopath. Z.* **41**: 156, 1961; key), Webster (*TBMS* **48**: 449, 1965), Srinivasulu & Sathe (*Sydowia* **26**: 83, 1974; Indian spp.), Leuchtmann (*Sydowia* **37**: 75, 1984), Hyde (*Mycol.* **83**: 839, 1992; key marine spp.), Hyde (*Mycol.* **99**: 291, 1995; list 132 names), Aptroot (*Nova Hedwigia* **66**: 89, 1998; monogr.), Tsui *et al.* (*Mycol.* **91**: 721, 1999; ultrastr.), Au *et al.* (*Bot. Mar.* **44**: 261, 2001; ultrastr.), Hyde *et al.* (*Fungal Diversity Res. Ser.* **7**: 93, 2002; marine taxa), Liew *et al.* (*Mycol.* **94**: 803, 2002; phylogeny), Eriksson & Hawksworth (*Mycol.* **95**: 426, 2003; phylogeny, fam. placement), Tanaka & Harada (*Mycoscience* **44**: 173, 2003; Japan), Döbbeler (*MR* **111**: 1406, 2007), Wang *et al.* (*MR* **111**: 1268, 2007; phylogeny).

Massarinaceae Munk (1956), Pleosporales. 5 gen. (+ 17 syn.), 189 spp. Molecular data have elucidated some relationships within this fam., but more research is needed. It has previously been confused with the *Lophiostomataceae*. See Aptroot (*Nova Hedwigia* **66**: 89, 1998; monogr.), Kodsueb *et al.* (*Botanical Journal of the Linnean Society* **155**: 283, 2007; descr.), Wang *et al.* (*MR* **111**: 1268, 2007; phylogeny).

Massarinula Géneau (1894) = Massarina fide Bose (*Phytopath. Z.* **41**, 1961), Aptroot (*Nova Hedwigia* **66**: 89, 1998).

Massariola Füisting (1868), Dothideomycetes. 3 (on bark), Europe.

Massariopsis Niessl (1876) = Amphisphaeria fide Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973).

Massariosphaeria (E. Müll.) Crivelli (1983), Pleosporales. 23, widespread. See Crivelli (*Über die heterogene Ascomycetengattung Pleospora Rbh.*, 1983; key 7 spp.), Leuchtmann (*Sydowia* **37**: 75, 1985; key), Holm & Holm (*Symb. bot. upsal.* **28** no. 2: 1, 1988), Huhndorf *et al.* (*Mycotaxon* **37**: 203, 1990), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; phylogeny), Inderbitzin *et al.* (*Mycol.* **94**: 651, 2002; phylogeny), Tanaka & Harada (*Mycoscience* **45**: 96, 2004; Japan), Wang *et al.* (*MR* **111**: 1268, 2007; phylogeny).

Massariothea Syd. (1939), anamorphic *Pezizomycotina*, St.≡ eP.15. 8, widespread. See Alcorn (*MR* **97**: 429, 1993; key).

Massariovalsa Sacc. (1882), Melanconidaceae. Anamorph *Melanconiopsis*. *c.* 4, widespread. See Wehmeyer (*Revision of Melanconis*, 1941), Petrak (*Sydowia* **19**: 279, 1966), Speer (*BSMF* **102**: 363, 1986).

Massariovalsaceae Hara (1913) = Melanconidaceae.

Massartia De Wild. (1897), ? Zoopagales. 1 (in *Algae*), Java. See Hesseltine (*Mycol.* **47**: 344, 1955).

Massee (George Edward; 1850-1917; England). French Foreign Legion (*c.* 1870s); schoolteacher, Scarborough (*c.* 1880s); freelance worker, Kew (1990s); Cryptogamic Botanist, Royal Botanic Gardens, Kew (1893-1915). First President of the British Mycological Society (1896). *Publs. British Fungus Flora* (1892-1895); *Textbook of Fungi* (1906); *Diseases of Cultivated Plants and Trees* (1910); *British Fungi and Lichens* (1911); (with Crossland) *Fungus Flora of Yorkshire* (1902-1905). *Biogs, obits etc.* Anon. (*Kew Bulletin* **1922**: 335, 1922, bibliography); Grummann (1974: 377); Ramsbottom (*TBMS* **5**: 469, 1917; Ramsbottom (*Journal of Botany* London **55**: 223, 1915); Stafleu & Cowan (*TL-2* **3**: 359, 1981).

Masseea Sacc. (1889), Helotiales. 1, N. America. See Baral (*SA* **13**: 113, 1994).

Masseeëlla Dietel (1895), Pucciniales. *c.* 5 (on dicots, mostly *Euphorbiaceae*), widespread (palaeotropical). See Sathe (*Sydowia* **19**: 187, 1966), Thaung (*Australasian Mycologist* **24**: 29, 2005; Burma) Cf. *Kamatomyces*.

Masseeola Kuntze (1891) ≡ Sparassis.

Masseerina Lloyd (1920) nom. nud., Agaricomycetes. See Donk (*Taxon* **6**: 64, 1957).

Massospora Peck (1879), Entomophthoraceae. 13 (on cicadas), widespread. *M. cicadina* is a parasite of the 17-year cicada in N. Am. See Soper (*Mycotaxon* **1**: 13, 1974; key), Soper *et al.* (*Ann. Ent. Soc. Am.* **69**: 89, 1976; biology), Keller & Petrini (*Sydowia* **57**: 23, 2005; key).

Mastigobasidium Golubev (1999), Leucosporidiaceae. 1, Japan. See Golubev (*Int. J. Syst. Bacteriol.* **49**: 1301, 1999; taxonomy), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Aime *et al.* (*Mycol.* **98**: 896, 2006; phylogeny).

Mastigochytrium Lagerh. (1892) ? = Rhizophydium fide Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960).

Mastigocladium Matr. (1911) = Acremonium fide Gams (*Cephalosporium-artige Schimmelpilze*, 1971).

Mastigomyces Imshen. & Kriss (1933), anamorphic *Pezizomycotina*, Hso.?.?. 2, former USSR. See Babjeva & Levin (*Mikrobiologiya* **48**: 541, 1979; neotypification).

Mastigomycètes Imshen. & Kriss (1933), anamorphic *Pezizomycotina*, Hso.?.?. 2, former USSR. See Babjeva & Levin (*Mikrobiologiya* **48**: 541, 1979; neotypification).

Mastigomycotina (obsol.). Used for fungi with motile zoospores now dispersed in the phyla *Chytridiomycota, Hyphochytriomycota, Oomycota, Plasmodiophoromycota*.

Mastigonema Speg. (1926) = Chaetospermum fide Petrak & Sydow (*Annls mycol.* **34**: 11, 1936).

mastigoneme, see flagellum.

Mastigonetron Kleb. (1914) = Harknessia fide Petrak (*Sydowia* **24**: 253, 1971), Sutton (*Mycol. Pap.* **141**, 1977).

mastigopod (of *Mycetozoa*), a swarm cell (obsol.).

Mastigosporella Höhn. (1914), anamorphic *Wuestneiopsis*, Cpd.0eH.19. 2, USA. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Mastigosporium Riess (1852), anamorphic *Pezizomycotina*, Hsy.≡ eH.19. 6 (causing leaf spots of grasses), widespread (temperate). See Bollard (*TBMS* **33**: 250, 1950), Hughes (*Mycol. Pap.* **36**, 1951), Austwick (*TBMS* **37**: 161, 1954), Huss *et al.* (*Pflanzenschutzberichte* **49**: 97, 1988; on *Dactylis* spp.), Mayrhofer *et al.* (*Mitt. naturwiss. Ver. Steiermark* **121**: 73, 1991; key), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 260, 1995; key).

Mastocephalus Battarra ex Kuntze (1891) ≡ Leucocoprinus.

Mastodia Hook. f. & Harv. (1847), Mastodiaceae (L). 6, Antarctica. See Brodo (*Bryologist* **79**: 385, 1976), Gremmen *et al.* (*Lichenologist* **27**: 387, 1995; ecology), Kohlmeyer *et al.* (*Mycol. Progr.* **3**: 51, 2004).

Mastodiaceae Zahlbr. (1907), Pezizomycotina (inc. sed.) (±L). 2 gen. (+ 3 syn.), 8 spp.

Lit.: Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991), Sancho & Valladares (*Polar Biol.* **13**: 227, 1993).

Mastoleucomyces Battarra ex Kuntze (1891) nom. nud. = Tricholoma fide Singer (*Agaric. mod. Tax.*, 1951).

Mastomyces Mont. (1848) ≡ Topospora fide Groves (*CJB* **43**: 495, 1965).

Mathurisporites Kalgutkar & Janson. (2000), Fossil Fungi, anamorphic *Ascomycota*. 1, Canada; India. See Kalgutkar & Jansonius (*AASP Contributions Series* **39**: 166, 2000).

matrix (1) the substratum in or on which an organism is living; (2) mucilaginous material in which conidia and some ascospores are produced, influences dissemination, survival, germination etc. See Louis & Cooke (*TBMS* **84**: 661, 1985).

Matruchotia Boulanger (1893) nom. dub., anamorphic *Fungi*. See Donk (*Reinwardtia* **2**: 466, 1954).

Matruchotiella Grigoraki (1924) nom. dub. ≡ Ateleothylax fide Dodge (*Medical Mycology*: 431, 1935).

Matsushimaea Subram. (1978), anamorphic *Pezizomycotina*, Hso.0bP.10. 1, Japan. See Subramanian (*Kavaka* **5**: 96, 1977), Mel'nik & Belomesyatseva (*Mikol. Fitopatol.* **35**: 29, 2001; Russia, Belorus).

Matsushimiella R.F. Castañeda & Heredia (2001), anamorphic *Pezizomycotina*, Hso.?.?. 1, Australia. See Castañeda Ruiz *et al.* (*Cryptog. Mycol.* **22**: 16, 2001).

Matsushimomyces V.G. Rao & Varghese (1979), anamorphic *Pezizomycotina*, Hso.1eH.?10. 1, India. See Rao & Varghese (*Bot. Notiser* **132**: 313, 1979), Castañeda Ruíz *et al.* (*Mycotaxon* **87**: 385, 2003).

Matsusphaeria K.L. Pang & E.B.G. Jones (2003) = Magnisphaera fide Pang *et al.* (*Nova Hedwigia* **77**: 14, 2003), Pang & Jones (*Nova Hedwigia* **78**: 269, 2004).

matsu-take, *Tricholoma matsutake*, an important edible fungus in Japan. Nisikado *et al.* (*Ber. Ohara Inst.* **8**(4), 1941); pine mushroom. 'Matsutake' of N. Am., *T. ponderosum*, *T. murrillianum* (fide Singer, 1961).

Mattickiolichen Tomas. & Cif. (1952) = Buellia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mattickiomyces Cif. & Tomas. (1953) ≡ Mattickiolichen.

Mattirolella S. Colla (1929), anamorphic *Kathistaceae*, St.0eH.15. 1. See Khan & Kimbrough (*Am. J. Bot.* **61**: 395, 1974), Blackwell *et al.* (*Mycol.* **95**: 987, 2003).

Mattirolia Berl. & Bres. (1889), Thyridiaceae. 1 (from bark), Italy. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Mattirolomyces E. Fisch. (1938), Pezizaceae. 1 (Mycorrhizal under *Cistaceae*), Mediterranean; N. Amer-

ica. See Percudani *et al.* (*Mol. Phylogen. Evol.* **13**: 169, 1999; phylogeny), Díez *et al.* (*Mycol.* **94**: 247, 2002; phylogeny), Healy (*Mycol.* **95**: 765, 2003; USA), Ferdman *et al.* (*MR* **109**: 237, 2005; phylogeny), Kovács *et al.* (*Mycol. Progr.* **6**: 19, 2007; ontogeny, mycorrhiza), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Matula Massee (1888), anamorphic *Aleurocystis*. 2, widespread (tropical). See Martin (*Lloydia* **5**: 158, 1942).

Maublancia G. Arnaud (1918), Microthyriaceae. 6, S. America; S. Africa.

Maublancomyces Herter (1950) = Gyromitra fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Mauginiella Cavara (1925), anamorphic *Pezizomycotina*, Hso.0eH.38. 1 (on *Phoenix*), Mediterranean; Middle East. See Sigler & Carmichael (*Mycotaxon* **4**: 349, 1976), von Arx *et al.* (*Sydowia* **34**: 42, 1981; ultrastr.), Abdullah *et al.* (*J. Phytopath.* **153**: 417, 2005; Spain).

Maurinia Niessl (1876) = Anthostomella fide Francis (*Mycol. Pap.* **139**, 1975), Lu & Hyde (*Fungal Diversity Res. Ser.* **4**, 2000).

Mauritiana Poonyth, K.D. Hyde, Aptroot & Peerally (2000), Requienellaceae. 1, Mauritius. See Poonyth *et al.* (*Fungal Diversity* **4**: 101, 2000).

Mauritzia Gyeln. (1935) = Pyrenopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Maurodothella G. Arnaud (1918) = Echidnodes fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Maurodothina G. Arnaud ex Piroz. & Shoemaker (1970) = Eupelte fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Maurodothis Sacc., Syd. & P. Syd. ex Syd. & P. Syd. (1904) = Cycloschizon fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Maurya Pat. (1898) nom. dub., Fungi. See Petrak (*Sydowia* **5**: 345, 1951).

Mawsonia C.W. Dodge (1948), ? Lichinaceae (L). 1, Antarctica. See Kärnefelt (*Cryptog. Bot.* **1**: 147, 1989).

Maxillispora Höhn. (1914) = Tetracladium fide Ingold (*TBMS* **25**: 371, 1942).

Mayamontana Castellano, Trappe & Lodge (2007), Stephanosporaceae. 1. See Castellano *et al.* (*Mycotaxon* **100**, 2007).

Mazaediate lichens, Traditionally treated as *Caliciales*, but that order has been shown to be heterogenous using molecular methods.

Lit.: Hutchinson (*Mycol.* **79**: 786, 1987; spp. on polypores), Middelborg & Mattsson (*Sommerfeltia* **5**, 1987; Norway), Nádvorník (*Studia bot. čsl.* **5**: 6, 1942), Pant & Awasthi (*Biovigyanam* **15**: 3, 1989; key 31 spp. India & Nepal), Puntillo (*Webbia* **43**: 145, 1989; key 59 spp. Italy), Santesson (*Ark. Bot.* **30A** (14), 1943; S. Am.), Sato (*Miscnea bryol. lich.* **7**: 39, 1975; gen. concepts), Schmidt (*Mitt. St. Inst. allg. Bot. Hamburg* **13**: 111, 1970), Selva & Tibell (*Bryologist* **102**: 377, 1999, N Am.), Tibell (*Symb. bot. upsal.* **21**(2), 1975; boreal N. Am., *Lichenologist* **13**: 161, 1981; Afr., **14**: 219, 1982; Costa Rica, *Beih. Nova Hedw.* **79**: 597, 1985; system, *Symb. bot. upsal.* **27**(2), 1987; keys 18 gen., 78 spp. Australia, *Bot. J. Linn. Soc.* **116**: 159, 1994; distrib. 162 spp., dispersal patterns, *Flora Neotropica Monograph* **69**, 1996), *Symb. bot. upsal.* **32**: 291, 1997; anams, *Bibl. Lichenol.* **71**: 107, 1998; S Am. spp.; *Nordic Lichen Flora* **1**, 1999), Tobolewski (*Pr. Kom. biol. Poznán* **24** (5), 1966; Poland).

Mazaediothecium Aptroot (1991), Pyrenulaceae (L). 2, Costa Rica; Papua New Guinea. See Eriksson (*Lichenologist* **25**: 307, 1993), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

mazaedium, a spore mass formed by an ascoma, as in *Caliciales* and *Onygenaceae*, in which the spores, generally with sterile elements, become free from the asci as a dry, loose powdery mass on the fruiting surface.

Media. Media for cultivation of fungi can be prepared from natural, synthetic or semi-synthetic components. Essential requirements for fungal growth include carbon and nitrogen sources, vitamins, minerals, air and water. There is no single standard medium on which all fungi grow. Many can be cultivated by supplying simple sugars however low-nutrient media are often required for obtaining sporulation. Since media can affect colony morphology, pigmentation, sporulation and retention of properties, standardization of formulae is often necessary for the purpose of identification. Defined media formulations are essential in quantitative experiments and investigations that require an element of reproducibility. Many culture media are available commercially, others are prepared in the laboratory. Useful publications include Booth (*in* Booth (Ed.), *Methods in microbiology* **4**: 57, 1971), Jong *et al.* (*ATCC Filamentous fungi*, edn 19, 1996), Atlas (*Handbook of microbiological media*, 1996), Smith *et al.* (Eds) (*The UKNCC biological resource: properties, maintenance and management*, 2001). The following entry provides an introduction to the most commonly used media for cultivation of fungi.

Potato Carrot Agar (PCA) is used for obtaining sporulation in a wide range of fungi. This medium is low in carbohydrates and many fungi are stimulated to sporulate in response to poor nutrient levels. Most Mucorales grow successfully on PCA and Malt Agar (MA). Many anamorphic fungi and ascomycetes also sporulate successfully on Malt Agar (MA), Cornmeal Agar (CMA) and Oatmeal Agar (OA). Hay Infusion Agar is useful as a low nutrient medium for production of conidia. Potato Dextrose Agar (PDA) is rich in carbohydrates stimulating good vegetative growth in many fungi. In the presence of high carbohydrate levels however, sporulation is often reduced. Some basidiomycetes in culture including *Armillaria* and *Ganoderma* have been grown successfully on Malt Extract Agar (MEA) and Yeast Malt Extract (YM). A specialized medium for obtaining sporulation of wood-rotting basidiomycetes in culture was described by Badcock (*TBMS* **25**: 200, 1941). To encourage sporulation in cellulolytic fungi, sterilized pieces of filter paper, wheatstraw or lupin stem can be placed on the surface of weak media such as PCA or Tap Water Agar (TWA). Successful cultivation of chytrids has been obtained using Yeast Peptone Soluble Starch Agar (YPSS). 25% seawater can be added for marine species. The use of Rabbit Dung Agar (RDA) is recommended for obtaining sporulation in coprophilous fungi. A method for culturing pathogenic *Entomophthorales* on coagulated egg-yolk medium was described by Müller-Kögler (*Entomophaga* **3**: 261, 1959). Further culture methods for this group are described by Keller (*Sydowia* **40**: 122, 1987) and Bałazy (*Fungi.T. XXIV. Entomophthorales*, 1993). Lichen-forming fungi produce good vegetative growth on Malt Yeast Extract Agar (MYE).

Many fungi from medical sources require rich media with a high nitrogen content. Dermatophytes grow successfully on media containing peptone and glucose (Sabouraud's Agar). Keratinophylic fungi benefit from the addition of sterilized animal hair or feathers (Al-Doory, 1968). For further details of media used in medical mycology see Kwon-Chung & Bennett (*Medical mycology*, edn 4, 1992), Rippon (*Medical mycology*. The pathogenic fungi and the pathogenic actinomycetes, edn 3, 1988).

Specialized media are required for some genera. For growth of *Aspergillus* and *Penicillium*, Czapek Dox Agar (CZ), Czapek Yeast Autolysate (CYA) and 2% Malt Extract Agar (MEA) are recommended. To distinguish closely related species in these genera, Creatine Sucrose Agar (CREA) is useful. CYA and MEA with 20-40% sucrose are used for cultivation of xerophilic species of *Aspergillus* and those producing *Eurotium* teleomorphs. See Samson & Pitt (Eds) (*Advances in Penicillium and Aspergillus Systematics*, 1985). Sporulation of *Fusarium* can be encouraged by the use of Carnation Leaf Agar (Fischer *et al.*, *Phytopathology* **72**: 151, 1982) or Spezieller Nährstoffarmer Agar (Nirenberg, *Mitt. Biol. Bundesanst. Land. Forstw.* **169**: 1, 1976). Sterilized pieces of filter paper are added to this medium to stimulate sporulation. To study growth rate and colony colour in *Fusarium*, Potato Sucrose Agar (PSA) is recommended. Lima Bean Agar (LBA) and V8 Juice Agar have been used successfully for growing *Pythium* and *Phytophthora*. See Harnish (*Mycol.* 57: 85, 1965), Romero & Gallegly (*Phytopathology* **53**: 899, 1963). *Saprolegniaceae* grow well on Cornmeal Agar and Glucose Yeast Peptone Salts medium (GYPS). Inoculated blocks can be transferred to water baited with sterile hemp seeds to obtain sporangia and oogonia. Most yeasts grow sucessfully on MEA, Glucose Peptone Yeast Extract Agar (GPY) or Yeast Malt Extract Agar (YM). For osmophilic and osmotolerant yeasts, a sugar content of 30-50% is recommended. For further details of media for cultivation of yeasts see Kurtzman & Fell (*The Yeasts, a taxonomic study*, edn 4, 1998), Barnett *et al.* (*The Yeasts: characteristics and identification*, edn 3, 2000).

Bacterial contamination in fungal cultures can be eliminated by the use of media containing antibiotics. Most frequently used is Penicillin G in combination with either streptomycin sulphate or chloramphenicol.

Antiobiotic medium: Penicillin G and Chloramphenicol

Chloramphenicol	150 mg
Penicillin G	150 mg
Distilled Water	10 ml
Ethanol	10 ml

Dissolve 150 mg penicillin G in 10ml distilled water. Filter sterilize using a 0.45 µm pore membrane. Dissolve 150 mg chloramphenicol in 10ml ethanol. To add to media, melt 250 ml agar. When still hot, add 1.25 ml chloramphenicol in ethanol using a sterile pipette. Allow agar to cool to 45°C then add 1.25 ml penicillin G. Swirl thoroughly to mix.

Antibiotic medium: Penicillin G and Streptomycin sulphate

Penicillin G	1.2 g
Streptomycin sulphate	1.0 g
Distilled water	40 ml

Dissolve 1g of streptomycin sulphate powder in sterile water. Add penicillin G and agitate to mix. To add to media, melt 250 ml agar and allow to cool until hand-hot (45°C). Using a sterile pipette, add 2 ml of the antibiotic mixture to the agar and swirl bottle thoroughly to mix.

Carnation Leaf Agar (CLA)

Agar	20 g

Distilled water 1 l
Carnation leaf pieces
Cut carnation leaves into 1cm pieces, allow to dry and sterilize using a few drops of propylene oxide. Add agar to water. Heat until dissolved and autoclave at 121°C for 15 min. Pour plates and add a few sterile leaf pieces when plates are almost set. See Fisher *et al.* (*Phytopatholgy* **72**: 151, 1982).

Corn Meal Agar (CMA)

Maize meal	30 g
Oxoid Agar N° 3	20 g
Tap Water	1 l

Place the maize and water in a saucepan. Heat over a double saucepan until boiling, continue heating for one hour stirring occasionally. Filter the decoction through muslin, add the agar, and boil until it is dissolved. Autoclave at 121°C for 20 min.

Creatine Sucrose Agar (CREA)

Creatine ($1H_2O$)	3.0 g
Sucrose	30.0 g
KCl	0.5 g
$MgSO_4.7H_2O$	0.5 g
$FeSO_4.7H_2O$	0.01 g
$KH_2PO_4.3H_2O$	1.3 g
Bromocresol purple	0.05 g
Agar	15.0 g
Distilled Water	1 l

Dissolve ingedients in water. Autoclave at 121°C for 15 min. Adjust pH to 8.0-8.2 after autoclaving.

Czapek Dox Agar (CZ)

Made with stock Czapek solution

Solution A

Sodium nitrate $NaNO_3$	40.0 g
Potassium chloride KCl	10.0 g
Magnesium sulphate $MgSO_4$ $7H_2O$	10.0 g
Ferrous sulphate $FeSO_4$ $7H_2O$	0.2 g

Dissolve in 1 l distilled water and store in a refrigerator.

Solution B

Di-potassium hydrogen orthophosphate $K_2HPO_4$20 g

Dissolve in 1 l distilled water and store in a refrigerator.

For 1 litre

Stock solution A	50 ml
Stock solution C	50 ml
Distilled water	900 ml
Sucrose (Analar)	30 g
Oxoid Agar N° 3	20 g

Dissolve agar in distilled water then add sucrose and stock solutions just before autoclaving.

To each litre add 1 ml of following stock solutions:

Zinc sulphate $ZnSO_4$ $7H_2O$ Analar 1.0 g in 100 ml distilled water

Cupric sulphate $CuSO_4$ $5H_2O$ Analar 0.5 g in 100 ml distilled water

Autoclave at 121°C for 20 min. See Smith (1954).

Czapek Yeast Autolysate Agar (CYA)

di-Potassium hydrogen phosphate K_2HPO_4	1.0 g
Czapek concentrate	10.0 ml
Oxoid Yeast extract or autolysate	5.0 g
Sucrose (Analar)	30.0 g
Oxoid Agar N° 3	15.0 g
Distilled water	1.0 l

Autoclave at 121°C for 15 min. See Pitt (1973).

Glucose Peptone Yeast Extract Agar (GPY)

Glucose	40 g
Peptone	10 g
Yeast Extract	5 g
Agar	20 g
Distilled Water	1 l

Dissolve ingredients in water. Autoclave at 121°C for 15 min.

Glucose Yeast Peptone Salts (GYPS)

Glucose	5.0 g
Mycological Peptone	0.5 g
Yeast Extract (Oxoid)	0.05 g
KH_2PO_4	0.5 g
$MgSO_4.7H_2O$	0.15 g
Agar	15.0 g
Distilled Water	1 l

Dissolve agar and yeast extract in water. When agar has dissolved, add peptone and glucose. Autoclave at 121°C for 15 min.

Hay Infusion Agar

Hay	50.0 g
Agar	15.0 g
Distilled Water	1 l

Sterilize 50 g hay in 1 litre of water at 121°C for 30 min. Strain through cloth and make up to 1 litre. Adjust pH to 6.2 with K2HPO4. Add 15 g agar to 1 litre of extract. Autoclave at 121°C for 15 min.

Malt Agar (MA)

Toffee barley malt extract	20 g
Oxoid Agar N° 3	20 g
Tap water	1 l

Add malt extract and agar to water in a double saucepan. Heat and stir until dissolved. Adjust pH to 6.5. Autoclave at 121°C for 15 min.

Malt-Czapek Agar (MCZ)

Stock Czapek solution A	50 ml
Stock Czapek solution C	50 ml
Sucrose	30 g
Toffee malt extract	40 g
Oxoid Agar N° 3	20 g
Distilled water	900 ml

Dissolve malt extract and agar in water. Heat over a double saucepan until dissolved. Then add sucrose, when dissolved add stock solutions. Adjust pH to 5.0. Autoclave at 121°C for 20 min.

Malt Extract Agar (MEA) Blakeslee's formulation

Malt extract (powdered Difco or Oxoid)	20 g
Peptone (bacteriological)	1 g
Glucose (Analar)	20 g
Oxoid Agar N° 3	15 g
Distilled water	1 l

Add malt extract, peptone and agar to water. Heat over a double saucepan until dissolved. Add glucose last and stir to dissolve. Sterilize by autoclaving at 121°C for 15 min.

Malt Extract Agar plus sucrose (M20, M40, M60)

Malt extract	20 g
Sucrose (Analar)	200 g
Oxoid Agar N° 3	20 g
Tap water	1 l

For M40 use 400 g sucrose, for M60 use 600g sucrose. Dissolve malt extract and agar in water by heating in a double saucepan. Reduce heat to avoid caramelisation and add sucrose. Stir until dissolved. Autoclave at 121°C for 15 min.

Malt Yeast Extract (MYE)

Malt extract	20 g
Yeast Extract	2 g
Agar	20 g
Distilled Water	1 l

Dissolve ingredients in water. Autoclave at 121°C

for 15 min.

Oat Agar (OA)

Oat Meal ground	30 g
Oxoid Agar N° 3	20 g
Tap water	1 l

Add oat meal to 500 ml of water in a saucepan. Heat for 1 h. To the other 500 ml water add agar and dissolve in a double saucepan. Pass cooked oat meal through a fine strainer and add to agar mixture. Stir thoroughly. Autoclave at 121°C for 20 min.

Potato Carrot Agar (PCA)

Avoid new crop potatoes, which do not make good media. Red Désirée potatoes have been found to be best. Wash, peel and grate vegetables.

Grated potato	20 g
Grated carrot	20 g
Oxoid Agar N° 3	20 g
Tap water	1 l

Boil vegatables for about 1 h in 500 ml tap water, then pass through a fine sieve keeping the liquid. The agar is added to 500 ml of water in a double saucepan. When the agar has dissolved add the strained liquid and stir. Pour through a funnel into bottles. Sterilize at 121°C for 20 min.

Potato Dextrose Agar (PDA)

Avoid new crop potatoes. Red Désirée have been found to be best.

Potatoes	200 g
Oxoid Agar N° 3	20 g
Dextrose	15 g
Tap water	1 l

Scrub potatoes clean and cut into 12 mm cubes (do not peel). Weigh out 200 g and rinse rapidly under a running tap, and drop into 1 l of tap water in a saucepan. Boil until potatoes are soft (about 1 h) then put through blender. Add 20 g of agar, and heat in a double saucepan until dissolved. Then add 15 g of dextrose and stir until dissolved. Make up to 1 l. Pour into bottles, stirring occasionally to ensure that each bottle has a percentage of solid matter. Autoclave at 121°C for 20 min.

Potato Sucrose Agar (PSA)

To make 1 litre of medium.

Potato water	500 ml
Sucrose	20 g
Oxoid Agar N° 3	20 g
Distilled water	500 ml

Heat in double saucepan until agar is dissolved. Autoclave at 121°C for 15 min. 2.3 kg potatoes makes 7 l. Adjust to pH 6.5 with calcium carbonate if necessary.

To make 2 litres of potato water:

Tap water	1125 g
Potato	450 g

Peel and dice potatoes, suspend in double cheesecloth and boil in the tap water until almost cooked.

PSA using powdered potato

Powdered potato	5 g
Sucrose	20 g
Oxoid Agar N° 3	20 g
Distilled water	1 l
Calcium carbonate	5 g

Autoclave at 121°C for 15 min.

Rabbit Dung Agar (RDA)

The rabbit dung must be from wild rabbits, and dried before use.

Oxoid Agar N° 3	15 g
Tap water	1 l

Heat agar to dissolve. Pour into bottles containing the rabbit dung. Autoclave at 126°C for 20 min.

Sabouraud's Agar

Glucose	20 g
Peptone	10 g
Oxoid Agar N° 3	15 g
Water	1 l

Autoclave 114°C for 15 min.

Spezieller Nährstoffarmer Agar (SNA)

Potassium di-hydrogen orthophosphate (KH_2PO_4)	1 g
Potassium nitrate (KNO_3)	1g
Magnesium sulphate ($MgSO_4.7H_2O$)	0.5 g
Potassium chloride (KCl)	0.5 g
Glucose (Analar)	0.2 g
Sucrose (Analar)	0.2 g
Oxoid Agar N° 3	20 g
Distilled Water	1 l

Dissolve all ingredients, except agar, in distilled water. Add agar and heat in a double saucepan until dissolved. Adjust pH to 6-6.5, then dispense into bottles. Autoclave at 121°C for 20 mins.

Tap Water Agar (TWA)

Tap water	1 l
Oxoid Agar N° 3	15 g

Dissolve agar in water. Autoclave at 121°C for 20 min.

V8 Agar (as recommended for *Actinomycetes*)

V8 Vegetable juice	200 ml
Calcium carbonate	4 g
Oxoid Agar N° 3	20 g
Water	800 ml

Adjust to pH 7.3 with KOH Autoclave at 121°C for 20 min. See Galindo & Gallegly (1960).

Yeast Malt Agar (YM)

Yeast Extract	3 g
Malt Extract	3 g
Mycological Peptone	5 g
Glucose	10 g
Agar	20 g
Distilled Water	1 l

Dissolve ingredients in water and adjust pH to 5-6. Add agar and heat until dissolved. Autoclave at 121°C for 15 minutes.

Yeast Peptone Soluble Starch Agar (YPSS)

Yeast Extract	4.0 g
Soluble Starch	15.0 g
KH_2PO_4	1.0 g
$MgSO_4.7H_2O$	0.5 g
Agar	20.0 g
Distilled Water	1 l

Dissolve ingredients in water. Autoclave at 121°C for 15 minutes.

Addition of dried materials to media

Filter papers

Cut filter papers to size (approximately 1 x 0.7 cm). Transfer to glass universal bottles and autoclave at 121°C for 20 min. Using sterilised forceps, transfer pieces of filter paper to agar plates when set.

Wheatstraws

Cut dried wheatstraws into 2 cm lengths and transfer to glass universal bottles, 10 pieces in each. Autoclave at 121°C for 20 min. Using sterilised forceps, add wheatstraws to poured plates before the agar sets.

Medical and veterinary mycology. The scientific

study of fungi that cause diseases in humans and animals, and the characteristics and epidemiology of the diseases they cause. In this *Dictionary*, veterinary mycology is treated as relating to vertebrates only; see also: Insects (and other invertebrates) and fungi. Fungi affect different organs and according to the disorder syndromes, the diseases are named chromoblastomycoses, dermatophytoses, mycetoma, onichoblastomycoses, otomycoses, phaeohyphomycoses, rhinosporidioses, etc. Clinical groupings for fungal infections recognize skin diseases attributed to superficial (e.g. piedra, seborrhoeic dermatitis), cutaneous (e.g. candidiasis of skin, dermatophytosis, ringworm of the scalp) and subcutaneous (e.g. lobomycosis, mucoromycosis, sporotrichomycosis) mycoses; infectious diseases are described as dimorphic (e.g. blastomycosis, histoplasmosis) and opportunistic (e.g. aspergillosis, candidiasis, cryptococcosis) systematic mycoses. The earliest to be described (see Gruby) and best known mycosis is ringworm (tinea), of the skin and hair (caused by gymnoascaceous fungi). The other widespread and systemic mycoses (e.g. coccidioidomycosis, cryptococcosis, histoplasmosis) are frequently fatal.

More than 3400 fungal names have appeared in the medical and veterinary literature (de Hoog *et al.*, *Atlas of clinical fungi*, edn 2, 1126 pp., 2000). Fungi important in medical and veterinary mycology include some members of the following genera: *Absidia, Arthrinium, Aspergillus, Bipolaris, Blastomyces, Candida, Cladophialophora, Cladosporium, Coccidioides, Cryptococcus, Exophiala, Histoplasma, Malassezia, Microsporum, Mucor, Phialophora, Penicillium, Pneumocystis, Pseudallescheria, Rhizopus, Rhinosporidium, Sporothrix, Stachybotrys, Trichophyton, Trichosporon, Trichothecium.*

Fungi pathogenic for humans are often polymorphic (see dimorphic) or 'pleomorphic' and this, in addition to the number of species proposed on clinical grounds and without adequate descriptions, made the earlier literature very confused. Most fungi causing serious skin mycoses are extremely variable soil saprobes with an ability to adapt to the environment of human or animal tissues. Primary fungal infections of dimorphic systematic mycoses are mainly pulmonary, following inhalation of conidia. Opportunistic systematic infections are caused by cosmopolitan fungi with a very low level of virulence, and occur when the normal defence mechanism of the host is weakened as, for example, in AIDS patients. Most of the fungal pathogens important in veterinary mycology are the same as those in medical mycology, but there are exceptions. The zoophilic dermatophyte *Microsporum gallinae* causes disease in chickens, but not humans; some of more common infections of the skin and tails of fish are caused by organisms no longer considered to be Fungi, e.g., *Saprolegnia* spp.

Mycoses (with the exception of dermatophytoses) are generally not contagious but originate from fungal populations in both the external and internal environments where many potential pathogens are present as saprobes (e.g. *Candida albicans* in the human mouth, alimentary and genital tracts; *Coccidioides immitis* and *Histoplasma capsulatum* in soil). With the rise in numbers of people who are immunocompromised, more and different opportunistic fungi are being recorded as causing often serious mycoses on such patients; see opportunistic fungi.

Medical antifungal agents belongs to groups of allylamines (butenafine, naftifine, etc.), antimetabolites, azoles (fluconazole, ketoconazole, clotrimazole, itraconazole, oxiconazole, etc.), chitin and glucan synthesis inhibitors, polyenes (different drugs on the basis of nystatin, amphotericin B, etc.) and some systemic (griseofulvin) and topical drugs (Pfaller *et al.*, *J. Clin. Microbiol.* **42**: 3142, 2004; Charlier *et al.*, *J. Antimicrob. Chemoter.* **57**: 384, 2006; Matta *et al.*, *Antimicrob. Agents and Chemother.* **51**: 1573, 2007; etc.). The eukaryotic nature of fungi and their hosts leads to problems with antifungal drug toxicity or cross-reactivity with host molecules during treatment. Therapy for dermatophytoses is by topical application of fungicides, oral administration of griseofulvin, or X-ray epilation. Systemic mycoses, which are frequently difficult to cure, may respond to surgery, X-rays, potassium iodide, or antibiotics (see amphotericin, nystatin). Certain honeys have significant antifungal activity against isolates of *Candida* spp. (Irish *et al.*, *Medical Mycology* **44**: 289, 2006) which cause systemic mycoses and are increasing worldwide (Pfaller & Diekema, *Clin. Microbiol. Rev.* **20**: 133, 2007). A wide range of molecular, immunological and cytological techniques is essential for ongoing research in medical mycology (Irish *et al.*, in Kavanagh (Ed.) *Medical Mycology: Cellular and Molecular Techniques*, 348pp., 2006).

For some important mycoses named after the pathogenic agents see: adiaspiromycosis, aspergillosis, blastomycosis, candidiasis, chromomycosis, *Coccidioides* (coccidioidomycosis), cryptococcosis, dermatophyte (ringworm), epizootic lymphangitis, *Histoplasma* (histoplasmosis), mycosis, mycetoma, *Paracoccidioides* (paracoccidiomycosis), phycomycosis, piedra, rhinosporidiosis, sporotrichosis, tinea; see also Allergy.

The International Society for Human and Animal Mycology (ISHAM) encourages and facilitates the study and practice of all aspects of medical and veterinary mycology; see also Internet, Societies and organizations.

Medical uses of Fungi. At various times different fungi have been put to medical use. *Fomes officinalis* (Agaricum, the female, white, or purging agaric) was a noted 'universal remedy' (see Faull, *Mycol.* **11**: 267, 1919; 'pineapple fungus'). Yeast is a part of some patent medicines and takadiastase has medical uses. *Lycoperdon* spores and capillitium has been used for stopping blood from wounds. *Inonotus obliquus* has been widely used in Siberia for prevention of cancers (Solzhenitsyn, *Cancer ward*, 1968). In the Far East *Cordyceps sinensis* (attached to the larva ('caterpillar') of which it is a parasite), bukuryo (sclerotia of *Pachyma hoelen*) and lingzhi (*Ganoderma lucidum*) are widely used as medicines. Many spp. continue to be used in Chinese traditional medicine (Ying *et al.*, *Icones of medicinal fungi for China*, 1987; 272 spp.). The Bini and Igbo peoples of Nigeria use *Daldinia concentrica* s.l. for curing skin diseases, stomach upsets, ulcers, whooping cough and for prevention of excessive growth of the foetus for easy delivery (Akpaja *et al*, *Int. j. medicinal mushrooms* **7**: 373, 2005). The medieval Doctrine of Signatures, whereby an organism's appearance was considered to indicate the diseased organs it could treat, led to use of a variety of lichens for medicinal purposes (e.g. dog lichen, lungwort); some lichens are still supplied by pharmacies and health shops, either loose or in pastilles, e.g. Iceland moss (*Cetraria islandica*); see Richardson (*in* Galun, *CRC Handbook of lichenology* **3**: 93, 1988; review). For further applications of products from lichens see Fahselt (*Symbiosis* **16**: 117, 1994; review). Few, if any, fungi now, however, appear in lists of officially sanctioned medicines (in Britain, for example, the last fungus to be listed in the British Pharmaceutical Codex was ergot (q.v.), the sclerotia of *Claviceps purpurea*; the Codex has now replaced by the British Pharmacopoeia, in which several preparations from ergot are listed, but not the fungus itself).

Interest in medicinal use of fungi has grown enormously since the ninth edition of this *Dictionary*, with the establishment of the *Int. j. medicinal mushrooms* devoted to the topic. This has been accompanied by intense exploration of chemicals produced by fungi and of pharmaceutical value, for example β-glucans used in cancer therapies (from e.g. *Agaricus subrufescens*), or the secondary metabolite concentricolide, isolated from *Daldinia eschscholzii*, which has potential value for treating HIV-positive patients (Stadler *et al.*, *Phytochemistry* **56**: 787, 2001).

Cohn on nutrition and medicine*, 2004). See also Antibiotics.

medium, **culture**, a substance or solution for the cul-

ture of microorganisms (see Media).

medulla (1) (of lichen thalli), the loose layer of hyphae below the cortex and algal layer; (2) (of sporocarps of macromycetes), the part composed mainly or entirely of longitudinal hyphae.

medullary excipulum (of ascomata), tissue below the generative layer in an apothecium; hypothecium. See excipulum.

Medusamyces G.L. Barron & Szijarto (1990), anamorphic *Pezizomycotina*, Hso.0eH.?. 1 (on rotifers), Canada. See Barron & Szijarto (*Mycol.* **82**: 136, 1990).

Medusina Chevall. (1826) = Hericium Pers. fide Saccardo (*Syll. fung.* **5**: 1, 1887).

Medusomyces Lindau (1913) nom. conf., Fungi. See Lindner (*Ber. dt. bot. Ges.* **31**: 364, 1913).

Medusosphaera Golovin & Gamalizk. (1962) = Erysiphe fide Braun & Takamatsu (*Schlechtendalia* **4**: 3, 2000).

Medusula Eschw. (1824) [non *Medusula* Pers. 1807, *Violaceae*] nom. dub. ? = Sarcographa fide Staiger (*Biblthca Lichenol.* **85**, 2002).

Medusula Tode (1790) nom. dub., anamorphic *Pezizomycotina*. See Holubová-Jechová (*Sydowia* **46**: 244, 1994).

Medusulina Müll. Arg. (1894) = Fissurina fide Staiger (*Biblthca Lichenol.* **85**, 2002), Archer (*Telopea* **10**: 589, 2004; Australia).

mega- (prefix), of great size; large; cf. macro-.

Megacapitula J.L. Chen & Tzean (1993), anamorphic *Pezizomycotina*, Hso.#eP.1. 1, Taiwan. See Chen & Tzean (*MR* **97**: 347, 1993).

Megachytriaceae Sparrow (1943) = Cladochytriaceae.

Megachytrium Sparrow (1931), Cladochytriaceae. 1 (on *Elodea*), N. America.

Megacladosporium Vienn.-Bourg. (1949) = Fusicladium fide Hughes (*Mycol. Pap.* **36**, 1951), Partridge & Morgan-Jones (*Mycotaxon* **85**: 357, 2003), Schubert *et al.* (*Schlechtendalia* **9**, 2003).

Megacollybia Kotl. & Pouzar (1972), Marasmiaceae. 1, Europe. See Kotlaba & Pouzar (*Česká Mykol.* **26**: 220, 1972).

Megalaria Hafellner (1984), Megalariaceae (L). 1, widespread (temperate). See Ekman & Tønsberg (*Bryologist* **99**: 34, 1996), Kantvilas *et al.* (*Lichenologist* **31**: 213, 1999), Ekman (*MR* **105**: 783, 2001; phylogeny).

Megalariaceae Hafellner (1984), Lecanorales (L). 3 gen., 3 spp.
Lit.: Ekman & Tønsberg (*Bryologist* **99**: 34, 1996), Kantvilas *et al.* (*Lichenologist* **31**: 213, 1999), Ekman (*MR* **105**: 783, 2001).

Megaloblastenia Sipman (1983), Megalosporaceae (L). 2, widespread. See Kantvilas (*Lichenologist* **26**: 349, 1994).

Megalocitosporides Wernicke (1892) = Coccidioides fide Dodge (*Medical Mycology*, 1935).

Megalocystidium Jülich (1978), Stereaceae. *c.* 10, widespread. See Boidin *et al.* (*BSMF* **113**: 60, 1997).

Megalodochium Deighton (1960), anamorphic *Pezizomycotina*, Hsp.0eP.1. 2, Africa (tropical). See Deighton (*Mycol. Pap.* **78**: 17, 1960).

megalogonidium (obsol.), a macrogonidium (q.v.).

Megalographa A. Massal. (1860), ? Dothideomycetes. See Staiger (*Biblthca Lichenol.* **85**, 2002).

Megalohypha A. Ferrer & Shearer (2007), Aliquandostipitaceae. 1, Panama; Thailand. See Ferrer *et al.* (*Mycol.* **99**: 456, 2007).

Megalonectria Speg. (1881) = Nectria fide Seifert (*Stud. Mycol.* **27**, 1985), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Megalopsora Vain. (1921) = Physcidia fide Kalb & Elix (*Biblthca Lichenol.* **57**: 265, 1995).

Megaloseptoria Naumov (1925), anamorphic *Dothideomycetes*, Cpd.0fH.15. 1, Russia. See Shoemaker (*CJB* **45**: 1297, 1967).

Megalospora A. Massal. (1852) = Mycoblastus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Megalospora Meyen (1843), Megalosporaceae (L). 35, widespread (esp. tropical). See Hafellner & Bellemère (*Nova Hedwigia* **35**: 207, 1982; ultrastr.), Sipman (*Biblthca Lichenol.* **18**, 1983; monogr., key), Kantvilas (*Lichenologist* **26**: 349, 1994; key 16 spp. Australia), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Untari (*Mycotaxon* **97**: 129, 2006; Indonesia), Lücking (*Fungal Diversity* **27**: 103, 2007; key American spp.).

Megalospora Naumov (1927) ≡ Gemmamyces.

Megalosporaceae Vězda ex Hafellner & Bellem. (1982), Teloschistales (L). 3 gen. (+ 5 syn.), 39 spp.
Lit.: Sipman (*Biblthca Lichenol.* **18**, 1983; monogr.), Sipman (*Willdenowia* **15**: 557, 1986), Kantvilas (*Lichenologist* **26**: 349, 1994; key 19 spp. Australia), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny).

Megalosporon, see *Endothrix*.

Megalotremis Aptroot (1991), Trypetheliaceae (L). 10, widespread (tropical). See Aptroot (*Nova Hedwigia* **60**: 325, 1995), Aptroot *et al.* (*Biblthca Lichenol.* **64**, 1997), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Megaloxyphium Cif., Bat. & Nascim. (1956) = Leptoxyphium fide Hughes (*Mycol.* **68**: 693, 1976).

Megaspora (Clauzade & Cl. Roux) Hafellner & V. Wirth (1987), Megasporaceae (L). 2, widespread (north temperate). See Lumbsch *et al.* (*J. Hattori bot. Lab.* **75**: 295, 1994; posn), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Ivanova & Hafellner (*Biblthca Lichenol.* **82**: 113, 2001; phylogeny), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**: 753, 2006; phylogeny).

Megasporaceae Lumbsch (1994), Pertusariales (L). 3 gen. (+ 10 syn.), 236 spp.
Lit.: Hafellner (*Acta Bot. Malac.* **16**: 133, 1991), Lumbsch *et al.* (*J. Hattori bot. Lab.* **75**: 295, 1994), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998), Ivanova & Hafellner (*Biblthca Lichenol.* **82**: 113, 2001), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**: 753, 2006), Lumbsch *et al.* (*MR* **111**: 257, 2007; phylogeny).

megaspore, see macrospore.

Megasporoporia Ryvarden & J.E. Wright (1982), Polyporaceae. 8, widespread (pantropical). See Ryvarden & Wright (*Mycotaxon* **16**: 173, 1982), Dai & Wu (*Mycotaxon* **89**: 379, 2004; China).

Megaster Cif., Bat., Nascim. & P.C. Azevedo (1956), anamorphic *Pezizomycotina*, Hso.0bP.1. 2, Brazil. See Ciferri *et al.* (*Publções Inst. Micol. Recife* **48**: 2, 1956).

Megathecium Link (1826) nom. rej. prop. ≡ Ceratostoma Fr.

Megatricholoma G. Kost (1984) = Tricholoma fide

Kuyper (*in litt.*).

Megatrichophyton Neveu-Lem. (1921) = Trichophyton fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mehtamyces Mundk. & Thirum. (1945), Pucciniales. 1 (on *Stereospermum* (*Bignoniaceae*)), Africa; India; Sri Lanka. See Thirumalachar & Mundkur (*Indian Phytopath.* **2**: 193, 1949; syn of *Phragmidiella*), Ramachar & Rao (*Mycol.* **73**: 778, 1981), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003).

meiocyte, a cell in which meiosis takes place. Cf. gonotokont.

Meionomyces Thaxt. (1931), Laboulbeniaceae. 6, widespread (tropical). See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

meiophase, the part of a life cycle in which a diploid nucleus undergoes reduction.

Meiorganaceae R. Heim ex Jülich (1982) = Coniophoraceae.

Meiorganum R. Heim (1966), Paxillaceae. 2, Malaysia; New Caledonia. See Heim (*Compte rendu hebdomadaire des Sciences de l'Academie des sciences* Paris **261**: 1720, 1965).

meiosporangium, a thick-walled diploid sporangium of certain *Blastocladiales* producing uninucleate, haploid zoospores (**meiospores**, q.v.) (Emerson, 1950); see Dick (*Mycologist* **1**: 166, 1987); cf. mitosporangium.

meiospore (1) a spore from a meiosporangium (q.v.); (2) (of ascomycetes and basidiomycetes), a basidiospore or ascospore which is the product of meiosis (see Kendrick & Watling, *in* Kendrick (Ed.), *The whole fungus* **2**: 473, 1979).

meiotangium, for the sporangium or gametangium in which meiosis occurs. See Corner (*TBMS* **15**: 336, 1931).

Meira Boekhout, Scorzetti, Gerson & Sztejnberg (2003), Exobasidiomycetidae. 3 (from mites), Israel; Japan. See Boekhout *et al.* (*Int. J. Syst. Evol. Microbiol.* **53**: 1655, 2003; phylogeny, links with *Cryptobasidiaceae*), Sampaio (*Frontiers in Basidiomycote Mycology*: 49, 2004), Yasuda (*Mycoscience* **47**: 36, 2006; from Japanese pear), Yasuda *et al.* (*Mycoscience* **47**: 36, 2006).

Meissneria Fée (1837) [non *Meisneria* DC. 1828, *Melastomataceae*] ≡ Laurera.

Meixner test. To detect amatoxins. Express juice from a fresh basidioma onto a piece of newspaper, allow to dry, add one drop of conc. hydrochloric acid (HCl) when a blue colour indicates presence of amatoxins. Adding more than one drop will significantly reduce detection rate when amatoxins are present only at low levels. Always perform the test with controls, using for example a species of *Russula* (not containing amatoxins) and a species known to contain amatoxins (e.g. *Amanita virosa*). See Meixner (*Z. Mykol.* **45**: 137, 1979), Beutler & Vergeer (*Mycol.* **72**: 1142, 1981), Vergeer (*West J. Med.* **138**: 576, 1983).

Melachroia Boud. (1885) = Podophacidium fide Seaver (*North American Cup Fungi* (Inoperculates), 1951).

Melaleuca Pat. (1887) [non *Melaleuca* L. 1767, *Myrtaceae*] ≡ Melanoleuca.

Melampsora Castagne (1843), Melampsoraceae. *c.* 90 (autoecious (*Euphorbia*, *Hypericum*, *Linum*), or heteroecious: (0, I) on conifers (*Abies*, *Larix*, *Pinus*, *Tsuga*) or angiosperms (*Allium*, *Mercurialis*, *Ribes*); (II, III) on *Salicaceae*), widespread (esp. north temperate). *M. lini* on flax (*Linum*). See Newcombe *et al.* (*MR* **104**: 261, 2000; hybrid sp.), Tian *et al.* (*Mycoscience* **45**: 56, 2004; phylog.), Pei *et al.* (*Rust Diseases of Willow and Poplar*: 1, 2005; phylog.), Pei *et al.* (*MR* **109**: 401, 2005; phylog.).

Melampsoraceae Dietel (1897), Pucciniales. 1 gen. (+ 5 syn.), 90 spp.

Lit.: Burdon & Roberts (*Pl. Path.* **44**: 270, 1995), Spiers & Hopcroft (*MR* **100**: 1163, 1996), Brasier (*BioScience* **51**: 123, 2001), Samils *et al.* (*Eur. J. Pl. Path.* **107**: 399, 2001), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003), Maier *et al.* (*CJB* **81**: 12, 2003), Nakamura *et al.* (*Mycoscience* **44**: 253, 2003), Smith *et al.* (*Mycol.* **96**: 1330, 2004), Tian *et al.* (*Mycoscience* **45**: 56, 2004), Wingfield *et al.* (*Australas. Pl. Path.* **33**: 327, 2004), Pei (*Rust Diseases of Willow and Poplar*: 11, 2005), Pei *et al.* (*MR* **109**: 401, 2005), Pei *et al.* (*Rust Diseases of Willow and Poplar*: 1, 2005), Aime (*Mycoscience* **47**: 112, 2006).

Melampsorella J. Schröt. (1874), Pucciniastraceae. 2 (on *Abies* (0, I); on *Boraginaceae* and *Caryophyllaceae* (II, III)), widespread (north temperate). See Berndt & Oberwinkler (*Mycol.* **89**: 698, 1997).

Melampsoridium Kleb. (1899), Pucciniastraceae. 9 (on *Larix* (0, I; where known) (*Pinaceae*); on *Betulaceae* (II, III) esp.), widespread (esp. north temperate). See Kurkela *et al.* (*Mycol.* **91**: 987, 1999; on birch and alder).

Melampsoropsis (J. Schröt.) Arthur (1906) = Chrysomyxa fide Arthur (*Manual Rusts US & Canada*, 1934).

Melampydiomyces Cif. & Tomas. (1953) ≡ Melampydium.

Melampydium, see *Melampylidium*.

Melampylidium Stirt. ex Müll. Arg. (1894) = Bactrospora fide Egea & Torrente (*Mycotaxon* **53**: 57, 1995).

Melanamphora Lafl. (1976), Diaporthales. Anamorph *Cytosporina*. 2 (from bark), widespread. See Prasil *et al.* (*Česká Mykol.* **28**: 1, 1974; anamorph).

Melanaria Erichsen (1936) = Pertusaria fide Hawksworth *et al.* (*Lichenologist* **12**: 1, 1980), Schmitt *et al.* (*Biblthca Lichenol.* **86**: 147, 2003; phylogeny), Schmitt *et al.* (*Lichenologist* **38**: 411, 2006; phylogeny).

Melanaspicilia Vain. (1909) = Buellia fide Lamb (*Sci. Repts Br. Antarct. Surv.* **61**, 1968).

Melanchlenus Calandron (1953) nom. inval. = Exophiala fide de Hoog (*Stud. Mycol.* **15**, 1977), Hoog *et al.* (*J. Clin. Microbiol.* **41**: 4767, 2003).

Melanconiaceae Corda (1842) = Melanconidaceae.

Melanconiales. (obsol.). Traditionally used for anamorphic fungi with acervular conidiomata. Not accepted by von Höhnel (1923) who treated *Melanconiales* in the *Hyphomycetes*, *Tuberculariales*, or by Sutton (1973, 1980) who discussed relationships of suprageneric taxa in Deuteromycotina. See Anamorphic fungi.

Melanconidaceae G. Winter (1886), Diaporthales. 13 gen. (+ 13 syn.), 104 spp.

Lit.: Wehmeyer (*Revision of Melanconis*, 1941), Barr (*Mycol. Mem.* **7**, 1978), von Arx *in* Kendrick (Ed.) (*The whole fungus* **1**: 201, 1979), Sieber *et al.* (*CJB* **69**: 2170, 1991), Belisario & Onofri (*MR* **99**: 1059, 1995), Orsenigo *et al.* (*Mycotaxon* **67**: 257, 1998), Belisario (*Eur. J. For. Path.* **29**: 317, 1999),

Yanna *et al.* (*Fungal Diversity* **2**: 199, 1999), Castlebury *et al.* (*Mycol.* **94**: 1017, 2002), Rossman *et al.* (*Mycoscience* **48**: 135, 2007; phylogeny).

Melanconidium (Sacc.) Kuntze (1898) ≡ Melanconis.

Melanconiella Sacc. (1882), Diaporthales. See Wehmeyer (*Revision of Melanconis*, 1941), Rossman *et al.* (*Mycoscience* **48**: 135, 2007; review).

Melanconiopsis Ellis & Everh. (1900), anamorphic *Massariovalsa*, Cac.0eP.19. 4, widespread. See Speer (*BSMF* **102**: 363, 1986), Suarez *et al.* (*MR* **104**: 1530, 2000; Argentina).

Melanconis Tul. & C. Tul. (1863), Melanconidaceae. Anamorph *Melanconium*. 28, widespread. *M. juglandis* (die-back of *Juglans*). The genus seems to be polyphyletic. See Wehmeyer (*Revision of Melanconis*, 1941), Castlebury *et al.* (*Mycol.* **94**: 1017, 2002).

Melanconites Göpp. (1852), Fossil Fungi. 1 (Tertiary), Europe.

Melanconium Link (1809), anamorphic *Melanconis*, Cac.0eP.19. *c.* 50, widespread. See Sutton (*Persoonia* **3**: 193, 1964; typification), Sieber *et al.* (*CJB* **69**: 2170, 1991; biochem. charact. *Alnus* isol.), Shamoun & Sieber (*Mycotaxon* **49**: 151, 1993; isozyme, protein patterns *Alnus* isol.), Belisario (*Eur. J. For. Path.* **29**: 317, 1999; on *Juglans*).

Melanelia Essl. (1978), Parmeliaceae (L). 42, widespread (esp. temperate and boreal). See Esslinger (*Taxon* **29**: 692, 1980), Lumbsch *et al.* (*Mycotaxon* **33**: 447, 1988), Kashiwadani *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **24**: 43, 1998; Japan), Crespo *et al.* (*Lichenologist* **31**: 451, 1999; morphology, chemistry, phylogeny), Guzow-Krzeminska & Wegrzyn (*Lichenologist* **35**: 83, 2003; phylogeny), Chen & Esslinger (*Mycotaxon* **93**: 71, 2005; China), Rico *et al.* (*Lichenologist* **37**: 199, 2005; Iberian peninsula), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny).

Melanelixia O. Blanco, A. Crespo, Divakar, Essl., D. Hawksw. & Lumbsch (2004), Parmeliaceae (L). 8, widespread. See Blanco *et al.* (*MR*, 2004), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny), Laundon (*Lichenologist* **38**: 277, 2006; infraspecific taxa), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Honegger & Zippler (*MR* **111**: 424, 2007; mating systems).

Melaniella R. Bauer, Vánky, Begerow & Oberw. (1999), Melaniellaceae. 2 (on *Selaginella*), India; Jawa; Zimbabwe. See Vánky & Vánky (*Lidia* **5**: 157, 2002; southern Africa).

Melaniellaceae R. Bauer, Vánky, Begerow & Oberw. (1999), Doassansiales. 1 gen., 2 spp.
Lit.: Bauer *et al.* (*CJB* **75**: 1273, 1997), Bauer *et al.* (*Mycol.* **91**: 475, 1999), Vánky (*Mycol. Balcanica* **1**: 175, 2004).

melanin, a black pigment (tyrosine derivative) produced by fungi, animals etc. (Butler *et al.* (*Mycol.* **93**: 1, 2001; pathogenic properties), Wheeler, *TBMS* **81**: 29, 1983; synthesis).

melanized, containing dark brown pigments.

Melanobasidium Maubl. (1906) = Sphaceloma fide Jenkins & Bitancourt (*Mycol.* **33**: 338, 1941).

Melanobasis Clem. & Shear (1931) = Sphaceloma fide Sutton (*Mycol. Pap.* **141**, 1977).

Melanobotrys Rodway (1926) = Xylobotryum fide Clements & Shear (*Gen. Fung.*, 1931).

Melanocarpus Arx (1975), Sordariales. 3 (thermophilic), widespread. See Maheshwari & Kamalam (*J. gen. Microbiol.* **131**: 3017, 1985), Guarro *et al.* (*MR* **100**: 75, 1996).

Melanocephala S. Hughes (1979), anamorphic *Pezizomycotina*, Hso.0eP.1. 5, widespread. See Hughes (*N.Z. Jl Bot.* **17**: 166, 1979), Wu & Zhuang (*Fungal Diversity Res. Ser.* **15**, 2005).

Melanochaeta E. Müll., Harr & Sulmont (1969), Chaetosphaeriaceae. Anamorphs *Sporoschisma*, *Chalara*-like. 4 (from wood etc.), Europe; Sri Lanka. See Réblová (*Czech Mycol.* **50**: 73, 1997), Réblová *et al.* (*Sydowia* **51**: 49, 1999), Sivichai *et al.* (*MR* **104**: 478, 2000), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny), Fernández *et al.* (*Mycol.* **98**: 121, 2006), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Melanochlamys Syd. & P. Syd. (1914) = Gilletiella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Melanocryptococcus Della Torre & Cif. (1964) = Cryptococcus Vuill. fide von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977).

Melanodecton A. Massal. (1860) = Chiodecton fide Thor (*Op. Bot.* **103**, 1990).

Melanodiscus Höhn. (1918), anamorphic *Pezizomycotina*, Hsp.0eP.?. 1, Europe.

Melanodochium Syd. (1938) ? = Sphaceloma fide Sutton (*Mycol. Pap.* **141**, 1977).

Melanodothis R.H. Arnold (1972), Mycosphaerellaceae. Anamorph *Ramularia*-like. 1, Asia; N. America. See Sivanesan (*Bitunicate Ascomycetes and their Anamorphs*, 1984).

Melanogaster Corda (1831) nom. cons., Paxillaceae. 25, widespread. See Zeller & Dodge (*Ann. Mo. bot. Gdn* **23**: 639, 1936), Wang *et al.* (*Mycotaxon* **93**: 315, 2005; Japan).

Melanogastraceae E. Fisch. (1933) = Paxillaceae.

Melanogastrales = Boletales. See also under Hypogeous fungi, gasteromycetes.

Melanogone Wollenw. & Ha. Richt. (1934) = Humicola fide Mason (*Mycol. Pap.* **5**: 113, 1941).

Melanogramma Pers. [not traced] nom. dub., Fungi. See Keissler (*Nyt Mag. naturv.* **66**: 79, 1927).

Melanographa Müll. Arg. (1882), Melaspileaceae (L). See Lendemer (*Bryologist* **106**: 311, 2003).

Melanographium Sacc. (1913), anamorphic *Pezizomycotina*, Hso/Hsy.0eP.10. 9, Asia (tropical). See Ellis (*Dematiaceous Hyphomycetes*, 1971), Srivastava & Morgan-Jones (*Mycotaxon* **57**: 195, 1996; India), Goh & Hyde (*MR* **101**: 1097, 1997; Hong Kong, key), Somrithipol & Jones (*Fungal Diversity* **19**: 137, 2005; Thailand).

Melanohalea O. Blanco, A. Crespo, Divakar, Essl., D. Hawksw. & Lumbsch (2004), Parmeliaceae (L). 20, widespread. See Blanco *et al.* (*MR* **108**: 882, 2004), Divakar & Upreti (*Lichenologist* **37**: 511, 2005), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny).

Melanolecia Hertel (1981), Lecanorales (L). 8, widespread. See Poelt & Vězda (*Biblthca Lichenol.* **16**, 1981), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004; reln with *Farnoldia*).

Melanoleuca Pat. (1897) nom. cons., Tricholomataceae. *c.* 50, widespread. See Bresinsky & Stangl (*Z. Pilzk.* **43**: 145, 1977), Gillman & Miller (*Mycol.* **69**: 927, 1977), Kühner (*Bull. Soc. linn. Lyon* **47**: 12, 1978), Boekhout (*Persoonia* **13**: 397, 1988; Netherlands), Boekhout & Kuyper (*Persoonia* **16**: 253, 1996), Fontenla *et al.* (*Rivista di Micologia* **44**: 27, 2001), Fontenla *et al.* (*Micologia e Vegetazione Mediterranea* **17**: 18, 2002), Fontenla *et al.* (*Rivista

di Micologia **48**: 113, 2005; spore morphology).

Melanomma Nitschke ex Fuckel (1870), Melanommataceae. Anamorph *Nigrolentilocus*. *c*. 27, widespread. See Chesters (*TBMS* **22**: 116, 1938), Holm (*Symb. bot. upsal.* **14** no. 3: 1, 1957), Réblová (*Czech Mycol.* **50**: 161, 1998), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; DNA), Inderbitzin & Huang (*Mycoscience* **42**: 187, 2001; China), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Wang *et al.* (*MR* **111**: 1268, 2007; phylogeny).

Melanommataceae G. Winter (1885), Pleosporales. 21 gen. (+ 9 syn.), 265 spp. The family is polyphyletic and in need of revision.

Lit.: Boise (*Mycol.* **77**: 230, 1985), Hawksworth & Boise (*Sydowia* **38**: 114, 1985), Barr (*N. Amer. Fl.* ser. 2 **13**: 129 pp., 1990), Huhndorf (*Mycol.* **90**: 527, 1998), Hyde & Fröhlich (*Sydowia* **50**: 81, 1998), Réblová (*Czech Mycol.* **50**: 161, 1998), Hyde & Goh (*Nova Hedwigia* **68**: 251, 1999), Liew *et al.* (*Mol. Melanommatales = Pleosporales.

Melanomphalia M.P. Christ. (1936), Tricholomataceae. 1, Europe. See Christiansen (*Friesia* **1**: 288, 1936), Montag (*Z. Mykol.* **62**: 75, 1996), Aime *et al.* (*Am. J. Bot.* **92**: 74, 2005; most species should be placed in *Crepidotus*), Eyssartier & Boisselet (*BSMF* **120**: 423, 2004).

Melanomyces Syd. & P. Syd. (1917) nom. dub., Fungi. See Petrak (*Sydowia* **1**: 169, 1947).

Melanopelta Kirschst. (1939) = Gnomonia fide Bolay (*Ber. schweiz. bot. Ges.* **81**, 1972).

Melanopeziza Velen. (1939), ? Helotiales. 1, former Czechoslovakia.

Melanophloea P. James & Vězda (1971), Thelocarpaceae (L). 1, British Solomon Islands; Papua New Guinea. See James & Vězda (*Lichenologist* **5**: 89, 1971).

Melanophoma Papendorf & J.W. du Toit (1967), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1, S. Africa. See Papendorf & du Toit (*TBMS* **50**: 503, 1967).

Melanophora Arx (1957) = Sphaceloma fide Jenkins (*Aq. Inst. Biol. S. Paulo* **38**: 83, 1971).

Melanophthalmum Fée (1825) = Strigula fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Melanophyllum Velen. (1921), Agaricaceae. 3, widespread. See Velenovský (*České Houby*: 569, 1921), Migliozzi & Zecchin (*Boll. Gruppo Micol. 'G. Bresadola'* **44**: 49, 2001), Vellinga (*MR* **108**: 354, 2004; phylogeny).

Melanoplaca Syd. & P. Syd. (1917) = Dothidasteroma fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Melanoporella Murrill (1907) = Nigrofomes fide Lowe (*Tech. Pub. Sta. Univ. Coll. Forestry, Syracuse* **90**, 1966) but used by, Pegler (*The polypores [Bull. BMS Suppl.]*, 1973).

Melanoporia Murrill (1907) = Nigrofomes fide Ryvarden (*Norw. Jl Bot.* **19**: 233, 1972).

Melanoporthe Wehm. (1938) = Diaporthe fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Melanops Nitschke ex Fuckel (1870), Botryosphaeriaceae. 1. See Holm (*Taxon* **24**: 475, 1975), Phillips & Pennycook (*Sydowia* **56**: 288, 2004), Crous *et al.* (*Stud. Mycol.* **55**: 235, 2006).

Melanopsamma Niessl (1876), Hypocreales. Anamorphs *Custingophora*-like, *Stachybotrys*. 41 (on old wood etc.), widespread (north temperate). See Barr (*Mycotaxon* **39**: 43, 1990; status, posn), Samuels & Barr (*CJB* **75**: 2165, 1998; key N Am. spp.), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny).

Melanopsammella Höhn. (1920), Chaetosphaeriaceae. Anamorphs *Chloridium*, *Gonytrichum*. 1, Europe. See Alcorn (*Mycotaxon* **39**: 361, 1990; phylogeny), Réblová (*Czech Mycol.* **50**: 73, 1997), Réblová *et al.* (*Sydowia* **51**: 49, 1999), Réblová (*Stud. Mycol.* **45**: 149, 2000; review), Fernández & Huhndorf (*Fungal Diversity* **18**: 15, 2005), Fernández *et al.* (*Mycol.* **98**: 121, 2006; phylogeny).

Melanopsammina Höhn. (1919) = Lentomita fide Holm (*Svensk bot. Tidskr.* **62**: 217, 1968).

Melanopsammopsis Stahel (1915) = Microcyclus fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Melanopsichiaceae Vánky (2001) = Ustilaginaceae.

Melanopsichium Beck (1894), Ustilaginaceae. 2 (on *Polygonaceae*), widespread. See Zundel (*Mycol.* **35**: 180, 1943), Zundel (*Mycol.* **35**: 654, 1943), Zundel (*Mycol.* **52**: 189, 1961), Vánky (*Illustrated genera of smut fungi*, 1987), Vánky (*Mycol. Balcanica* **2**: 113, 2005).

Melanopus Pat. (1887) = Polyporus P. Micheli ex Adans. fide Singer (*Agaric. mod. Tax.*, 1951).

Melanormia Körb. (1865), ? Helotiales (?L). 1, Germany.

Melanosella Örösi-Pál (1936), anamorphic *Pezizomycotina*, Hso.0eH.?. 1 (yeast-like), widespread. *M. mors-apis* (melanosis of bees).

Melanosorus De Not. (1847) ≡ Rhytisma.

Melanosphaeria Sawada (1922) ? = Sirosphaera fide Petch (*TBMS* **11**: 258, 1926).

Melanosphaerites Grüss (1928), Fossil Fungi. 2 (Devonian), Europe.

Melanospora Corda (1837) nom. cons., Ceratostomataceae. Anamorphs *Harzia*, *Gonytrichum*. 29 (from soil, often fungicolous), widespread. See Doguet (*Botaniste* **39**, 1955), Cannon & Hawksworth (*J. Linn. Soc.* Bot. **84**: 115, 1982; key 12 Br. spp.), Vakili (*MR* **93**: 67, 1989; anamorph), Goh & Hanlin (*Mycol.* **86**: 357, 1994; ontogeny), Goh & Hanlin (*Mycol.* **90**: 655, 1998; TEM), Goh *et al.* (*Fungal Science* Taipei **13**: 1, 1998; anamorph), Jones & Blackwell (*MR* **102**: 661, 1998; DNA), Stchigel *et al.* (*MR* **103**: 1305, 1999), Nitzan *et al.* (*Sydowia* **56**: 281, 2004), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny), Tsui *et al.* (*Mycol.* **99**: 884, 2007; phylogeny, anamorph).

Melanospora Mudd (1861) ≡ Poeltinula.

Melanosporaceae Bessey (1950) = Ceratostomataceae.

Melanosporales N. Zhang & M. Blackw. (2007). Hypocreomycetidae. 1 fam., 12 gen., 63 spp. Fam.:
Ceratostomataceae

For *Lit.* see under fam.

Melanosporites Pampal. (1902), Fossil Fungi. 1 (Miocene), Italy.

Melanosporopsis Naumov (1927) = Melanospora Corda fide Clements & Shear (*Gen. Fung.*, 1931).

melanosporous, black-spored.

Melanostigma Kirschst. (1939) = Herpotrichiella fide Barr (*Rhodora* **78**: 67, 1976).

Melanostroma Corda (1829) = Ceuthospora Grev. fide Nag Raj *in* Sherwood (Ed.) (*Mycotaxon* **5**: 1, 1977).

Melanostromella Petr. (1953) = Antennularia fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Melanotaeniaceae Begerow, R. Bauer & Oberw. (1998), Ustilaginales. 3 gen., 14 spp.

Lit.: Ingold (*TBMS* **91**: 712, 1988), Boekhout *et al.* (*Stud. Mycol.* **38**: 175, 1995), Bauer *et al.* (*CJB* **75**: 1273, 1997), Begerow *et al.* (*CJB* **75**: 2045, 1998), Piepenbring *et al.* (*Protoplasma* **204**: 202, 1998), Walker (*MR* **105**: 225, 2001), Vánky (*Mycol. Balcanica* **1**: 175, 2004).

Melanotaenium de Bary (1874), Melanotaeniaceae. 9, widespread. Black spots or swellings on dicotyledonous plants. See Zambettakis & Joly (*BSMF* **88**: 193, 1972; key, numerical taxonomy), Vánky (*Illustrated genera of smut fungi*, 1987), Bauer *et al.* (*CJB* **75**: 1273, 1997), Vánky (*Mycotaxon* **70**: 44, 1999), Vánky (*Mycol. Balcanica* **2**: 169, 2005).

Melanotheca Fée (1837) = Pyrenula Ach. (1809) fide Harris (*Mem. N. Y. bot. Gdn* **49**, 1989).

Melanothecomyces Cif. & Tomas. (1953) = Laurera fide Letrouit-Galinou (*Revue bryol. lichén.* **26**: 207, 1957).

Melanothecopsis C.W. Dodge (1967), Pyrenulaceae (?L). 5, widespread. See Dodge (*Nova Hedwigia* **12**: 308, 1966).

Melanotopelia Lumbsch & Mangold (2008), Thelotremataceae (L). 2, N. America; Australia. See Mangold *et al.* (*Lichenologist* **40**: 39, 2008).

Melanotrema A. Frisch (2006), Thelotremataceae (L). 6, pantropical. See Frisch (*Biblthca Lichenol.* **92**: 382, 2006), Frisch *et al.* (*Biblthca Lichenol.* **92**: 517, 2006; phylogeny).

Melanotrichum Corda (1833) = Trichosporum Vuill. fide Saccardo (*Syll. fung.* **4**: 292, 1886).

Melanotus Pat. (1900) = Psilocybe (Fr.) P. Kumm. fide Kuyper (*in litt.*).

Melanustilospora Denchev (2003), Urocystidaceae. 2 (on *Araceae*), Europe. See Denchev (*Mycotaxon* **87**: 475, 2003).

Melascypha Boud. (1885) = Pseudoplectania fide Seaver (*North American Cup Fungi* (Operculates), 1928).

Melasmia Lév. (1846), anamorphic *Rhytisma*, St.0eH.15. 20, widespread. See Braun (*Arnoldia* **15**: 44, 1998; *M. ulmicola*).

Melaspilea Nyl. (1857), Melaspileaceae (±L). *c.* s.lat. 66, widespread (esp. tropical). See Hafellner *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 419, 1994; rels, polyphyly), Vrijmoed *et al.* (*MR* **100**: 291, 1996), Kantvilas & Coppins (*Lichenologist* **29**: 525, 1997), Lendemer (*Bryologist* **106**: 311, 2003; nomencl.).

Melaspileaceae Walt. Watson (1929), Arthoniomycetes (inc. sed.) (±L). 1 gen. (+ 6 syn.), *c.* 66 spp.

Lit.: Hafellner *in* Hawksworth (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 419, 1994), Vrijmoed *et al.* (*MR* **100**: 291, 1996).

Melaspileella (P. Karst.) Vain. (1921) ? = Melaspilea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Melaspileomyces Cif. & Tomas. (1953) = Melaspilea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Melastiza Boud. (1885), Pyronemataceae. 14, widespread (north temperate). See Maas Geesteranus (*Persoonia* **4**: 418, 1967; key), Dissing (*Svampe*: 29, 1980; key Danish spp.), Lassuer (*Docums Mycol.* **11** no. 42: 1, 1980; key), Häffner (*Beitr. Kenntn. Pilze Mitteleur.* **2**: 183, 1986; key 9 spp.), Arroyo & Calonge (*Boln Soc. Micol. Madrid* **12**: 23, 1988), Moravec (*Czech Mycol.* **47**: 237, 1994; synonym of *Aleuria*), Spooner & Yao (*Mycotaxon* **53**: 467, 1995), Hansen *et al.* (*Mol. Phylogen. Meliolales Gäum. ex D. Hawksw. & O.E. Erikss. (1986). Meliolomycetidae. 1 fam., 22 gen., 1980 spp. Fam.:

Meliolaceae
Lit.: Hosagoudar (*Meliolales of India*, 1996), Katumoto & Hosagoudar (*J. Econ. Tax. Bot.* **13**: 615, 1989; lists 169 taxa supplemental to Hansford's monograph), Saenz & Taylor (*MR* **103**: 1049, 1999; phylogeny), Schmiedeknecht (*Wiss. Zeitschr. Friedrich-Schiller Univ. Jena* **38**, 185, 1989; 109 spp. Cuba), and see under *Meliolaceae*.

Meliolaster Doidge (1920) = Amazonia fide Stevens (*Annls mycol.* **25**: 405, 1927).

Meliolaster Höhn. (1918), Asterinaceae. 1, widespread (tropical).

Meliolidium Speg. (1924) = Perisporiopsis Henn. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Meliolina Syd. & P. Syd. (1914), Meliolinaceae. Anamorph *Briania*. 39, widespread. See Reynolds (*Cryptog. Mycol.* **10**: 305, 1989; asci), Hughes (*Mycol. Pap.* **166**, 1993; key), Saenz & Taylor (*MR* **103**: 1049, 1999; phylogeny), Hosagoudar (*Zoos' Print Journal* **17**: 786, 2002; key).

Meliolinaceae S. Hughes (1993), Pezizomycotina (inc. sed.). 2 gen., 40 spp.
Lit.: Reynolds (*Pacific Sci.* **43**: 161, 1989), Reynolds (*Cryptog. Mycol.* **10**: 305, 1989), Hughes (*Mycol. Pap.* **166**: 255 pp., 1993), Hughes (*Mycol. Pap.* **166**, 1993), Johnston (*N.Z. Jl Bot.* **37**: 289, 1999), Saenz & Taylor (*MR* **103**: 1049, 1999; phylogeny).

melioline, one of the *Meliolaceae*, esp. *Meliola* spp.

Meliolinella Hansf. (1946) = Scolionema fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Hosagoudar (*Persoonia* **18**: 123, 2002).

Meliolinites Selkirk ex Janson. & Hills (1978), Fossil Fungi. 3 (Eocene, Miocene), Australia; USA.

Meliolinopsis Beeli (1920) ≡ Patouillardina G. Arnaud.

Meliolinopsis F. Stevens (1924) = Scolionema fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Melioliphila Speg. (1924), Tubeufiaceae. Anamorphs *Chionomyces*, *Eriomycopsis*. 7, widespread (tropical). See Rossman (*Mycol. Pap.* **157**, 1987; key).

Meliolomycetidae, Sordariomycetes. Ord.:
Meliolales
For *Lit.* see fam.

Meliolopsis (Sacc.) Sacc. (1891) nom. dub., Fungi. See Theissen & Sydow (*Annls mycol.* **15**: 465, 1917).

Meliothecium Sacc. (1901) ≡ Myxothecium.

Melittosporiopsis, see *Mellitiosporiopsis*.

Melittosporium, see *Mellitiosporium*.

Mellitiosporiella Höhn. (1919), Rhytismatales. 2, Europe; N. America. See Sherwood (*Mycotaxon* **5**: 1, 1977), Sherwood (*Sydowia* **38**: 267, 1986).

Mellitiosporiopsis Rehm (1900) = Tapellaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mellitiosporium Corda (1838), Rhytismatales. 3, Europe; N. America. See Hawksworth & Kinsey (*SA* **14**: 59, 1995; nomencl.).

Meloderma Darker (1967), Rhytismataceae. 4, widespread. Nests within *Lophodermium* in phylogenetic analyses. See Johnston (*Mycotaxon* **33**: 423, 1988; gen. concept), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Ortiz-García *et al.* (*Mycol.* **95**: 846, 2003; phylogeny).

Melogramma Fr. (1849), Melogrammataceae. Anamorph *Cytosporina*. 3, Europe. See Laflamme (*Sydowia* **28**: 237, 1977), Barr (*Mycol. Mem.* **7**, 1978), Cannon (*SA* **7**: 23, 1988; posn).

Melogrammataceae G. Winter (1886), Diaporthales. 1 gen., 3 spp. Ascomata perithecial, long-necked, clustered within a dark pseudostroma. Asci cylindrical, fairly thick-walled but not fissitunicate, with an apical ring that does not stain in iodine, remaining attached at maturity. Ascospores fusiform to cylindrical, often curved, with several transverse septa, dark brown but with the end cells remaining ± hyaline. Anamorph coelomycetous.

Melomastia Nitschke ex Sacc. (1875), Xylariales. 3 or 4 (bark and wood), widespread. Probably close to *Pleurotrema* as interpreted by Harris & Barr, but the true identity of that genus is uncertain. See Kang *et al.* (*Fungal Diversity* **2**: 135, 1999).

melophase, the part of a life cycle in which a diploid nucleus undergoes reduction.

Melophia Sacc. (1884), anamorphic *Pezizomycotina*, St.0fH.?. 10, widespread. See Sutton (*Mycol. Pap.* **141**, 1977).

Melzericium Hauerslev (1975), Atheliaceae. 3, widespread. See Greslebin & Rajchenberg (*N.Z. Jl Bot.* **41**: 437, 2003; Patagonia).

Melzerodontia Hjortstam & Ryvarden (1980), Corticiaceae. 3, Tanzania. See Hjortstam & Ryvarden (*Mycotaxon* **12**: 177, 1980).

Membranatheca Matsush. (1995) = Amerosporium fide Sutton (*in litt.*).

Membranicium J. Erikss. (1958) = Phanerochaete fide Donk (*Persoonia* **2**: 223, 1962) but see, Hayashi (*Bull. Govt. For. Res. Stn* **88**: 260, 1974).

Membranomyces Jülich (1975), Clavulinaceae. 2, Europe; Canada. See Dentinger & McLaughlin (*Mycol.* **98**: 746, 2006; phylogeny).

membranous (membranaceous), like a thin skin or parchment.

Memnoniella Höhn. (1923), anamorphic *Hypocreales*, Hso.0eP.15. 5, widespread. See Verona & Mazzucchetti (*Publ. Ente naz. Cellul. Carta*, 1968), Haugland *et al.* (*Mycol.* **93**: 54, 2001; phylogeny), Photita *et al.* (*Cryptog. Mycol.* **24**: 147, 2003; on *Musa*).

Memnonium Corda (1833) = Trichosporum Vuill. fide Saccardo (*Syll. fung.* **4**: 294, 1886).

memnospore, a spore remaining at its place of origin (Gregory, *in* Madelin (Ed.), *The fungus spore*, 1966). Cf. xenospore.

Mendogia Racib. (1900), Schizothyriaceae. 2, widespread.

Mendoziopeltis Bat. (1959), Micropeltidaceae. 2, C. America. See Batista (*Publções Inst. Micol. Recife* **56**: 434, 1959).

Menegazzia A. Massal. (1854), Parmeliaceae (L). *c.* 78, widespread (esp. south temperate). See Santesson (*Ark. Bot.* **30A** no. 11: 1, 1943), Adler & Calvelo (*Mycotaxon* **59**: 367, 1996), Bjerke & Elvebakk (*Mycotaxon* **78**: 363, 2001; S. Am.), James *et al.* (*Biblthca Lichenol.* **78**: 91, 2001; New Guinea), Bjerke (*Lichenologist* **34**: 503, 2002; neotropics), Aptroot *et al.* (*Bryologist* **106**: 157, 2003; Taiwan), Bjerke (*Lichenologist* **36**: 15, 2004; Japan), Kantvilas & Louwhoff (*Lichenologist* **36**: 103, 2004; Australia), Thell *et al.* (*Mycol. Progr.* **3**: 297, 2004; phylogeny), Bjerke (*Mycotaxon* **91**: 423, 2005; S America), Bjerke & Obermayer (*Nova Hedwigia* **81**: 301, 2005; Tibet), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Arup *et al.* (*Mycol.* **99**: 42, 2007; phylogeny), Bjerke & Sipman (*J. Linn. Soc.* Bot. **153**: 489, 2007; SE Asia).

Menezesia Torrend (1913), ? Saccharomycetales. 1,

Madeira.

Menidochium R.F. Castañeda & W.B. Kendr. (1990), anamorphic *Pezizomycotina*, Hsp.0eP.15. 1, Cuba. See Castañeda & Kendrick (*Univ. Waterloo Biol. Ser.* **32**: 28, 1990).

Meniscoideisporites Watanabe, H. Nishida & Kobayashi (1999), Fossil Fungi. 1. See Watanabe *et al.* (*Int. J. Pl. Sci.* **160**: 438, 1999).

Menispora Pers. (1822), anamorphic *Chaetosphaeria*, Hso.0eH.15. 13, widespread (esp. temperate). See Hughes (*CJB* **41**: 693, 1963; key), Holubová-Jechová (*Folia geobot. phytotax.* **8**: 317, 1973; key 4 spp.), Constantinescu *et al.* (*MR* **99**: 585, 1995; teleomorph-anamorph connexions), Réblová (*Stud. Mycol.* **45**: 149, 2000; review), Réblová & Winka (*Mycol.* **92**: 939, 2000; phylogeny), Markovskaja (*Botanica Lithuanica* **8**: 63, 2002; Lithuania), Fernández *et al.* (*Mycol.* **98**: 121, 2006; phylogeny), Réblová *et al.* (*MR* **110**: 104, 2006; teleomorph), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Menisporella Agnihothr. (1962) = Dictyochaeta fide Sutton (*in litt.*).

Menisporopascus Matsush. (2003), Chaetosphaeriaceae. Anamorph *Menisporopsis*. 1, Japan. See Matsushima (*Matsush. Mycol. Mem.* **10**: 141, 2001).

Menisporopsis S. Hughes (1952), anamorphic *Chaetosphaeriaceae*, Hsy.0-1eH.15. 6, Africa; New Zealand. See Hughes (*Mycol. Pap.* **48**: 59, 1952), Castañeda Ruíz *et al.* (*Mycotaxon* **64**: 335, 1997), Tsui *et al.* (*MR* **103**: 148, 1999), Castañeda Ruíz *et al.* (*Cryptog. Mycol.* **22**: 259, 2001; Venezuela), Matsushima (*Matsush. Mycol. Mem.* **10**, 2001; teleomorph).

Menoidea L. Mangin & Har. (1907), anamorphic *Pezizomycotina*, Hsp.0eH.?. 1, France; British Isles. See Wilson & Waldie (*TBMS* **13**: 151, 1928).

Mensularia Lázaro Ibiza (1916), Hymenochaetaceae. 4, widespread. See Wagner & Fischer (*Mycol.* **94**: 998, 2002).

Merarthonis Clem. (1909) = Arthonia fide Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Mercadomyces J. Mena (1988), anamorphic *Pezizomycotina*, Hsy.≡ eP.25. 1, Cuba. See Mena (*Revta Jardín bot. Nac.* Univ. Habana **9**: 52, 1988).

merenchyma, see plectenchyma.

Meria Vuill. (1896), anamorphic *Rhabdocline*, Hso.0eH.?. 2, Europe; N. America. *M. laricis* on *Larix*. See Peace & Holmes (*Oxf. forest. Mem.* **15**, 1933), Drechsler (*Phytopathology* **31**: 773, 1941), Jansson *et al.* (*Antonie van Leeuwenhoek* **50**: 321, 1984; ultrastr., life history), Gernandt *et al.* (*Mycol.* **89**: 735, 1997; teleomorph), Stone & Gernandt (*Mycotaxon* **91**: 115, 2005; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Merimbla Pitt (1979), anamorphic *Talaromyces*, Hso.0eH.15. 4, widespread. See Pitt (*CJB* **57**: 2394, 1979), Ogawa & Sugiyama (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 149, 2000; phylogeny), Pitt *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 9, 2000; accepted names), Bills *et al.* (*MR* **105**: 1273, 2001; Mexico).

Meringosphaeria Peyronel (1918) = Acerbiella fide Clements & Shear (*Gen. Fung.*, 1931).

Meripilaceae Jülich (1982), Polyporales. 7 gen. (+ 7 syn.), 57 spp.

Lit.: Larsen & Lombard (*Mycol.* **80**: 612, 1988), Corner (*Beih. Nova Hedwigia* **96**: 218 pp., 1989), Shen *et al.* (*Mycol.* **94**: 472, 2002), Kim *et al.* (*Antonie van Leeuwenhoek* **83**: 81, 2003), Wang *et al.* (*Mycol.* **96**: 1015, 2004), Binder *et al.* (*Systematics and Biodiversity* **3**: 113, 2005).

Meripilus P. Karst. (1882), Meripilaceae. 5, widespread. See Corner (*Beih. Nova Hedwigia* **78**: 193, 1984), Larson & Lombard (*Mycol.* **80**: 612, 1988; key).

Merisma (Fr.) Gillet (1878) ≡ Grifola.

Merisma Pers. (1797) = Thelephora fide Donk (*Reinwardtia* **2**: 435, 1954).

Merismatium Zopf (1898), Verrucariaceae. *c.* 11 (on lichens), Europe. See Triebel (*Biblthca Lichenol.* **35**, 1989).

merismatoid (of a pileus), made up of smaller pilei.

Merismella Syd. (1927), anamorphic *Chaetothyrium*, Cpt.0eH.38. 5, C. America. See Hofmann & Piepenbring (*Fungal Diversity* **22**: 55, 2006; Panama).

Merismodes Earle (1909), Niaceae. 20, widespread. See Singer (*Agaric. mod. Tax.* edn 3, 1975).

merispore, see sporidesm.

Meristacraceae Humber (1989), Entomophthorales. 3 gen. (+ 3 syn.), 7 spp.

Lit.: Tucker (*Mycotaxon* **13**: 481, 1981; key), Humber (*Mycotaxon* **34**: 441, 1989), Saikawa (*CJB* **67**: 2484, 1989), Saikawa & Sakuramata (*Trans. Mycol. Soc. Japan* **33**: 237, 1992), Saikawa *et al.* (*CJB* **75**: 762, 1997).

Meristacrum Drechsler (1940), Meristacraceae. 2, widespread. See Drechsler (*J. Wash. Acad. Sci.* **30**: 250, 1940), Drechsler (*Sydowia* **14**: 98, 1960; spore discharge), Davidson & Barron (*CJB* **51**: 231, 1973), Couch *et al.* (*Proc. natn Acad. Sci. U.S.A.* **76**: 2299, 1979), Tucker (*Mycotaxon* **13**: 481, 1981; key), Prasad & Dayal (*Curr. Sci.* **55**: 321, 1986), Saikawa *et al.* (*CJB* **75**: 762, 1997; ultrastr.), Keller & Petrini (*Sydowia* **57**: 23, 2005; key).

meristem arthrospore, one of the chain of conidia maturing in basipetal succession and originating by apical wall building at the tip of the condiogenous cell; **- blastospore**, a conidium arising either apically or laterally from a conidiogenous cell which elongates through ring wall building at the base (a basauxic conidiophore; Hughes, 1953). See Anamorphic fungi.

meristematic (of conidiophores), see wall-building.

meristogenous (of pycnidia, etc.), formed by growth and division of one hypha; **symphogenous**, formed from a number of hyphae. See Sutton (*in* Ainsworth *et al.* (Eds), *The Fungi* **4A**: 1973).

Meristosporum A. Massal. (1860) = Laurera fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Merocinta Pell & E.U. Canning (1993), Microsporidia. 1.

Merodontis Clem. (1909), Helotiales. 1, Java. See Carpenter (*Mem. N. Y. bot. Gdn* **33**, 1981; status).

merogamy, copulation between special sex cells or gametes.

Merolpidiaceae A. Fisch. (1892) = Synchytriaceae.

meront (of *Mycetozoa*), one of the daughter myxamoebae cut off in succession by a parent myxamoeba.

Merophora Clem. (1909) = Umbilicaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Meroplacis Clem. (1909) = Caloplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Merorinis Clem. (1909) = Rinodina fide Zahlbruckner

(*Catalogus Lichenum Universalis* 7, 1931).

merosporangium (of *Zygomycetes*), a cylindrical outgrowth from the swollen end of a sporangiophore in which a chain-like series of sporangiospores is generally produced. See Benjamin (*Mycol.* **58**: 1, 1966; review, *in* Kendrick (Ed.), *The whole fungus* **2**: 573, 1979).

Merosporium Corda (1831) nom. dub., ? Fungi. See Hughes (*CJB* **36**: 784, 1958), Hennebert (*CJB* **76**: 1596, 1998).

Merostictina Clem. (1909) = Pseudocyphellaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Merostictis Clem. (1909) = Diplonaevia fide Hein (*Nova Hedwigia* **38**: 669, 1983).

Merrilliopeltis Henn. (1908) = Oxydothis fide Barr (*Mycol.* **68**, 1976), Hyde (*Sydowia* **46**: 265, 1995).

Merugia Rogerson & Samuels (1990), Sordariomycetes. 1 (living petioles of *Palicourea*), Guyana. See Rogerson & Samuels (*Mem. N. Y. bot. Gdn* **64**: 165, 1990).

Meruliaceae P. Karst. (1881), Polyporales. 47 gen. (+ 44 syn.), 420 spp.

Lit.: Reid (*Beih. Nova Hedwigia* **18**: 1090, 1965), Chamuris (*Mycol. Mem.* **14**: 247 pp., 1988; as *Podoscyphaceae*), Corner (*Beih. Nova Hedwigia* **96**: 218 pp., 1989), Tzean & Liou (*Phytopathology* **83**: 1015, 1993; as *Hyphodermataceae*), Nakasone & Sytsma (*Mycol.* **85**: 996, 1993), Nakasone & Burdsall Jr. (*Mycotaxon* **54**: 335, 1995), Chang *et al.* (*Mycol. Mesophelliopsis Bat. & A.F. Vital (1957), Agaricales. 1, Brazil. ? = *Geastrum* (Geastr.) fide Demoulin (*in litt.*).

mesophile, see thermophily.

Mesopsora Dietel (1922) = Melampsora fide Berndt (*in litt.*).

Mesopyrenia M. Choisy (1931) = Arthopyrenia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

mesospore (1) a 1-celled teliospore among 2-celled ones; (2) an amphispore (obsol.); (3) the middle layer of a three-layered spore wall.

meta- (prefix), changed in form or position; between; with; after.

Metabasidiomycetidae. Subclass in *Basidiomycota* (Lowy, *Taxon* **17**: 125, 1968), for fungi considered intermediate between *Heterobasidiomycetes* and *Homobasidiomycetes*.

metabasidium, see basidium.

metabiosis, the association of two organisms acting or living one after the other; cf. synergism.

Metabolic products. Fungal metabolites are many and diverse. In addition to those associated with protein synthesis and respiration many additional products ('secondary metabolites') have been isolated and, frequently, chemically defined. Some of these are waste products while others such as antibiotics, pigments and toxins clearly have biological functions. Because of their synthetic abilities fungi are used in industry for the production of alcohol, citric acid and other organic acids, various enzymes, riboflavin, etc. (see Industrial mycology). Molecular genetic and metabolomic approaches are slowly providing a greater insight into the initiation, synthesis and production of secondary metabolites. In *Aspergillus nidulans*, for

example, it has been shown how the metabolic model establishes the functional links between genes. David *et al. BMC Genomics* **9**: 163, 2008)

Many fungal products, even when chemically defined, have been given vernacular names derived from the scientific names of the fungi involved, e.g. 'griseofulvin' from *Penicillium griseofulvum*. More than 400 such names were compiled in the sixth edition of this *Dictionary*, but most of these have been omitted since the seventh because of the monograph by Turner (1971) and Turner & Aldridge (1982) although representative antibiotics, hormones, mycotoxins, pigments, and other interesting metabolites are still included. See also Hegnauer (*Chemotaxonomie der Pflanzen* **7**: 277, 1986).

About 400 compounds have been reliably reported from lichens of which about 230 are only known in this biological group (lichen products, lichen substances; Culberson & Elix, *Meth. Pl. Biochem.* **1**: 509, 1989; Huneck, *Beih. Nova Hedw.* **79**: 793, 1984). The lichen substances are mainly derivatives of orcinol and β-orcinol and are weak phenolic acids. The most important groups of these are depsides (e.g. olivetoric acid), depsidones (e.g. physodic acid), and dibenzonfuran derivatives (e.g. usnic acid). Most are colourless but some are brightly coloured: red, yellow, orange or emerald green (e.g. pulvic acid derivatives such as vulpinic acid). These are deposited on the surfaces of hyphae in the medulla and cortex (different substances often occurring in different regions of the thalli; e.g. hymenium, thalline exciple, medulla, cortex) and are produced by the fungal partner; the hypothesis that production was dependent on the presence of an alga (Culberson & Ahmadjian, *Mycol.* **72**: 90, 1980), has not been upheld by later work (Leuckert *et al.*, *Mycol.* **82**: 370, 1990). However, their position and quantitative expression can be affected by the thallus environment (Fahselt, 1994).

Some depsides and depsidones give characteristic colours with 10% caustic potash (K), bleach (C), K followed by C (KC), C followed by KC (CK), iodine (I, q.v.), and *p*-phenylenediamine (P, PD; see Steiner's stable PD solution); diagnostic microcrystal tests (q.v.); and characteristic colours in UV-light. The metabolic products generally characterize particular lichens and are routinely used in identification of antibiotic properties. Their role in the lichen thallus is largely unknown, but may be partly antimicrobial and antifeedent (see Lawrey, *Biology of lichenized fungi*, 1984).

Micheli (Pier Antonio; 1679-1737; Italy). Botanist to Cosmo III (Grand Duke of Tuscany), keeper of the public gardens in Florence, and Professor of Botany, University of Pisa (1706). His additions to the knowledge of fungi, including lichen-forming species, were the greatest made by any one man before Persoon and Fries. He described these discoveries in *Nova Plantarum Genera*, his most important printed work. Some of Micheli's fungal names are still used for common genera (e.g. *Aspergillus*, *Clathrus*, *Mucor* and *Polyporus*). He made a new systematic arrangement with keys to what would now be regarded as genera and species. With the help of the microscope (then coming into use), he was the first to see cystidia on the lamella-edge and between the lamellae of agarics, and he saw the arrangement of spores (which he took to be seeds) in groups of four in the *Agaricaceae*, and in asci of *Pertusaria*. He was the first to make experiments on the culture of moulds by placing spores of *Botrytis*, *Aspergillus* and *Mucor* on freshly-cut bits of melon, quince and pear, noting their growth and development [for an English translation of his observations on culturing moulds, see Buller, *Transactions of the Royal Society of Canada* section 4, series 3, **9**: 1915 (reprinted by Ainsworth, 1976)]. His important discoveries in connexion with flowering plants and bryophytes are, in general, better known. *Publs. Nova Plantarum Genera* (1729) [this book was completed in 1719, but the first part not published till 1729, and the second (the Figures

for which are still in existence) was never printed]. *Biogs, obits etc.* Ainsworth (*Introduction to the History of Mycology*, 1976); Hawksworth (introduction, *Nova Plantarum Genera*, 1976 reprint); Stafleu & Cowan (*TL-2* **3**: 446, 1981); Targioni-Tozzetti (*Notizie della Vita e delle Opere di Pier Antonio Micheli*, 1858).

Michenera Berk. & M.A. Curtis (1868), anamorphic *Licrostroma*. 3, pantropical. See Donk (*Taxon* **11**: 89, 1962), Parbery & Rumba (*MR* **95**: 761, 1991).

Micraspis Darker (1963), Helotiales. Anamorph *Periperidium*. 3 (on *Rhytismatales*), N. America; British Isles. See Darker (*CJB* **41**: 1389, 1963).

micro- (prefix), small; one-thousandth (Système International d'Unités); see micron.

microaerophilic, making best growth under lowered oxygen pressure.

Microallomyces R. Emers. & J.A. Robertson (1974), Blastocladiaceae. 1 (from pond sediment), Costa Rica. See Meyer (*Mycol.* **79**: 44, 1987; ultrastr.).

Microanthomyces Grüss (1926) = Candida fide Lodder (*Yeasts, a taxonomic study* 2nd edn, 1970).

Microascaceae Luttr. ex Malloch (1970), Microascales. 20 gen. (+ 18 syn.), 131 spp.

Lit.: Malloch (*Mycol.* **62**: 729, 1970), von Arx *et al.* (*Beih. Nova Hedwigia* **94**, 1988), von Arx *et al.* (*Beih. Nova Hedwigia* **94**: 104 pp., 1988), Barr (*Mycotaxon* **39**: 43, 1990; concept), Dykstra *et al.* (*Mycol.* **81**: 896, 1989), Issakainen *et al.* (*J. Med. Vet. Mycol.* **35**: 389, 1997), Abbott *et al.* (*Mycol.* **90**: 297, 1998), Wedde *et al.* (*Medical Mycology* **36**: 61, 1998), Issakainen *et al.* (*MR* **103**: 1179, 1999), Lee & Hanlin (*Mycol.* **91**: 434, 1999; DNA), Okada *et al.* (*CJB* **76**: 1495, 1998), Hausner *et al.* (*CJB* **78**: 903, 2000), Rainer *et al.* (*J. Clin. Microbiol.* **38**: 3267, 2000), Issakainen *et al.* (*Medical Mycology* **41**: 31, 2003), Rainer & Hoog (*MR* **110**: 151, 2006).

Microascales Luttr. ex Benny & R.K. Benj. (1980). Hypocreomycetidae. 4 fam., 92 gen., 397 spp. Stromata absent. Ascomata solitary, perithecial or cleistothecial, usually black, thin-walled, sometimes with well-developed smooth setae. Interascal tissue absent or rarely of undifferentiated hyphae. Asci ± globose to clavate, very thin-walled, evanescent, 8-spored, sometimes formed in chains. Ascospores hyaline, yellow or reddish brown, aseptate or septate, sometimes curved, sometimes with very inconspicuous germ pores, with or without a sheath. Anamorphs hyphomycetous, prominent. Saprobic from soil or rotting vegetation, sometimes marine, a few opportunistic human and animal pathogens, cosmop. Fams:

(1) **Ceratocystaceae**
(2) **Chadefaudiellaceae**
(3) **Halosphaeriaceae**
(4) **Microascaceae.**

The *Halosphaeriaceae* are often placed separately in their own order, and further molecular studies may confirm this arrangement. *Lit.*: Tang *et al.* (*Ant. v. Leeuwenh.* **91**: 327, 2007).

Microascus Sacc. (1916) ≡ Microdiscus Sacc.

Microascus Zukal (1885), Microascaceae. Anamorphs *Cephalotrichum*, *Scopulariopsis*, *Wardomyces*, *Wardomycopsis*. 19 (coprophilous, on soil etc.), widespread. See Barron *et al.* (*CJB* **39**: 1609, 1961), Corlett (*CJB* **41**: 253, 1963; ontogeny, sexuality), Corlett (*CJB* **44**: 79, 1966; perithecial development), von Arx (*Persoonia* **8**: 191, 1975; key), Nishimura & Miyaji (*Mycopathologia* **90**: 29, 1985; yeast-like state), von Arx *et al.* (*Beih. Nova Hedwigia* **94**, 1988), Hausner *et al.* (*CJB* **71**: 1249, 1993; DNA), Abbott *et al.* (*Mycol.* **90**: 297, 1998; anamorph), Lee & Hanlin (*Mycol.* **91**: 434, 1999; DNA), Abbott & Sigler (*Mycol.* **93**: 1211, 2001; heterothallism), Abbott *et al.* (*Mycol.* **94**: 362, 2002), Issakainen *et al.* (*Medical Mycology* **41**: 31, 2003; anamorph), Mohammedi *et al.* (*European Journal of Clinical Microbiology & Infectious Diseases* **23**: 215, 2004; clinical strain), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Microasellaria Tuzet, Manier & Jolivet (1957) nom. dub., Kickxellomycotina. See Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986).

Microbasidium Bubák & Ranoj. (1914) = Hadrotrichum fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **125**: 111, 1916).

microbe, a microorganism (q.v.).

microbial (adj.), pertaining to microbes (q.v.).

microbiology, the study of microorganisms (q.v.).

microbiota, all the microorganisms present in the area or habitat specificied, including algae, bacteria and protozoa as well as fungi; see mycobiota.

Microbispora Nonom. & Y. Ohara (1957), Actinobacteria. q.v.

Microblastosporon Cif. (1930), anamorphic *Pezizomycotina*, Hso.0eH.?. 1, Europe.

microbodies, see peroxisome.

Microbotryaceae R.T. Moore (1996), Microbotryales. 5 gen. (+ 2 syn.), 104 spp.

Lit.: Berbee *et al.* (*CJB* **69**: 1795, 1991), Begerow *et al.* (*CJB* **75**: 2045, 1998), Vánky (*Mycotaxon* **67**: 33, 1998), Swann *et al.* (*Mycol.* **91**: 51, 1999), Bucheli *et al.* (*Mol. Ecol.* **10**: 285, 2001), Vánky (*Aust. Syst. Bot.* **14**: 385, 2001), Almaraz *et al.* (*MR* **106**: 541, 2002), Hood *et al.* (*Infect. Genet. Evol.* **2**: 167, 2003), Sampaio *et al.* (*Mycol. Progr.* **2**: 63, 2003), Van Putten *et al.* (*Evolution* Lancaster, Pa. **57**: 766, 2003), Begerow *et al.* (*MR* **108**: 1257, 2004), Giraud (*Heredity* **93**: 559, 2004), Van Putten *et al.* (*J. Evol. Biol.* **18**: 203, 2005), Vánky (*Mycol. Balcanica* **1**: 175, 2004), Lutz *et al.* (*Mycol. Progr.* **4**: 225, 2005), Kemler *et al.* (*BMC Evol. Biol.* **6**: 35, 2006).

Microbotryales R. Bauer & Oberw. (1997). Microbotryomycetes. 2 fam., 9 gen., 114 spp. Fams:

(1) **Microbotryaceae**
(2) **Ustilentylomataceae**

For *Lit.* see under fam.

Microbotryodiplodia Sousa da Câmara (1951) = Microdiplodia Allesch. fide Petrak (*Sydowia* **16**: 353, 1963), Sutton (*Mycol. Pap.* **141**, 1977).

Microbotryomycetes R. Bauer, Begerow, J.P. Samp., M. Weiss & Oberw. (2006), Pucciniomycotina. 4 ord., 4 fam., 25 gen., 208 spp. Host-parasite interactions without deposits of specific fungal vesicles. Ord:

(1) **Heterogastridiales**
(2) **Leucosporidiales**
(3) **Microbotryales**
(4) **Sporidiobolales**

Lit.: Bauer *et al.* (*Mycol. Progr.* **5**: 41, 2006).

Microbotryum Lév. (1847), Microbotryaceae. 87 (on dicots), widespread (temperate). See Deml & Oberwinkler (*Phytopath. Z.* **104**: 345, 1982), Vánky (*Mycotaxon* **67**: 33, 1998; monogr., emend., key), Swann *et al.* (*Mycol.* **91**: 51, 1999; classific.), Almaraz *et al.* (*MR* **106**: 541, 2002; phylogeny), Vánky (*Mycologia Balcanica* **1**: 189, 2004; taxonomy, nomenclature,

problems in species delimitation), Lutz *et al.* (*Mycol. Progr.* **4**: 225, 2005; molecular characters), Aime *et al.* (*Mycol.* **98**: 896, 2006; phylogeny).

Microcaliciaceae Tibell (1984), Teloschistales (±L). 1 gen. (+ 2 syn.), 4 spp.

Lit.: Tibell (*Biblthca Lichenol.* **71**: 107 pp., 1998), Tibell (*Nordic Lichen Flora* **1**. Introductory Parts; Calicioid Lichens and Fungi: 20, 1999).

Microcalicium Vain. (1927), Microcaliciaceae. 4 (mainly on lichens), widespread (boreal; temperate). See Tibell (*Bot. Notiser* **131**: 229, 1978; key), Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 1, 1981; anamorphs), Tibell (*Symb. bot. upsal.* **27** no. 1: 279 pp., 1987; Australasia), Tibell (*Symb. bot. upsal.* **32** no. 1: 291, 1997; anamorphs), Tibell (*Biblthca Lichenol.* **71**: 107 pp., 1998; S America).

Microcalliomyces Bat. & Cif. (1962) = Microcallis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Microcalliopsis Bat. & Cif. (1962) = Microcallis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Microcallis Syd. (1926), Chaetothyriaceae. 10, widespread (tropical). See Hansford (*Mycol. Pap.* **15**, 1946).

microcephalic, see septum.

Microcephalis Bainier (1882) = Syncephalis fide Benjamin (*Aliso* **4**: 321, 1959).

Microcera Desm. (1848) = Fusarium fide Petch (*TBMS* **7**: 89, 1921), Wollenweber & Reinking (*Die Fusarien*: 6, 1935), Dingley (*Mem. N. Y. bot. Gdn* **49**: 206, 1989).

Microclava F. Stevens (1917), anamorphic *Pezizomycotina*, Hso.1eP.1. 4, pantropical. See Deighton (*TBMS* **52**: 315, 1969; key).

Microcollybia Métrod ex Lennox (1979) = Collybia fide Kuyper (*in litt.*).

Microcollybia Métrod (1952) nom. nud. = Collybia fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

microconidium (1) the smaller conidium of a fungus which also has macroconidia; (2) a spermatium (q.v.).

microcrystal test, method of identification of phenolic metabolites in lichens developed by Asahina (q.v.) involving re-crystalizations on microscope slide from a range of solvents and the formation of salts with diagnostic shapes. The crystals are examined microscopically for identification. Many of these tests are extremely sensitive and can detect some compounds at concentrations close to the resolution possible by thin-layer chromatography (q.v.).

Lit.: Asahina (*J. Jap. Bot.* **12-16**, 1936-40), Hale (1974), Hawksworth (*Bull. Br. lichen Soc.* **28**: 5, 1971), Thomson (*The lichen genus Cladonia in North America*, 1968). See Metabolic products.

microculture, a culture of an organism under the microscope, as in a hanging drop.

Microcyclella Theiss. (1914), Dothideomycetes. 1, Africa.

Microcyclephaeria Bat. (1958), Pezizomycotina. 1, Australia. See Batista (*Revta Biol.* Lisb. **1**: 301, 1958).

microcyclic (of conidiation), germination of spores by the direct function of the conidia without the intervention of mycelial growth (Hanlin, *Mycoscience* **35**: 113, 1994); (of rusts), see *Pucciniales*.

Microcyclus Sacc., Syd. & P. Syd. (1904), ? Mycosphaerellaceae. Anamorphs *Aposphaeria*-like, *Fusicladium*-like, *Pazschkeella*. *c*. 17, widespread (esp. tropical). Almost certainly polyphyletic. *M. ulei* (anamorphs *Aposphaeria ulei*, *Fusicladium macrosporum*); S. Am. leaf blight of *Hevea*). See Cannon *et al.* (*MR* **99**: 353, 1995; key 7 S. Am. spp.), Barr (*Mycotaxon* **60**: 433, 1996).

microcyst, see cyst.

Microcyta Petr. & Syd. (1927) ≡ Ceuthosporella Petr. & Syd. fide Sutton (*Mycol. Pap.* **141**, 1977).

microcytospore (1) an encysted zoospore (planospore); (2) an encysted gametangium (*Blastocladiales*).

Microdiplodia Allesch. (1901), anamorphic *Botryosphaeriaceae*, Cpd.1eP.?. 31, widespread. See Zambettakis (*BSMF* **70**: 219, 1955), Sutton (*Mycol. Pap.* **141**, 1977), Crous *et al.* (*Stud. Mycol.* **55**: 235, 2006; phylogeny).

Microdiplodia Tassi (1902) ? = Microdiplodia Allesch. fide Sutton (*Mycol. Pap.* **141**, 1977).

Microdiplodiites Babajan & Tasl. (1973), Fossil Fungi. 1 (Tertiary), former USSR.

Microdiscula Höhn. (1915), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Europe.

Microdiscus Sacc. (1916), Helotiales. 1, N. America.

Microdiscus Steinecke (1916) nom. dub., ? Fungi.

Microdochium Syd. (1924), anamorphic *Monographella*, Hsp.0-≡ eH.21. 10, widespread. *M. nivale* (pink snow mould of turf grasses), *M. panattonianum* (lettuce ring spot). See Sutton *et al.* (*CJB* **50**: 1899, 1972), Sutton & Hodges (*Nova Hedwigia* **27**: 215, 1976), v. Arx (*Sydowia* **34**: 30, 1981), Samuels & Hallett (*TBMS* **81**: 473, 1983; teleomorphs), Litschko & Burpee (*TBMS* **89**: 252, 1987; variation in *M. nivale*), Parman & Price (*Australas. Pl. Path.* **20**: 41, 1991; microsclerotia in *M. panattonianum*), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 267, 1995; subgen., key), Mahuku *et al.* (*MR* **102**: 559, 1998; on turfgrass, genetics), Glynn *et al.* (*MR* **109**: 872, 2005; speciation), Kwasna & Bateman (*Mycol.* **99**: 765, 2007; UK, key).

Microdothella Syd. & P. Syd. (1914), Dothideales. 2, N. America; Philippines.

Microdothiorella C.A.A. Costa & Sousa da Câmara (1955), anamorphic *Pezizomycotina*, St.0eH.?. 1, Portugal. See Costa & Sousa da Câmara (*Agron. lusit.* **17**: 156, 1955).

Microeccrina Maessen (1955) = Arthromitus fide Manier (*Annls Parasit. hum. comp.* **38**: 1, 1961) See *Arthromitus*.

microendospore, minute cytoplasmic particles behaving like spores in *Ophiostoma ulmi* (Ouellette & Gagnon, *CJB* **38**: 235, 1960).

Microeurotium Ghatak (1936), ? Pezizales. 1 (? coprophilous), British Isles.

Microfilum N. Faye, B.S. Toguebaye & G. Bouix (1991), Microsporidia. 1.

microflora, sometimes used, inappropriately, for all the microorganisms present in a specified site or habitat; see microbiota, mycobiota.

microform, see *Pucciniales* and Table 5.

microfungi, see *Micromycetes*.

Microgemma Ralphs & Matthews (1986), Microsporidia. 4.

Microglaena Körb. (1855) [non *Microglena* Ehrenb. 1831, *Chlorophyta*] = Thelenella fide Eriksson (*Op. Bot.* **60**, 1981), Mayrhofer & Poelt (*Herzogia* **7**: 13, 1985; Europe), Mayrhofer (*Biblthca Lichenol.* **26**: 106 pp., 1987).

Microglaenaceae Servít (1954) = Thelenellaceae.

Microglaenomyces Cif. & Tomas. (1953) = Chroma-

tochlamys fide Mayrhofer & Poelt (*Herzogia* **7**: 13, 1985).

Microglena Lönnr. (1858) ≡ Microglaena.

Microgloeum Petr. (1922), anamorphic *Blumeriella*, Cac.0eH.10. 1, widespread.

Microglossum Gillet (1879), Leotiaceae. 8, widespread (temperate). See Mains (*Mycol.* **47**: 846, 1955; key N Am spp.), Maas Geesteranus (*Persoonia* **3**: 82, 1964), Nitare & Ryman (*Svensk bot. Tidskr.* **78**: 63, 1984; Sweden), Spooner (*Biblthca Mycol.* **116**: 711 pp., 1987; Australasia), Verkley (*Persoonia* **15**: 405, 1994; ultrastr.), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Microglossum Sacc. (1884) = Geoglossum fide Spooner (*in litt.*, 2008).

microgonidia, very small green bodies in lichen hyphae (Minks) (obsol.).

Micrographa Müll. Arg. (1890) ? = Lembosia fide Santesson (*Svensk bot. Tidskr.* **43**: 547, 1949), Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Micrographina Fink (1930) = Mazosia fide Santesson (*Svensk bot. Tidskr.* **43**: 547, 1949).

Micrographomyces Cif. & Tomas. (1953) nom. illegit. ≡ Micrographa.

Microhaplosporella Sousa da Câmara (1949) ? = Aplosporella fide Sutton (*in litt.*).

Microhendersonula Dias & Sousa da Câmara (1952), anamorphic *Pezizomycotina*, St.≡ eP.?. 1, Portugal. See Dias & Sousa da Câmara (*Agron. lusit.* **14**: 118, 1952).

Microhilum H.Y. Yip & A.C. Rath (1989), anamorphic *Cordycipitaceae*, Hso.0eH.10. 1 (on *Oncoptera* larvae), Australia. See Yip & Rath (*J. Invert. Path.* **53**: 361, 1989), Wright & Patel (*MR* **96**: 578, 1992), Sung *et al.* (*Stud. Mycol.* **57**, 2007; phylogeny).

Microides H.Y. Yip & A.C. Rath (1989), anamorphic *Cordycipitaceae*, Hso.0eH.10. 1 (on *Oncoptera* larvae), Australia. See Yip & Rath (*J. Invert. Path.* **53**: 361, 1989), Wright & Patel (*MR* **96**: 578, 1992), Sung *et al.* (*Stud. Mycol.* **57**, 2007; phylogeny).

Microlecia M. Choisy (1949) = Catillaria fide Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1984).

microlichens, lichens in which the whole of their morphological characteristics can be seen only with a magnifier equal or larger than ×10. See Messuti (*Br. Lich. Soc. Bull.* **73**: 49, 1993).

Microlychnus A. Funk (1973) = Gyalideopsis fide Sérusiaux & De Sloover (*Veröff. geobot. Inst., Zürich* **91**: 260, 1986), Lücking *et al.* (*Lichenologist* **37**: 123, 2005).

Micromastia Speg. (1909), Dothideomycetes. 2.

micrometre, one-thousandth of a millimetre (0.001 mm; 1 μm) (Système International d'Unités); formerly often as 'μ'.

Micromium Pers. (1811) ≡ Phlyctis.

Micromma A. Massal. (1860) = Pyrenula Ach. (1814).

Micromonospora Orskov (1923), Actinobacteria. q.v.

Micromphale Gray (1821) nom. rej. = Marasmiellus fide Antonín *et al.* (*Mycotaxon* **63**: 359, 1997; taxonomy) A proposal to reject *Micromphale* against *Marasmiellus* has not been published.

Micromucor (W. Gams) Arx (1984) = Umbelopsis fide von Arx (*Sydowia* **35**: 10, 1982; key), Yip (*TBMS* **86**: 334, 1986), Amano *et al.* (*Mycotaxon* **44**: 257, 1992; chemotaxonomy), Ruiter *et al.* (*MR* **97**: 690, 1993; chemotaxonomy) = Umbelopsis (Mortierell.) fide.

Micromucor Malchevsk. (1939) = Umbelopsis fide Kirk (*in litt.*).

Micromyces P.A. Dang. (1889), Synchytriaceae. 12 (on green algae), widespread. See Sparrow (*Aquatic Phycomycetes* Edn 2: 194, 1960; key), Kadłubowska (*Acta Mycologica* Warszawa **34**: 177, 1999; Poland).

Micromycetes, fungi having small (microscopic) sporocarps; microfungi. Most handbooks for the identification of microfungi are based on systematic groups (e.g. ascomycetes, hyphomycetes, coelomycetes), orders (*Laboulbeniales*, *Saprolegniales*), or genera (*Aspergillus*, *Penicillium*), q.v. Ellis & Ellis (*Microfungi on land plants: an identification handbook*, 1985; and *Microfungi on miscellaneous substrates*, 1988) cover most temperate groups. See also Literature.

Micromycopsidaceae Subram. (1974) = Synchytriaceae.

Micromycopsis Scherff. (1926) ? = Micromyces fide Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960) but see, Subramanian (*Curr. Sci.* **43**: 723, 1974).

Micromyriangium Petr. (1929) = Uleomyces fide von Arx (*Persoonia* **2**: 421, 1963).

micron, see micrometre.

Micronectria Speg. (1885) nom. dub., Sordariomycetes. 3, widespread. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999; ? placement in *Hyponectriaceae*).

Micronectriella Höhn. (1906) = Sphaerulina fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Micronectriopsis Höhn. (1918) = Linocarpon fide Hyde (*J. Linn. Soc.* Bot. **123**: 109, 1997), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Micronegeria, see *Mikronegeria*.

micronematous (micronemeous), (1) having hyphae of small diameter; (2) (of conidiophores) similar morphologically to vegetative hyphae (cf. Micronemeae).

Micronemeae, hyphomycetes with conidiophores or conidia like the hyphae (e.g. *Oospora*), or having no hyphae. Cf. Macronemeae.

microorganism, an organism which belongs to a phylum many members of which either cannot be seen with the unaided eye or require microscopic examination and/or growth in pure culture for their identification; a microbe; includes all unicellular prokaryotes and eukaryotes, and also some multicellular eukaryotes, i.e. microscopic algae, bacteria, fungi (including yeasts), protozoa and viruses; sometimes used (incorrectly) only for prokaryotes (bacteria and viruses). See Cowan (*A dictionary of microbial taxonomy*: 162, 1978; inappropriateness of term), Zavarzin (*in* Allsopp *et al.* (Eds), *Microbial diversity and ecosystem function*: 17, 1995; concept).

Micropeltella Syd. & P. Syd. (1913) = Micropeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Micropeltidaceae Clem. & Shear (1931), ? Dothideomycetes (inc. sed.). 27 gen. (+ 25 syn.), 186 spp.

Lit.: Batista (*Publções Inst. Micol. Recife* **56**, 1959; 445 spp.), Eboh (*Sydowia* **39**: 37, 1986), Farr (*Mycol.* **79**: 97, 1987), Panwar *et al.* (*Geobios* New Rep. **10**: 41, 1991), Hsieh *et al.* (*MR* **99**: 917, 1995), Hyde (*Sydowia* **49**: 1, 1997), Cannon (*IMI Descr. Fungi Bact.* **141**: [22] pp., 1999).

Micropeltidium Speg. (1919) = Micropeltis fide von

Arx & Müller (*Stud. Mycol.* **9**, 1975).

Micropeltis Mont. (1842), Micropeltidaceae. *c.* 106, widespread (tropical). See Batista (*Publções Inst. Micol. Recife* **56**, 1959), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; Australia), Hofmann & Piepenbring (*Fungal Diversity* **22**: 55, 2006; Panama), Reynolds & Gilbert (*Cryptog. Mycol.* **27**: 249, 2006; Panama).

Micropeltopsis Vain. (1921) = Lichenopeltella fide Santesson (*SA* **9**: 15, 1990).

Micropera Lév. (1846) [non *Micropera* Lindl. 1832, *Orchidaceae*] = Foveostroma fide DiCosmo (*CJB* **56**: 1682, 1978).

Microperella Höhn. (1909), anamorphic *Pezizomycotina*, St.1eH.1. 1, Japan.

Micropeziza Fuckel (1870), Helotiales. 5, Europe. See Nannfeldt (*Bot. Notiser* **129**: 323, 1976; key), Nauta & Spooner (*Mycologist* **14**: 65, 2000; UK), Raitviir (*Folia cryptog. Estonica* **40**: 43, 2003; Estonia).

Microphiale (Stizenb.) Zahlbr. (1902) ≡ Dimerella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Rivas Platas *et al.* (*Fungal Diversity* **23**: 255, 2006).

Microphiodothis Speg. (1919) = Ophiodothella fide Petrak (*Sydowia* **5**: 352, 1951).

Microphlyctis J. Schröt. (1889) nom. dub., Chytridiales.

Microphoma N.F. Buchw. (1958) = Dothichiza fide Sutton (*Mycol. Pap.* **141**, 1977).

microphylline (of lichen thalli), composed of minute lobes or scales.

Microphyma Speg. (1889) = Phillipsiella fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Micropodia Boud. (1885), ? Helotiaceae. 1 or 2, Europe. Some authors place this gen. in the *Hyaloscyphaceae.*

Microporaceae Jülich (1982) = Polyporaceae.

Microporellus Murrill (1905), Polyporaceae. 19, widespread (tropical). See Reid (*Microscopy* **32**: 452, 1975), Decock & Ryvarden (*Czech Mycol.* **54**: 19, 2002).

Microporus P. Beauv. (1805), Polyporaceae. 11, widespread. See Pegler (*The polypores [Bull. BMS Suppl.]*, 1973), Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 429, 1980; key 7 Afr. spp.).

Micropsalliota Höhn. (1914), Agaricaceae. *c.* 40, widespread (esp. tropical). See Heinemann (*BSMF* **106**: 1, 1990; key 73 spp.), Heinmann & Leelavathy (*MR* **95**: 341, 1991; key spp. of Kerala), Vellinga (*MR* **108**: 354, 2004; phylogeny).

Micropuccinia Rostr. (1902) = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928) See, Laundon (*Mycol. Pap.* **99**, 1965).

micro-Puccinia, a microform of *Puccinia.*

Micropustulomyces R.W. Barreto (1995), anamorphic *Capnodiales*, Cac.≡ eH.1/4. 1, Brazil. See Barreto *et al.* (*MR* **99**: 779, 1995).

Micropyrenula Vain. (1921) = Microtheliopsis fide Santesson (*Svensk bot. Tidskr.* **43**: 547, 1949).

Micropyxis Seeler (1943) [non *Micropyxis* Duby 1930, *Algae*] ≡ Gelatinopsis.

microsclerid, see cystidium.

microsclerotium, a very small sclerotium, as in *Verticillium dahliae*; pseudosclerotium.

Microscopy.

Light microscopes. The compound microscope has two sets of lenses (objective and eyepiece) which magnify the object at each step. The image has a maximum final magnification of around ×1000. Stereomicroscopes (also known as dissecting microscopes) are lower power and have a long free working distance for manipulation of the specimen. For use in the field, portable instruments are available. For viewing with the compound microscope, a small sample of the subject is mounted on a glass slide with water or a mountant which may contain a stain, and overlaid with a coverslip. Common stains in mycology are cotton blue or fuchsin in lactic acid, or lactic acid alone if no stain is needed. Air bubbles can be eliminated by gentle heating. To keep the slide for examination at a later date, the coverslip must be sealed with a preparatory sealant or nail varnish.

Brightfield: The most common method of viewing subjects in the compound microscope. Light travels from beneath the subject, passing through a condenser and through the subject, illuminating translucent structures.

Differential Interference Contrast (DIC; Nomarski). This system uses special polarizing prisms arranged according to a design by Georges Nomarski; high quality objectives are required in addition to a dedicated condenser and adapter, with a concomitant rise in cost. Using such lenses and prisms results in an almost three dimensional image of the subject, particularly useful for colourless structures such as gelatinous sheaths.

Phase contrast: Special objectives and condenser are required for this technique. The image suffers from optical imperfections, such as a halo, but this effect can be of some value in drawing attention to small objects or details. Low contrast material benefits greatly from this technique, but it can be difficult to measure accurately in phase contrast.

Darkfield: Direct light is prevented from passing through the objective aperture and the image is formed from light scattered by features in the object, the detail appearing bright against a dark background.

Fluorescence: Microscopy in which the image is formed by fluorescence emitted from the specimen when illuminated with ultra-violet radiation. The sample may autofluoresce naturally, but fluorochromes such as mithramycin and calcafluor are typically used to enhance specific structures. Fluorescence microscopy has been important in detecting regions of wall synthesis in fungal hyphae and spores.

Limitations in depth of field with light microscopy can now, to some extent, be overcome when using digital cameras, by photographic the same object several times, each at a slightly different plane of focus, then using proprietory montage software to 'stitch' the resulting images into a single composite image. Among other activities, the software compares the different images and selects in favour of well-defined edges. Where such edges are not present, the result may be unsatisfactory, with 'halo' artefacts.

Electron microscopes. Scanning electron microscopy (SEM; q.v.) provides higher magnification images (to around ×80,000) of the surface morphology of the specimen, and also gives large depth of field. Transmission electron microscopy (TEM) images provide a view similar to that of light microscopy at much higher magnifications (over x100,000) to show ultrastructural details. Specimens are prepared by fixing, dehydrating, staining, embedding in resin and

cutting ultrathin sections on an ultramicrotome; see also Ultrastructure.

Microspora Velen. (1934), ? Helotiales. 1, former Czechoslovakia.

microsporangium, secondary sporangium formed from a zoospore cyst, either without any mitoses, or with very few mitoses.

microspore (1) a small spore, where there are spores of two sizes; (2) a spore from a microsporangium (q.v.).

Microsporella Höhn. (1918) ? = Microsphaeropsis Höhn. fide Sutton (*Mycol. Pap.* **141**, 1977).

Microsporidia (**Microspora** V. Sprague 1977), Eukaryota. Earlier classified as *Protozoa* (q.v.), now usually as *Fungi* (q.v.). More than 1300 species and about 170 genera (Bulla & Cheng (Eds), 1976, 1977; Larsson, 1999; Wittner & Weiss (Eds), 1999; Canning & Vávra, 2000; Lom *et al.* (Eds), 2005). Supergeneric classification remains unclear. Eukaryotic, spore-forming, parasitic organisms lacking flagellae and peroxisomes. With polar vesicles (mitosomes) interpreted as remainders of mitochondria (Willams *et al.*, 2002; Vávra, 2005), mitochondrial enzymes (a chaperon protein, HSP70) (Germot *et al.*, 1997; Hirt *et al.*, 1997) and genes related to mitochondrial functions (alpha and beta subunits of PDH) (Fast & Keeling, 2001). With 70S ribosomes, chitin in the spore wall, and atypical Golgi apparatus (Ishihara & Hayashi, 1968; Curgy *et al.*, 1980; Vávra & Larsson, 1999). Life cycle usually comprising vegetative reproduction (called merogony) and sporogony. Nuclei either isolated (monokaryotic) or coupled (diplokaryotic) with closed intranuclear pleuromitosis (Hollande, 1972). In some microsporidia diplokaryotic merogony is followed by a sporogony with isolated nuclei and with sexual processes and meiosis in the shift from diplokaryotic to monokaryotic condition at the beginning of sporogony (Becnel & Andreadis, 1999). Spores of various shapes, with a usually coiled polar filament with layered internal structure, which during hatching is ejected and reorganized to an infection tube through which the infectious cell (the sporoplasm) is injected into the host cell (Weidner 1976, 1982).

Microsporidians are obligate parasites of all groups of animals with a few species parasitizing protozoa. Some species have complex life cycles with 2 or 3 hosts, and producing 2 or 3 different types of spores. They most commonly infect insects, crustaceans and fish (Canning & Lom, 1986; Becnel & Andreadis, 1999). They have been extensively studied as biocontrol agents, and one species (*Nosema locustae*) is commercially available for the control of locusts and grasshoppers (Canning, 1981; Shah & Goettel (Eds), 1999). Of economic importance are among others *Nosema apis* (a cosmopolitan parasite of honey bees) and *Nosema bombycis* (a parasite of silk worms). At least 8 species of microsporidians cause disease in immuno-compromized humans (Kotler & Orenstein, 1999).

Early phylogenies that included microsporidians, when based on ultrastructure and SSU rRNA, had these organisms at the base of the Tree of Life (Cavalier-Smith, 1988; Patterson, 1994; Vossbrinck *et al.*, 1987). Studies of alpha-and beta-tubulin have indicated that microsporidians either are related to organisms higher in the phylogenetic tree (Canning, 1998; Edlind, 1998) or to the *Fungi* (Hirt *et al.*, 1997; Keeling & McFadden, 1998; Keeling *et al.*, 2000; van de Peer *et al.*, 2000). The last alternative is also supported by other genes.

In the official classifications by the Society of Protozologists microsporidians have been ranked in the Subphylum *Cnidosporidia* of the Phylum *Protozoa* (Honigberg *et al.*, 1964), as the Phylum *Microspora* (Levine *et al.*, 1980) or included in (the Kingdom) *Opisthokonta* together with *Fungi*, *Metazoa* and some other organisms (Adl *et al.*, 2005). Microsporidians were for a period included in the Kingdom *Archezoa* (Cavalier-Smith, 1988, 1993) or split between the Infrakingdom *Alveolata* (Subphylum *Manubrispora* – Family *Metchnikovellidae*) and the Kingdom *Fungi* (Phylum *Microsporidia* – all other microsporidians) (Cavalier-Smith, 1998).

The recent classifications treat the supergeneric ranking differently and no classification can accomodate all established taxa (Sprague, 1977; Weiser, 1977; Sprague, 1982; Issi, 1986; Canning 1989; Sprague *et al.*, 1992).

miso, an oriental food product, used for soups and as a flavouring agent, composed of rice and cereals + soybeans fermented by *Aspergillus oryzae* and *Saccharomyces rouxii* (Hesseltine, *Mycol.* **57**: 168, 1965); see Fermented food and drinks.

Mison Adans. (1763) nom. rej. = Phellinus fide Donk (*Persoonia* **1**: 173, 1960).

Mites. Species of *Tyrophagus* and *Tarsonemus* sometimes infest fungus cultures. They are a serious problem as they transfer spores from culture to culture, causing cross-contamination that may be irredeemable and often introduce bacteria into the culture.

To prevent mite invasion, work surfaces must be kept clean and cultures protected from aerial infestation by storage in cabinets or incubators. To clean work surfaces, wash with a non-fungicidal acaricide (0.2% v/v Actelic was used at IMI). Mites can be de-

tected by scrutiny of cultures at twice-weekly intervals; they appear as white objects, just detectable with the naked eye. Ragged colony margins or growth of contaminant fungi or bacteria forming trails mey denote their presence. If mites are detected, contaminated cultures should be destroyed by autoclaving (121°C for 15 min.).

Where contamination is not severe and the original fungus is sporulating it will normally be possible to recover an uncontaminated culture. If mite-infested cultures cannot be reisolated, they can be stored at –18°C for 1-3 days before being subcultured. This procedure will kill both eggs and adult mites. Fungi which would not survive short-term cold storage may be covered with a layer of mineral oil and subcultured after 24 hours. However, this latter procedure does not kill the eggs.

A cigarette paper fastened on the necks of universal bottles or test-tubes provides an effective barrier against mites. The cigarette papers are sterilized by dry heat at 180°C for 2 h. and aseptically stuck to the rim of the bottle using a copper sulphate/gelatin glue (20 g gelatin; 2 g copper sulphate; 100 mls distilled water) (Snyder & Hansen, 1946).

Standing the cultures on liquid paraffin and treating the wool plugs with kerosene (crude, such as 'tractor vapourizing oil') has proved an effective control. See Area Leão *et al.* (*Mem. Inst. Oswaldo Cruz* **42**: 559, 1946), Smith (*Mycol.* **59**: 600, 1967). Cf. insects, invertebrates and lichens.

mitochondrion, membrane bound intracellular organelle containing enzymes and electron transport chains for oxidative respiration of organic acids and the concomitant production of ATP. Possesses DNA, messenger RNA and small ribosomes and thus capable of protein synthesis.

Models of larger fungi. Early models were made by James Sowerby during 1796 and 1815 for his museum. These were later restored by Worthington G. Smith (q.v.) and are now at The Natural History Museum, London (see Tribe, *Bull. BMS* **15**: 161, 1984). The Ware Collection of Glass Models of Plants, made by B. Blaschka in 1929, at the Botanical Museum of Harvard University include a series showing fungal diseases of fruit; the Department of Applied Biology, Cambridge University has a collection of glass models of macro- and microfungi made by W.A.R. Dillon Western (1899-1953) which were exhibited at the 50th Anniversary Meeting of the British Mycological Society (*TBMS* **30**: 21, 1948). The longest more recent series of coloured pottery models (some 200) are those designed by the late Mr and Mrs Lovenzens of Lantz, Nova Scotia, of which there is a complete set in the Nova Scotia Museum, Halifax. Many larger fungi are visually very attractive and various artists who are also interested in mycology produce models, usually from clay, but also from wax, plaster of Paris or various resins, and often using silicone moulds. The 1987 British Mycological Society workshop on modelling larger fungi, led by Dr S. Diamandis, revived interest in production of such models, and the society maintains a collection as a travelling exhibition (Chattaway, Making models of fungi. *Association of British fungus groups journal* **6**: 26, 2002). There are still, however, few if any museums with such models, and perhaps none with models showing microscopic structures of fungi greatly enlarged, although this medium is ideal for educational purposes.

Algorithms to produce images of fungi by computer models have been described by Desbenoit *et al* (Interactive modelling of mushrooms. *Eurographics*, 2004), and animated 3D computerized images of fungi can be purchased from various internet sites. Although apparently mainly for use as components for realistic backgrounds in computer games, models are also being used in airflow studies of spore dispersal (Deering *et al.*, *Mycol.* **93**: 732, 2001).

Modicella Kanouse (1936), Mortierellaceae. 2, N. & S. America. See Gerdemann & Trappe (*Mycol. Mem.* **5**, 1974; key), Benny *et al.* *in* Sylvia *et al.* (Eds) (*Mycorrhizae in the next decade, practical applications and research priorities*: 311, 1987; syst. posn).

Moelleria Bres. (1896) [non *Moelleria* Scop. 1777, *Algae*] ≡ Moelleriella.

Moelleriella Bres. (1897), Clavicipitaceae. Anamorph *Aschersonia*-like. 40, pantropical. See Rogerson (*Mycol.* **62**: 865, 1970), Sung *et al.* (*Stud. Mycol.* **57**, 2007), Chaverri *et al.* (*Stud. Mycol.* **60**, 2008; phylogeny, neotropics).

Moelleroclavus Henn. (1902), anamorphic *Xylaria*. 1, neotropics; Hawaii. See Clements & Shear (*Gen. Fung.*, 1931), Læssøe (*SA* **13**: 43, 1994; ? synonym of *Xylaria*), Rogers *et al.* (*MR* **101**: 345, 1997).

Moeszopeltis Petr. (1947) = Leptopeltis fide Holm & Holm (*Bot. Notiser* **130**: 215, 1977).

Mohgaonidium Singhai (1974), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Eocene), India.

Mohortia Racib. (1909) = Septobasidium fide Couch (*The genus Septobasidium*, 1938).

Molecular biology. Techniques in molecular biology have made a major contribution to understanding of fungal biology and relationships (see Phylogeny; Bruns *et al.*, 1991; Bridge & Hawksworth, 1998; Moncalvo (*in* Xu (Ed.), *Evolutionary Genetics of Fungi*, 1, 2005), also opening new possibilities for their use. Various different molecular techniques are available, and the one(s) most appropriate for a particular task must be selected. Most are DNA based, and the DNA for study first has to be extracted; of the methods available those of Raeder & Broda (*Lett. App. Microbiol.* **1**: 17, 1985) and Zolan & Pukkila (*Molec. Cell. Biol.* **6**: 195, 1986) are now well-tested. The DNA can then be studied by a variety of methods:

DNA-DNA hybridisation involves the separation of the DNA from two fungi to be compared into separate strands and then noting the extent to which they can reassociate; the extent of successful pairing is expressed as % DNA relatedness; formerly used extensively in yeasts and mould-fungi (see Kurtzman, 1985) but now used predominantly in bacterial systematics studies.

DNA probes, labelled fragments of DNA that are used to identify particular regions of DNA in other organisms, including fungi. Typically, a DNA probe will be used to generate RFLPs (see below) from DNA digestions. DNA probes may be constructed for regions specific to individual species and can provide valuable identification tools (e.g. Dobrowolski &

O'Brien, *FEMS Microbiol. Letts* **113**: 43, 1993), currently being harnessed to PCR (q.v.) technology for high throughput studies (e.g. Martin *et al. J. Clin. Microbiol.* **38**:: 3735, 2000).

mol % G + C (guanine + cytosine, **GC**) contents in the DNA are determined by thermal denaturation profiles and expressed as a percentage; widely used in the 1970s (see Kurtzman, 1985) but now largely replaced by more sensitive methods, and now only of historical interest; see base ratio.

RFLP (restriction fragment length polymorphisms), used on both nuclear and mitochondrial DNA involves the use of restriction enzymes (e.g. *Hae*III, *Msp*I) which cut the molecules into fragments at particular sites; the size of the fragments will vary, and these are then separated by electrophoresis (q.v.); electrophoresis of digested total cellular DNA produces a 'smear' of fragments of different sizes and polymorphisms associated with individual genes or gene clusters require hybridization to a labelled DNA probe (q.v.; e.g. Correll *et al.*, *Phytopath.* **83**: 1199, 1993). In some instances, such as PCR products or purified mitochondrial DNA, RFLPs can be detected without probes (e.g. Varga *et al.*, *Can. J. Microbiol.* **40**: 612, 1994). Fungal mitochondrial DNA is very rich in A+T which means that if (good quality) total fungal DNA from a given organism is digested using a G+C cutting enzyme such as Hae III [cuts at -GG'CC-], any bands of >1-2Kb may be presumed mitochondrial in origin [the chromosomal DNA will have been digested to form a background smear]; see Freeman *et al.* (*Exper. Mycol.* **17**: 309, 1993) for rationale.

PCR (polymerase chain reaction), a series of heating and cooling steps that allow for amplification of DNA. DNA is melted and primers attached to the separated single strands; new complementary strands are formed from the primers by the addition of dNTPs in the presence of a thermostable DNA polymerase. Further heating melts this new dimer and the process is repeated through a number of cycles. This method has revolutionised the study of the biology of fungi and other organisms since its inception in the late 1980s. Numerous variations/modifications now exist on/from the basic PCR methodology, allowing investigation of specific genes or loci in a 'targeted' approach (i.e. where the sequence of the gene of interest or its flanking region is known), or alternatively a 'non-targeted' approach that allows population/taxon discrimination on the basis of complex banding patterns. Some of the most significant variations are listed below [see also: DNA fingerprinting; DNA sequencing]. Amplification products may be visualised by use of a suitable stain (normally ethidium bromide – although less toxic alternatives are now available – in the presence of UV light; see Electrophoresis).

reverse transcriptase (RT) PCR. Sometimes confused with real time PCR (see below), this method is used to investigate specific mRNAs by 'converting' the RNA (which is notoriously difficult to handle) 'back' into DNA (called 'cDNA'), using the enzyme reverse transcriptase. It has also been used as an aid to the study of gene expression; e.g. see Reddy & D'Souza (*in* Bridge *et al.* (Eds) *Applications of PCR in Mycology*, 1998: 207; gene expression in lignocellulose degradation in white rot fungi).

real time PCR is a powerful technique that is used in quantification of DNA, gene expression studies, screening environmental samples, for diagnosis of certain disease genes and, increasingly, in food safety & biosecurity analyses. The technique uses double stranded DNA dyes or, for more accurate results, fluorescent reporter probes. See Nolan *et al.* (*Nat. Protoc.* **1**: 1559, 2006; use in mRNA quantification), Nailis *et al.* (*BMC Mol. Biol.* **7**: 25, 2006; use in *Candida albicans* gene expression studies), Kasai *et al.* (*J. Clin. Microbiol.* **44**: 143, 2006; detection of *Candida*).

DNA microarrays are a valuable tool for identifying gene expression and for diagnosing particular diseases such as cancers (see Sambrook & Russell, *Molecular Cloning: A Laboratory Manual*, edn 3, **3**: A10, 2001) and even medically important fungi (e.g. Leinberger *et al.*, *J. Clin. Microbiol.* **43**: 4943, 2005). In the construction of a DNA microarray, relevant DNA fragments (e.g. PCR products) are fixed precisely, by robotic 'printing', to a glass slide (although other supports may be used). Alternatively, arrays of single-stranded oligonucleotides that correspond to known gene sequences may be constructed *in situ*. Either way, the microarrays operate as a form of DNA probe to cDNA targets derived from RNA samples which are mixed with the probe to determine the degree of hybridization. Detection is usually by high resolution laser scanning of fluorophore-labelled probes (see Sambrook & Russell, 2001). This can be viewed semi-quantitatively (see Kazan *et al.*, *Mol. Plant Pathol.* **2**: 177, 2001). [see also *Genomics*].

monoblastic (of a conidiogenous cell), producing a blastic conidium at one locus.

Monoblastiopsis R.C. Harris & C.A. Morse (2008), Pleosporales. 2, USA. See Harris & Morse (*Opuscula Philolichenum* **5**: 89, 2008).

Monoblepharella Sparrow (1940), Gonapodyaceae. 5, C. & N. America. See Sparrow (*Aquatic Phycomycetes* Edn 2: 721, 1960; key), Steciow & Arambarri (*Nova Hedwigia* **70**: 107, 2000; *Monoblepharella mexicana*), James *et al.* (*Mycol.* **98**: 860, 2006; phylogeny).

Monoblepharidaceae A. Fisch. (1892), Monoblepharidales. 1 gen. (+ 2 syn.), 12 spp.

Lit.: Perrott (*TBMS* **38**: 247, 1955), Noyes Mollicone & Longcore (*Mycol.* **86**: 615, 1994).

Monoblepharidales Sparrow (1942). Monoblepharidomycetes. 4 fam., 5 gen., 26 spp. Thallus hyphal with oogamous reproduction (the only chytrids with non-motile female gametes and smaller, motile, male gametes), or thallus simple and no sexual stage known; zoospores possessing a non-flagellated centriole parallel to the kinetosome, a striated disk extending part way around the kinetosome, microtubules arising from the striated disk and extending into the cytoplasm, rumposome backed by microbody, and numerous lipid globules; aquatic saprobes. Fams:

(1) **Gonapodyaceae**
(2) **Harpochytriaceae**
(3) **Monoblepharidaceae**
(4) **Oedogoniomycetaceae**

Lit.: Sparrow (1960: 713, *in* Ainsworth *et al.* (Eds), *The Fungi* **4B**: 85, 1973), Gauriloff *et al.* (*CJB* **58**: 2098, 1980; ultrastr.), Barr (1990), Mollicone & Longcore (*Mycol.* **86**: 615, 1994, **91**: 727, 1999; zoospore ultrastr.), James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), Hibbett *et al.* (*MR* **111**: 109, 2007), and see under Familes.

Monoblepharidomycetes J.H. Schaffn. (1909), Chytridiomycota. 1 ord., 4 fam., 5 gen., 26 spp. Ord.: **Monoblepharidales**

Lit.: James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), and see under Order.

Monoblephariopsis Laib. (1927) = Monoblepharis fide Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960).

Monoblepharis Cornu (1871), Monoblepharidaceae. 12, Europe; N. America. See Perrott (*TBMS* **38**: 247, 1955), Sparrow (*Aquatic Phycomycetes* Edn 2: 727, 1960; key), James *et al.* (*Mycol.* **98**: 860, 2006; phylogeny).

monocarpic (of *Exobasidium* infections), circumscribed and annual (Nannfeldt, 1981: 10), cf. polycarpic, surculicolous.

monocentric (of a chytrid thallus), having one centre of growth and development; see polycentric and cf. reproductocentric.

monocephalic (adj. **monocephalous**), 1-headed.

Monocephalis Bainier (1882) = Syncephalis fide Benjamin (*Aliso* **4**: 321, 1959).

Monoceras Guba (1961) [non *Monoceras* Gothan 1909, fossil *Phanerogamae*] = Seimatosporium fide Sutton (*Mycol. Pap.* **97**, 1964).

Monochaetia (Sacc.) Allesch. (1902), anamorphic *Amphisphaeriaceae*, Cac.≡ eP.19. 28, widespread. See Anon. (*Monograph of Monochaetia and Pestalotia*, 1961), Sutton (*The Coelomycetes*, 1980), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Nag Raj & Mel'nik (*Mycotaxon* **50**: 435, 1994; redispositions), Jeewon *et al.* (*Mol. Phylogen. Evol.* **25**: 378, 2002; phylogeny), Jeewon *et al.* (*MR* **107**: 1392, 2003; phylogeny).

Monochaetiella E. Castell. (1943), anamorphic *Pezizomycotina*, Cac.0eH.15. 1, widespread.

Monochaetiellopsis B. Sutton & DiCosmo (1977), anamorphic *Hypnotheca*, Cac.1eH.?. 2, widespread. See Punithalingam (*Nova Hedwigia* **54**: 255, 1992; nuclei in conidial appendages).

Monochaetina Subram. (1961) = Bleptosporium fide Sutton (*Mycol. Pap.* **88**, 1963).

Monochaetinula Muthumary, Abbas & B. Sutton (1986), anamorphic *Amphisphaeriaceae*, Cpd.≡ eP.19. 6, widespread (tropical). See Bianchinotti (*Mycotaxon* **39**: 455, 1990; Argentina), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Monochaetiopsis L. Cai, R. Jeewon & K.D. Hyde (2003), anamorphic *Dyrithiopsis*, Cac.?.?. 1, China. See Jeewon *et al.* (*Mycol.* **95**: 913, 2003).

Monochaetites Babajan & Tasl. (1973), Fossil Fungi. 1 (Tertiary), former USSR.

Monochaetopsis Pat. (1931), anamorphic *Pezizomycotina*. 1, N. Africa.

Monochytrium Griggs (1910) ? = Olpidium fide Fitzpatrick (*The lower fungi. Phycomycetes*, 1930).

Monocillium S.B. Saksena (1955), anamorphic *Niesslia, Hyaloseta*, Hso.0eH/1eP.15. *c.* 15, widespread. See Gams (*Cephalosporium-artige Schimmelpilze*, 1971; key 12 spp.), Gams & Turhan (*Mycotaxon* **59**: 343, 1996), Girlanda & Luppi-Mosca (*Mycotaxon* **67**: 265, 1998), Ramaley (*Mycotaxon* **79**: 267, 2001).

monoclinous, having the antheridium on the oogonial stalk. Cf. androgynous.

Monoconidia Roze (1897) ? = Acremonium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Monodelphus Earle (1909) = Omphalotus fide Singer (*Agaric. mod. Tax.*, 1951).

Monodia Breton & Faurel (1970), anamorphic *Pezizomycotina*, Cpd.≡ eH.1. 1 (coprophilous), Chad. See Breton & Faurel (*Revue mycol.* Toulouse **35**: 23, 1970), Nag Raj & DiCosmo (*Univ. Waterloo Biol. Ser.* **20**, 1982).

Monodictyites Barlinge & Paradkar (1982), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Cretaceous), India.

Monodictys S. Hughes (1958), anamorphic *Dothideomycetes*, Hsp.#eP.1. 27, widespread. Certainly polyphyletic. See Rao & de Hoog (*Stud. Mycol.* **28**: 25, 1986; key), Wedin (*Lichenologist* **25**: 203, 1993; ultrastr.), Rodríguez *et al.* (*Nova Hedwigia* **72**: 201, 2001; Cuba), Zhao & Zhang (*Mycosystema* **23**: 324, 2004; China), Kukwa & Diederich (*Lichenologist* **37**: 217, 2005; lichenicolous spp.), Day *et al.* (*Mycotaxon* **98**: 261, 2006).

Monodidymaria U. Braun (1994), anamorphic *Pezizomycotina*, Hso.≡ eH.1. 5, Canada; India. See Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**, 1998).

Monodisma Alcorn (1975), anamorphic *Pezizomycotina*, Hso.≡ eH.10. 1, widespread. See Alcorn (*TBMS* **65**: 139, 1975).

monoecism (adj. **monoecious**), having the male and female sex organs on one thallus; cf. dioecism, heterothallism, homothallism.

monogeocentric, see reproductocentric.

Monogrammia F. Stevens (1917) = Titaea fide Damon (*J. Wash. Acad. Sci.* **42**: 365, 1952).

Monographella Petr. (1924), Xylariales. Anamorph *Microdochium*. 6 (pathogenic on cereals), widespread. See Müller (*Revue Mycol.* Paris **41**: 129, 1977; *M. nivalis*), Subramanian & Bhat (*Revue Mycol.* Paris **42**: 293, 1978; ontogeny), Parkinson *et al.* (*TBMS* **76**: 59, 1981; *M. albescens*, rice leaf scald), Samuels & Hallett (*TBMS* **8**: 473, 1983), Müller & Samuels (*Nova Hedwigia* **40**: 113, 1984), Mahuku *et al.* (*MR* **102**: 559, 1998; mol. diversity), Wang & Hyde (*Fungal Diversity* **3**: 159, 1999), Winka & Eriksson (*Mycoscience* **41**: 97, 2000), Jeewon *et al.* (*MR* **107**: 1392, 2003; phylogeny).

Monographos Fuckel (1875) = Scirrhia fide Holm & Holm (*Bot. Notiser* **131**: 97, 1978), Eriksson & Hawksworth (*SA* **11**: 178, 1993).

Monographus Clem. & Shear (1931) ≡ Monographos.

Monoicomyces Thaxt. (1900), Laboulbeniaceae. 48, widespread. See Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Santamaría (*Mycotaxon* **50**: 89, 1994), Santamaría (*MR* **100**: 1179, 1996), De Kesel (*Sterbeeckia* **25**: 62, 2005; Belgium).

monokaryon, see haplont.

monokaryotic, having genetically identical haploid nuclei; cf. dikaryon.

Monoloculia Hara (1927) = Yoshinagaia fide Sivanesan & Hsieh (*MR* **99**: 1295, 1995).

Monolpidiaceae A. Fisch. (1892) = Olpidiaceae.

monomitic, see hyphal analysis.

monomorphic, having one structure or form; not pleomorphic.

monomycelial (of an isolate), from one spore or hyphal tip.

Monomyces Battarra ex Earle (1909) = Tricholoma fide Singer (*Agaric. mod. Tax.*, 1951).

Mononema Balbiani (1889), ? Kickxellomycotina. 3, Africa; Europe. See Manier *et al.* (*Biol. Gabon.* **8**: 323, 1972), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*: 343 pp., 1986; posn).

mononematous (of conidiophores), solitary or in tufts or loose fascicles; cf. synnematous.

monophagy (adj. **monophagous**) (of *Chytridiales*), the condition of having the thallus in one host cell; the opposite of polyphagy, in which the thallus branches

invade more than one host cell.

monophialidic (of a conidiogenous cell), having one locus through which conidia are produced. Cf. polyphialidic.

monophyllous (of foliose lichens), having a single leaf-like thallus.

monoplanetism (of zoospores in oomycetes), the condition of having one motile phase, with no resting period.

Monoplodia Westend. (1859) = Coniothyrium fide Saccardo & Trotter (*Syll. fung.* **22**, 1913).

monopodial, a type of branching in which a persistant main axis gives off branches, one at a time and frequently in alternate or spiral series.

Monopodium Delacr. (1890) = Acremoniella fide Mason (*Mycol. Pap.* **3**: 29, 1933).

Monoporidicellaesporites Frunzescu & Bacaran (1990), Fossil Fungi. 1. See Frunzescu & Bacaran (*Revue roum. Géol., Géophys. Géogr.* Géol. **34**: table 1 + pl. 1, fig. 16, 1990).

Monoporimonocellasporites Frunzescu & Bacaran (1990), Fossil Fungi. 1. See Frunzescu & Bacaran (*Revue roum. Géol., Géophys. Géogr.* Géol. **34**: table 1 + pl. 1, fig. 7, 1990).

Monoporimonodicellaesporites Frunzescu & Bacaran (1990), Fossil Fungi. 1. See Frunzescu & Bacaran (*Revue roum. Géol., Géophys. Géogr.* Géol. **34**: table 1 + pl. 1, figs 9, 10, 1990).

Monoporimulticellaesporites Frunzescu & Bacaran (1990), Fossil Fungi. 1. See Frunzescu & Bacaran (*Revue roum. Géol., Géophys. Géogr.* Géol. **34**: table 1+ pl. 1, figs 23, 25, 1990).

Monoporisporites Hammen (1954), Fossil Fungi. 15 (Cretaceous, Tertiary), widespread.

Monoporitetracellaesporites Frunzescu & Bacaran (1990), Fossil Fungi. 1. See Frunzescu & Bacaran (*Revue roum. Géol., Géophys. Géogr.* Géol. **34**: table 1 + pl. 1, figs 14, 15, 17, 1990).

Monoporitricellaesporites Frunzescu & Bacaran (1990), Fossil Fungi. 1. See Frunzescu & Bacaran (*Revue roum. Géol., Géophys. Géogr.* Géol. **34**: table 1, 1990).

Monopus Theiss. & Syd. (1915) = Rosenscheldiella fide Hansford (*Mycol. Pap.* **15**, 1946).

Monopycnis Naumov (1916) = Cytospora fide Petrak (*Annls mycol.* **23**: 1, 1925).

monoreproductocentric, see reproductocentric.

Monorhiza Theiss. & Syd. (1915) = Rhagadolobium fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Monorhizina Theiss. & Syd. (1915), Microthyriaceae. 1, Sri Lanka.

Monospermella Speg. (1924) = Psorotheciopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

monospermous, 1-spored.

Monospora Metschn. (1884) [non *Monospora* Hochst. 1841, *Algae*] ≡ Metschnikowia.

Monosporascus Pollack & Uecker (1974), Xylariales. 3 (thermophilic), widespread. See Hawksworth & Ciccarone (*Mycopathologia* **66**: 147, 1978), Martyn *et al.* (*Phytopathology* **82**: 1115, 1992; ascospores, germination), Uematsu *et al.* (*Ann. phytopath. Soc. Japan* **58**: 354, 1992; Japan), Martyn *et al.* (*Phytopathology* **83**: 1347, 1993), Lovic *et al.* (*Phytopathology* **85**: 655, 1995; phylogeny), Waugh *et al.* (*MR* **105**: 745, 2001; SEM), Collado *et al.* (*MR* **106**: 118, 2002; Spain), Sales *et al.* (*Fitopatol. Brasil* **28**: 567, 2003; Brazil).

monospore, used by Corner (*New Phytol.* **46**: 195, 1947) for the one spore maturing on a 2-spored basidium normally bearing 2 dispores (q.v.).

Monosporella Keilin (1920) ≡ Metschnikowia.

Monosporella S. Hughes (1953) ≡ Monotosporella.

monosporic (adj. **monosporous**), 1-spored.

Monosporidium Barclay (1888), Phakopsoraceae. 4 (on *Euphorbiaceae*, *Lauraceae*, *Rubiaceae*), India; China; Japan. Telial aeciospores produce basidia on germination. See Thirumalachar & Kern (*Bull. Torrey bot. Club* **82**: 102, 1955), Buriticá (*Rev. Acad. Colomb. Cienc.* **18** no. 69: 131, 1991), Ono (*Mycoscience* **43**: 421, 2002; nuclear cycle).

Monosporiella Speg. (1918), anamorphic *Pezizomycotina*, Hso.0eH.?. 1, Argentina. See Deighton & Pirozynski (*Mycol. Pap.* **128**, 1972).

Monosporium Bonord. (1851) nom. illegit., anamorphic *Pezizomycotina*. See Hughes (*CJB* **36**: 727, 1958).

Monosporonella Oberw. & Ryvarden (1991) = Oliveonia fide Roberts (*Rhizoctonia-forming fungi*, 1999).

Monostachys Arnaud (1954) = Chloridium fide Gams & Holubová-Jechová (*Stud. Mycol.* **13**, 1976).

Monostichella Höhn. (1916), anamorphic *Drepanopeziza*, Cac.0eH.15. 10, widespread. See von Arx (*Biblthca Mycol.* **24**, 1970).

monostichous, in one line or series.

Monothecium Lib. [non *Monothecium* Hochst. 1842, Acanthaceae] [not traced] nom. nud. et nom. dub. = Mastigosporium fide Saccardo (*Syll. fung.* **4**: 220, 1886).

Monotospora Corda (1837) nom. dub., Pezizomycotina. See Carmichael (*CJB* **40**: 1137, 1962).

Monotospora Sacc. (1880) ≡ Acrogenospora.

Monotosporaceae Vuill. (1912) = Hysteriaceae.

Monotosporella S. Hughes (1958), anamorphic *Pezizomycotina*. 1, widespread. See Ellis (*Mycol. Pap.* **72**, 1959; synonymy with *Brachysporiella*), Rao & de Hoog (*Stud. Mycol.* **28**: 6, 1986), Ranghoo *et al.* (*Mycoscience* **40**: 377, 1999), Tsui *et al.* (*Mycol.* **93**: 389, 2001).

Monotoyella Castell. & Chalm. (1913) nom. dub., anamorphic *Pezizomycotina*. See de Hoog & Hermanides-Nijhof (*Stud. Mycol.* **15**: 186, 1977).

monotretic, see tretic.

Monotretomyces Morgan-Jones, R.C. Sinclair & Eicker (1987) = Corynesporopsis fide Sutton (*in litt.*).

monotrichous (**monotrichiate**) (of bacteria), having one polar flagellum.

Monotrichum Gäum. (1922), anamorphic *Pezizomycotina*, Hso.1eH.?. 1, Celebes; India. See Carmichael *et al.* (*Genera of Hyphomycetes*, 1980; relationships).

Monotropomyces Costantin & Dufour (1921) nom. dub., anamorphic *Pezizomycotina*. See de Hoog & Hermanides-Nijhof (*Stud. Mycol.* **15**: 185, 1977).

monotypic, having only one representative, as a genus having only one species.

monoverticillate (of a penicillus), composed of phialides only.

Montagne (Jean Pierre François Camille; 1784-1866; France). A medic in Napoleon's army; in retirement, an amateur mycologist living in Paris. Noted for his work on fungi of Chile, Cuba, France and other countries, and on plant diseases, particularly as the author of *Botrytis infestans* (= *Phytophthora infestans*) the causal organism of potato late blight. *Publs*. Centu-

ries des plantes cellulaires. *Annales des Sciences Naturelles* Botanique (1837-1860) [reprint 1970; see Stafleu, *Taxon* **19**: 633, 1970]; Botanique. Plantes cellulaires. *In* R. de la Sagra [ed.] *Histoire Physique Politique et Naturelle de l'Ile de Cuba* (1838-1842); Hongos I& II. *In* C. Gay [ed.] *Historia Física y Política de Chile. Botánica* (1853-1854); *Sylloge Generum Specierumque Cryptogamarum* (1856). *Biogs, obits etc.* Stafleu & Cowan (*TL-2* **3**: 557, 1981).

Montagnea Fr. (1836), Agaricaceae. 5, widespread (subtropical dry areas). See Reid & Eicker (*S. Afr. J. Bot.* **57**: 161, 1991), Hopple & Vilgalys (*Mol. Phylogen. Evol.* **13**: 1, 1999; phylogeny), Stasinska & Prajs (*Polish Botanical Journal* **47**: 211, 2002; *Montagnea arenaria* in Poland).

Montagneaceae Singer (1976) = Agaricaceae.

Montagnella Speg. (1881), Dothideomycetes. 9, widespread.

Montagnellina Höhn. (1912) ? = Guignardia fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Montagnina Höhn. (1910) ≡ Gibbera fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Montagnites Fr. (1838) ≡ Montagnea.

Montagnula Berl. (1896), Montagnulaceae. Anamorph *Aposphaeria*. 24, widespread. The systematic position is doubtful, and it is almost certainly polyphyletic. See Huhndorf (*Brittonia* **44**: 208, 1992), Aptroot (*Nova Hedwigia* **60**: 325, 1995; posn in *Phaeosphaeriaceae*), Ramaley & Barr (*Mycotaxon* **54**: 75, 1995), Hyde *et al.* (*Nova Hedwigia* **69**: 449, 1999; on palms), Barr (*Mycotaxon* **77**: 193, 2001; fam. placement), Liew *et al.* (*Mycol.* **94**: 803, 2002; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Montagnulaceae M.E. Barr (2001), Pleosporales. 7 gen. (+ 8 syn.), 100 spp. In need of reappraisal using molecular methods.

Lit.: Barr (*Mycotaxon* **77**: 193, 2001), Liew *et al.* (*Mycol.* **94**: 803, 2002; phylogeny), Wang *et al.* (*MR* **111**: 1268, 2007; phylogeny).

Montemartinia Curzi (1927) = Chaetosphaeria fide Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979).

Montinia A. Massal. (1855) [non *Montinia* Thunb. 1776, *Saxifragaceae*] ≡ Pyrenocarpon.

Montoyella Castell. & Chalm. (1907) nom. dub., anamorphic *Pezizomycotina*. See de Hoog & Hermanides-Nijhof (*Stud. Mycol.* **15**: 186, 1977).

Moorella P. Rag. Rao & D. Rao (1964), anamorphic *Pezizomycotina*, Hso.0-≡ hP.10. 1, India. See Rao & Rao (*Mycopathologia* **22**: 51, 1964).

Morakotiella Sakay. (2005), Halosphaeriaceae. 1, Italy. See Sakayaroj *et al.* (*Mycol.* **97**: 806, 2005).

Moralesia Urries (1956), anamorphic *Pezizomycotina*, St.1bH.?. 1, Canary Islands. See Urries (*An. Inst. bot. A.J. Cavanilles* **14**: 167, 1956).

Moravecia Benkert, Caillet & Moyne (1987), Pyronemataceae. 2, Europe. See Caillet & Moyne (*Bull. Soc. Hist. nat. Doubs* **84**: 9, 1991), Benkert & Kristiansen (*Z. Mykol.* **65**: 33, 1999; Norway).

Morchella Dill. ex Pers. (1794), Morchellaceae. Anamorph *Costantinella*. *c.* 36, widespread (esp. temperate). The morels, important edible fungi. See Patrignani & Pellegrini (*Atti Accad. naz. Lincei Rc. Sed. solen.* Cl. Sci., Fis., Mat. Nat. **75**: 161, 1983; ultrastr.), Gessner *et al.* (*Mycol.* **79**: 683, 1987; genetics), Yoon *et al.* (*Mycol.* **82**: 227, 1990; population genetics), Amir *et al.* (*MR* **96**: 943, 1992; growth in culture), Rohe (*Biblthca Mycol.* **146**, 1992; genetics), Amir *et al.* (*MR* **97**: 683, 1993; morphology, physiology), Jung *et al.* (*Mycol.* **85**: 677, 1993; ELISA), Bunyard *et al.* (*Exp. Mycol.* **19**: 223, 1995; phylogeny), Bunyard *et al.* (*Mycol.* **86**: 762, 1994; RFLP analysis), Gessner (*CJB* **73** Suppl. 1: S967, 1995; genetics, systematics), Wipf *et al.* (*Appl. Environm. Microbiol.* **62**: 3541, 1996; ITS sequences), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; phylogeny), Guzmán & Tapia (*Mycol.* **90**: 705, 1998; Mexico), Parguey-Leduc *et al.* (*Cryptog. Bryol.-Lichénol.* **19**: 277, 1998; asci, ascospores), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Wipf *et al.* (*Can. J. Microbiol.* **45**: 769, 1999; ITS variation), Kellner *et al.* (*Organ. Divers. Evol.* **5**: 101, 2005; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).

Morchellaceae Rchb. (1834), Pezizales. 4 gen. (+ 8 syn.), 49 spp.

Lit.: Jacquetant (*Les Morilles*: 144 pp., 1984), Volk & Leonard (*MR* **94**: 399, 1990), Amir *et al.* (*MR* **96**: 943, 1992), Buscot (*Mycorrhiza* **4**: 223, 1994), Bunyard *et al.* (*Mycol.* **86**: 762, 1994), Bunyard *et al.* (*Exp. Mycol.* **19**: 223, 1995), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Wipf *et al.* (*Cryptog. Mycol.* **18**: 95, 1997), Guzmán & Tapia (*Mycol.* **90**: 705, 1998), Parguey-Leduc *et al.* (*Cryptog. Bryol.-Lichénol.* **19**: 277, 1998), Harrington *et al.* (*Mycol.* **91**: 41, 1999), Wipf *et al.* (*Can. J. Microbiol.* **45**: 769, 1999), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Moreaua Liou & H.C. Cheng (1949), Anthracoideaceae. 31 (on *Cyperaceae*), widespread. See Vánky (*Mycotaxon* **74**: 343, 2000), Vánky (*Mycotaxon* **81**: 367, 2002), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002; New Zealand).

morel, the edible ascoma of *Morchella*; **false -**, see lorchel.

Morella Pérez Reyes (1964), ? Olpidiaceae. 1, USA. See Karling (*Bull. Torrey bot. Club* **99**: 223, 1972).

Morellus Eaton (1818) ≡ Phallus.

Morenoella Speg. (1885) = Lembosia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Goos (*Mycotaxon* **73**: 455, 1999).

Morenoina Theiss. (1913), ? Asterinaceae. Anamorph *Sirothyriella*. 11, widespread. See Ellis (*TBMS* **74**: 297, 1980; key Brit. spp.), Cannon (*TBMS* **86**: 190, 1986; Pakistan), Hofmann & Piepenbring (*Fungal Diversity* **22**: 55, 2006; Panama).

Morfea (G. Arnaud) Cif. & Bat. (1963) = Polychaeton fide Punithalingam (*Mycol. Pap.* **149**, 1981), Reynolds (*Madroño* **45**: 250, 1998).

Morfea Roze (1867) = Polychaeton fide Hughes (*Mycol.* **68**: 792, 1976).

Morganella Zeller (1948), Agaricaceae. 9, widespread (esp. tropical). See Kreisel & Dring (*Feddes Repert.* **74**: 109, 1967; key 7 spp.), Ponce de Leon (*Fieldiana, Bot.* **34**: 27, 1971), Suárez & Wright (*Mycol.* **88**: 655, 1996; S. Amer. spp.), Krüger & Kreisel (*Mycotaxon* **86**: 169, 2003; *Morganella* subgen. *Apioperdon*), Kreisel & Karasch (*Mycologia Bavarica* **8**: 9, 2005).

moriform, like a mulberry (*Morus*) fruit in form.

Morilla Quél. (1886) ≡ Morchella.

Morinia Berl. & Bres. (1889), anamorphic *Amphisphaeriaceae*, Cac.#eP.?. 2, Europe; Asia. See

Collado *et al.* (*Mycol.* **98**: 616, 2006).

Moriola Norman (1872), Moriolaceae (±L). 4, Europe. See Bachman (*Nyt Mag. naturv.* **64**: 170, 1926), Eriksson (*Op. Bot.* **60**, 1981), Triebel (*Biblthca Lichenol.* **35**, 1989).

Moriolaceae Zahlbr. (1903), ? Dothideomycetes (inc. sed.) (±L). 1 gen., 4 spp.

Lit.: Eriksson (*Op. Bot.* **60**, 1981), Clauzade & Roux (*Bull. Soc. bot. Centre-Ouest* Nouv. sér., num. spec. 7: 893 pp., 1985).

Moriolomyces Cif. & Tomas. (1953), Dothideomycetes. 1, Europe. See Eriksson (*Op. Bot.* **60**, 1981), Eriksson & Hawksworth (*SA* **9**: 27, 1991).

Moriolopis Norman ex Keissl. (1927) nom. inval. = Melanomma fide Keissler (*Rabenh. Krypt.-Fl.* **9** 1(1), 1933).

Morispora Salazar-Yepes, Pardo-Card. & Buriticá (2007), Phragmidiaceae. Anamorph *Gerwasia*. 1, S. America. See Salazar Yepes, M.; Pardo Cardona, V.M.; Buriticá Céspedes, P. (*Caldasia* **29**: 105, 2007).

Moristroma A.I. Romero & Samuels (1991), ? Chaetothyriales. 1, widespread. See Romero & Samuels (*Sydowia* **43**: 228, 1991), Nordén *et al.* (*Mycol. Progr.* **4**: 325, 2005; phylogeny, morphology), Lee *et al.* (*Mycol.* **98**: 598, 2006; phylogeny).

Morobia E. Horak (1979) = Lepiota fide Kuyper (*in litt.*).

Morochkovsky (Semion Filimonovich; 1897-1962; Ukraine). Postgraduate student in mycology and plant pathology (1928-1931) then Research Officer (1931-1938), All Union Scientific Research Institute of the Sugar Beet Industry, Kiev; Senior Research Officer (1938-1939) then Head of the Department of Mycology (1939-1962), M.G. Kholodny Institute of Botany, Kiev. Greatly influenced by Jaczewski (q.v.). Investigated widespread sudden death of horses (1938-1939) [an extremely dangerous occupation when Stalin was purging Ukraine of so-called 'wreckers'], establishing the cause as toxins from fodder contaminated by *Stachybotrys*. Studied factors promoting growth of wild mushrooms to alleviate postwar hunger (1945-1948). Established the series [*Guide to the Identification of Fungi of Ukraine*] [in Ukrainian]. *Publs.* (with Zerova, Lavitska & Smitska) [*Handbook of the Fungi of Ukraine*] (1969) [in Ukrainian, published posthumously]. *Biogs, obits etc.* Smitskaya & Dudka ([*Mikologiya i Fitopatologiya*] **2**: 79, 1968, portrait [in Russian]).

Moronopsis Delacr. (1891) ? = Cheirospora fide Sutton (*Mycol. Pap.* **141**, 1977).

Morosporium Renault & Roche (1898), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Eocene), France.

morph, form.

morphotype, a group of morphologically differentiated individuals of a species of unknown or of no taxonomic significance.

Morqueria Bat. & H. Maia (1963) = Cirsosia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Morrisiella Saikia & A.K. Sarbhoy (1985), Chaetosphaeriaceae. See Sutton (*in litt.*), Shenoy *et al.* (*MR* **110**: 916, 2006; phylogeny).

Morrisographium M. Morelet (1968), anamorphic *Pezizomycotina*, Hsy.≡ eP.1. 7, widespread. See Illman & White (*CJB* **63**: 423, 1985; key), Murvanishvili & Svanidze (*Soobshch. Akad. Nauk Gruz.* **137**: 573, 1990).

Morthiera Fuckel (1870) = Entomosporium fide Saccardo (*Syll. fung.* **3**: 657, 1884).

Mortierella Coem. (1863), Mortierellaceae. *c.* 85 (mainly in soil), widespread. See Kuhlman (*Mycol.* **64**: 325, 1972), Kuhlman (*Mycol.* **67**: 678, 1975; zygospores), Gams (*Persoonia* **9**: 381, 1977; key spp. in cult.), Benjamin (*Aliso* **9**: 157, 1978), Ansell & Young (*TBMS* **91**: 221, 1988; zygospores), Chen (*Mycosystema* **5**: 23, 1992; Chinese spp.), Degawa & Tokumasu (*Mycoscience* **38**: 387, 1997; zygosporogensis), Kirk (*IMI Descr. Mothesia Oddo & Tonolo (1967) = Claviceps fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

mould (1) a microfungus having a well-marked mycelium or spore mass, esp. an economically important saprobe; **anther -** of clover, *Botrytis anthophila*; **black -**, *Aspergillus niger*; **blue -**, *Penicillium*; of apple, *P. expansum*; of citrus, *P. italicum*; of tobacco, *Peronospora hyoscyami* (syn. *P. tabacina*; Shepherd, *TBMS* **55**: 253, 1970), McKeen (*Blue mold of tobacco*, 1989); **bread -**, *Chrysomilia sitophila*; also used of *Mucorales* on bread; **green -** of citrus, *Penicillium digitatum*; **grey -**, *Botrytis cinerea*; of snowdrop, *B. galanthina*; **pin -**, *Mucor* and other *Zygomycetes*; **plaster -**, brown, *Papulospora byssina*; white, '*Oospora*' (q.v.) *fimicola*; **slime -s**, *Mycetozoa*; **snow -s**, low temp. tolerant pathogens growing on unfrozen soil surface below snow cover, causing diseases of winter cereals, grasses and forage legumes, *Monographella nivalis* (pink snow mould), *Sclerotinia borealis*, *Typhula* spp.; **sooty -s**, *Atichiaceae*, *Capnodiales*, etc.; **tomato leaf -**, *Fulvia fulva*; **water -s**, aquatic *Chytridiomycetes* and *Oomycetes*, esp. *Saprolegniales*; **white -** of sweet pea, *Hyalodendron album*; (2) see mildew (2). Illman (*Mycol.* **62**: 1214, 1970) advocated as American usage 'mould' for a fungus, 'mold' for a shape.

Moulíniea C.P. Robin (1853), Pezizomycotina. 1, Europe.

Mounting media. The appearance of microscopic structures of fungi differs greatly depending on the condition of the material and the mountant used. Ideally and if possible, microscopic examination of fungi should begin with material in a fresh living state and water as the mounting fluid (see Baral, *Mycotaxon* **44**: 333, 1992; vital taxonomy); this will enable structures to be measured without problems of shrinkage, and their natural colour to be observed; it is also useful for observing gelatinous material and non-cellular appendages. Thereafter, if necessary or desired, other mountants including stains may be suitable. Various mounting fluids are available. Stains are often combined with clearing agents such as lactic acid, glycerol and chloral hydrate to produce temporary or permanent mounts. Lactophenol (Amann, 1896) was also formerly used, but is now not recommended because of its carcinogenic properties. See Dring in Booth (Ed.) (*Methods in microbiology* **4**: 96, 1971), Tuite (*Plant pathological methods. Fungi & bacteria*, 1969). Many mountants are adversely affected by exposure to light and should be stored in a dark bottle.

Lactic acid in glycerol

Although less effective than lactophenol for clearing plant tissues, lactic acid has similar properties and can be used neat or combined with glycerol and water for routine examination of many fungi.

Lactic acid	25.0 ml
Glycerol	50.0 ml
Distilled water	25.0 ml

Cotton blue in lactic acid

This is widely used as a standard mountant which rapidly stains the cytoplasm of fungal cells. Permanent mounts can be prepared by sealing with nail varnish.

Cotton blue	0.01 g
Lactic acid (85%)	100.0 ml

Add cotton blue powder to lactic acid. Heat in a glass beaker and stir until dissolved. Allow to cool then filter to remove any sediment. Store in a dark bottle.

Erythrosin B in ammonia

An aqueous mountant which stains fungal cell walls, producing a clear outline of septation in spores and mycelium. It is particularly useful for examining hyaline structures and conidiogenesis in anamorphic fungi. This stain crystallizes within 48 hours and can only be used as a temporary mountant.

Erythrosin B	1.0 g
Ammonia	10.0 ml
Distilled water	90.0 ml

Mix ammonia and distilled water. Add erythrosin B and stir until dissolved.

Lactofuchsin

A red stain produced by combining acid-fuchsin with lactic acid (Carmichael, *Mycologia* **47**: 611, 1955). This has a slightly better refractive index than cotton blue, enabling structures to be seen clearly and is particularly suitable for staining structures prior to photographing.

Acid-fuchsin	0.1 g
Lactic acid	100.0 ml

Polyvinyl alcohol in lactic acid

This mountant has a high refractive index (1.39) resulting in minimal distortion of structures, sets rapidly and requires no sealing, providing an excellent permanent mounting medium for examination of fungi. See Omar *et al.* (*Stain Technology* **53**: 293, 1978).

Polyvinyl alcohol	1.66 g
Lactic acid	10.0 ml
Glycerol	1.0 ml
Distilled water	10.0 ml

Potassium hydroxide (KOH)

Used at 5-10%, potassium hydroxide is useful for softening and clearing fungal tissues. It is most commonly used as a pre-treatment for examining ascomycetes and anamorphic fungi with tough-walled fruit-bodies. After clearing, the KOH can be washed off with water using a dropper or pipette and replaced with a stain. A 5% solution is prepared as follows:

Potassium hydroxide	5.0 g
Distilled water	100.0 ml

Weigh out 5 g potassium hydroxide pellets. Add to distilled water in a glass beaker. Stir until dissolved.

Shear's mounting fluid

A colourless mounting fluid suitable for permanent preparations of myxomycetes, ascomycetes, rusts and smuts and particularly useful for microphotography. See Chupp (*Mycologia* **32**: 269, 1940), Gams *et al.* (*CBS Course of mycology*, edn 3, 1987).

Potassium acetate	3 g

glycerol	60 ml
Ethanol (95%)	90 ml
Distilled water	150 ml

Lugol's iodine
Used as an alternative to Melzer's iodine for testing the amyloid reaction in spores, asci and hymenium of ascomycetes and basidiomycetes. It is particularly useful for examining apical apparatus in asci of lichenised fungi, giving a clearer result than Melzer's iodine.

Iodine	1.0 g
Potassium iodide	2.0 g
Distilled water	100.0 ml

Prepare in a fume cupboard. Dissolve potassium iodide in distilled water in a glass beaker. Add iodine. Cover the beaker and leave to dissolve for 24 hours. Mix thoroughly.
Melzer's iodine
Mainly used for testing the amyloid reaction in sporulating structures of ascomycetes and basidiomycetes. (Melzer, *BSMF* **40**: 78, 1924). Also clears and stains fungal tissues including cell walls and can be used for general examination of fungal structures. Pre-treatment of material with 5-10 % potassium hydroxide is recommended. Permanent mounts can be made by drawing off the reagent with filter paper, replacing with lactic acid or lactophenol and sealing with nail varnish.

Chloral hydrate	22.0 g
Iodine	0.5 g
Potassium iodide	1.5 g
Distilled water	20.0 ml

Prepare in a fume cupboard. Dissolve potassium iodide in distilled water. Add iodine and leave to dissolve for 24 hours. Add chloral hydrate and stir until dissolved. Mix thoroughly.
Water (distilled or tap)

Hyphom.) **1**, 1995).

Mukagomyces S. Imai (1940) = Tuber fide Trappe (*Mycotaxon* **9**: 247, 1979), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Mukhakesa Udaiyan & V.S. Hosag. (1992) nom. inval., Xylariales. 1 (wood, aquatic), India. See Kang *et al.* (*Fungal Diversity* **2**: 135, 1999).

Mukorites Grüss (1931), Fossil Fungi. 1.

Müller (Emil; 1920-2008; Switzerland). Graduate in agriculture, Swiss Institute of Technology (1944); Agricultural Advisor, Plantahof Agricultural School, Grisons Canton (1944-1948); PhD, Swiss Institute of Technology (1949); Curator of Fungal Collections (1954-1966) then Lecturer (1966-1970) then Professor (1970-1973) then Regius Professor (1973 onwards), Swiss Institute of Technology (1954 onwards). An outstanding systematist, specializing in the ascomycetes (he was affectionately nicknamed 'Ascus'), collaborating with Ahmad (q.v.) and Arx (q.v.) and producing more than 200 papers; Managing Editor of *Sydowia* for many years. *Publs.* (with Arx) Die Gattungen der amerosporen Pyrenomyceten. *Beiträge zur Kryptogamenflora der Schweiz* (1954); (with Arx) Die Gattungen der didymosporen Pyrenomyceten. *Beiträge zur Kryptogamenflora der Schweiz* (1962); (with Loeffler) *Mycology. An Outline for Science and Medical Students* (1971) [English translation, 1976]; (with Arx) Pyrenomycetes: Meliolales, Coronophorales, Sphaeriales. In Ainsworth, Sparrow & Sussman [eds] *The Fungi. An Advanced Treatise* **4A** (1973). *Biogs, obits etc.* Petrini (*Sydowia* **52**: v, 2000); Petrini & Horak (*Sydowia* **38**: 400, 1985) [portrait].

Müller Argoviensis (Jean; 1828-1896; Switzerland). Student, Zürich (up to 1857); Curator, de Candolle Herbarium (1851-1869); Curator, Delessert Herbarium, Geneva (1869-1896); Director, Geneva Botanic Garden (1870-1874); Professor of Botany, Geneva (1871-1889). Carried out important work on tropical lichens, particularly from Cuba; published over 100 papers on lichen-forming fungi including many new species [reprint *Gesammelte Lichenologische Schriften*, 2 vols, 1967]. Most specimens in **G**, other material in **BM** and **M**. *Publs.* Lichenologische Beiträge. I-XXV. *Flora* (1874-1891). *Biogs, obits etc.* Briquet (*Bulletin de l'Herbier Boissier* **4**: 111, 1896); Grummann (1974: 633); Stafleu & Cowan (*TL-2* **3**: 628, 1981).

multi- (prefix), a great number; many; much.

multiallelic (of an incompatibility system), having more than 2 alleles per locus; cf. biallelic.

Multicellaesporites Elsik (1968), Fossil Fungi. 42 (Tertiary), widespread.

Multicellites Kalgutkar & Janson. (2000), Fossil Fungi, anamorphic *Ascomycota*. 1, widespread. See Kalgutkar & Jansonius (*AASP Contributions Series* **39**: 189, 2000).

Multicladium K.B. Deshp. & K.S. Deshp. (1966), anamorphic *Pezizomycotina*, Hso.0bP.?. 1, India. See Deshpande & Deshpande (*Mycopath. Mycol. appl.* **30**: 185, 1966).

Multiclavula R.H. Petersen (1967), Clavulinaceae. 13 (3 L; some assoc. with *Myxomycetes* and *Musci*), widespread. See Petersen (*Am. midl. Nat.* **77**: 205, 1967; key), Oberwinkler (*Dtsch. bot. Ges.* N.F. **4**: 139, 1970), Petersen & Kan tvilas (*Aust. J. Bot.* **34**: 217, 1986), Poelt & Obermayer (*Herzogia* **8**: 289, 1990; bulbil diaspores).

multifid, having division into a number of parts or lobes.

Multifurca Buyck & V. Hofstetter (2008), Russulaceae. 5, USA; India; Thailand; New Caledonia. See Buyck *et al.* (*Fungal Diversity* **28**: 15, 2008).

multiguttulate, containing many oil-like drops.

Multipatina Sawada (1928), anamorphic *Pezizomycotina*, Hso.?.?. 1, Taiwan. *M. citricola* ('leaf felt' of citrus).

multiperforate, of a septum with many pores connecting compartments. See Cole & Samson (*Patterns of development in conidial fungi*, 1979). (Fig. 22D).

multiseptate, having a number of septa.

multisporous, having a number of spores.

multivesicular bodies, small vesicles limited by a membrane which in *Sclerotinia fructigena* originate from the endoplasmic reticulum and are possibly related to extracellular enzyme secretion (Calonge *et al.*, *J. gen. Microbiol.* **55**: 177, 1969).

Mundkur (Balchendra Bhavanishankar; 1896-1952; India). Student, Presidency College, Madras (*c.* 1920); Assistant Mycologist, Cotton Research Scheme, Dharwar, Bombay (1922-1928); PhD, Iowa State College of Agriculture, Iowa, USA (1929-1931); Assistant Mycologist, Division of Mycology, Indian Agricultural Research Institute, first in Pusa and later in Delhi (1931-1947); Deputy Director of Plant Diseases, Directorate of Plant Protection, Quarantine and Storage (1947); Professor of Botany, Poona University (after 1947). Noted for work on rusts and smuts. *Publs. Fungi and Plant Disease* (1949), (with M.J. Thirumalachar) *Ustilaginales of India* (1952). *Biogs, obits etc.* Joshi *et al.* (*Review of Tropical Plant Pathology* **7**: 91, 1993); Mehta (*Indian Phytopathology* **5**: 1, 1953) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **3**: 660, 1981).

Mundkurella Thirum. (1944), Urocystidaceae. 5 (on *Araliaceae*), S. & E. Asia; N. Amer.; New Zealand. See Savile (*Mycol.* **67**: 273, 1975), Vánky (*MR* **94**: 269, 1990; key), Vánky *et al.* (*N.Z. Jl Bot.* **37**: 329, 1999; key).

Munk pores, Small (*c.* 1 µm) pores, each surrounded by a ring of thickening, between cells of the ascoma wall in the *Nitschkeaceae*.

Munkia Speg. (1886), anamorphic *Hypocreales*, St.0eH.?. 2, S. America. See Marchionatto (*Rev. argent. Agron.* **7**: 172, 1940), Bischoff *et al.* (*Mycol.* **96**: 1088, 2004; placement).

Munkiella Speg. (1885), Polystomellaceae. Anamorph *Lasmenia*. 3, S. America.

Munkiellaceae Luttr. (1973) = Polystomellaceae.

Munkiodothis Theiss. & Syd. (1915) = Rehmiodothis fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Munkovalsaria Aptroot (1995), ? Dacampiaceae. Anamorph *Lecythophora*-like. 3, widespread (esp. tropical). See Aptroot (*Nova Hedwigia* **60**: 325, 1995).

Murangium Seaver (1951), Patellariaceae. 1, N. America. See Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Murashkinskija Petr. (1928) = Mytilinidion fide Barr (*SA* **6**: 144, 1986).

Muratella Bainier & Sartory (1913) = Cunninghamella fide Hesseltine (*Mycol.* **47**: 344, 1955).

Murciasporidium Thor (1930), Fungi. 1 (in mites), Spitzbergen.

Muribasidiospora Kamat & Rajendren (1968), Exobasidiaceae. 3, India. See Rajendren (*Mycol.* **61**:

1159, 1969), Rajendren (*Mycopathologia* **41**: 287, 1970; culture) = Exobasidium (Exobasid.) fide, Donk (*Persoonia* **8**: 33, 1974).

Muribasidiosporaceae Kamat & Rajendren (1969) = Exobasidiaceae.

muricate, rough with short, hard outgrowths.

Muricopeltis Viégas (1944), Micropeltidaceae. 1, Brazil. See Petrak (*Sydowia* **5**: 341, 1951).

Muricularia Sacc. (1877) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

muriculate, delicately muricate.

muriform (of spores), see dictyospore.

muriform cell, a thick-walled, dark, muriform cell (frequently referred to as a sclerotic cell or body), found in tissues affected by chromoblastomycosis (Matsumoto *et al.*, *Mycol.* **76**: 244, 1984).

Murogenella Goos & E.F. Morris (1965) = Coryneum fide Sutton (*TBMS* **86**: 1, 1986).

Muroia I. Hino & Katum. (1958), Lophiostomataceae. 1, Japan. See Hino & Katumoto (*J. Jap. Bot.* **33**: 79, 1958).

Murrill (William Alphonso; 1869-1957; USA). Student, Randolph-Macon College, Ashland, Virginia (1887-1891); Assistant Cryptogamic Botanist, Cornell (up to 1890); Assistant Curator (1904-1909) then Assistant Director (1908-1919) then Curator & Supervisor of Public Instruction (1919-1924), New York Botanic Garden; after a period of ill-health (1924-1926), employed during semi-retirement, University of Florida, Gainesville (1926 onwards). A leading agaricologist; first editor of *Mycol.* (1909-1924); author of more than 500 papers and articles; he also identified and named the causal organism of chestnut blight. His specimens of hymenomycetes (more than 70,000) are in the fungal reference collection of New York Botanic Garden. *Publs.* Agaricaceae. *North American Flora* (1910-1916); Agaricaceae of tropical North America. *Mycol.* (1911-1918 [reprint 1971]). *Biogs, obits etc.* Halling (An annotated index to species and infraspecific taxa of Agaricales & Boletales described by W.A. Murrill. *Memoirs of the New York Botanic Garden* **40**: 1, 1980); Stafleu & Cowan (*TL-2* **3**: 672, 1981); Weber (*Mycol.* **53**: 543, 1961) [bibliography, portrait]; Weber (*Mycologia Index*, 1968); see also the website: Smith-Vikos (*William Alphonso Murrill (1869-1957)* http://sciweb.nybg.org/science2/hcol/intern/murrill1.asp.

Murrilloporus Ryvarden (1985) = Heterobasidion fide Stalpers (*Stud. Mycol.* **40**: 59, 1996).

Musaespora Aptroot & Sipman (1993) = Trypetheliopsis fide Aptroot (*in litt.*), Lücking & Sérusiaux (*Nordic Jl Bot.* **16**: 661, 1996), Aptroot *et al.* (*Biblthca Lichenol.* **64**, 1997), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

muscardine fungus (green), *Metarhizium anisopliae*; -- (yellow), *Paecilomyces farinosus*. Pathogens of silkworms and other insects.

muscaridin, and **muscarin(e)**, toxic quaternary ammonium compounds from *Amanita muscaria*; muscarin also from *Inocybe patouillardii*.

muscazone, an insecticidal toxin from *Amanita muscaria*. Cf. tricholomic acid.

Muscia Gizhitsk. (1929), ? Helotiales. 1, former USSR.

Muscicola Velen. (1934), Helotiales. 1, Europe. See Svrček (*Česká Mykol.* **43**: 65, 1989).

muscicolous, growing on *Musci*; see Bryophilous fungi.

muscimol, see pantherine.

Muscodor Worapong, Strobel & W.M. Hess (2001), anamorphic *Xylariaceae*. 3, widespread (tropical). See Worapong *et al.* (*Mycotaxon* **79**: 71, 2001), Daisy *et al.* (*Mycotaxon* **84**: 39, 2002), Worapong *et al.* (*Mycotaxon* **81**: 463, 2002), Sopalun *et al.* (*Mycotaxon* **88**: 239, 2003; Thailand), Ezra *et al.* (*Microbiology* Reading **150**: 4023, 2004).

mushroom (1) an agaric (or a bolete), basidioma, esp. an edible one; (2) any agaric; a macrofungus with a distinctive fruiting body which can be either hypogeous or epigeous, large enough to be seen with the naked eye and to be picked by hand (Chang & Miles, *Mycologist* **6**: 65, 1992). Cf. toadstool.

mushroom bodies (entom.), corpora pedunculata, paired lobes of neurophile in dorsal brain of insects.

Mushroom cultivation. Apart from the button mushroom, *Agaricus bisporus*, several other species are now cultivated, but still only very few at a commercial scale, e.g. enokitake (*Flammulina velutipes*), lawyer's wig or shaggy-mane mushroom (*Coprinus comatus*), lion's mane mushroom (*Hericium erinaceus*), maitake (*Grifola frondosa*), oyster mushrooms (*Pleurotus* spp.), padi straw mushroom (*Volvariella volvacea*), reishi (*Ganoderma lucidum*), shimeji (*Hypsizygus tessulatus*), shii-take (*Lentinula edodes*), snow-fungus (*Tremella fuciformis*); most are cultivated for their culinary, but some for their medicinal or psychotropic value; the market is substantial.

Cultivation of the button mushroom starts from a master culture which is used to inoculate spawn. Well-composted horse manure is used as substratum (or sometimes 'artificial compost'). Gypsum and superphosphate may be added before or during decomposition and the compost has to be turned occasionally. Mushrooms do not need light but for the best results they have to be kept at an even temperature and the beds may be in any place meeting these conditions. Indoor beds, where space is limited, such as those in special houses ('sheds'), are frequently of the 'flat' type and are made up of a 15-23 cm layer of compost in boxes or trays; those outdoors are generally made as ridges about.75 m high. In place of the old method of using natural, 'virgin' spawn to make the 'brick' spawn for spawning the beds, 'pure culture' spawn (made by inoculating a sterile compost with cultures from spores or tissues of a good type of mushroom) is now used for inoculating bricks of horse manure, cow manure, and rich soil, or, better, the beds themselves. Spawning is done when the temperature has become 80°F or less and some 10 days later, when the spawn is 'running', the bed is covered ('cased') with an inch of soil and, if necessary, a layer of straw in addition. Mushrooms are first seen 6-8 weeks after spawning and basidioma production is stimulated by bacteria (Hayes *et al.*, *Ann. appl. Biol.* **64**: 177, 1969). A bed may go on producing for 4 months; the mean weight of mushrooms is about 6 kg for every m^2 of bed, though higher weights are not uncommon. Cultivation of other commercial species can be more complex: *Tremella fuciformis*, for example, which grows on wood, derives its nutrition as a parasite from ascomycetes in the wood, and not from the wood itself.

Lit.: Chang *et al.* (Eds) (*Mushroom biology and mushroom products*, 1993), Ware (*Bull. Min. Agric., Lond.* **34**, edn 4, 1938), Lambert (*Fmr's Bull. US Dep. Agric.* **1875**, 1941; *Bot. Rev.* **4**: 397, 1938),

Maher (Ed.) (*Mushroom Science 13, Science and cultivation of edible fungi*, 1991), Stamets (*Growing gourmet and medicinal mushrooms*, 1993), Stoller (*Pl. Physiol.* **18**: 397, 1943; artificial composts), Atkins (*Mushroom growing today*, edn 5, 1966), Singer & Harris (*Mushrooms and truffles*, 1987), Chang & Hayes (Eds) (*The biology and cultivation of edible mushrooms*, 1978; compr. review).

Mushroom parasites: *Mycogone perniciosa* (white mould, wet bubble; *IMI Descr.* **499**), *Verticillium lamellicola* (dry bubble, brown spot, mole; flock), *V. fungicola*, *Cladobotryum dendroides* (mildew or cobweb diseases; *IMI Descr.* **498**, *Fusarium solani*, *Myceliophthora* (q.v.). See also Hawksworth (*in* Cole & Kendrick (Eds), *The biology of conidial fungi* **1**: 171, 1981), Jeffries & Young (*Interfungal parasitic relationships*, 1994).

Mushroom losses are sometimes caused by the presence of other fungi which inhibit the development of the mushrooms (mushroom weeds). Examples of such fungi ('invaders') are: *Xylaria vaporaria* (= *X. pedunculata*), *Scopulariopsis fimicola* (see *Oospora*) and *Papulospora byssina* (white and brown plaster moulds), *Diehliomyces microsporus* (q.v.), *Clitocybe dealbata*, *Clitopilus augeana*; see also cat's ear. Recent sanitary techniques have eliminated some of these species from commercial production, leading to concern over the conservation status of the mushroom weed itself (Minter, *Descriptions of Fungi and Bacteria*, 1714, 2007).

Mushroom pests: see Ware (*loc. cit.*; *J.S.-E. agric. Coll., Wye* **31**: 15, 1933 *et seq.*).

mushroom stones, mushroom-like effigies perhaps associated with Mayan religious cults, mainly S. Am. (see Lowy, *Mycol.* **63**: 983, 1971).

mushroom sugar, see trehalose.

Musicillium Zare & W. Gams (2007), anamorphic *Plectosphaerellaceae*. 1, pantropical. See Zare *et al.* (*Nova Hedwigia* **85**: 463, 2007).

musiform, banana-shaped (basidiospores in *Exobasidium*, fide Nannfeldt, *Symb. bot. upsal.* **23**: 27, 1981).

must (1) unfermented or fermented grape juice; new wine; (2) = mould.

mutagen, a chemical or physical agent which promotes or increases the mutation rate.

mutant, a strain that differs by an induced or natural mutation of at least one genetic locus.

Mutatoderma (Parmasto) C.E. Gómez (1976), Corticiaceae. 4, widespread. See Gómez (*Boln Soc. argent. Bot.* **17**: 346, 1976).

muticate (adj. **muticous**), having no point; not sharp at the ends.

Mutinus Fr. (1849) nom. cons., Phallaceae. 12, widespread. See Guez & Nagasawa (*Nippon Kingakukai Kaiho* **41**: 75, 2000; Japan).

mutualism, persistent and intimate association between organisms of different size in which the larger organism (the host) utilizes novel or enhanced properties possessed by the smaller partner(s) (symbionts), e.g. lichens, mycorrhizas. See Douglas & Smith (*in* Smith, *Pap. Proc. R. Soc. Tasmania* **123**: 1, 1989), symbiosis.

Muyocopron Speg. (1881), Microthyriaceae. 7, widespread (tropical). See Hyde (*Sydowia* **49**: 1, 1997).

myc- (mycet-, myceto-, myco-) (prefix), pertaining to fungi.

Mycacolium Reinke (1895) nom. inval. = Acolium (Ach.) Gray fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

mycangium (pl. **mycangia**), a sac or cup-shaped fungal repository of ectodermal origin located in or on an ambrosia beetle (Batra, *Trans. Kansas Acad. Sci.* **66**: 226, 1963).

Mycardothelium, see *Arthothelium*.

Mycarthonia Reinke (1895) ? = Arthonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycarthopyrenia Keissl. (1921) = Arthopyrenia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycarthothelium Vain. (1928) = Arthothelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycasterotrema Räsänen (1943) ≡ Asterotrema.

Mycastrum Raf. (1813) = Scleroderma fide de Toni *in* Saccardo (*Syll. fung.* **7**: 134, 1888).

Mycaureola Maire & Chemin (1922), Physalacriaceae. (parasitic on *Rhodophyceae*). See Binder *et al.* (*Am. J. Bot.* **93**: 547, 2006; evolutionary relationships).

Mycelia sterilia Maire & Chemin (1922), Physalacriaceae. (parasitic on *Rhodophyceae*). See Binder *et al.* (*Am. J. Bot.* **93**: 547, 2006; evolutionary relationships).

mycelial cord, a discrete filamentous aggregation of hyphae which, in contrast to a rhizomorph (q.v.), has no apical meristem; syrrotia. Thompson & Rayner (*TBMS* **78**: 193, 1982) prefer not to use 'mycelial strand' for such structures.

mycelial muff, a subterranean hyphal system surrounding a living root (Buscott & Roux, *TBMS* **89**: 249, 1987).

Myceliochytrium A.E. Johanson (1945), Actinobacteria. See Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960), Karling (*Chytriomyc. Iconogr.*, 1977).

Myceliophthora Costantin (1892), anamorphic *Arthroderma, Ctenomyces*, Hso.0eH/1eP.1/3/10/13. 9, widespread (temperate). Also used for anamorphs of *Corynascus*, *Arthroderma*. *M. lutea* (vert-de-gris disease ('mat disease') of mushrooms in culture). See van Oorschot (*Stud. Mycol.* **20**, 1980; key), Currah (*Mycotaxon* **24**: 1, 1985), Guarro & Figueras (*Int. J. Mycol. Lichenol.* **3**: 135, 1986), Stchigel *et al.* (*MR* **104**: 879, 2000).

Mycelites W. Roux (1887), Fossil Fungi ? Fungi. 1 (Devonian – Recent), widespread.

Mycelithe Gasp. (1841), anamorphic *Polyporus*. 1. See Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Mycelium nom. dub., anamorphic *Fungi*. auct. (obsol.). The name *M. radicis* has been used for certain mycorrhizal fungi.

mycelium, a mass of hyphae; the thallus of a fungus; 'spawn'; **mycelioid**, like mycelium. See Jennings & Rayner (Eds) (*The ecology and physiology of the fungal mycelium*, 1984), Gregory (*TBMS* **82**: 1, 1984; review).

Myceloblastanon M. Ota (1924) = Candida fide Diddens & Lodder (*Die anaskosporogenen Hefen* **2**, 1942), von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981; anamorph of *Pichia*).

myceloconidium, see stylospore.

Myceloderma Ducomet (1907), anamorphic *Pezizomycotina*, Hso.0eP/#eP.1. 1 (with pycnothyrial state), Europe.

Mycena (Pers.) Roussel (1806), Mycenaceae. Anamorph *Decapitatus*. *c.* 500, widespread. *M. citricolor*

on coffee, etc. is luminous (see Buller, 6). The genus is largely polyphyletic but a new classification has not yet been proposed. See Kühner (*Le Genre Mycena*, 1938), Smith (*North American species of Mycena [reprint 1971]*, 1947), Métrod (*Les Mycènes de Madagascar*, 1949), Pearson (*Naturalist* Hull: 41, 1955; key Br. spp.), Haluwyn (*Docums Mycol.* **5**: 17, 1972; ecology), Charbonnel (*Docums Mycol.* **7**: 26, 1977; microsc. char.), Pegler (*Kew Bull.* Addit. Mycenaceae Overeem (1926), Agaricales. 10 gen. (+ 35 syn.), 705 spp.

Lit.: Benny *et al.* (*Mycotaxon* **22**: 119, 1985), Corner (*Gdns' Bull.* Singapore **39**: 103, 1986), Maas Geesteranus (*Verh. K. Akad. Wet.* tweede sect. **1**: 571 pp., 1992), Maas Geesteranus & Horak (*Biblthca Mycol.* **159**: 208, 1995), Jin *et al.* (*Mycotaxon* **79**: 7, 2001), Jin *et al.* (*Mycol.* **93**: 309, 2001), Desjardin *et al.* (*Fungal Diversity* **11**: 69, 2002), Grgurinovic (*Fungal Diversity Res. Ser.* **9**: 329 pp., 2003), Lodge *et al.* (*Mem. N. Y. bot. Gdn* **89**: 131, 2004).

Mycenastraceae Zeller (1948) = Agaricaceae.

Mycenastrum Desv. (1842), Agaricaceae. 1, widespread. See Heim (*Revue Mycol.* Paris **36**: 81, 1971; Patouillard's spp.), Homrich & Wright (*Mycol.* **65**: 779, 1973), Miller *et al.* (*Mycol.* **97**: 530, 2005).

Mycenella (J.E. Lange) Singer (1938), Tricholomataceae. 10, widespread (temperate). See Boekhout (*Persoonia* **12**: 425, 1985; key Eur. spp.), Kühner (*Mycol. helv.* **3**: 331, 1989; alpine spp.), Grgurinovic (*Victorian Naturalist* **110**: 65, 1993; Australia), Robich (*Rivista di Micologia* **40**: 365, 1997; *Mycenella margaritispora*), Komorowska (*Polish Botanical Journal* **50**: 83, 2005; Poland).

Mycenitis, see *Mycetinis*.

Mycenoporella Overeem (1926) c Mycena fide Kuyper (*in litt.*).

Mycenopsis Velen. (1947) ? = Mycena fide Kuyper (*in litt.*).

Mycenula P. Karst. (1889) = Mycena fide Singer (*Agaric. mod. Tax.*, 1951).

Mycepimyce Nieuwl. (1916) = Sphaerellopsis Cooke fide Sutton (*Mycol. Pap.* **141**, 1977).

Mycerema Bat., J.L. Bezerra & Cavalc. (1963), Schizothyriaceae. Anamorph *Plenotrichaius*-like. *c.* 2, widespread (tropical). See Farr (*Mycol.* **79**: 97, 1987).

Myces Paulet (1808) ≡ Fungus Tourn. ex Adans.

mycetal, a fungus or a lichen (obsol.).

Myceteae, See *FUNGI*.

Mycetes (obsol.), (1) *Fungi*. (2) **mycetes**, a general term (obsol.) for minute vegetable organisms or microbes. Hence **mycetology** = mycology; schizomycetes = bacteria; etc.

-mycetes (suffix), indicating the rank of a fungal class (see Classification).

Mycetinis Earle (1909), Marasmiaceae. 8, widespread. See Wilson & Desjardin (*Mycol.* **97**: 667, 2005).

Mycetism (**mycetismus**) (poisoning by larger fungi). This is of common occurrence and has a long history. Some people are allergic (see Allergy) or intolerant to mushrooms and illness may result from eating decayed or mouldy specimens, but serious poisoning is usually the result of eating fungus fruitbodies which contain toxins. About 6 species are both common and deadly poisonous. Symptoms vary from a slight stomach upset to death. It is important to identify the fungus consumed by the patient, as there are several different categories of poisoning. These include:

(1) *Cyclopeptide poisoning* (see amatoxins, phallotoxins) (by *Amanita phalloides*, *A. virosa*, *A. verna*). Symptoms first occur 4-6 h or more after ingestion. Early gasteroenteric symptoms may obscure hepatic and renal damage. This, the most dangerous type, is responsible for most deaths by mushroom poisoning in Eur. and N. Am. but, where early treatment can be made, chances of recovery have been enhanced by the introduction of antiserum therapy and dialysis. Orollanine and Cortinarins (from *Cortinarius* spp.) have an incubation period of 2-20+ days and cause renal failure (see Muchelot & Tebbett, *MR* **94**: 289, 1990).

(2) *Haemolytic poisoning* (*A. rubescens*, *A. vaginata*). Characterized by anaemia resulting from consumption of raw or undercooked mushrooms containing thermolabile haemotoxins.

(3) *Muscarine poisoning* (*A. muscaria*, *A. pantherina*). Early symptoms, within 2 h, include increased perspiration, salivation, dehydration, and nausea.

(4) *Coprine poisoning* (*Coprinus atramentarius*). See antabuse.

(5) *Psychotropic poisoning*. Hallucinations and delirium 2-4 h after ingestion. (a) Ibotenic acid, muscimol group (*A. muscaria*, *A. pantherina*): sleep, torpidity, or coma in extreme cases; (b) Indole group

(psilocin, psilocybin): stimulates psychic perception, see Hallucinogenic fungi.

(6) Gasteroenteric irritants (*Entoloma sinuatum*, *Paxillus involutus*, *Agaricus xanthoderma*, *Boletus satanus*, *Hebeloma crustuliniforme*, many *Tricholoma* spp., *Hypholoma fasciculare*, several *Lactarius* and *Russula* spp.).

The ascomycete *Gyromitra esculenta* contains gyromitrin (q.v.) which causes gasteroenteric discomfort, followed by hepatic and renal attack. This is the only fungus poisoning known to induce fever. The ascoma is edible if used without the cooking water or after drying.

Lit.: Dujarric de la Rivière & Heim (*Les champignons toxiques*, 1938; 600 refs), Heim (*Champignons toxiques et hallucinogènes*, 1963; edn 2, 1978), Arietti & Tomasi (*Funghi velenosi*, 1969), Duffy & Vergeer (*California toxic fungi*, 1977), Lincoff & Mitchell (*Toxic and hallucinogenic mushroom poisoning. A handbook for physicians and mushroom hunters*, 1977), Rumack & Salzman (Eds) (*Mushroom poisoning: diagnosis and treatment*, 1978), Pegler & Watling (*Bull. BMS* **16**: 66, 1982; Br. toxic fungi), Ammirati *et al.* (*Poisonous fungi of the Northern United States and Canada*, 1985), Bresinsky & Besl (*Giftpilze mit einer Entführung in die Pilzbestimmung*, 1985 [Engl. transl. *A colour atlas of poisonous fungi*, 1990]), Oldridge *et al.* (*Wild mushroom and toadstool poisons*, 1989). See also amatoxins, Ergot, Mycotoxicoses, phallotoxins.

mycetismus, see Mycetism.

mycetobionts, fungus-dependent, used of obligate fungus-feeding arthropods.

mycetocyte, see mycetosome.

Mycetodium A. Massal. (1856) ≡ Gomphillus.

mycetology, see *Mycetes*.

mycetoma (maduramycosis, madura foot), a disease, esp. tropical, of humans, mostly adult males, of the foot or other part, usually acquired during agricultural work, resulting in tumefactions and characterized by mycotic granules ('grains') in the infected tissues. Although a clinical entity, many different fungi (**eumycetoma**) and actinomycetes (**actinomycetoma**) are involved. Mycetomas can be roughly classified according to whether the grains are white or yellow (*Aspergillus* spp., *Nocardia madurae*, *Pseudallescheria boydii*, etc.), red (*Streptomyces pelletieri*, *S. somaliensis*) or black (*Madurella mycetomatis*, etc.). See Mahgoub & Murray (*Mycetoma*, 1973).

Mycetophagites Poinar & R. Buckley (2007), Fossil Fungi, Basidiomycota. 1.

mycetophagy, see mycophagy.

mycetophiles, fungus-loving, facultative fungus-feeding arthropods.

mycetophilous, see mycophilic.

mycetosome, a sac-like structure in the gut of Anobiid beetles lined with cells (**mycetocytes**) containing yeast cells.

Mycetosporidium L. Léger & E. Hesse (1905), ? Fungi. 2 (on insects), Europe. See Tate (*Parasitology* **32**: 462, 1940).

mycid, a secondary effect (manifested as eczema, urticaria, etc.) which is an allergic reaction to spores or toxin of a dermatophyte; dermatophytid. Cf. mycosis (2). A mycid may be a trichophytid (caused by *Trichophyton*); microsporid (*Microsporum*); epidermophytid (*Epidermophyton*).

-mycin (suffix), the recommended ending for names coined for antibiotics derived from actinomycetes.

Mycinema C. Agardh (1824) nom. dub. = Corticium Pers. fide Saccardo (*Syll. fung.* 326 **6**: 614, 1888).

myco- (prefix), pertaining to fungi.

Mycoacia Donk (1931), Meruliaceae. 15, widespread. See Ragab (*Mycol.* **43**: 459, 1951), Eriksson & Ryvarden (*Cortic. N. Europ.* **4**: 873, 1976; key Eur. spp.), Hjortstam & Ryvarden (*Syn. Fung.* **18**: 20, 2004).

Mycoaciella J. Erikss. & Ryvarden (1978), Meruliaceae. 5, widespread. See Hjortstam *et al.* (*Kew Bull.* **45**: 303, 1990; key), Hjortstam & Ryvarden (*Syn. Fung.* **18**: 20, 2004).

Mycoalvimia Singer (1981), Tricholomataceae. 1, Brazil. See Singer (*Mycol.* **73**: 504, 1981).

Mycoamaranthus Castellano, Trappe & Malajczuk (1992), Boletaceae. 3, Australasia; Africa; S.E. Asia. See Castellano *et al.* (*Aust. Syst. Bot.* **5**: 613, 1992), Lumyong *et al.* (*Mycol. Progr.* **2**: 323, 2003).

Mycoarachis Malloch & Cain (1970), Bionectriaceae. Anamorph *Acremonium*-like. 1 (coprophilous), widespread. See Valldosera & Guarro (*Nova Hedwigia* **47**: 231, 1988), Rehner & Samuels (*CJB* **73** Suppl. 1: S816, 1995; phylogeny), Ogawa *et al.* (*Mycol.* **89**: 756, 1997; phylogeny), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999; posn), Suh & Blackwell (*Mycol.* **91**: 836, 1999; phylogeny).

Mycoarctium K.P. Jain & Cain (1973), ? Pezizales. 2 (coprophilous), Canary Islands; USA. See Korf & Zhuang (*Mycotaxon* **40**: 79, 1991), van Brummelen (*Persoonia* **16**: 425, 1998; posn).

Mycoarthopyrenia Cif. & Tomas. (1953) nom. illegit. ≡ Arthopyrenia.

Mycoarthris Marvanová & P.J. Fisher (2002), anamorphic *Hyaloscyphaceae*. 1, Great Britain. See Marvanová *et al.* (*Nova Hedwigia* **75**: 258, 2002), Baschien *et al.* (*Nova Hedwigia* **83**: 311, 2006; phylogeny).

Mycobacidia Rehm (1890) = Arthrorhaphis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycobacillaria Naumov (1915), anamorphic *Pezizomycotina*, Hso.≡ eP.1/10. 1, former USSR.

Mycobanche Pers. (1818) ≡ Mycogone.

Mycobilimbia Rehm (1890), ? Lecanorales (L). *c.* 26, widespread. See Awasthi & Mathur (*Proc. Indian Acad. Sci.* Pl. Sci. **97**: 481, 1987; key 3 spp. India), Hafellner (*Herzogia* **8**: 53, 1989; key 8 spp. Eur.), Pietschmann (*Nova Hedwigia* **51**: 521, 1990; asci), Sarrión *et al.* (*Lichenologist* **35**: 1, 2003; Spain), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004; phylogeny), Kantvilas *et al.* (*Lichenologist* **37**: 251, 2005; S Hemisphere), Naesborg *et al.* (*MR* **111**: 581, 2007; phylogeny).

mycobiont, the fungal component of a lichen (Scott, *Nature* **179**: 486, 1957); cf. phycobiont, photobiont.

mycobiota (1) the total fungal inventory of the area under consideration (e.g. all the species present); (2) the fungal mass present (e.g. in a soil sample).

Mycoblastaceae Hafellner (1984), Lecanorales (L). 1 gen. (+ 3 syn.), 10 spp.

Lit.: Śliwa (*Fragm. flor. geobot.* **41**: 491, 1996), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Arup *et al.* (*Mycol.* **99**: 42, 2007; sister group relations with *Parmeliaceae*), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny).

Mycoblastomyces Cif. & Tomas. (1953) ≡ Mycoblas-

tus.

Mycoblastus Norman (1853) nom. cons., Mycoblastaceae (L). 10, widespread. See Anders (*Hedwigia* **68**: 87, 1928), James (*Lichenologist* **5**: 114, 1971; key 4 Br. spp.), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Arup *et al.* (*Mycol.* **99**: 42, 2007; sister group relations with *Parmeliaceae*).

Mycobonia Pat. (1894) nom. cons., Gloeophyllaceae. 1, widespread (tropical). See Martin (*Mycol.* **31**: 247, 1939), Corner (*Beih. Nova Hedwigia* **78**: 102, 1984; key).

Mycoboniaceae Jülich (1982) = Gloeophyllaceae.

Mycobystrovia Goujet & Locq. (1979), Fossil Fungi (mycel.) Fungi. 1 (Devonian), Europe.

Mycocalia J.T. Palmer (1961), Agaricaceae. 7, widespread. See Burnett & Boulter (*New Phytol.* **62**: 217, 1963; mating systems), Jeppson (*Agarica* **6**: 228, 1985; key), Malaval (*Docums Mycol.* **32**: 19, 2002), Sarasini (*Gasteromiceti Epigei*: 406 pp., 2005).

Mycocaliciaceae Alf. Schmidt (1970), Mycocaliciales. 6 gen. (+ 4 syn.), 99 spp.

Lit.: Tibell (*Nova Hedwigia* Beih. **79**: 597, 1984), Hutchison (*Mycol.* **79**: 786, 1987), Tibell (*Nordic Jl Bot.* **10**: 221, 1990), Tibell (*Nordic Jl Bot.* **13**: 331, 1993), Tibell (*Ann. bot. fenn.* **33**: 205, 1996), Tibell (*Symb. bot. upsal.* **32**: 291, 1997; anams), Wedin & Tibell (*CJB* **75**: 1236, 1997), Peterson & Rikkinen (*Mycol.* **90**: 1087, 1998), Tibell (*Biblthca Lichenol.* **71**: 107 pp., 1998; S. Am.), Selva & Tibell (*Bryologist* **102**: 377, 1999), Rikkinen & Poinar (*MR* **104**: 7, 2000), Tibell & Wedin (*Mycol.* **92**: 577, 2000), Angeles Vinuesa *et al.* (*MR* **105**: 323, 2001).

Mycocaliciales Tibell & Wedin (2000), (±L). Mycocaliciomycetidae. 2 fam., 8 gen., 108 spp. Thallus immersed, often absent. Ascomata stalked, brown or black. Asci cylindrical, uniformly thin-walled or thick-walled at least at the apex, evanescent or not. Ascospores brown, smooth or ornamented, sometimes in a mazaedial mass. Mainly saprobic on wood or bark, some lichenicolous, fungicolous or ? lichen-forming. Fams.:

(1) **Mycocaliciaceae**
(2) **Sphinctrinaceae**

Lit.: Geiser *et al* (*Mycol.* **98**: 1051, 2006), Tibell & Wedin (*Mycol.* **92**: 577, 2000), Wedin & Tibell (*CJB* **75**: 1236, 1997).

Mycocaliciomycetidae Tibell (2007), Eurotiomycetes. Ord.:

Mycocaliciales
For *Lit.* see fam.

Mycocalicium Vain. (1890), Mycocaliciaceae. Anamorph *Phialophora*-like. 11, widespread (esp. temperate). See Samuels & Buchanan (*N.Z. Jl Bot.* **21**: 163, 1983; anamorph), Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Tibell (*Nordic Jl Bot.* **10**: 221, 1990; anamorphs), Vinuesa *et al.* (*MR* **105**: 323, 2001; ITS), Tibell & Vinuesa (*Taxon* **54**: 427, 2005; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Muñiz & Hladun (*Lichenologist* **39**: 205, 2007; Spain).

Mycocandida Langeron & Talice (1932) = Candida fide Diddens & Lodder (*Die anaskosporogenen Hefen* **2**, 1942).

Mycocarpon S.A. Hutch. (1955), Fossil Fungi ? Ascomycota. 5 (Carboniferous), Europe; USA. See Baxter (*Paleont. Contrib. Univ. Kansas* **77**, 1975), Pirozynski (*Ann. Rev. Phytopath.* **14**: 237, 1976).

mycocecidium, see cecidium.

Mycocentrodochium K. Matsush. & Matsush. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Japan. See Matsushima & Matsushima (*Matsush. Mycol. Mem.* **9**: 34, 1996).

Mycocentrospora Deighton (1972), anamorphic *Pleosporales*, Hso.≡ fH.10. 9, widespread. See Constantinescu (*Revue Mycol.* Paris **42**: 105, 1978; conidial polymorphism), Braun (*Mycotaxon* **48**: 275, 1993; reassessment), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 224, 1995; key), Marvanová (*Czech Mycol.* **49**: 7, 1996; aquatic spp.), Stewart *et al.* (*MR* **103**: 1491, 1999; phylogeny), Goodwin *et al.* (*Phytopathology* **91**: 648, 2001; ITS seq. data; affinity with *Pleosporales*).

Mycochaetophora Hara & Ogawa (1931), anamorphic *Pezizomycotina*, Hso.0fH.?. 1, Japan.

Mycochlamys S. Marchand & Cabral (1976), anamorphic *Pezizomycotina*, Hso.0eP.10. 1 (from soil), Argentina. See Marchand & Cabral (*Boln Soc. argent. Bot.* **17**: 66, 1976).

Mycociferria Tomas. (1953) ≡ Ciferriolichen.

Mycocitrus Möller (1901), Bionectriaceae. Anamorph *Acremonium*-like. 1 (on living bamboo stems), Asia (tropical). See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Mycocladus Beauverie (1900), Syncephalastraceae. 4, widespread (esp. tropical). See Hesseltine & Ellis (*Mycol.* **56**: 569, 1964), Mirza *et al.* (*Mucorales of Pakistan*, 1979), Vánová (*Česká Mykol.* **45**: 25, 1991), Santos *et al.* (*Rev. Iberoam. Micol.* **22**: 174, 2005; preservation, zygospore formation), Hoffman *et al.* (*MR* **111**: 1169, 2007; phylogeny, classification).

Mycoclelandia Trappe & G.W. Beaton (1984), Pezizaceae. 2 (hypogeous), Australia. See Trappe & Beaton (*TBMS* **83**: 536, 1984), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

mycoclena (orig. 'micoclena'), term coined by Peyronel (1922) for the 'fungus mantle' of an ectotrophic mycorrhiza having a loose structure; cf. mycoderm.

Mycocoelium Kütz. (1843) nom. dub., ? Fungi.

Mycocoenogonium Cif. & Tomas. (1954) = Coenogonium Ehrenb. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

mycocoenosis, the complete assemblage of fungi within a certain plant community and its environment, or in the absence of green plants another defined habitat; see mycosociology, phytosociology.

Mycoconiocybe Reinke (1895) nom. inval. ? = Coniocybe fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycocoscoma Bref. (1912), Ustilaginales. 1, Europe.

Mycocryptospora J. Reid & C. Booth (1987), Dothideomycetes. 1, Germany. See Reid & Booth (*CJB* **65**: 1333, 1987).

Mycodendron Massee (1891) nom. dub., Agaricomycetes. 'basidiomycetes' ? based on an abnormal polypore (see Donk, *Fungus* **28**: 13, 1958).

mycoderm, coined by Ziegenspeck (1929) for a compact, tissue-like, ectotrophic mycorrhiza; cf. mycolena.

Mycoderma Desm. (1827) nom. illegit. = Pichia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995) but see Wu *et al.* (*FEMS Yeast Res.* **6**: 305, 2006; phylogeny).

Mycoderma Pers. (1822) nom. dub., Pezizomycotina.

mycodextran, an unbranched polysaccharide from *Aspergillus niger*, etc. (Barker *et al.*, *J. chem. Soc.*

1957: 2488, 1957); nigeran; see Bobbitt & Nordin (*Mycol.* **70**: 1201, 1979; as phylogenetic marker).

Mycodidymella C.Z. Wei, Y. Harada & Katum. (1998), Pleosporales. Anamorphs *Blastostroma*, *Mycopappus*-like. 1 (on *Aesculus*), Japan. See Wei *et al.* (*Mycol.* **90**: 334, 1998), Suto & Suyama (*Mycoscience* **46**: 227, 2005).

mycoecology, ecology of fungi; see Ecology.

Mycoëmilia Kurihara, Degawa & Tokum. (2004), Kickxellaceae. 1, Japan. See Kurihara *et al.* (*MR* **108**: 1143, 2004).

Mycoenterolobium Goos (1970), anamorphic *Pezizomycotina*, Hso.#eP.1. 1 (conidia flattened and fan-shaped), widespread (tropical). See Goos (*Mycol.* **62**: 171, 1970).

Mycofalcella Marvanová, Om-Kalth. & J. Webster (1993), anamorphic *Pezizomycotina*, Hso.?.?. 1, British Isles. See Marvanová *et al.* (*Nova Hedwigia* **56**: 402, 1993).

mycoflora, see mycobiota (a more appropriate term as fungi are not plants).

mycofungicides, see Mycopesticides.

Mycogala Rostaf. ex Sacc. (1884) = Orbicula fide Hughes (*Mycol. Pap.* **42**, 1951).

Mycogalopsidaceae Gjurašin (1925) = Pyronemataceae.

Mycogalopsis Gjurašin (1925), Pyronemataceae. 1, Europe.

Mycogelidiaceae W.Y. Zhuang (2007), Basidiomycota (inc. sed.). 1 gen., 1 spp. See Zhuang & He (*Mycosystema* **26**: 339, 2007).

Mycogelidium W.Y. Zhuang (2007), Mycogelidiaceae. 1, China. See Zhuang & He (*Mycosystema* **26**: 339, 2007).

Mycogemma K.M. Zalessky (1915), Fossil Fungi. 1 (Carboniferous), former USSR.

mycogenous, coming from, or living on, fungi.

mycogeography, study of the geographical distribution of fungi (q.v.).

Mycoglaena Höhn. (1909), Dothideomycetes. *c.* 10, Europe; N. America. See Riedl (*Öst. bot. Z.* **119**: 41, 1971; key 6 spp.), Harris (*Mich. Bot.* **12**: 3, 1973), Holm & Holm (*Nordic Jl Bot.* **11**: 675, 1991).

Mycogloea L.S. Olive (1950), Agaricostilbales. Anamorph *Kurtzmanomyces*. 7, widespread. See McNabb (*TBMS* **48**: 187, 1965), Kirschner *et al.* (*Antonie van Leeuwenhoek* **84**: 109, 2003; anam.).

Mycogone Link (1809), anamorphic *Hypomyces*, Hso.1eH.1. 10, widespread. See Mushroom diseases. See Holland *et al.* (*TBMS* **85**: 730, 1985; germination), Põldmaa (*Stud. Mycol.* **45**: 83, 2000; phylogeny).

mycohaemia (**mycohemia**), a condition in which fungi are present in the blood stream.

mycoherbicide (1) a herbicide derived from a fungus; (2) a preparation of fungal spores used in the biocontrol of weeds (see Mycopesticides).

myco-heterotrophic, See Leake (*New Phytologist* **127**: 171, 1994), Domínguez & Sérsic (*Mycologia* **96**: 1143, 2004).

Mycohypallage B. Sutton (1963), anamorphic *Deshpandiella*, St.≡ eP.1. 1, Africa; Sri Lanka. See Sutton (*Mycol. Pap.* **88**: 4, 1963).

mycoin, see patulin.

mycoinsecticide, a fungus used to control insects; see Entomogenous fungi, Mycopesticide.

Mycokidstonia D. Pons & Locq. (1981), Fossil Fungi. 1, France.

Mycokluyveria Cif. & Redaelli (1947) = Pichia fide von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977), Wu *et al.* (*FEMS Yeast Res.* **6**: 305, 2006; phylogeny).

Mycolachnea Maire (1937) ≡ Humaria Fuckel fide Wu & Kimbrough (*Int. J. Pl. Sci.* **153**: 128, 1992), Eriksson & Hawksworth (*SA* **11**: 179, 1993).

Mycolangloisia G. Arnaud (1918) = Actinopeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

mycolatry, the worship of fungi (introduced by Wasson, 1980).

Mycolecidia P. Karst. (1888) ? = Dactylospora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycolecis Clem. (1909) ? = Dactylospora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycoleptodiscus Ostaz. (1968), anamorphic *Omnidemptus*, Hsp.0-1eH.15. 16, widespread. *M. indicus* on vanilla. See Bezerra & Ram (*Fitopatol. Brasil* **12**: 717, 1986), Sutton & Alcorn (*MR* **94**: 564, 1990; key), Alcorn (*Aust. Syst. Bot.* **7**: 591, 1994; incl. review of appressoria), Cannon & Alcorn (*Mycotaxon* **51**: 483, 1994; teleomorph), Ando (*Czech Mycol.* **49**: 1, 1996; Australia), Watanabe *et al.* (*Mycoscience* **38**: 91, 1997; Dominican Republic).

Mycoleptodon Pat. (1897) = Steccherinum fide Donk (*Persoonia* **3**: 199, 1964).

Mycoleptodonoides M.I. Nikol. (1952), Meruliaceae. 4, former USSR. See Nikolajeva (*Bot. Mater. Otd. Sporov. Rast. Bot. Inst. Komarova Akad. Nauk S.S.S.R.* **8**: 117, 1952).

Mycoleptorhaphis Cif. & Tomas. (1953) = Leptorhaphis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycolevis A.H. Sm. (1965), Albatrellaceae. 1, N. America. Basidioma gasteroid. See Fogel (*Mycol.* **68**: 1097, 1976), Albee-Scott (*MR* **111**: 653, 2007; phylogenetic placement).

Mycolindtneria Rauschert (1988) = Lindtneria fide Rauschert (*Feddes Repert.* **98**: 660, 1988).

mycoliths, sand grains bound together with mycelium, forming structures 5-6 cm long, esp. by *Melanospora tulasnei.*

Mycological Society of America. Founded in 1932; recognized as the Committee for North America within the International Mycological Association (q.v.); structure comprises individual and corporate members, and an elected executive; organizes annual meetings. Publications: *Inoculum*, *Mycologia*. Website: www.msafungi.org.

mycologist, one engaged in the pursuit of mycology.

mycology, the scientific study of fungi.

mycolysis, the lysis of a fungus.

Mycomalus Möller (1901), Hypocreales. 1, Brazil. See Shao *et al.* (*Taxonomy of Fungi*, 1984), Bischoff *et al.* (*Mycol.* **96**: 1088, 2004).

Mycomater Fr. (1825) nom. dub., anamorphic *Fungi*. Based on mycelium fide Fries (*Summ. veg. Scand.*, 1849).

Mycomedusa R. Heim (1966) = Favolaschia fide Pegler (*Kew Bull.* Addit. Ser. **6**, 1977).

Mycomedusiospora G.C. Carroll & Munk (1964), Lasiosphaeriaceae. 1, Brazil; Costa Rica. See Carroll & Munk (*Mycol.* **56**: 91, 1964).

Mycomelanea Velen. (1947), ? Helotiales. 1, former Czechoslovakia.

Mycomelaspilea Reinke (1895) ? = Melaspilea fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Mycomicrothelia Keissl. (1936), Arthopyreniaceae (±L). 44, widespread (esp. tropical). See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **14**: 43, 1985; key 25 spp.), Aptroot (*Biblthca Lichenol.* **44**, 1991), Aptroot (*Nova Hedwigia* **60**: 325, 1995), Sérusiaux & Aptroot (*Bryologist* **101**: 144, 1998), Sipman & Aptroot (*Lichenologist* **37**: 307, 2005; gen. limits), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Mycomyces Wyss-Chod. (1927), anamorphic *Pezizomycotina*. 1 (on humans), Europe.

Mycomycophytes, see *Mycophytes*.

mycomyringitis, a fungal inflammation of the eardrum.

mycomysticism, mystical state induced by eating hallucinogenic fungi.

Myconeesia Kirschst. (1936) = Anthostomella See Læssøe (*SA* **13**: 43, 1994; ? synonym of *Xylaria*), Læssøe & Spooner (*Kew Bull.* **49**: 1, 1994), Lu & Hyde (*Fungal Diversity Res. Ser.* **4**, 2000).

myconematicides, see Mycopesticides.

Myconymphaea Kurihara, Degawa & Tokum. (2001), Kickxellaceae. 1, Japan. See Kurihara *et al.* (*MR* **105**: 1398, 2001).

Mycopandora Velen. (1947) = Unguicularia fide Svrček (*Česká Mykol.* **40**: 215, 1986).

Mycopappus Redhead & G.P. White (1985), anamorphic *Redheadia*, Sc.#eH-P.42. 2, north temperate. The genus is clearly polyphyletic, with disparate teleomorph links. See Redhead & White (*CJB* **63**: 1430, 1985), Suto & Kawai (*Mycoscience* **41**: 55, 2000), Suto & Suyama (*Mycoscience* **46**: 227, 2005; teleomorph), Takahashi *et al.* (*Mycoscience* **47**: 388, 2006; Japan).

Mycopara Bat. & J.L. Bezerra (1960), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1 (on *Dimerosporiopsis*), USA. See Batista & Bezerra (*Publções Inst. Micol. Recife* **286**: 17, 1960).

mycoparasitism, the parasitism of one fungus by another (the **mycoparasite**); preferable to hyperparasitism which has been used for the same phenomenon; see Fungicolous fungi.

mycopathology, the study of disease caused by fungi.

Mycopegrapha Vain. (1921) ? = Opegrapha Ach. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycopepon Boise (1987), Melanommataceae. 2, widespread (neotropics). See Boise (*SA* **6**: 167, 1987), Boise (*Mycotaxon* **52**: 303, 1994; nomencl.), San Martín González (*Acta Bot. Mexicana* **35**: 9, 1996), Bhattacharya *et al.* (*Mol. Biol. Evol.* **17**: 937, 2000; posn).

Mycopesticides. Are mass-produced, usually commercially formulated and marketed products based on fungi which are pathogens, parasites or antagonists, of arthropod pests (mycoinsecticides), plant parasitic nematodes (myconematicides), weeds (mycoherbicides) or crop pathogens (mycofungicides), applied inundatively, like a chemical pesticide (Hall & Mann (Eds), *Biopesticides: use and delivery*, 1998). Mycopesticides have also been used to further political and military objectives, for example against illegal cultivation of drug plants like coca; such uses are generally secretive, and have raised public concerns (editorial, A very unholy war, *New Scientist* **2203**: 3, 1999; website: www.mycoherbicide.info; see also Biological control, Bioterrorism and fungi, Mycotoxicoses).

The potential of mycoinsecticides was first investigated more than 100 years ago when *Metarhizium anisopliae* was applied against weevil pests in the former USSR (Steinhaus, *Hilgardia* **26**: 107, 1965). A mycopesticide using *Metarhizium anisopliae* has been developed for control of termites (Milner, *in* Lomer & Prior, *Biological control of locusts and grasshoppers* 200, 1992), scarab beetles (Rath, *in* Glare & Jackson, *Use of pathogens in scarab pest management*, 217, 1992) and black vine weevils (Wolfram, *in Proc. V Int. Colloq. Invert. Path. & Microb. Contr.* 2, 1990). *Metarhizium anisopliae* has been field tested against locusts and grasshoppers in Africa (Lomer & Prior, 1992; Driver *et al.*, *MR* **104**: 134, 2000; Cherry *et al.*, *Biocontrol Science & Technology* **9**: 35, 1999) and is currently marketed as Green Muscle^R; see http://www.lubilosa.org/. *Beauveria bassiana* has been extensively employed against a range of crop pests but mainly at the semi-commercial or cottage-industry level, under the trade name Boverin™ in the former USSR (Ferron, *in* Burge, *Microbial control of pests and plant diseases 1970-1980*, 45, 1981), and in a commune-produced system in China (Hussey & Tinsley, *in* Burge, 1981: 785). *Beauveria brongniartii* has been mass-produced and aerially applied against cockchafer pests in Switzerland and, despite problems with fungal stability and formulation (Zimmermann, *in* Glare & Jackson, 1992), is now a registered product (Engerlingspilz^R).

The first commercial mycoinsecticides became available in the 1980s and were based on strains of *Verticillium lecanii* for aphid (Vertalec™) and whitefly (Mycotal™) control in glasshouses (Quinlan, *in* Burge, *Fungi in biological control systems* 19, 1988). *Aschersonia aleyrodis* has also been assessed for control of whitefly pests (Samson & Rombach, *in* Hussey & Scopes, *Biological pest control* 34, 1985). Production and marketing problems are discussed by Samson *et al.* (*Atlas of entomopathogenic fungi*, 1988) and Prior & Moore (*Biocontrol News Inf.* **14**: 31, 1993).

Few myconematicides have been commercialized and, because of problems with quality control, inconsistent performance, potential health hazards and uneconomic application rates, none is currently available on the market (Stirling, *Biological control of plant parasitic nematodes*, 1991). Previous commercial or semi-commercial products have been based on: *Arthrobotrys robusta* (Royal 300^R), *A. superba* (Royal 350^R) and *Verticillium chlamydosporium* (Kerry *et al.*, *Ann. appl. Biol.* **105**: 509, 1984; Kerry, *in* Brown & Kerry, *Principles and practice of nematode control in crops*, 233, 1987).

The use of mycoherbicides is a relatively recent concept but a number of products are already on the market: COLLEGO (*Colletotrichum gloeosporioides* f.sp. *aeschynomenes* for control of northern jointvetch, DeVine (*Phytophthora palmivora*) for control of milkweed vine; CASST (*Alternaria cassiae*) for control of sicklepod; Bio Mal (*C. gloeosporioides* f.sp. *malvae*) against round-leaved mallow; BioChon (*Chondrostereum purpureum*) for stump treatment of woody invasives (DeJong, *Mycologist* **14**: 58, 2000); while several others are in the final stages of commercialization (Charudattan, *in* Burge (Ed.), *Fungi in biological control systems* 86, 1988; TeBeest & Templeton, *Plant Disease* **69**: 6, 1985; Charudattan, *in* TeBeest (Ed.), *Microbial control of weeds*, 24,

1991). Although most are readily culturable, necrotrophic pathogens, marketing of the rust *Puccinia canaliculata*, as a formulated product ('Dr Biosedge') for control of yellow nutsedge has been proposed (Phatak, *Proc. I. Int. Weed Control Conf.* 388, 1992). Considerable research is now being concentrated on fermentation technology and formulation to improve performances of potential mycoherbicides (*Pl. Prot. Quart.* 7 (4): 30 pp., 1992; Auld, *Crop Protection* **12**: 477, 1993); Burge (Ed., *Formulation of microbial biopesticides*, 1998); Green *et al.* (*in* Boland & Kuykendall (Eds), *Plant – microbe interactions and biological control*: 249, 1997).

The first mycofungicide, and indeed one of the first commercially available mycopesticides, arose from the pioneering work of Rishbeth (*Ann. appl. Biol.* **52**: 63, 1963) who investigated the potential of *Phlebia gigantea* for control of butt rot of conifers caused by *Heterobasidion annosum* (Deacon, *Microbial control of plant pests and diseases*, 1983; Campbell, *Biological control of microbial plant pathogens*, 1989). Most work has concentrated on *Trichoderma* and *Gliocladium* as antagonists; reviewed by Lynch & Ebben (*J. appl. Bact. Symp. Suppl.* 1986, 115), Papavizas (*Ann. Rev. Phytopath.* **23**: 23, 1985), Whipps & Lumsden (Eds) (*Biotechnology of fungi for improving plant growth* 1989) and Whipps (*Aspects Appl. Biol.* **24**: 211, 1990). Apart from Binab T, based on *T. viride*, for control of forest diseases, GlioGard™ (now SoilGard™) based on *Trichoderma virens* has been marketed recently for control of *Rhizoctonia solani* and *Pythium ultimum* in horticultural crops (Mink & Walker, *in* Lumsden & Vaughn (Eds), *Pest management: biologically based technologies*, 398, 1993).

Mycophaga F. Stevens (1924) ? = Hyaloderma fide Pirozynski (*Kew Bull.* **31**: 595, 1977).

mycophage (1) a mycophagist; (2) a phage-like antibacterial substance produced by certain actinomycetes.

mycophagist, an eater of fungi.

mycophagy (adj. **mycophagous**), (1) the use of fungi as food; mycetophagy; (2) the lysis of a fungus by a phage.

Mycopharus Petch (1926) = Lysurus fide Dring (*Kew Bull.* **35**: 1, 1980).

mycophilic (1) fond of fungi (or mushrooms); mycetophilous; see Fungicolous fungi; (2) growing on fungi.

mycophobia, fear of mushrooms.

mycophthorous (of a fungus), parasitic on another fungus; see mycoparasitism.

Mycophycias Kohlm. & Volkm.-Kohlm. (1998) = Stigmidium fide Kohlmeyer & Volkmann-Kohlmeyer (*SA* **16**: 2, 1998), Aptroot (*CBS Biodiversity Series* **5**, 2006).

mycophycobiosis, an obligate symbiosis between a systemic (inhabitant) marine fungus and a marine alga in which the alga is the exhabitant and dominates (Kohlmeyer & Kohlmeyer, *Bot. Mar.* **15**: 109, 1972), e.g. *Mycosphaerella ascophylli* on *Ascophyllum nodosum*; cf. Lichens.

Mycophycophila Cribb & J.W. Cribb (1960) = Chadefaudia fide Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973).

Mycophycophyta. Phylum name used by Margulis (*Symbiosis in cell evolution*, edn 2, 1993) for *all* lichens regardless of the systematic position of either the fungal, algal or cyanobacterial partners; i.e. embracing lichen-forming *Ascomycota* and *Basidiomycota* as well as their photosynthetic partners. ≡ *Lichenes*. See Lichens.

Mycophycophytes, see *Mycophytes*.

Mycophyta, see *Eumycetes*.

Mycophytes (obsol.) = Mycomycophytes (i.e. non-lichenized fungi) + Mycophycophytes (i.e. lichenized fungi) (Marchand, *Énumération méthodique des Mycophytes*, 1896).

Mycoplacographa Reinke (1895) ? = Lithographa fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

mycoplasm, a symbiotic phase of rust fungus and host protoplasm (Eriksson; now taken as an error); see also mycoplasma.

mycoplasma (1) an intimate relationship between plant-invading fungi or other microorganisms and their host cells (Frank, *Ber. Deutsch. bot. Ges.* **7**: 332, 1889) (obsol.); (2) bacterium-like organisms without a cell wall living inside cells of a host, mollicutes (Krass & Gardner, *Internat. J. Syst. Bact.* **23**: 62, 1973).

Mycoporaceae Zahlbr. (1903), ? Dothideomycetes (inc. sed.). 1 gen. (+ 3 syn.), *c.* 28 spp.

Lit.: Harris (*Mich. Bot.* **12**: 3, 1973), Coppins & James (*Lichenologist* **11**: 27, 1979), Eriksson (*Op. Bot.* **60**, 1981), Lumbsch (*Pl. Biol.* **1**: 321, 1999).

Mycoporellum Müll. Arg. (1884), Dothideomycetes. 7, widespread. See Riedl (*Sydowia* **15**: 257, 1962).

Mycoporis Clem. (1909), Dothideomycetes. 1, Austria.

Mycoporopsis Müll. Arg. (1885), Dothideomycetes (?L). 6, widespread. See Riedl (*Sydowia* **16**: 215, 1963).

Mycoporum Flot. ex Nyl. (1855) nom. cons., Mycoporaceae (±L). *c.* 28, widespread. See Harris (*Mich. Bot.* **12**: 3, 1973), Coppins & James (*Lichenologist* **11**: 27, 1979), Lumbsch (*Pl. Biol.* **1**: 321, 1999; development), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Mycoporum G. Mey. (1825) nom. rej., Pyrenulales.

mycoprotein, fungal protein, e.g. 'Quorn' (q.v.); commercially processed mycelium of non-pathogenic *Fusarium venenatum* (also sometimes and formerly called *Fusarium graminearum* A35) for human consumption (Newark, *Nature* **287**: 6, 1980); see Gray & Staff (*Econ. Bot.* **21**: 341, 1966), Trinci (*MR* **96**: 1, 1992).

Mycopyrenium Hampe ex A. Massal. (1860) = Thelotrema fide Zahlbruckner (*Catalogus Lichenum Universalis* **2**, 1923).

Mycopyrenula Vain. (1921) = Pyrenula Ach. (1809) fide Harris (*Mem. N. Y. bot. Gdn* **49**, 1989).

Mycorhizonium F.E. Weiss (1904), Fossil Fungi (mycorrhizal) Fungi. 1 (Cretaceous), British Isles.

Mycorhynchella Höhn. (1918) = Ceratocystis fide Sutton (*Mycol. Pap.* **141**, 1977).

Mycorhynchidium Malloch & Cain (1971), Pyxidiophoraceae. 1 (coprophilous), Kenya. See Malloch & Cain (*CJB* **49**: 850, 1971).

Mycorhynchus Sacc. & D. Sacc. (1906) = Pyxidiophora fide Lundqvist (*Bot. Notiser* **133**: 121, 1980).

Mycorrhaphiaceae Jülich (1982) = Steccherinaceae.

Mycorrhaphium Maas Geest. (1962), Meruliaceae. 3, USA; Europe; Africa. See Ryvarden (*Mem. N. Y. bot. Gdn* **49**: 344, 1989; key), Mossebo & Ryvarden (*Mycotaxon* **88**: 229, 2003; Africa).

Mycorrhiza (pl. **mycorrhizas, mycorrhizae**) (fungus root). A symbiotic, non-pathogenic or feebly or

weakly pathogenic association of a fungus and the roots of a plant. Found in most, perhaps 85% of plant species. The resulting dual organism (cf. lichen) was first described in detail by Frank (1895) who observed it on the roots of the major tree species of temperate forests. Frank (1887) then recorded two types of mycorrhiza, which he called: (a) **ectotrophic** (the characteristic mycorrhiza of temperate and boreal forest trees with different basidiomycetes esp. spp. of *Amanita*, *Boletus*, *Cortinarius*, *Russula*, *Suillus*, and some ascomycetes, e.g. *Tuber*), in which the fungus forms a sheath on the surface of the root from which hyphae extend outward into the soil and inwards between the outer cortical cells with which they interface to form a 'Hartig net'; and: (b) **endotrophic** (e.g. of orchid-basidiomycete and ericoid-ascomycete associations) in which the fungal hyphae enter the cortical cells of the root, enveloped by the plasmalemma of host.

The mycorrhiza now known to be most widely distributed both through the plant kingdom (see Trappe, *in* Safir *et al.*, 1987), and geographically, is a type of endo-association formed by *Glomeromycota* and called vesicular-arbuscular (**VA**, or **VAM**). In this, the penetrating hyphae produce finely branched haustorial branches (arbuscules) or coils (pelotons) and vesicles (Schlicht, 1889; Gallaud, 1905; Mosse, 1956). The taxonomic status of VA fungi is reviewed by Morton & Benny (*Mycotaxon* **37**: 471, 1990). VA mycorrhizas are known from the fossil record going back at least 400 million years (Remy *et al.*, *Proc. nat. acad. sci.* **91**: 11841, 1994).

Current classifications of mycorrhizal types avoid use of the suffix 'trophic' and recognize the following categories: **Ectomycorrhiza, Vesicular-arbuscular** (occasionally simply '**arbuscular**'; AM), **Ericoid, Orchid, Arbutoid** and **Monotropoid** (Lewis, *Biol. Rev.* **48**: 261, 1973; Read, *CJB* **61**: 985, 1983).

For the fungal partner, the main benefit is usually constant access to a supply of carbohydrates produced by the plant partner's photosynthesis. For the plant partner, the benefit is an enhanced supply of mineral nutrients from the soil, taken up by the hyphae of the fungal partner. These, being more narrow than root hairs, have a larger surface area through which mineral absorption can take place, and can approach more closely to a mineral nutrient source, thereby steepening the diffusion gradient by which the nutrients may move. Mycorrhizal associations are therefore particularly beneficial for plants growing on nutrient poor soils. Fungal partners are known which trap insects and thereby enhance the supply of nitrogen for the plant partner (Klironomos & Hart, *Nature* **410**: 651, 2001).

Early development of some plants, especially those with very small seeds (e.g. orchids) is completely dependent upon establishment of a successful fungal association. This dependence may be retained where, as in *Monotropaceae*, and some members of *Orchidaceae* and *Gentianaceae*, plants lack chlorophyll throughout their lives, and hence continue to require all carbon and most mineral supplies from their fungal symbiont. In green plants the main function of the association differs according to mycorrhizal type. Enhancement of phosphorus (P) supply to the plant is characteristic of VA associations, that of nitrogen (N) of ericoid associations, while both N and P supplies can be supplemented by ecto, ectendo and probably orchid associations. The global distribution of mycorrhizal types largely reflects these functional attributes, selection favouring plants with VA fungi in primarily P limited tropical and temperate grasslands, ectomycorrhizal plants in predominantly N and P limited temperate and boreal forests, and ericoid plants in N-limited tundra (Read, *Experientia* **47**: 376, 1991). In each of these circumstances the associated plants show differing levels of responsiveness depending upon the extent of nutrient limitation and the structure of their root systems. Those with 'fibrous' root systems, e.g. grasses, are less responsive than those with coarsely branched so called 'magnolioid' roots (Baylis, see Sanders *et al.*, 1975).

In the past 50 years, many plantations of northern-hemisphere conifers have been established on poor soils in southern hemisphere countries, and mycorrhizal fungi known to enhance their growth have been deliberately introduced with them. Concern has been voiced that this can lead to carbon depletion, thereby contributing to rather than ameliorating climate change (Chapela *et al*, *Soil biol. biochem.* **33**: 1733, 2001).

Lit.: Agerer (*Colour atlas of ectomycorrhizae*, 1991), Allen (*Ecology of ectomycorrhizae*, 1990), Currah & Zelmer (*Rep. Tottori mycol. Inst.* **30**: 43, 1992; key 15 gen. with orchids), Declerk *et al.* (Eds) (*In vitro culture of mycorrhizas*, 2005), De Roman *et al.* (*MR* **109**: 1063, 2005; revision of ectomycorrhiza descriptions since 1961), Frank (*Ber. dtsch bot. Ges.* **3**: 128, 1885; **5**: 248, 1887), Gallaud (*Rev. Gen. Bot.* **17**: 5, 1905), Gianinnazzi & Schüepp (Eds) (*Impact of arbusclar mycorrhizas on sustainable agriculture and natural ecosystems*, 1994), Harley (*Biology of mycorrhiza*, 1959, edn 2, 1970), Harley & Harley (*A check-list of mycorrhiza in the British flora*, 1987; *New Phytol.* Suppl. **105**), Harley & Smith (*Mycorrhizal Symbiosis*, 1983), Kapulnik & Douds (*Arbuscular mycorrhizas: physiology and function*, 2000), Kelly (*Mycotrophy in plants*, 1950), Khalil *et al.* (*Soil Biol. Biochem.* **26**: 1587, 1994; recovery VAM spores from soil), Marks & Kozlowski (Eds) (*Ectomycorrhizae their physiology and ecology*, 1973), Mejstřík *et al.* (Eds) (*Agric., Ecosyst. Environ.* **28-29**, 1990; Eur. Congr. Mycorrh.), Melin (*Untersuchungen uber die Bedeutung der Baummycorrhiza*, 1925), Morton (*Mycotaxon* **32**: 267, 1988; checklist 126 VA spp.), Mosse (*Ann. Bot. Lond.* **20**: 349, 1956), Norris *et al.* (Eds) (*Techniques for the study of mycorrhiza. Methods in Microbiology* **23** & **24**, 1991), Peterson *et al.* (*Mycorrhizas: anatomy and cell biology*, 2004), Read *et al.* (Eds) (*Mycorrhizas in ecosystems*, 1992), Safir (Ed.) (*Ecophysiology of VA mycorrhizal plants*, 1987), Sanders *et al.* (Eds) (*Endomycorrhiza*, 1975), Schlicht (*Landwirtsch. Jahrb.* **18**: 478, 1889), Sieverding (*VA mycorrhiza management in tropical agroecosystems*, 1991), Trappe (*Bot. Rev.* **28**: 538, 1962; fungus & tree lists, 407 refs.), Varma & Hoch (Eds) (*Mycorrhiza: structure, function, molecular biology and biochemistry*, 1995); see also the journal *Mycorrhiza* (1991-).

Mycosarcoma Bref. (1912) = Ustilago fide Vánky (*in litt.*).

mycosclerid, see cystidium.

mycose, see trehalose.

mycosin, a nitrogenous substance like animal chitin in the cell wall of fungi.

mycosis (pl. **mycoses**), (1) a fungus disease of humans, animals, or, rarely, plants (e.g. tracheomycosis). Mycoses are frequently named after the part attacked (**broncho-**, respiratory tract; **dermato-**, skin; **onycho-**, nails; **oto-**, ear; **pneumo-**, lungs), or the pathogen **blasto-** (q.v.) (*Blastomyces*); **coccidioido-**, coccidioidal granuloma (*Coccidioides immitis*); (2) the first limited infection of a dermatophyte; cf. mycid. Nomenclature, see Odds (*J. med. vet. Mycol.* **30**: 21, 1992). See AIDS, Medical and veterinary mycology.

Mycosisymbrium Carris (1994) = Scolecobasidiella fide Sutton (*in litt.*).

mycosocieties (1) communities of fungi occurring in a special habitat; see Winterhoff (1992), mycosociology; (2) mycological societies (see Societies and organizations).

Mycosociology. the study of fungal communities. Some communities of lichens and plants have a long tradition of being named using rules developed for plant communities (Barkman *et al.*, *Vegetatio* **67**: 145, 1986), and this form of name has also sometimes been used for other fungi, e.g. the association *Clitocybo-Phellodonetum nigrae* (Smarda, *Acta Nat. Acad. Sci. Bohemoslov.* **7**, 1973).

Darimont (*Inst. roy. Sci. nat. Brussels, Mém.* **170**, 1975), introduced a separate system for fungi in which the basic unit was the **sociomycie** (the name for which terminates in '**-ecium**', e.g. *Amanitecium muscariae*) (± = 'association') which are grouped (in ascending order) as 'alliances' ('*-ecion*'; *Boletecion scabri*), 'orders' ('*-ecia*'; *Boleto-Amanitecia*), and 'classes' ('*-ecea*'; *Cortinario-Boletacea*).

The number of works explicitly on this topic remains small, but includes studies in southern Chile (Valenzuela *et al.*, *Mycotaxon* **72**: 217, 1999). Issues relating to mycosociology were reviewed by Hawksworth & Mueller *in* Dighton *et al.*, *The fungal community: its organization and role in the ecosystem*, 2005).

See also Benkert (*Boletus* **2**: 37, 1978; synopsis approach, bibliogr.), Winterhoff (Ed.) (*Fungi in vegetation science* [*Handbook of Vegetation Science* **19**(1)], 1992), mycocoenosis, mycosynusium, Phytosociology.

Mycosphaerangium Verkley (1999), Helotiales. 3 (from dead wood), USA. See Verkley (*Stud. Mycol.* **44**: 180 pp., 1999).

Mycosphaerella Johanson (1884), Mycosphaerellaceae. Anamorphs many, esp. *Cercospora*, *Cercosporella*, *Cercosporidium*, *Passalora*, *Pseudocercospora*, *Ramularia* and *Septoria*. *c*. 647, widespread. A large genus with enormously varied anamorphs. Several large groups have been removed (e.g. *Davidiella*, *Teratosphaeria*, but it may well require further subdivision. See von Arx (*Sydowia* **3**: 28, 1949; anamorph gen.), von Arx (*Proc. K. ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **86**: 15, 1983; anamorph gen.), Evans (*Mycol. Pap.* **153**, 1984; on *Pinus* (now as *Eruptio*)), Sivanesan (*Bitunicate Ascomycetes and their Anamorphs*, 1984), Niyo *et al.* (*Mycol.* **78**: 202, 1986; ultrastructure), Corlett (*Mycotaxon* **31**: 59, 1988; on *Brassicaceae*)), Corlett (*Mycol. Mem.* **18**: 328 pp., 1991; nomenclator), Corlett (*Mycotaxon* **53**: 37, 1995; catalogue names), Crous (*Mycol. Mem.* **21**: 170 pp., 1998; spp. on *Eucalyptus*), Fröhlich & Hyde (*Sydowia* **50**: 171, 1998; spp. on palms), Crous (*MR* **103**: 607, 1999; spp. on *Myrtaceae*), Crous & Corlett (*CJB* **76**: 1523, 1998; spp. on *Platanus*), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999; DNA), Stewart *et al.* (*MR* **103**: 1491, 1999; DNA), Crous *et al.* (*Stud. Mycol.* **45**: 107, 2000; review), Taylor & Crous (*MR* **104**: 618, 2000; on *Proteaceae*), Verkley & Priest (*Stud. Mycol.* **45**: 123, 2000; *Septoria* anams.), Crous *et al.* (*MR* **105**: 425, 2001; ITS of spp. on *Myrtaceae*), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Goodwin *et al.* (*Phytopathology* **91**: 648, 2001; phylogeny), Milgate *et al.* (*Forest Pathology* **31**: 53, 2001; on *Eucalyptus*), Crous & Mourichon (*Sydowia* **54**: 35, 2002; on banana), Kuijpers & Aptroot (*Nova Hedwigia* **75**: 451, 2002; long-spored spp.), Linde *et al.* (*Petria* **12**: 95, 2002; population structure), Sivanesan & Shivas (*MR* **106**: 355, 2002; Australia), Braun *et al.* (*Mycol. Progr.* **2**: 3, 2003; exclusion of *Davidiella*), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003; anamorphs), Crous *et al.* (*Sydowia* **55**: 136, 2003; separation from *Sphaerulina*), Hayden *et al.* (*Pl. Path.* **52**: 703, 2003; on banana), Taylor *et al.* (*MR* **107**: 653, 2003; phylogeny on *Proteaceae*), Zhan *et al.* (*Fungal Genetics Biol.* **38**: 286, 2003; *M. graminicola* genetics), Crous *et al.* (*CBS Diversity Ser.* **2**, 2004; anamorphs), Crous *et al.* (*Stud. Mycol.* **50**: 195, 2004; on *Eucalyptus*), Crous *et al.* (*Stud. Mycol.* **50**: 457, 2004; on *Acacia*), Verkley *et al.* (*MR* **108**: 1271, 2004; typification), Hayden *et al.* (*Phytopathology* **95**: 489, 2005; genetics), Aptroot (*CBS Diversity Ser.* **5**, 2006; monogr.), Crous *et al.* (*Stud. Mycol.* **55**: 99, 2006; on *Eucalyptus*), Hunter *et al.* (*Stud. Mycol.* **55**: 147, 2006; on *Eucalyptus*), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogenetic posn), Crous *et al.* (*Stud. Mycol.* **58**: 1, 2007; phylogeny), Arzanlou *et al.* (*Persoonia* **20**: 19, 2008; on *Musa*).

Mycosphaerellaceae Lindau (1897) nom. cons., Capnodiales. 53 gen. (+ 70 syn.), 6033 spp.

Lit.: Scharen & Sanderson (*Septoria of Cereals* Proceedings of the Workshop held August 2-4, 1983, at Montana State University, Bozeman, Montana: 37, 1985), Corlett (*Mycol. Mem.* **18**: 328 pp., 1991), Johanson *et al.* (*Pl. Path.* **43**: 701, 1994), Cannon *et al.* (*MR* **99**: 353, 1995), David (*Mycol. Pap.* **172**: 157 pp., 1997), Crous (*Mycol. Mem.* **21**: 170 pp., 1998), Caten (*Septoria on Cereals* A Study of Pathosystems: 26, 1999), Crous (*MR* **103**: 607, 1999), Crous & Corlett (*CJB* **76**: 1523, 1998), Cunfer & Ueng (*Ann. Rev. Phytopath.* **37**: 267, 1999), Stewart *et al.* (*MR* **103**: 1491, 1999), Taylor *et al.* (*Ann. Rev. Phytopath.* **37**: 197, 1999), Crous *et al.* (*Stud. Mycol.* **45**: 107, 2000), Verkley & Priest (*Stud. Mycol.* **45**: 123, 2000), Crous *et al.* (*Mycol.* **93**: 1081, 2001), Braun *et al.* (*Mycol. Progr.* **2**: 8, 2003), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003), Hunter *et al.* (*MR* **108**: 672, 2004), Verkley *et al.* (*Mycol.* **96**: 558, 2004), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Mycosphaerellales P.F. Cannon (2001) = Capnodiales.

Mycosphaerellopsis Höhn. (1918) = Didymella fide Barr (*Mycotaxon* **60**: 433, 1996).

Mycospongia Velen. (1939) nom. dub., ? Agaricales. ? 'gasteromycetes'.

Mycospraguea U. Braun & Rogerson (1993), anamorphic *Pezizomycotina*, Cac.≡ eH.1. 1, USA. See Braun (*Cryptog. bot.* **4**: 108, 1993).

mycostasis (adj. **mycostatic**), inhibition of fungal growth; fungistasis (fungistatic); sporostasis; **mycostatic** in soil, see Dobbs *et al.* (*Nature* **172**: 197, 1953), Parkinson & Waid (Eds) (*The ecology of fungi*, 130, 1960).

mycostatin, trade name for nystatin.

Mycostevensonia Bat. & Cif. (1962) = Treubiomyces fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Mycosticta Höhn. (1918), anamorphic *Pezizomycotina*, ?.0eH.?. 1, Europe.

Mycostigma Jülich (1976), ? Atheliaceae. 1, Europe. See Jülich (*Persoonia* **8**: 432, 1976).

mycostratum, see perisporium; Spore wall.

Mycosylva M.C. Tulloch (1973), anamorphic *Pezizomycotina*, Hsy.0eH.3. 3, Europe; Asia (esp. temperate). See Samson & Hintikka (*Karstenia* **14**: 133, 1974).

mycosymbiont, see mycobiont.

mycosymbiosis, symbiosis of two or more fungi (Vainio, 1921; cf. *Gonidiomyces*).

mycosynusium (pl. **-iae**), a part of the total number of fungal communities in a site or region studied; e.g. **macrofungussynusiae** (only macromycetes considered); see Winterhoff (1992), mycosociology.

Mycosyringaceae R. Bauer & Oberw. (1997), Urocystidales. 1 gen., 4 spp.

Lit.: Vánky (*Cryptog. Stud.* **1**: 159 pp., 1987), Vánky (*Mycoscience* **37**: 173, 1996), Bauer & Oberwinkler (*Mycotaxon* **64**: 303, 1997), Bauer *et al.* (*CJB* **75**: 1273, 1997), Piepenbring *et al.* (*Protoplasma* **204**: 170, 1998), Vánky (*MR* **102**: 513, 1998), Vánky (*Mycol. Balcanica* **1**: 175, 2004).

Mycosyrinx Beck (1894), Mycosyringaceae. 4 (on *Vitaceae*), pantropical. See Mordue (*Mycopathologia* **103**: 171, 1988), Vánky (*Mycoscience* **37**: 173, 1996; key).

Mycota, See *FUNGI*.

mycothallus (pl. **-lli**), a mutualistic symbiosis of a fungus with a hepatic (liverwort) or fern gametophyte (Boullard, *Syllogeus* **19**: 1, 1979; *in* Pirozynski & Hawksworth (Eds), *Coevolution of fungi with plants and animals*: 107, 1988).

Mycothamnion Kütz. (1843) nom. dub., ? Fungi.

mycotheca, a distributed set of dried specimens of fungi.

Mycothele Jülich (1976), ? Gloeophyllaceae. 1, New Zealand. See Jülich (*Persoonia* **8**: 452, 1976).

Mycothelocarpon Cif. & Tomas. (1953) nom. illegit. = Thelocarpon.

Mycothyridium E. Müll. (1973) = Thyridium Nitschke fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Mycothyridium Petr. (1962), Dothideomycetes. 36, widespread. See Petrak (*Sydowia* **15**: 288, 1972), Eriksson & Hawksworth (*SA* **13**: 191, 1994; nomencl.).

mycotic (esp. of disease), caused by fungi.

Mycotodea Kirschst. (1936), Pezizomycotina. 14 (on *Musci*), widespread. See Hawksworth (*SA* **8**: 71, 1989; posn).

mycotope, a major fungal association of a particular type of woodland (Darimont, 1975); see mycosociology.

Mycotorula H. Will (1916) = Syringospora fide von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977).

Mycotoruloides Langeron & Talice (1932) = Syringospora fide von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977).

Mycotoxicoses. Literally fungus poisonings, but in current use limited to poisoning of animals and esp. humans, usually by feed and food products contaminated (and sometimes rendered carcinogenic) by toxin-producing microfungi, also by contact with toxin-containing microfungi in particular environments (e.g. sick-building syndrome). See aflatoxins, citreoviridin, citrinin, fumonisins, islanditoxin, lupinosis, luteoskyrin, lysergic acid, maltoryzine, ochratoxin, patulin, roridins, rubratoxin, satratoxins, slaframine, sporidesmin, sterigmatocystin, tremorgen, trichothecenes, zearalenone. The difficult issue of fungi and fungal toxins as weapons was reviewed by Paterson (*MR* **110**: 1003, 2006). See also Biological control, Bioterrorism and fungi, Mycopesticides.

Lit.: Reviews: Assouline-Dayan *et al.* (*J. Asthma* **39**: 191, 2002), Forgacs & Carll (*Adv. vet. Sci.* **7**: 272, 1962), Wheeler & Luke (*Ann. Rev. Microbiol.* **17**: 223, 1963), Wright (*Ann. Rev. Microbiol.* **22**: 269, 1968). Books: Betina (*Mycetotoxins*, 1989), Castegnaro *et al.* (Eds) (*Mycotoxins, endemic nephropathy and urinary tract tumours*, 1991), Champ *et al.* (Eds) (*Fungi and mycotoxins in stored products*, 1992). An encyclopaedic handbook* **1**, *Mycotoxic fungi and chemistry of mycotoxicoses*, 1977; **2**, *Mycotoxicoses of domestic and laboratory animals, poultry, and aquatic invertebrates and vertebrates*, 1978; **3**, *Mycotoxicoses of man and plants; mycotoxin control and regulatory aspects*, 1978), Smith & Henderson (*Mycotoxins and animal foods*, 1991), Smith & Moss (Eds) (*Mycotoxins*, 1985), Steyn (Ed.) (*The biosynthesis of mycotoxins*, 1980), Upadhyay (*Advances in microbial toxin research and its biotechnological exploitation*, 2002), Xu *et al.* (*Epidemiology of mycotoxin producing fungi*, 2003). See also phytoalexins.

mycotoxicosis, one of the Mycotoxicoses (q.v.).

mycotoxin, see toxin.

Mycotribulus Nag Raj & W.B. Kendr. (1970), anamorphic *Pezizomycotina*, St.0eH.4. 1, pantropical. See Nag Raj & Kendrick (*CJB* **48**: 2219, 1970).

mycotroph, a fungus which obtains its nutrients from another fungus; cf. mycoparasitism and see Fungi on fungi.

mycotrophein, a 'growth factor' from fungi needed by a mycoparasite (Waley & Barnett, *Mycol.* **55**: 209, 1963).

mycotrophic (of plants), having mycorrhiza.

Mycotypha Fenner (1932), Mycotyphaceae. 3, widespread. See Young (*J. gen. Microbiol.* **55**: 243, 1969; sporangiolum ultrastr.), Benny & Benjamin (*Aliso* **8**: 391, 1976), Brain & Young (*Microbios* **25**: 93, 1979; ultrastr.), Benny *et al.* (*Mycotaxon* **22**: 119, 1985;

key), Edelmann & Klomparens (*MR* **99**: 539, 1995; ultrastr), O'Donnell *et al.* (*Mycol.* **93**: 286, 2001; phylogeny), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Mycotyphaceae Benny & R.K. Benj. (1985), Mucorales. 1 gen., 3 spp.
Lit.: Benny *et al.* (*Mycotaxon* **22**: 119, 1985; key), Forst & Prillinger (*Z. Mykol.* **54**: 139, 1988).

Mycousteria M.L. Farr (1986), anamorphic *Pezizomycotina*, Cpt.0eP.?. 2, Brazil. See Farr (*Mycol.* **78**: 280, 1986).

Mycovellosiella Rangel (1917) = Passalora fide Deighton (*Mycol. Pap.* **137**, 1974), Liu & Guo (*Mycosystema* **1**: 241, 1988; 21 spp. from China), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**, 1998), Crous (*MR* **103**: 607, 1999; on *Myrtaceae*), Crous *et al.* (*Stud. Mycol.* **45**: 107, 2000; review), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Crous *et al.* (*MR* **105**: 425, 2001; on *Myrtaceae*), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003; nomenclator).

mycoviruses, see Viruses in fungi.

Mycowinteria Sherwood (1986), Protothelenellaceae. 1, widespread (temperate). See David (*SA* **6**: 217, 1987), Sherwood-Pike (*Mycotaxon* **28**: 137, 1987), Aptroot & Iperen (*Nova Hedwigia* **67**: 481, 1998; New Guinea).

Mydonosporium Corda (1833) = Cladosporium fide Saccardo (*Syll. fung.* **4**: 354, 1886).

Mydonotrichum Corda (1831) = Helminthosporium fide Saccardo (*Syll. fung.* **4**: 407, 1886).

Myelochroa (Asahina) Elix & Hale (1987), Parmeliaceae (L). 22, widespread (esp. north-east Asia). See Hale (*Smithson. Contr. Bot.* **33**, 1976), Kurokawa & Arakawa (*Bull. Bot. Gdns Toyama* **2**: 23, 1997; Japan), Wang *et al.* (*Mycotaxon* **77**: 25, 2001; China), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Myeloconidiaceae P.M. McCarthy (2001), Ostropales. 2 gen., 5 spp.
Lit.: McCarthy & Elix (*Lichenologist* **28**: 402, 1996), McCarthy (*Flora of Australia* **58** A: 242 pp., 2001), McCarthy *et al.* (*Lichenologist* **33**: 292, 2001).

Myeloconis P.M. McCarthy & Elix (1996), Myeloconidiaceae (L). 4, widespread (tropical). See McCarthy & Elix (*Lichenologist* **28**: 402, 1996).

Myelorrhiza Verdon & Elix (1986), Cladoniaceae (L). 2, Australia. See Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Stenroos *et al.* (*Mycol. Progr.* **1**: 267, 2002; phylogeny).

Myelosperma Syd. & P. Syd. (1915), Myelospermataceae. 4 (on *Palmae*), Brunei; Irian Jaya. See Hyde (*Sydowia* **45**: 241, 1993), Hyde & Wong (*MR* **103**: 347, 1999; fam. rels).

Myelospermataceae K.D. Hyde & S.W. Wong (1999), Xylariales. 1 gen., 4 spp.
Lit.: Hyde (*Sydowia* **45**: 241, 1993), Kang *et al.* (*Fungal Diversity* **1**: 147, 1998), Hyde & Wong (*MR* **103**: 347, 1999).

Myiocopraloa Cif. (1958) = Schizothyrium fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Myiocoprella Sacc. (1916) = Rhagadolobium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Myiocopron, see *Muyocopron*.

Myiocoprula Petr. (1955), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, USA. See Petrak (*Sydowia* **9**: 547, 1955).

Myiophagus Thaxt. ex Sparrow (1939), ? Chytridiales. 2, widespread (north temperate). See Karling (*Am. J. Bot.* **35**: 246, 1948).

Myiophyton Lebert (1857) = Empusa fide Saccardo (*Syll. fung.* **7**: 1, 1888).

Mykoblastus, see *Mycoblastus*.

mykoholz, basidioma of the edible *Kuehneromyces mutabilis* cultivated in Germany (Chang & Hughes, 1978).

Mylitta Fr. (1825) nom. dub., Fungi. Based on bacterial root nodules on *Robinia* fide Mattirolo (*Bull. Soc. bot. ital.* 1924: 13, 1924).

mylitta, a large sclerotium, e.g. that of blackfellows' bread (q.v.).

Mylittopsis Pat. (1895), Basidiomycota. 1, USA; Malaysia. See Rogers & Martin (*Mycol.* **47**: 891, 1955).

myosin, see actin.

Myosporidium E. Baquero, M. Rubio, I.N.S. Moura, N.J. Pieniazek & R. Jordana (2005), Microsporidia. 1. See Baquero *et al.* (*J. Eukary. Microbiol.* **52**: 476, 2005).

Myriadoporus Peck (1884) = Bjerkandera fide Donk (*Persoonia* **1**: 173, 1960).

Myriangiaceae Nyl. (1854), Myriangiales. 4 gen. (+ 8 syn.), 18 spp.
Lit.: Boedijn (*Persoonia* **2**: 63, 1963; Indonesia), von Arx (*Persoonia* **2**: 421, 1963; gen. names), Rao & Pande (*Cryptog. bot.* **3**: 255, 1993), Inácio & Dianese (*MR* **102**: 695, 1998), Winka & Eriksson (*Phylogenetic Relationships Within the Ascomycota Based on 18S rDNA Sequences* Akademisk Avhandling [Thesis (PhD), Department of Ecology and Environmental Science, Umeå University]: [17] pp., 2000), Lumbsch & Lindemuth (*MR* **105**: 901, 2001).

Myriangiales Starbäck (1899). Dothideomycetidae. 3 fam., 18 gen., 157 spp. Stromata crustose or pulvinate, composed of subhyaline or brown thin-walled pseudoparenchymatous tissue, with immersed ascomatal locules or fertile outgrowths of similar tissue containing scattered asci in individual locules, becoming gelatinous at maturity, opening by unordered breakdown of the surface layers. Specialized interascal tissue absent. Asci in a single layer or irregularly disposed, ± globose, sessile, fissitunicate, usually with a poorly defined ocular chamber. Ascospores hyaline to brown, transversely septate or muriform. Anamorphs acervular where known. Fams:
(1) **Cookellaceae**
(2) **Elsinoaceae**
(3) **Myriangiaceae**
Molecular data have confirmed links between the *Elsinoaceae* and *Myriangiaceae*, but relationships of the *Cookellaceae* remain uncertain.
Lit.: Eriksson (*Opera Bot.* **60**, 1981), Schoch *et al* (*Mycol* **98**: 1041, 2006; phylogeny).

Myriangiella Zimm. (1902), ? Schizothyriaceae. *c.* 5, widespread (tropical). See von Arx & Müller (*Stud. Mycol.* **9**, 1975), Hofmann & Piepenbring (*Fungal Diversity* **22**: 55, 2006; Panama).

Myriangina (Henn.) Höhn. (1909) = Uleomyces fide von Arx (*Persoonia* **2**: 421, 1963).

Myrianginella F. Stevens & Weedon (1923) = Uleomyces fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Myriangiomyces Bat. (1958) = Saccardia fide von Arx (*Persoonia* **2**: 421, 1963).

Myriangiopsis Henn. (1902), Dothideomycetes. 1, Mexico.

Myriangium Mont. & Berk. (1845), Myriangiaceae. c. 8, widespread. See Petch (*TBMS* **10**: 45, 1924; on *Insecta*), Miller (*Mycol.* **30**: 158, 1938), Miller (*Mycol.* **32**: 587, 1940), von Arx (*Persoonia* **2**: 241, 1963), Lumbsch & Lindemuth (*MR* **105**: 901, 2001; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Myriapodophila Speg. (1918) ? = Pyxidiophora fide Blackwell (*Mycol.* **86**: 1, 1994).

Myridium Clem. (1909) nom. rej. = Laetinaevia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Myriellina Höhn. (1915), anamorphic *Pezizomycotina*, Cac.≡ eH.15. 2, Europe; Papua New Guinea. See Sankaran & Sutton (*MR* **95**: 1021, 1991).

Myrillium Clem. (1931) nom. dub., ? Onygenales. See Kuehn (*Mycol.* **51**: 665, 1959), Currah (*Mycotaxon* **24**: 1, 1985).

Myrioblastus Trevis. (1857) ≡ Biatorella.

Myrioblepharis Thaxt. (1895) nom. dub., Fungi. Based on a protozoan on *Pythium* or *Phytophthora* fide Waterhouse (*TBMS* **28**: 94, 1945), Koch (*Mycol.* **56**: 436, 1964).

Myriocarpa Fuckel (1870) [non *Myriocarpa* Benth. 1846, *Urticaceae*] ? = Guignardia fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Myriocarpium Bonord. (1864) = Leptosphaeria fide Saccardo (*Syll. fung.* **2**: 13, 1883).

Myriocephalum De Not. ex Corda (1842) = Cheirospora fide Hughes (*CJB* **36**: 727, 1958).

Myriococcum Fr. (1823), anamorphic *Agaricomycetes*. 1 or 2, widespread. *M. albomyces* is included in *Melanocarpus*.

Myrioconium Fr. (1823), anamorphic *Agaricomycetes*. 1, widespread. See Stalpers *in* Sugiyama (Ed.) (*Pleomorphic Fungi: The Diversity and its Taxonomic Implications*: 201, 1987).

Myrioconium Syd. (1912), anamorphic *Sclerotinia*, *Myriosclerotinia*, Cac.0eH.15. 7, Europe; N. America. See Palmer (*Öst. Z. Pilzk.* **4**: 81, 1995; on *Eriophorum*).

Myriodiscus Boedijn (1935), Helotiales. 1, Sumatra. See Liu & Guo (*Acta Mycol. Sin.* Suppl. **1**: 97, 1988).

Myriodontium Samson & Polon. (1978), anamorphic *Pezizomycotina*, Hso.0eH.12. 1, Europe; N. America. See Samson & Polonelli (*Persoonia* **9**: 505, 1978).

Myriogenis Clem. & Shear (1931) ≡ Myriogenospora.

Myriogenospora G.F. Atk. (1894), Clavicipitaceae. 2 (on *Poaceae*, incl. *Saccharum*), America. See Diehl (*USDA agric. Monogr.* **4**, 1950), Luttrell & Bacon (*CJB* **55**: 2090, 1977), Hanlin & Tortolero (*Mycotaxon* **39**: 237, 1990), Phelps & Morgan-Jones (*Mycotaxon* **47**: 41, 1993), White & Glenn (*Am. J. Bot.* **81**: 216, 1994), Glenn *et al.* (*MR* **102**: 483, 1998; DNA), Bacon & White (*Microbial Endophytes*, 2000).

Myriogonium Cain (1948) = Helicogonium fide Kreger-van Rij *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 15, 1973), Carpenter & Krapp (*Mycotaxon* **21**: 487, 1984), Baral (*Nova Hedwigia* **69**: 1, 1999), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Myriolecis Clem. (1909) = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Myrionora R.C. Harris (1988), Lecanoraceae (L). 1, USA. See Harris (*Evansia* **5**: 27, 1988).

Myriophacidium Sherwood (1974), Rhytismataceae. 4, widespread. See Sherwood (*Occ. Pap. Farlow Herb. Crypt. Bot.* **15**, 1980; key), Cannon & Minter (*Mycol. Pap.* **155**, 1986).

Myriophysa Fr. (1849) ? = Atichia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Myriophysella Speg. (1910) = Seuratia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Myriosclerotinia N.F. Buchw. (1947), Sclerotiniaceae. Anamorphs *Myrioconium*, *Sclerotium*. 10, widespread. See Palmer (*Friesia* **9**: 193, 1969), Schwegler (*Schweiz. Z. Pilzk.* **56**: 49, 1978), Schumacher & Kohn (*CJB* **63**: 1610, 1985; key), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Saito (*Mycoscience* **39**: 145, 1998), Holst-Jensen *et al.* (*Nordic Jl Bot.* **18**: 705, 1999; phylogeny), Holec *et al.* (*Sydowia* **59**: 57, 2007).

Myriosperma Nägeli (1853) = Sarcogyne Flot. (1851) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Jørgensen (*Taxon* **53**: 521, 2004; nomencl.).

Myriospora Nägeli (1853), Acarosporaceae (L). 2. See Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Harris & Knudsen (*Opuscula Philolichenum* **3**: 1, 2006).

myriosporous, having many spores. Cf. oligosporous.

Myriostigma G. Arnaud (1925) ≡ Myriostigmella.

Myriostigma Kremp. (1874) nom. rej. = Cryptothecia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Lücking *et al.* (*Lichenologist* **38**: 235, 2006).

Myriostigmella G. Arnaud (1952), Dothideomycetes. 1, Brazil. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Myriostoma Desv. (1809), Geastraceae. 1, widespread. See Sunhede (*Syn. Fung.* **1**: 534 pp., 1989), Rees *et al.* (*Australasian Mycologist* **24**: 25, 2005; Australia).

Myriotrema Fée (1824), Thelotremataceae (L). 150, widespread (esp. tropical). See Hale (*Mycotaxon* **11**: 130, 1980), Hale (*Bull. Br. Mus. nat. hist.* Bot. **8**: 227, 1981), Matsumoto & Deguchi (*Bryologist* **102**: 86, 1999; anamorphs), Frisch (*Biblthca Lichenol.* **92**: 3, 2006; monogr. African spp.), Frisch *et al.* (*Biblthca Lichenol.* **92**: 517, 2006; phylogeny, polyphyly), Mangold *et al.* (*Nova Hedwigia* **83**: 275, 2006; Australia).

Myriotrichum, see *Myxotrichum*.

Myrmaeciella Lindau (1897), Hypocreales. Anamorph *Patellina*. 1, N. America. See Samuels & Seifert *in* Sugiyama (Ed.) (*Pleomorphic Fungi: The Diversity and its Taxonomic Implications*: 29, 1987), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999; allied to *Niessliaceae*).

Myrmaecium Nitschke ex Fuckel (1870), Pezizomycotina. 2, Europe.

Myrmaecium Sacc. (1880) ≡ Myrmaeciella.

Myrmecocystis Harkn. (1899) = Genabea fide Trappe (*TBMS* **65**: 496, 1975), Smith *et al.* (*Mycol.* **98**: 699, 2006), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Myrmecomyces Jouvenaz & Kimbr. (1991), anamorphic *Pezizomycotina*, Hso.0eH.10. 1 (endoparasitic on fire ants), USA; Argentina. See Jouvenaz & Kimbrough (*MR* **95**: 1400, 1991).

myrmecophilous (of fungi), being a covering or food for ants.

Myrmecridium Arzanlou, W. Gams & Crous (2007), anamorphic *Sordariomycetes*. 2, widespread.

Myrophagus, see *Myiophagus*.

Myropyxis Ces. ex Rabenh. (1851), anamorphic *Pezizomycotina*. 1 or 2, Europe.

Myrotheciastrum Abbas & B. Sutton (1988), anamor-

phic *Pezizomycotina*, St.0eP.19. 1, Pakistan; India. See Abbas & Sutton (*TBMS* **91**: 352, 1988).
Myrotheciella Speg. (1910) = Myrothecium fide Tulloch (*Mycol. Pap.* **130**, 1972).
Myrothecium Tode (1790), anamorphic *Hypocreales*, Cpd.0eP.15. 22, widespread. See Tulloch (*Mycol. Pap.* **130**, 1972; key), Nag Raj (*Mycotaxon* **53**: 295, 1995; *M. prestonii* heterogeneous), Schroers *et al.* (*Sydowia* **51**: 114, 1999; teleomorph), Ahrazem *et al.* (*Archs Microbiol.* **173**: 296, 2000; cell wall polysaccharides), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny), Seifert *et al.* (*Mycotaxon* **87**: 317, 2003; Canada), Watanabe *et al.* (*Mycoscience* **44**: 283, 2003; Japan), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).
Mystrosporiella Munjal & Kulshr. (1969), anamorphic *Pezizomycotina*, Hso.#eP.10. 2, India. See Munjal & Kulshreshtha (*Mycopathologia* **39**: 356, 1969), Sharma *et al.* (*Indian Phytopath.* **59**: 257, 2006).
Mystrosporium Corda (1837) nom. dub., anamorphic *Pezizomycotina*, Hso.#eP.?. 5, widespread (temperate). *M. adustum* (ink disease of iris). See Hughes (*CJB* **36**: 788, 1958).
Mythicomyces Redhead & A.H. Sm. (1986), Psathyrellaceae. 1, widespread (north temperate). See Redhead & Smith (*CJB* **64**: 643, 1986).
Mytilidion Sacc. (1875) ≡ Mytilinidion.
mytiliform, like a mussel shell in form.
Mytilinidiaceae Kirschst. (1924), Pleosporales. 11 gen. (+ 7 syn.), 93 spp.
Lit.: Zogg (*Beitr. Kryptfl. Schweiz* **11** no. 3, 1962; Eur.), Blackwell & Gilbertson (*Mycol.* **77**: 50, 1985), Checa (*Mycotaxon* **63**: 467, 1997), Checa (*Mycotaxon* **62**: 349, 1997; Iberian spp.), Vasilyeva (*Mycoscience* **38**: 341, 1997).
Mytilinidion Duby (1862), Mytilinidiaceae. Anamorph *Septonema*-like. 12, Europe; N. America. See Zogg (*Beitr. Kryptfl. Schweiz* **11** no. 3, 1962), Speer (*BSMF* **102**: 97, 1986), Checa (*Mycotaxon* **63**: 467, 1997; Spain), Vasil'eva (*Mikol. Fitopatol.* **35**: 15, 2001; E Russia).
Mytilodiscus Kropp & S.E. Carp. (1984), Helotiaceae. 1, N. America; Europe. See Kropp & Carpenter (*Mycotaxon* **20**: 365, 1984).
Mytilostoma P. Karst. (1880), Dothideomycetes. 2, Finland. See Mathiassen (*Pyrenomyceter (Ascomyceter) på Salix i Troms*, 1985).
Myxacium (Fr.) P. Kumm. (1871) = Cortinarius fide Kuyper (*in litt.*).
myxamoeba (1) (of *Mycetozoa*), a zoospore after becoming amoeba-like; (2) a myxopod (obsol.).
Myxariaceae Jülich (1982) = Hyaloriaceae.
myxarioid (of basidia), having a stalk-like portion separated by a wall from the globose metabasidial portion, as in *Myxarium* (Donk, *Persoonia* **4**: 232, 1966).
Myxarium Wallr. (1833), Hyaloriaceae. 6, widespread. See Roberts (*Mycotaxon* **69**: 209, 1998), Wells *et al.* (*Frontiers in Basidiomycote Mycology*: 237, 2004).
Myxasterina Höhn. (1909) = Asterina fide Stevens & Ryan (*Ill. biol. monogr.* **17** no. 2, 1939).
Myxobacterales. An order of Bacteria (gliding bacteria) bearing extracellular slime; lyse filamentous and yeast fungi and bacteria in soil, dung and decaying vegetation.
Myxobilimbia Hafellner (2001) = Bilimbia fide Hafellner & Türk (*Stapfia* **76**: 154, 2001), Veldkamp (*Lichenologist* **36**: 191, 2004), Llop (*Lichenologist* **38**: 279, 2006).
Myxocephala G. Weber, Spaaij & Oberw. (1989), ? Sordariomycetes. 1. See Jacobs *et al.* (*CJB* **79**: 110, 2001; phylogeny).
Myxochytridiales, see *Archimycetes*.
Myxocladium Corda (1837) = Cladosporium fide Saccardo (*Syll. fung.* **4**: 364, 1886).
Myxocollybia Singer (1936) = Flammulina fide Singer (*Agaric. mod. Tax.*, 1951).
Myxocybe Fayod (1889) = Hebeloma fide Singer (*Agaric. mod. Tax.*, 1951).
Myxocyclus Riess (1852), anamorphic *Pleomassariaceae*, Hsp/Cac.#eP.1. 1, Europe; N. America. See Tanaka *et al.* (*Mycoscience* **46**: 248, 2005).
Myxocystis Mrázek (1897), Microsporidia. 1.
Myxoderma Fayod ex Kühner (1926) ≡ Limacella.
Myxodictyon A. Massal. (1860) = Brigantiaea fide Hafellner & Bellemère (*Nova Hedwigia* **35**: 237, 1982), Hafellner (*Symb. bot. upsal.* **32** no. 1: 35, 1997).
Myxodictyonomyces Cif. & Tomas. (1953) ≡ Myxodictyon.
Myxodiscus Höhn. (1906) = Leptothyrium fide Höhnel (*Mykol. Unters.* **1**: 301, 1923).
Myxodochium Arnaud (1952) nom. inval., anamorphic *Agaricomycetes*, Hsp.0eH.1. 1 (with clamp connexions), Europe.
Myxofusicoccum Died. (1912) = Pseudodiscula fide Sutton (*Mycol. Pap.* **141**, 1977).
Myxolibertella Höhn. (1903) nom. rej. = Phomopsis (Sacc.) Bubák. fide Sutton (*Mycol. Pap.* **141**, 1977).
myxolichens, synthetically produced loose associations of myxomycete plasmodia and a green alga (*Chlorella*).
Myxomonas Brzez. (1906) nom. dub., Fungi. Based on dead or partly formed cells fide Trzebinski (*Z. PflanKrKh.* **17**: 321, 1908).
Myxomphalia Hora (1960), Tricholomataceae. 4, widespread (north temperate). See Hora (*TBMS* **43**: 453, 1960), Antonín (*Mykol. Listy* **76**: I/1, 2001), Antonín (*Mykol. Listy* **90-91**: 20, 2004; key European species).
Myxomphalos Wallr. (1833) = Agyrium fide Saccardo (*Syll. fung.* **8**: 635, 1889).
Myxomycetes Renault (1895), Fossil Fungi ? Myxogastria. 1 (Carboniferous), France.
myxomyceticolous, growing on *Mycetozoa*. See Fungi on fungi.
Myxomycidium Massee (1901) = Mucronella fide Petersen (*Mycol.* **72**: 301, 1980).
Myxomycites Mesch. (1898) ≡ Myxomycetes (class).
Myxomyriangiaceae Theiss. (1917) = Elsinoaceae.
Myxomyriangium Theiss. (1913) = Saccardinula fide von Arx (*Persoonia* **2**: 421, 1963).
Myxonema Corda (1837) [non *Myxonema* Fr. 1825, *Algae*] ≡ Myxonyphe.
Myxonyphe Rchb. (1841) nom. dub., Fungi.
Myxoparaphysella Caball. (1941), anamorphic *Pezizomycotina*, Cac.0eH.?. 1, Spain.
Myxophacidiaceae Petr. (1922) = Ascodichaenaceae.
Myxophacidiella Höhn. (1917) = Pseudophacidium fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).
Myxophacidium Höhn. (1917) = Pseudophacidium fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954), DiCosmo *et al.* (*Mycotaxon* **21**: 68, 1984).
Myxopholis Locq. (1979) = Cortinarius fide Kuyper (*in litt.*).

Myxophora Döbbeler & Poelt (1978), Dothideomycetes. 1 (lichenicolous), widespread. See Döbbeler (*Biblthca Lichenol.* **58**: 73, 1995), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000).

Myxopuntia Mont. (1846) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Myxormia Berk. & Broome (1850) = Myrothecium fide Tulloch (*Mycol. Pap.* **130**, 1972).

myxospore, a myxomycete spore (obsol.).

Myxosporella Sacc. (1881), anamorphic *Pezizomycotina*, Cac.0eH.23. 1, Italy. See Sutton (*Mycol. Pap.* **141**, 1977).

Myxosporidiella Negru (1960), anamorphic *Pezizomycotina*, Ccu.0eH.?. 1, Roumania. See Negru (*Stud. Cercet. Biol. Acad. romana* **11**: 11, 1960).

Myxosporina Höhn. (1927) = Rhodesia fide Sutton (*Mycol. Pap.* **141**, 1977).

Myxosporium Link (1825) nom. conf., anamorphic *Pezizomycotina*. See Höhnel (*Z. Garungs.* **5**: 191, 1915), Weindlmayr (*Sydowia* **17**: 74, 1964), Weindlmayr (*Sydowia* **18**: 26, 1965), Weindlmayr (*Sydowia* **19**: 193, 1966).

myxosporium, see perisporium; Spore wall.

Myxostomella Syd. (1931) = Campoa fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Myxostomellina Syd. (1931), anamorphic *Pezizomycotina*, St.0eH.?. 1, Philippines.

Myxotheca Ferd. & Winge (1910) = Cryptothecia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Lücking *et al.* (*Lichenologist* **38**: 235, 2006).

Myxotheciella Petr. (1959) = Scolionema fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Myxothecium Kunze (1823) = Meliola fide Hansford (*Beih. Sydowia* **2**, 1961).

Myxothyriaceae Höhn. (1909) = Asterinaceae.

Myxothyriopsis Bat. & A.F. Vital (1956), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Brazil. See Batista & Vital (*An. Soc. Biol. Pernambuco* **14**: 90, 1956).

Myxothyrium Bubák & Kabát (1915), anamorphic *Pezizomycotina*, St.0eH.15. 1, Europe.

Myxotrichaceae Locq. ex Currah (1985), Leotiomycetidae (inc. sed.). 5 gen. (+ 7 syn.), 60 spp.

Lit.: Currah (*Mycotaxon* **24**: 1, 1985), Rosing (*Mycol.* **77**: 920, 1985), Currah (*SA* **7**: 1, 1988; key gen.), Dalpé (*New Phytol.* **113**: 523, 1989; mycorrhizas), Caretta & Piontelli (*Mycopathologia* **140**: 77, 1997), Hambleton *et al.* (*Mycol.* **90**: 854, 1998; anams), Currah *et al.* (*Karstenia* **39**: 65, 1999), McLean *et al.* (*New Phytol.* **144**: 351, 1999), Monreal *et al.* (*CJB* **77**: 1580, 1999), Sugiyama *et al.* (*Mycoscience* **40**: 251, 1999; phylogeny), Chambers *et al.* (*MR* **104**: 168, 2000), Gibas *et al.* (*Stud. Mycol.* **47**: 131, 2002), Tsuneda & Currah (*Mycol.* **96**: 627, 2004), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Myxotrichella (Sacc.) Sacc. (1899) = Myxotrichum fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Myxotrichellaceae Nann. (1934) = Myxotrichaceae.

Myxotrichum Kunze (1823), Myxotrichaceae. Anamorph *Oidiodendron*. 12, widespread. See Orr *et al.* (*CJB* **41**: 1463, 1963; key), Hughes (*CJB* **46**: 939, 1968; synonymy), Currah (*Mycotaxon* **24**: 1, 1985), Dalpé (*MSA News* **38**: 22, 1987; anamorph), Udagawa & Uchiyama (*Mycoscience* **40**: 291, 1999), Rice & Currah (*MR* **106**: 1463, 2002), Tsuneda & Currah (*Mycol.* **96**: 627, 2004; ontogeny), Rice & Currah (*Stud. Mycol.* **53**: 83, 2005; anamorphs), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Myxozyma Van der Walt, Weijman & Arx (1981), anamorphic *Lipomycetaceae*, Hso.0eH.3/4. 5, N. America; S. Africa. See Yamada (*J. gen. appl. Microbiol.* Tokyo **32**: 259, 1986; coenzyme Q system), van der Walt *et al.* (*Syst. Appl. Microbiol.* **9**: 121, 1987; key 4 spp.), Cottrell & Kock (*Syst. Appl. Microbiol.* **12**: 291, 1989; history, delimitation, phenotypic characters), Kurtzman & Liu (*Curr. Microbiol.* **21**: 387, 1990), Spaaij *et al.* (*Syst. Appl. Microbiol.* **13**: 182, 1990), Jansen van Rensburg *et al.* (*Syst. Appl. Microbiol.* **18**: 410, 1995), Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 592, 1998), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny), Kurtzman *et al.* (*FEMS Yeast Res.* **7**: 1027, 2007; phylogeny).

Myxyphe (orthographic variant), see *Myxonyphe*.

Myzeloblastanon, see *Myceloblastanon*.

nacreous, like mother-of-pearl.

Nadelspora Olson, Tiekotter & Reno (1994), Microsporidia. 1.

Nadsonia Syd. (1912), Saccharomycetales. 2, widespread (north temperate). See Golubev *et al.* (*Antonie van Leeuwenhoek* **55**: 369, 1989; key), Yamada *et al.* (*J. gen. appl. Microbiol.* Tokyo **38**: 585, 1992; phylogeny), Miller & Phaff *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 268, 1998), Schweigkofler *et al.* (*Organ. Divers. Evol.* **2**: 1, 2002; phylogeny), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Nadsoniella Issatsch. (1914), anamorphic *Herpotrichiellaceae*, Hso.0eH.6. 1 (from sea water), former USSR. See Haase *et al.* (*Stud. Mycol.* **43**: 80, 1999; phylogeny).

Nadsoniomyces Kudrjanzev (1932) = Trichosporon fide Carmo-Sousa *in* Lodder (Ed.) (*Yeasts, a taxonomic study* 2nd edn, 1970).

Nadvornikia Tibell (1984), Thelotremataceae (L). 3, widespread. See Harris (*Some Florida lichens*, 1990; posn), Lumbsch *et al.* (*Symb. bot. upsal.* **34** no. 1: 9, 2004; phylogeny).

Naegelia Rabenh. (1844) nom. dub., Fungi.

Naegiella (Rehm) Clem. (1909) = Eupropolella fide Défago (*Sydowia* **21**: 1, 1967).

Naemacyclus Fuckel (1873), Leotiomycetes. 6, widespread. See Cannon & Minter (*Mycol. Pap.* **155**: 123 pp., 1986), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Johnston (*Aust. Syst. Bot.* **19**: 135, 2006), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Naemaspora Pers. (1796) nom. conf., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Naemaspora Sacc. (1880) = Roscoepoundia fide Sutton (*Mycol. Pap.* **141**, 1977).

Naemaspora Willd. (1787) ≡ Bombardia.

Naematelia Fr. (1822) nom. dub., Basidiomycota. 1. Based on parasitized *Stereum* fide Bandoni (*Am. midl. Nat.* **66**: 319, 1961).

Naematoloma P. Karst. (1879) = Psilocybe (Fr.) P. Kumm. fide Kuyper (*in litt.*).

Naemosphaera (Sacc.) Sacc. (1892) = Naemosphaera P. Karst. fide Sutton (*in litt.*).

Naemosphaera P. Karst. (1888), anamorphic *Pezizomycotina*, Cpd.0eP.?. 1, Finland.

Naemosphaerella Höhn. (1923), anamorphic *Pezizomycotina*. 2, Brazil; Japan. See Petrak (*Sydowia* **6**: 302, 1952).

Naemospora Roth ex Kuntze (1898) nom. dub., anamorphic *Pezizomycotina*.

Naemostroma Höhn. (1919) = Septoriella fide Sutton *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**, 1973).

Naetrocymbaceae Höhn. ex R.C. Harris (1995), Pleosporales (±L). 5 gen. (+ 16 syn.), 79 spp.

Lit.: Aguirre & Hawksworth (*Biblthca Lichenol.* **25**: 249, 1987), Aguirre-Hudson & Fiol (*Lichenologist* **25**: 207, 1993), Harris (*More Florida Lichens*, 1995), Harris (*More Florida Lichens*: 192 pp., 1995), Hyde & Wong (*MR* **103**: 347, 1999).

Naetrocymbe Bat. & Cif. (1963) = Limacinula Höhn. fide Eriksson (*Op. Bot.* **60**, 1981).

Naetrocymbe Körb. ex Körb. (1865), Naetrocymbaceae (L). 12. See Eriksson (*Opera Bot.* **60**: 111, 1981; concept), Harris (*More Florida Lichens*, 1995).

Naevala B. Hein (1976), Helotiales. 6, Europe. See Hein (*Willdenowia* Beih. **9**, 1976), Nauta & Spooner (*Mycologist* **13**: 65, 1999; Brit. spp.).

Naevia Fr. (1825) = Arthonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Naevia Fr. (1849) ≡ Naevala.

Naeviella (Rehm) Clem. (1909), Helotiales. 3, Europe. See Nannfeldt (*Sydowia* **35**: 162, 1982), Scheuer (*Biblthca Mycol.* **123**: 274, 1988), Suková (*Czech Mycol.* **56**: 63, 2004).

Naeviopsis B. Hein (1976), Helotiales. 15, Europe. See Suková *et al.* (*Czech Mycol.* **55**: 223, 2003).

Naganishia Goto (1963) = Cryptococcus Vuill. fide Phaff & Fell *in* Lodder (Ed.) (*Yeasts, a taxonomic study* 2nd edn: 1088, 1970).

Nagrajia R.F. Castañeda & W.B. Kendr. (1991), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1, Cuba. See Castañeda Ruiz & Kendrick (*Univ. Waterloo Biol. Ser.* **35**: 76, 1991).

Nagrajomyces Melnik (1984), anamorphic *Pezizomycotina*, Cpd.#eP.19. 1, Russia. See Melnik (*Mikol. Fitopatol.* **18**: 9, 1984).

Naiadella Marvanová & Bandoni (1987), anamorphic *Classicula*, Hso.0eH.1. 1 (aquatic), Canada; former Czechoslovakia. See Marvanová & Bandoni (*Mycol.* **79**: 579, 1987).

Nailisporites T.C. Huang (1981), Fossil Fungi. 1 (Miocene), Taiwan.

Naïs Kohlm. (1962), Halosphaeriaceae. 2 (marine and freshwater), Europe; N. America. See Crane & Shearer (*TBMS* **86**: 509, 1986), Hyde *et al.* (*Mycoscience* **40**: 165, 1999), Kong *et al.* (*MR* **104**: 35, 2000; DNA), Pang *et al.* (*Mycol. Progr.* **2**: 29, 2003).

Nakaiomyces Kobayasi (1939) nom. dub., Fungi. Based on a parasitized *Tremella* fide Olive (*Bull. Torrey bot. Cl.* **85**: 99, 1958).

Nakaseomyces Kurtzman (2003), Saccharomycetaceae. 2, widespread. See Kurtzman (*FEMS Yeast Res.* **4**: 240, 2003), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Nakataea Hara (1939) = Pyricularia fide Sivanesan (*in litt.*), Bussaban *et al.* (*Mycol.* **97**: 1002, 2005; phylogeny, morphology).

Nakatopsis Whitton, McKenzie & K.D. Hyde (2001), anamorphic *Pezizomycotina*. 2, Malaysia. See Whitton *et al.* (*Fungal Diversity* **8**: 165, 2001).

Nakazawaea Y. Yamada, K. Maeda & Mikata (1994), Saccharomycetales. 1, USA. See Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 273, 1998), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Nalanthamala Subram. (1956), anamorphic *Rubrinectria*, Hsp.0eH.15. 2, pantropical. See Subramanian (*J. Indian bot. Soc.* **35**: 478, 1956), Schroers *et al.* (*Mycol.* **97**: 375, 2005; phylogeny, morphology).

Namakwa Hale (1988), Parmeliaceae (L). 2, S. Africa. See Thell *et al.* (*Mycol. Progr.* **3**: 297, 2004; phylogeny), Thell *et al.* (*J. Hattori bot. Lab.* **100**: [797], 2006).

nameko, basidioma of the edible *Pholiota nameko* cultivated in Japan (Chang & Hayes, 1978).

names (1) of fungi, see Common names, Nomenclature; (2) Escallon (*Precis de myconymie*, 1989; meaning of scientific names).

Nannenga-Bremekamp (Neeltje Elizabeth; 1916-1996; Netherlands). An amateur and authority on *Mycetozoa*, noted for her acute observation; contributed to understanding of certain difficult genera (*Cribraria*, *Diderma*, *Didymium*, *Licea*, *Reticularia* and the *Stemonitidaceae* in general); her illustrative work was exemplary, and her book became a worldwide standard on the subject. *Publs. De Nederlandse Myxomyceten* (1974); *A Guide to Temperate Myxomycetes* (1991). *Biogs, obits etc.* Ing (*Mycologist* **10**: 191, 1996) [portrait]; Rammeloo (*Coolia* **40**: 1, 1997).

Nannfeldt (John Axel Frithiof; 1904-1985; Sweden). Assistant Professor (*c.* 1932-1939) then Professor and Director of the Botanical Garden and Herbarium (1939-1970), University of Uppsala. He produced critical accounts of numerous groups of discomycete fungi, and later some pyrenomycetes (especially *Sordariales* and *Xylariales*) and smuts. He was noted for his innovative thinking, and his dedication to mycology: he continued to dictate the text of his final paper, from a hospital oxygen tent. *Publs.* Studien über die Morphologie und Systematik der nichlichenisierten inoperculaten Discomyceten. *Nova Acta Regiae Societatis Scientiarum Upsaliensis* (1932) [this work established two main types of ascomycete ontogeny: ascohymenial and ascolocular (see also Luttrell)]; (with E. Melin) *Researches into the Blueing of Ground Wood-pulp* (1934) [a pioneering investigation into blue-stain fungi]. *Biogs, obits etc.* Grummann (1974: 495); Holm (*Mycol.* **78**: 692, 1986).

Nannfeldtia Petr. (1947), ? Leptopeltidaceae. 1, Austria. See Scheuer (*Biblthca Mycol.* **123**, 1988).

Nannfeldtiella Eckblad (1968) = Pseudombrophila fide Harmaja (*Ann. bot. fenn.* **16**: 159, 1979), Nannfeldt (*Sydowia* **35**: 166, 1982), van Brummelen (*Libri Botanici* **14**, 1995), Hansen *et al.* (*Mycol.* **97**: 1023, 2005), Yao & Spooner (*Fungal Diversity* **22**: 267, 2006).

Nannfeldtiomyces Vánky (1981), Doassansiaceae. 2 (on *Sparganium*), Europe; N. America. See Vánky (*Sydowia* **34**: 171, 1981).

Nannizzia Stockdale (1961) = Arthroderma fide Weitzman *et al.* (*Mycotaxon* **25**: 505, 1986), Kawasaki *et al.* (*Mycopathologia* **118**: 95, 1992), Hirai *et al.* (*Antonie van Leeuwenhoek* **83**: 11, 2003).

Nannizziopsis Currah (1985), Onygenaceae. Anamorph *Chrysosporium*. 3, widespread. See Guarro *et al.* (*Mycotaxon* **42**: 193, 1991; key), Udagawa & Uchiyama (*Mycoscience* **40**: 291, 1999), Sugiyama & Mikawa (*Mycoscience* **42**: 413, 2001), Solé *et al.* (*MR* **106**: 388, 2002; phylogeny), Thomas *et al.* (*Medical Mycology* **40**: 143, 2002; from crocodile).

Nanomyces Thaxt. (1931), Laboulbeniaceae. 3, Pacific. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Nanoschema B. Sutton (1980), anamorphic *Pezizomycotina*, St.1eH.15. 1, Solomon Islands. See Sutton

(*The Coelomycetes*: 589, 1980).

Nanoscypha Denison (1972), Sarcoscyphaceae. Anamorph *Molliardiomyces*. *c*. 10, widespread. See Das & Pant (*Indian Phytopath.* **37**: 294, 1984; Indian spp.), Pfister (*Mem. N. Y. bot. Gdn* **49**: 339, 1989), Harrington (*Mycol.* **90**: 235, 1998; DNA), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Nanostictis M.S. Christ. (1954), Stictidaceae. 2 (on lichens, esp. *Peltigera*), Denmark; N. America. See Sherwood (*Sydowia* **38**: 267, 1986).

Nanstelocephala Oberw. & R.H. Petersen (1990), Cortinariaceae. 1, USA. See Oberwinkler & Petersen (*Mycol.* **82**: 783, 1990).

Naohidea Oberw. (1990), Naohideales. 1, widespread (north temperate). See Piątek (*Polish Botanical Journal* **47**: 49, 2002; rediscov. in Poland).

Naohideales R. Bauer, Begerow, J.P. Samp., M. Weiss & Oberw. (2006). Cystobasidiomycetes. 1 gen., 1 spp. No familes recognized.

Naohidemyces S. Sato, Katsuya & Y. Hirats. (1993), Pucciniastraceae. 3 (on *Tsuga* (0, I); on *Ericaceae* (II, III)), north temperate. See Sato *et al.* (*TMSJ* **34**: 48, 1993).

Naothyrsium Bat. (1960), anamorphic *Pezizomycotina*, Cpt.1eP.1. 1, Brazil. See Batista (*Publções Inst. Micol. Recife* **250**: 5, 1960).

Napamichum J.I.R. Larsson (1990), Microsporidia. 3.

Napicladium Thüm. (1875) = Fusicladium fide Hughes (*CJB* **36**: 727, 1958), Schubert *et al.* (*Schlechtendalia* **9**, 2003).

napiform, turnip-like in form (Fig. 23.26).

Napomyces Setch. ex Clem. & Shear (1931) ≡ Daleomyces fide Korf (*Mycol.* **48**: 711, 1956).

Naranus Ts. Watan. (1995), anamorphic *Pezizomycotina*. 1, Japan. See Watanabe (*MR* **99**: 806, 1995).

Narasimhania Thirum. & Pavgi (1952), Doassansiaceae. 1 (on *Alisma*), India; Mali. See Vánky (*Sydowia* **34**: 167, 1981).

Narasimhella Thirum. & P.N. Mathur (1966) = Gymnoascus fide von Arx (*Persoonia* **13**: 173, 1986), Solé *et al.* (*Stud. Mycol.* **47**: 141, 2002; phylogeny).

Nascimentoa Cif. & Bat. (1956) = Spiropes fide Ellis (*Mycol. Pap.* **114**, 1968).

nassace (nasse), the finger-like protrusion of the inner part of a bitunicate ascus into the inner tunica; internal apical beak; see ascus.

nasse, see nassace.

Natalia Fr. (1847) [non *Natalia* Hochst. 1841, *Melianthaceae*] ≡ Levieuxia.

Natantispora J. Campb., J.L. Anderson & Shearer (2003), Halosphaeriaceae. 2, USA. See Campbell *et al.* (*Mycol.* **95**: 543, 2003), Sakayaroj *et al.* (*Mycol.* **97**: 804, 2005; key).

Natarajania Pratibha & Bhat (2006), anamorphic *Pezizomycotina*. 1 (from decaying leaves), India.

native bread, see blackfellows' bread.

Nattrassia B. Sutton & Dyko (1989) = Fusicoccum fide Sutton & Dyko (*MR* **93**: 483, 1989), Roeijmans *et al.* (*J. Med. Vet. Mycol.* **35**: 181, 1997; molecular taxonomy), Sigler *et al.* (*J. Clin. Microbiol.* **35**: 433, 1997; in man), Farr *et al.* (*Mycol.* **97**: 730, 2005; synonymy).

Naucoria (Fr.) P. Kumm. (1871), Strophariaceae. 30 (usually associated with *Alnus*), widespread. Because of nomenclatural complications the name *Alnicola* is often used for this genus. See Orton (*TBMS* **43**: 308, 1960), Reid (*TBMS* **82**: 191, 1984; key 17 Br. spp.), Moreau (*Fungal Diversity* **20**: 121, 2005; as *Alnicola*), Moreau *et al.* (*Mol. Phyl. Evol.* **38**: 794, 2006; phylogeny, as *Alnicola*).

Naufragella Kohlm. & Volkm.-Kohlm. (1998), Halosphaeriaceae. 2 (marine), Europe; N. America. See Kohlmeyer & Volkmann-Kohlmeyer (*SA* **16**: 9, 1998).

Naumov (Nikolai Aleksandrovich; 1888-1959; Russia). Student, Department of Natural Sciences, St Petersburg University (1906-1910); Assistant, Bureau of Mycology and Phytopathology (1910-1919); organizer and Head of Phytopathology Station, Tsarskoye Selo (1919-1931); Head, Phytopathology Department (1930-1935) then Director (1935-1954), All Union Institute of Plant Protection; Lenin Prize (1954). Directed development of plant pathology (particularly diseases of brassicas, cereals and potato), and research on the mechanism of fungicides in the difficult conditions of the Soviet Union under Stalin and World War II; produced textbooks highly influential in the Soviet Union and China. *Publs*. [*Tables of the Identification of Mucoraceae*] (1915) [in Russian]; [*Methods of Microscopic Investigations in Phytopathology*] (1932) [in Russian]; [*Methods of Mycological and Phytopathological Investigations*] (1937) [in Russian]; [*Mycoflora of Leningrad Oblast'*] vols 1 & 2 (1954, 1964) [in Russian, published posthumously]. *Biogs, obits etc.* Khokhryakov ([*Mikologiya i Fitopatologiya*] **2**: 167, 1968) [portrait, in Russian]; Khokhryakov, Novotelnova & Potlaichuk ([*Mikologiya i Fitopatologiya*] **3**: 197, 1969) [in Russian].

Naumovela Kravtzev (1955), Pezizomycotina. 2 (on wood), former USSR. See Kravtzev (*Trudy Inst. Bot., Alma-Ata* **2**: 153, 1955).

Naumovia Dobrozr. (1928) = Rosenscheldia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Naumovia Kurtzman (2003) ≡ Naumovozyma.

Naumoviella Novot. (1950) = Mortierella fide Hesseltine (*Mycol.* **47**: 344, 1955).

Naumovozyma Kurtzman (2008), Saccharomycetaceae. 2. See Kurtzman (*FEMS Yeast Res.* **4**: 240, 2003; as *Naumovia*), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny; as *Naumovia*).

Nautosphaeria E.B.G. Jones (1964), Halosphaeriaceae. 1 (marine), British Isles. See Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991).

Navaneethospora V.G. Rao (1994), anamorphic *Pezizomycotina*, Hso.?.?. 1, India. See Rao (*Advances in Mycology and Aerobiology* (Dr S.T. Tilak Commemoration Volume). *Current Trends in Life Sciences* **20**: 134, 1994).

navel, see umbilicus.

Navicella Fabre (1879), Massariaceae. 5, widespread. See Eriksson (*Op. Bot.* **60**, 1981), Holm & Holm (*Symb. bot. upsal.* **28** no. 2, 1988), Barr (*N. Amer. Fl.* ser. 2 **13**: 129 pp., 1990; posn), Aptroot & van Iperen (*Nova Hedwigia* **67**: 481, 1998), Elshafie *et al.* (*Sydowia* **57**: 19, 2005; Costa Rica).

navicular (naviculate), boat-like in form; cymbiform (Fig. 23.32).

Navisporus Ryvarden (1980), Polyporaceae. 6, widespread (pantropical). See Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 429, 1980), Decock & Herrera Figueroa (*Cryptog. Mycol.* **21**: 153, 2000; Cuba), Ryvarden & Iturriaga (*Mycol.* **95**: 1066, 2003; Venezuela).

Nawawia Marvanová (1980), anamorphic *Pezizomy-*

cotina, Hso.0eH.15. 2 (aquatic), widespread. See Kuthubutheen *et al.* (*CJB* **70**: 96, 1992), Hyde *et al.* (*MR* **100**: 810, 1996; S Africa), Mel'nik & Hyde (*Mikol. Fitopatol.* **40**: 411, 2006; E Russia).

Necator Massee (1898), anamorphic *Erythricium*. 1, S.E. Asia. See Brooks & Sharples (*Ann. appl. Biol.* **2**: 58, 1915).

Necium Arthur (1907) = Melampsora fide Davis (*Transactions of the Wisconsin Academy of Sciences, Arts and Letters* **18**: 78, 1915).

Necol technique, see Mounting media.

necral layer, a layer of horny dead fungal hyphae with indistinct lumina in or near the cortex of lichens; **epinecral layer** if above the algal layer, **hyponecral layer** if below.

Necraphidium Cif. (1951), anamorphic *Pezizomycotina*, Hso.0-1eH.?. 1 (on larvae of *Callipterus*), Italy. See Ciferri (*Mycopath. Mycol. appl.* **6**: 25, 1951).

necrophagous, saprobic.

necrophyte, an organism living on dead material (Münch); cf. perthophyte, saprophyte.

Necrosis Paulet (1793) = Ustilago fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

necrosis, death of plant cells, esp. when resulting in the tissue becoming dark in colour; commonly a symptom of fungus infection.

necrotroph, a parasite that derives its energy from dead cells of the host (Thrower, *Phytopath. Z.* **56**: 258, 1966). Cf. biotroph.

nectar, the sticky, sometimes sweet, secretion (esp. of pycnia of rusts) in which spores or spermatia may be freed, and which has an attraction for insects.

Nectaromyces Syd. & P. Syd. (1919) = Metschnikowia fide von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977), Giménez-Jurado (*Syst. Appl. Microbiol.* **15**: 432, 1992; teleomorph).

Nectaromycetaceae Cif. & Redaelli (1929) = Metschnikowiaceae.

Nectria (Fr.) Fr. (1849) nom. cons., Nectriaceae. Anamorphs *Tubercularia*, *Acremonium*-like. 82 (from decaying wood, bark etc.), widespread. *N. cinnabarina* (coral spot of woody plants. See also Fungicolous fungi. See Lohman & Watson (*Lloydia* **6**: 77, 1943; spp. on hardwoods), Booth (*Mycol. Pap.* **73**, 1959; UK, keys), Passeur (*Sydowia* **27**: 7, 1975; morphology, substratum), Perrin (*BSMF* **92**: 335, 1976; key Eur. spp.), Doyle (*Mycol.* **70**: 355, 1978; metabolites), Rossman (*Mycol. Pap.* **150**, 1983; phragmosporous spp.), Dargan *et al.* (*Nova Hedwigia* **42**: 109, 1986; Himalayas), Samuels (*Brittonia* **40**: 306, 1988), Samuels (*Mem. N. Y. bot. Gdn* **48**: 1, 1988; fungicolous spp.), Rossman (*Mem. N. Y. bot. Gdn* **49**: 253, 1989; key 28 spp.; *N. cinnabarina* agg.), Rossman (*The Fungal Holomorph: Mitotic, Meiotic and Pleomorphic Speciation in Fungal Systematics*: 149, 1993; review), Samuels & Brayford (*Sydowia* **46**: 75, 1994; spp. with striate ascospores), Rossman (*Mycol.* **88**: 1, 1996; phylogeny, review), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999; generic revision), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Nectriaceae Tul. & C. Tul. (1865), Hypocreales. 57 gen. (+ 64 syn.), 646 spp.

Lit.: Brayford & Samuels (*Mycol.* **85**: 612, 1993), Samuels & Brayford (*Sydowia* **45**: 55, 1993), Rehner & Samuels (*CJB* **73**: S816, 1995), Nirenberg & O'Donnell (*Mycol.* **90**: 434, 1998), O'Donnell *et al.* (*Mycol.* **90**: 465, 1998), Victor *et al.* (*MR* **102**: 273, 1998), Aoki & O'Donnell (*Mycol.* **91**: 597, 1999), Arie *et al.* (*Mycoscience* **40**: 311, 1999), Leslie (*Pl. Path. J.* **15**: 259, 1999), Möller *et al.* (*J. Phytopath.* **147**: 497, 1999), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Baayen *et al.* (*Phytopathology* **90**: 891, 2000), Lieckfeldt & Seifert (*Stud. Mycol.* **45**: 35, 2000), O'Donnell *et al.* (*Proc. natn Acad. Sci. U.S.A.* **97**: 7905, 2000), Rossman (*Stud. Mycol.* **45**: 27, 2000), Schoch *et al.* (*Stud. Mycol.* **45**: 45, 2000), Crous (*Taxonomy and Pathology of Cylindrocladium (Calonectria) and Allied Genera*: 278 pp., 2002), Brayford *et al.* (*Mycol.* **96**: 572, 2004), Crous *et al.* (*Stud. Mycol.* **55**: 213, 2006).

Nectricladiella Crous & C.L. Schoch (2000), Nectriaceae. Anamorph *Cylindrocladiella*. 2, widespread (tropical). See Schoch *et al.* (*Stud. Mycol.* **45**: 45, 2000), Crous (*Taxonomy and Pathology of Cylindrocladium (Calonectria) and Allied Genera*: 278 pp., 2002; revision).

Nectriella Nitschke ex Fuckel (1870), Bionectriaceae. Anamorphs *Acremonium*-like, *Kutilakesa*, *Dendrodochium*-like. 35 (on dead plant tissues or fungicolous), widespread (temperate). See Lowen (*Mycotaxon* **39**: 461, 1990; concept), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Ramaley (*Mycotaxon* **90**: 181, 2004; on *Agavaceae*).

Nectriella Sacc. (1877) ≡ Pseudonectria fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

NectrioidaceaeSacc. (1884).

Lit.: Petch (*TBMS* **26**: 53, 1943; genera), Sutton *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**, 1973; discussion family names).

Nectriopsis Maire (1911), Bionectriaceae. Anamorphs *Acremonium*-like, *Rhopalocladium*. 58 (on fungi and myxomycetes), widespread. See Samuels (*Mem. N. Y. bot. Gdn* **48**, 1988), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny), Samuels *et al.* (*CBS Diversity Ser.* **4**, 2006; USA).

needle cast (of conifers), loss of leaves caused by spp. of *Hypoderma*, *Lophodermium*, *Rhabdocline*, or other *Rhytismatales*.

Neelakesa Udaiyan & V.S. Hosag. (1992), Sordariomycetes. 1 (submerged wood), India. See Udaiyan & Hosagoudar (*J. Econ. Taxon. Bot.* **15**: 649, 1992).

Nees (von Esenbeck, Christian Gottfried Daniel; 1776-1858; Germany). Medical degree, Giesen (1800); Professor of Botany, Erlangen (1818-1819); Professor of Botany, Bonn (1819-1830); Professor of Botany, Breslau (1831-1851) [dismissed for alleged 'moral turpitude', but more probably because of involvement in a movement for emancipation of the under-privileged]. Produced influential early work on fungal taxonomy. *Publs. Das System der Pilze und Schwämme* (1817) [366 colour figures on 44 plates]; *Horae Physicae Berolinensis* (1820); also various papers jointly with his brother (T.F.L. Nees, q.v.). *Biogs, obits etc.* Grummann (1974: 34); Stafleu & Cowan (*TL-2* **3**: 705, 1981).

Nees (von Esenbeck, Theodor Friedrich Ludwig; 1787-1837; Germany, later Switzerland, Netherlands). Pharmaceutical Assistant, Basle (1811-1816), then Hanau (1816-1817); Inspector, Botanic Garden, Leiden (1817-1819); Garden Inspector and Lecturer (1819-1822) then Professor of Pharmacy (1822-1827) then Regius Professor of Pharmacy (1827-1833) then Co-Director of Botanic Garden (1833 onwards), University of Bonn. Produced influential

early work on fungal taxonomy. *Publs*. (with Henry) *Das System der Pilze* (1837, with coloured plates) [Abt. 2 by Bail (1858)]; also various papers jointly his brother (C.G.D. Nees, q.v.). *Biogs, obits etc.* Grummann (1974: 34); Stafleu & Cowan (*TL-2* **3**: 712, 1981).

Neesiella Kirschst. (1935) [non *Neesiella* Schiffn. 1893, *Hepaticae*] ≡ Myconeesia.

Negeriella Henn. (1897), anamorphic *Pezizomycotina*, Hsy.≡ eP.?. 2, S. America. See Morris (*Mycopathologia* **33**: 183, 1967).

Neilreichina Kuntze (1891) ≡ Polytrichia.

Nelliemelba J.I.R. Larsson (1983), Microsporidia. 1.

Nemaclada J. Sm. (1896), Fossil Fungi (mycel.) Fungi. 1 (Carboniferous), British Isles.

Nemacola A. Massal. (1855) nom. dub., ? Dothideomycetes (L). Possibly an alga.

Nemadiplodia Zambett. (1955) = Lasiodiplodia fide Petrak (*Sydowia* **16**: 353, 1963).

Nemania Gray (1821), Xylariaceae. Anamorph *Geniculosporium*. 44, widespread. See Pouzar (*Česká Mykol.* **39**: 129, 1985), Pouzar (*Česká Mykol.* **39**: 15, 1985), Petrini & Rogers (*Mycotaxon* **26**: 40, 1986; key, as *Hypoxylon serpens* group), Læssøe (*SA* **13**: 113, 1994), Granmo *et al.* (*Sommerfeltia* **27**, 1999), Sánchez-Ballesteros *et al.* (*Mycol.* **92**: 964, 2000; phylogeny), Stadler *et al.* (*Mycotaxon* **77**: 379, 2001; chemistry), Ju & Rogers (*Nova Hedwigia* **74**: 75, 2002; revision), Ju *et al.* (*Mycol.* **97**: 562, 2005), Ju *et al.* (*Mycol.* **99**: 612, 2007; phylogeny), Tang *et al.* (*MR* **111**: 392, 2007; Thailand).

Nemaplana J. Sm. (1896), Fossil Fungi (mycel.) ? Fungi. 1 (Carboniferous), British Isles.

Nemaria Navas (1909) = Roccella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Nemariaceae Navas (1910) = Roccellaceae.

Nematidia Stirt. (1879) = Eremothecella fide Sérusiaux (*SA* **11**: 39, 1992).

Nematococcomyces C.L. Hou, M. Piepenbr. & Oberw. (2004), Rhytismataceae. 1, China. See Hou *et al.* (*Mycol.* **96**: 1381, 2004).

Nematococcus Kütz. (1833) nom. dub., Fungi.

Nematocolla Link (1833) = Myxosporium fide Link (*Handbuck zur Erkennung der Nutzbarsten und am Häufigsten Vorkommenden Gewächse* **3**, 1833).

Nematoctonus Drechsler (1941), anamorphic *Hohenbuehelia*, Hso.0-1eP.10+1. 16 (with clamp connexions, on nematodes), widespread. See Giuma *et al.* (*TBMS* **60**: 49, 1973; nematoxins), Thorn & Barron (*Mycotaxon* **25**: 321, 1986; key 14 spp.), Rubner (*Stud. Mycol.* **39**, 1996).

nematodes (fungi pathogenic to), see Mycopesticides, Predacious fungi, *Zoopagaceae*.

nematogenous, of conidiogenous cells arising at all levels from single hyphae; lanose. See Gams (*Cephalosporium-artige Schimmelpilze*, 1971).

Nematogonum Desm. (1834), anamorphic *Pezizomycotina*, Hso.0eH.3. 2 (contact mycoparasites), widespread (temperate). See Gams (*Revue Mycol.* Paris **39**: 273, 1975), Walker & Minter (*TBMS* **77**: 299, 1981).

Nematographium Goid. (1935), anamorphic *Pezizomycotina*, Hsy.0eH.?. 5, Europe.

Nematoloma, see *Naematoloma*.

Nematomyces Faurel & Schotter (1966) = Gliomastix fide von Arx (*Gen. Fungi Sporul. Cult.*, 1970).

Nematonostoc Nyl. ex Elenkin (1934), Algae. Algae.

nematophagous, nematode-feeding; see Predacious fungi. Nematophagous fungi are also reported as fossils (Jansson & Poinar, *TBMS* **87**: 471, 1986).

Nematophagus Mekht. (1975) = Arthrobotrys fide Scholler *et al.* (*Sydowia* **51**: 89, 1999).

Nematora Fée (1825) = Strigula fide Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Nematospora Peglion (1897) = Eremothecium fide Batra (*USDA Tech. Bull.* **1469**, 1973), Kurtzman (*J. Industr. Microbiol.* **14**: 523, 1995), de Hoog *et al.* in Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 201, 1998).

Nematospora Tassi (1904) ≡ Giulia.

Nematosporaceae E.K. Novák & Zsolt (1961) = Eremotheciaceae.

Nematostigma Syd. & P. Syd. (1913), Pseudoperisporiaceae. 1, S. Africa. See Hansford (*Mycol. Pap.* **15**, 1946), Petrak (*Sydowia* **3**: 251, 1949).

Nematostoma Syd. & P. Syd. (1914), Pseudoperisporiaceae. Anamorph *Chaetosticta*. *c.* 12, widespread (tropical). See Hansford (*Mycol. Pap.* **15**, 1946), Petrak (*Sydowia* **3**: 251, 1949), Rossman (*Mycol. Pap.* **157**, 1987), Barr (*Mycotaxon* **64**: 149, 1997).

Nematothecium Syd. & P. Syd. (1912), ? Pseudoperisporiaceae. Anamorph *Atractilina*. *c.* 2, widespread (tropical). See Rossman (*Mycol. Pap.* **157**, 1987).

nematotoxin, a metabolic product toxic to nematodes, e.g. **nematoctonins** from *Nematoctonus* spp. (Kennedy & Taplin, *TBMS* **70**: 140, 1978); see also Mycopesticides.

Nemecomyces Pilát (1933) = Pholiota fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

nemin, a principle from a nematode-free culture filtrate of *Neoplectana glaseri*, which caused *Arthrobotrys conoides* to differentiate traps (Pramer & Stoll, *Science, N.Y.* **129**: 966, 1959); see Predacious fungi.

nemoral, living in woods or groves.

Nemostroma, see *Naemostroma*.

Nemozythiella Höhn. (1925), anamorphic *Pezizomycotina*, St.1eH.?. 1, Europe.

neo- (prefix), new.

Neoalpakesa Punith. (1981), anamorphic *Pezizomycotina*, Cpd.0eH.19. 1, British Isles. See Punithalingam (*Nova Hedwigia* **34**: 137, 1981).

Neoarachnotheca Ulfig, Cano & Guarro (1997), Onygenaceae. 2, Australasia; S. Africa. See Cano *et al.* (*Antonie van Leeuwenhoek* **72**: 149, 1997).

Neoarbuscula B. Sutton (1983), anamorphic *Pezizomycotina*, Hso.#eP.42. 1, widespread (tropical). See Subramanian & Vittal (*CJB* **51**: 977, 1973).

Neoarcangelia Berl. (1900) = Pleurostoma fide Shear (*Mycol.* **29**: 355, 1937).

Neoballadyna Boedijn (1961) = Dysrhynchis fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Neobarclaya Sacc. (1899), anamorphic *Pezizomycotina*, Cac.1eP.19. 1, USA. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Neobarya Lowen (1986), ? Clavicipitaceae. Anamorph *Acremonium*-like. 3 (parasitic on agarics), widespread. See Seifert (*SA* **5**: 310, 1986; status), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999; possible synonym of *Berkelella*), Candoussau *et al.* (*Sydowia* **59**: 179, 2008; monogr.).

Neobroomella Petr. (1947), Amphisphaeriaceae. Anamorph *Pestalotiopsis*. 1, Syria. See Eriksson (*SA* **5**: 145, 1986), Kang *et al.* (*MR* **103**: 53, 1999).

Neobulgaria Petr. (1921), ? Helotiaceae. Anamorph

Myrioconium-like. 8, Europe. See Verkley (*Persoonia* **15**: 3, 1992; ultrastr.), Landvik *et al.* (*Mycoscience* **37**: 237, 1996; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Neocallimastigaceae I.B. Heath (1983), Neocallimastigales. 6 gen. (+ 1 syn.), 20 spp.

Lit.: Heath *et al.* (*CJB* **61**: 295, 1983), Heath *et al.* (*Fourth International Mycological Congress Abstracts*, 1989), Coleman *in* Levett (Ed.) (*Anaerobic microbiology. A practical approach*, 1991), Dore & Stahl (*CJB* **69**: 1964, 1991; RNA, phylogeny), Li & Heath (*Fifth International Colloquium on Invertebrate Pathology and Microbial Control* [Adelaide, Australia, 20-24 August 1990] Proceedings and Abstracts, 1992), Li *et al.* (*CJB* **71**: 393, 1993), Ho & Barr (*Mycol.* **87**: 655, 1995).

Neocallimastigales J.L. Li, I.B. Heath & L. Packer (1993). Neocallimastigomycetes. 1 fam., 6 gen., 20 spp. Thallus mono- or polycentric; zoospores mono- or polyflagellate, without mitochondria; kinetosomes with a skirt, spur, cylinder and microtubule root, lacking props; anaerobic saprobes occurring in the guts of herbivores. Fam.:

Neocallimastigaceae

Lit.: Heath (*CJB* **67**: 2815, 1989; emend.), Heath *et al.* (*CJB* **71**: 393, 1993), Li & Heath (*CJB* **70**: 1738, 1992; RNA, cladistics), Trinci *et al.* (*MR* **98**: 129, 1994, review), Ho & Barr (*Mycol.* **87**: 655, 1995; taxonomy), James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), Hibbett *et al.* (*MR* **111**: 109, 2007), and see under Familes.

Neocallimastigomycetes M.J. Powell (2007), Neocallimastigomycota. 1 ord., 1 fam., 6 gen., 20 spp. Ord.:

Neocallimastigales

Lit.: James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), and see under Order.

Neocallimastigomycota M.J. Powell (2007), Fungi. 1 class., 1 ord., 1 fam., 6 gen., 20 spp. Class:

Neocallimastigales

Lit.: James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), and see under Orders.

Neocallimastix Vavra & Joyon ex I.B. Heath (1983), Neocallimastigaceae. 5 (in rumen of sheep and cattle), widespread. See Orpin & Munn (*TBMS* **86**: 178, 1986; emend.), Wubah *et al.* (*CJB* **69**: 835, 1991; morphology), Wubah *et al.* (*Mycol.* **83**: 40, 1991; resistant body), Chen *et al.* (*FEMS Microbiol. Lett.* **221**: 227, 2003; genetics).

Neocapnodium W. Yamam. (1955) = Phragmocapnias fide Reynolds (*Mycotaxon* **8**: 917, 1979).

Neocarpenteles Udagawa & Uchiy. (2002), Trichocomaceae. 1. See Udagawa & Uchiyama (*Mycoscience* **43**: 4, 2002).

Neocatapyrenium H. Harada (1993), Verrucariaceae (L). 4, widespread. See Harada (*Nat. Hist. Res.* **2**: 129, 1993), Breuss (*Bryologist* **108**: 537, 2005; N America), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

Neochaetospora B. Sutton & Sankaran (1991), anamorphic *Pezizomycotina*, Cpd.≡ eH.1. 1 (coprophilous), Sahara. See Sutton & Sankaran (*MR* **95**: 768, 1991).

Neoclaviceps J.F. White, Bills, S.C. Alderman & Spatafora (2001), Clavicipitaceae. 1, Costa Rica. See White *et al.* (*Mycol.* **93**: 90, 2001).

Neoclitocybe Singer (1962), Tricholomataceae. 10, widespread (esp. tropical). See Singer (*Sydowia* **15**: 55, 1961), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; phylogeny).

Neococcomyces Y.R. Lin, C.T. Xiang & Z.Z. Li (1999), Rhytismataceae. 1, China. See Lin *et al.* (*Mycosystema* **18**: 357, 1999), Gao & Hou (*Nova Hedwigia* **82**: 123, 2006).

Neocoleroa Petr. (1934) = Wentiomyces fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Neocordyceps Kobayasi (1984), ? Cordycipitaceae. 1 (entomogenous), Japan. See Fukatsu (*Nippon Kingakukai Kaiho* **40**: 34, 1999), Fukatsu & Nikoh (*Mycology Series* **19**: 311, 2003), Sung *et al.* (*Stud. Mycol.* **57**, 2007).

Neocosmospora E.F. Sm. (1899), Nectriaceae. Anamorph *Acremonium*-like. 13, widespread (esp. tropical). See also *Haematonectria*. See Cannon & Hawksworth (*TBMS* **82**: 673, 1984; key), Udagawa *et al.* (*Sydowia* **41**: 349, 1989; key 7 spp.), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), O'Donnell (*Mycol.* **92**: 919, 2000; phylogeny), Cornely *et al.* (*Emerging Infectious Diseases* **7**: 149, 2001; clinical strain).

Neocryptospora Petr. (1959), Pezizomycotina. 1, Brazil. See Petrak (*Sydowia* **13**: 51, 1959).

Neocudoniella S. Imai (1941), ? Helotiaceae. 2, Japan; Canada. See Kohn *et al.* (*Mycol.* **78**: 934, 1986).

Neodasyscypha Spooner (1987) nom. inval. = Neodasyscypha Suková & Spooner.

Neodasyscypha Suková & Spooner (2005), Hyaloscyphaceae. 2, widespread (temperate). See Spooner (*Biblthca Mycol.* **116**: 711 pp., 1987), Eriksson & Hawksworth (*SA* **7**: 83, 1988; status), Suková (*Czech Mycol.* **57**: 139, 2005).

Neodeightonia C. Booth (1970), Botryosphaeriaceae. 1. See Punithalingam (*Mycol. Pap.* **119**, 1969), von Arx & Müller (*Stud. Mycol.* **9**, 1975), Phillips *et al.* (*Persoonia* **21**: in press, 2008; phylogeny).

Neodimerium Petr. (1950) = Epipolaeum fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Neodiplodina Petr. (1954), anamorphic *Pezizomycotina*, St.1eH.?. 1, Australia. See Petrak (*Sydowia* **8**: 36, 1954).

Neoerysiphe U. Braun (1999), Erysiphaceae. Anamorph *Oidium* subgen. *Striatoidium*. 5, widespread. See Braun (*Beih. Nova Hedwigia* **89**, 1987; key (as *Erysiphe* sect. *Galeopsidis*)), Braun (*Schlechtendalia* **3**: 50, 1999; taxonomy), Bolay (*Cryptogamica Helvetica* **20**, 2005; Switzerland), Voytyuk *et al.* (*Mycotaxon* **97**: 247, 2006; Israel), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Neofabraea H.S. Jacks. (1913), Dermateaceae. Anamorphs *Cryptosporiopsis*, *Phlyctema*. 4, widespread. Molecular data do not support separation from *Pezicula*. See Verkley (*Stud. Mycol.* **44**, 1999), Abeln *et al.* (*Mycol.* **92**: 685, 2000; phylogeny), Cunnington (*Australas. Pl. Path.* **33**: 453, 2004; Australia), Gariépy *et al.* (*Can. J. Pl. Path.* **27**: 118, 2005; Pacific NW), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Neoflageoletia J. Reid & C. Booth (1966), Hyponectriaceae. 1 (on bamboo stem), Philippines. See Reid & Booth (*CJB* **44**: 445, 1966).

Neofracchiaea Teng (1938), Scortechiniaceae. 1, China; USA. See Huhndorf *et al.* (*MR* **108**: 1384, 2004; phylogeny).

Neofuckelia Zeller & Goodd. (1935), anamorphic *Pezizomycotina*, St.0eH.?. 1, N. America.

Neofuscelia Essl. (1978) = Xanthoparmelia fide Elix (*Bryologist* **96**: 359, 1993; close to *Xanthoparmelia*) but see also Elix (*Flora of Australia* **55**: 68, 1994),

Krug & Sang (*Flechten Follmann* Contributions to Lichenology in Honour of Gerhard Follmann: 263, 1995; Namibia), Rico & Manrique (*Lazaroa* **16**: 9, 1995; Spain), Crespo & Cubero (*Lichenologist* **30**: 369, 1998; phylogeny), Elix (*Mycotaxon* **71**: 431, 1999; S hemisphere), Elix (*Australasian Lichenology* **51**: 7, 2002; chemistry), Elix (*Australasian Lichenology* **53**: 14, 2003; Australia), Giordani *et al.* (*Lichenologist* **35**: 377, 2003; Italy), Blanco *et al.* (*Taxon* **53**: 959, 2004; phylogeny, synonymy with *Xanthoparmelia*), Thell *et al.* (*Mycol. Progr.* **3**: 297, 2004; phylogeny), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny).

Neofusicoccum Crous, Slippers & A.J.L. Phillips (2006), anamorphic *Botryosphaeriaceae*, H?.?.?. 13, widespread. See Morgan-Jones & White (*Mycotaxon* **30**: 117, 1987), Darvas (*Phytophylactica* **23**: 295, 1991; S Africa), Jacobs & Rehner (*Mycol.* **90**: 601, 1998; morphology, ITS), Smith & Stanosz (*Mycol.* **93**: 505, 2001), Phillips *et al.* (*Sydowia* **54**: 59, 2002), Denman *et al.* (*Mycol.* **95**: 294, 2003; on *Proteaceae*), Slippers *et al.* (*Stud. Mycol.* **50**: 343, 2004; on *Eucalyptus*), van Niekerk *et al.* (*Mycol.* **96**: 781, 2004; on *Vitis*), Barber *et al.* (*MR* **109**: 1347, 2005; synanamorph), Slippers *et al.* (*Mycol.* **97**: 99, 2005; on *Mangifera*), Crous *et al.* (*Stud. Mycol.* **55**: 247, 2006), Slippers *et al.* (*Pl. Path.* **56**: 128, 2007; on *Rosaceae*).

Neoligniella Naumov (1951), anamorphic *Pezizomycotina*, St.0eH.?. 1, former USSR. See Naumov (*Bot. Mater. Otd. Sporov. Rast. Bot. Inst. Komarova Akad. Nauk S.S.S.R.* **7**: 116, 1951).

Neolinocarpon K.D. Hyde (1992) = Linocarpon fide Yanna & Ho (*MR* **107**: 1305, 2003; ultrastr.).

Neolysurus O.K. Mill., Ovrebo & Burk (1991), Phallaceae. 1, Costa Rica. See Miller *et al.* (*MR* **95**: 1230, 1991).

Neomarssoniella U. Braun (1991), anamorphic *Pezizomycotina*, Cac.1eH.?. 2, Europe; N. America. See Braun (*Nova Hedwigia* **53**: 304, 1991).

Neomelanconium Petr. (1940), anamorphic *Pezizomycotina*, St.0eP.19. 2, Europe; Africa.

Neomichelia Penz. & Sacc. (1901) = Pithomyces fide Ellis (*Mycol. Pap.* **76**, 1960).

Neomunkia Petr. (1947), anamorphic *Hypocreales*, St.0eH.?. 1, S. America. See Bischoff *et al.* (*Mycol.* **96**: 1088, 2004; phylogeny).

Neonaumovia Schwarzman (1959) = Lophophacidium fide Korf *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 249, 1973).

Neonectria Wollenw. (1917), Nectriaceae. Anamorph *Cylindrocarpon*. 33, widespread. *N. galligena* (canker and eye rot of apple and pear; Flack & Swinburne, *TBMS* **68**: 186, 1977; host range). See Brayford & Samuels (*Mycol.* **85**: 612, 1993; *Cylindrocarpon* anamorphs), Samuels & Brayford (*Sydowia* **45**: 55, 1993; phragmosporous spp.), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Schoch *et al.* (*Stud. Mycol.* **45**: 45, 2000), Mantiri *et al.* (*CJB* **79**: 334, 2001; phylogeny), Langrell (*MR* **106**: 280, 2002; molecular detection), Seifert *et al.* (*Phytopathology* **93**: 1533, 2003; on ginseng), Brayford *et al.* (*Mycol.* **96**: 572, 2004; spp. without microconidia), Halleen *et al.* (*Stud. Mycol.* **50**: 431, 2004; on *Vitis*), Castlebury *et al.* (*CJB* **84**: 1417, 2006; phylogeny on *Fagus*), Hirooka & Kobayashi (*Mycoscience* **48**: 53, 2007; Japan).

Neonorrlinia Syd. (1923) = Cercidospora fide Hafellner & Obermayer (*Cryptog. Bryol.-Lichénol.* **16**: 177, 1995).

Neonosemoides N. Faye & B.S. Togubaye (1996), Microsporidia. 1.

Neonothopanus R.H. Petersen & Krisai (1999), Marasmiaceae. 1, S. America. See Petersen & Krisai-Greilhuber (*Persoonia* **17**: 210, 1999).

Neoovularia U. Braun (1992), anamorphic *Pezizomycotina*, Hsp.0eP.10. 3, Europe; Japan. See Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 342, 1998; key).

Neoparodia Petr. & Cif. (1932), Parodiopsidaceae. Anamorph *Chuppia*-like or *Sarcinella*-like. 1, West Indies.

Neopatella Sacc. (1908) = Selenophoma fide Petrak (*Sydowia* **5**: 354, 1951).

Neopaxillus Singer (1948), Serpulaceae. 5, C. & S. America. See Singer *et al.* (*Beih. Nova Hedwigia* **98**: 17, 1990).

Neopeckia Sacc. (1883), Pleosporales. 1, N. America. See Bose (*Phytopath. Z.* **41**, 1961; syn. with *Herpotrichia*), Barr (*Mycotaxon* **20**: 1, 1984), von Arx & Müller (*Sydowia* **37**: 6, 1984; syn. with *Herpotrichia*), Chen & Hsieh (*Sydowia* **56**: 24, 2004).

Neopeltella Petr. (1950), ? Schizothyriaceae. 1, S. America. See Petrak (*Sydowia* **4**: 329, 1950).

Neopeltis Petr. (1949) = Microcallis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Neopeltis Syd. (1937), anamorphic *Pezizomycotina*, St.0eH.?. 1, C. America.

Neoperezia I.V. Issi & Voronin (1979), Microsporidia. 1.

Neopericonia Kamal, A.N. Rai & Morgan-Jones (1983), anamorphic *Pezizomycotina*, Hso.#eP.10. 1, India. See Kamal *et al.* (*Mycotaxon* **18**: 15, 1983).

Neopetromyces Frisvad & Samson (2000), Trichocomaceae. Anamorph *Aspergillus*. 1, Philippines. See Frisvad & Samson (*Stud. Mycol.* **45**: 201, 2000).

Neophacidium Petr. (1950), ? Rhytismatales. 2, Pakistan; S. America. See Petrak (*Sydowia* **4**: 333, 1950).

Neophaeosphaeria M.P.S. Câmara, M.E. Palm & A.W. Ramaley (2003), Pleosporales. Anamorph *Coniothyrium*-like. 5 (on *Agavaceae*), widespread. See Câmara *et al.* (*MR* **107**: 519, 2003).

Neophoma Petr. & Syd. (1927), anamorphic *Pezizomycotina*, St.0eH.?. 2, Europe; N. America.

Neophyllis F. Wilson (1891), Sphaerophoraceae (L). 2, Australasia. See Ahti (*Regnum veg.* **128**: 58, 1993), Döring *et al.* (*Aust. J. Bot.* **47**: 783, 1999), Wedin & Döring (*MR* **103**: 1131, 1999; phylogeny), Döring & Wedin (*Pl. Biol.* **2**: 361, 2000; phylogeny, morphology), Wedin *et al.* (*Lichenologist* **32**: 171, 2000; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Neophyscia M. Choisy (1959) nom. nud. = Physcia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Neopiptostoma Kuntze (1898) ≡ Piptostoma.

Neoplaconema B. Sutton (1977), anamorphic *Pezizomycotina*, St.0eH.15. 2, Germany; Australia. See Yuan & Mohammed (*MR* **101**: 1531, 1997; n.sp. Australia).

Neoplacosphaeria Petr. (1921) = Sphaeriothyrium fide Petrak (*Annls mycol.* **22**: 1, 1924).

Neopsoromopsis Gyeln. (1940), ? Parmeliaceae (L). 1, Argentina.

Neopycnodothis Tak. Kobay. (1965) = Cytoplea fide Sutton (*Mycol. Pap.* **141**, 1977).

Neoramularia U. Braun (1991), anamorphic *Pezizomycotina*, St.0-1eH.3. 9, widespread. See Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 351, 1998; key), Braun *et al.* (*Australas. Pl. Path.* **34**: 509, 2005; Australia).

Neoravenelia Long (1903) = Ravenelia fide Arthur (*Manual Rusts US & Canada*, 1934).

Neorehmia Höhn. (1902), Trichosphaeriaceae. Anamorph *Tritirachium*-like. 2, Austria. See Müller & Samuels (*Sydowia* **35**: 143, 1982), Barr (*Mycotaxon* **39**: 43, 1990), Samuels & Barr (*CJB* **75**: 2165, 1998), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Neosaccardia Mattir. (1921) ? = Scleroderma fide Guzmán (*Ciencia* **25**: 195, 1967).

Neosartorya Malloch & Cain (1973), Trichocomaceae. Anamorph *Aspergillus*. 12, widespread. See Takada *et al.* (*TMSJ* **27**: 415, 1986; mating), Guarro & Figueras (*Boln Soc. Micol. Madrid* **11**: 217, 1987; ontogeny), Peterson (*MR* **96**: 547, 1992; 6 spp. DNA homology), Udagawa *et al.* (*Mycoscience* **37**: 217, 1996; toxigenic spp.), Geiser *et al.* (*Mycol.* **90**: 831, 1998; DNA), Samson (*Contributions to Microbiology* **2**: 5, 1999; review), Varga *et al.* (*Antonie van Leeuwenhoek* **77**: 235, 2000; phylogeny), Takada *et al.* (*Mycoscience* **42**: 361, 2001; Africa), Klich (*Identification of Common Aspergillus Species*: 116 pp., 2002), Horie *et al.* (*Mycoscience* **44**: 397, 2003; Brazil), Balajee *et al.* (*J. Clin. Microbiol.* **43**: 5996, 2005; comparison with *Aspergillus fumigatus*), Dyer & Paoletti (*Medical Mycology* **43** Suppl. 1: S7, 2005; genetics), Nierman (*Nature* Lond. **438** no. 7071: 1151, 2005; genome sequence), Rydholm *et al.* (*Eu-*

karyotic Cell **5**: 650, 2006; population structure), Samson *et al.* (*Medical Mycology* **44** Suppl. 1: S133, 2006; species concepts), Wortman *et al.* (*Medical Mycology* **44** Suppl. 1: S3, 2006; phylogeny), Samson *et al.* (*Stud. Mycol.* **59**: 147, 2007; phylogeny, chemistry, morphology), Samson *et al.* (*Stud. Mycol.* **59**: 147, 2007; section *Fumigati*), Hong *et al.* (*Antonie van Leeuwenhoek* **93**: 87, 2008).

Neoscytalidium Crous & Slippers (2006), anamorphic *Botryosphaeriaceae*, H?.?.?. 1, tropical. See Crous & Slippers (*Stud. Mycol.* **55**: 244, 2006).

Neosecotium Singer & A.H. Sm. (1960), Agaricaceae. 2, N. America; Africa. Basidioma gasteroid. See Singer & Smith (*Madroño* **15**: 154, 1960).

neosexual, see protosexual.

Neoskofitzia Schulzer (1880) nom. dub., Sordariomycetes. 5, widespread. See Rossman (*Stud. Mycol.* **42**, 1999).

Neosolorina (Gyeln.) Räsänen (1943) = Solorina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Neospegazzinia Petr. & Syd. (1936), anamorphic *Pezizomycotina*, Cpd.0fH.?. 1, S. America.

Neosphaeropsis Petr. (1921) ? = Sphaeropsis Sacc. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Neosporidesmium Mercado & J. Mena (1988), anamorphic *Pezizomycotina*, Hsy.≡ eP.1. 1, Cuba. See Mercado & Mena (*Acta Bot. Cubana* **59**: 2, 1988).

Neostomella Syd. (1927), Asterinaceae. 4, C. America. See Hansford (*Mycol. Pap.* **15**, 1946).

Neotapesia E. Müll. & Hütter (1963), Helotiales. 3, Europe. See Korf *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 249, 1973), Nannfeldt (*TBMS* **67**: 283, 1976).

Neotestudina Segretain & Destombes (1961), Testudinaceae. 3, widespread. *N. rosatii* (mycetoma of foot). See Hawksworth & Booth (*Mycol. Pap.* **135**, 1974), Hawksworth (*CJB* **57**: 91, 1979), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny).

Neothyridaria Petr. (1934), Pezizomycotina. 1, Europe.

neotony, a process in which normal development of cells, except those involved in reproduction, is arrested; results in a sexually mature organism with juvenile features; see Kreisel (*in* Hawksworth (Ed.), *Frontiers in mycology*: 69, 1991; in fungal phylogeny); cf. pedogenesis.

Neotremella Lowy (1979), Tremellaceae. 1, Mexico. See Lowy (*Boletín de la Sociedad Mexicana de Micología* **13**: 224, 1979).

Neotrichophyton Castell. & Chalm. (1919) = Trichophyton fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Neotrotteria Sacc. (1921), Coronophorales. See Nannfeldt (*Svensk bot. Tidskr.* **69**: 49, 1975), Nannfeldt (*Svensk bot. Tidskr.* **69**: 289, 1975), Subramanian & Sekar (*Kavaka* **18**: 19, 1993).

Neottiella (Cooke) Sacc. (1889), Pyronemataceae. *c.* 13, Europe. See Caillet & Moyne (*BSMF* **103**: 179, 1987; synonym of *Octospora*), Caillet & Moyne (*Bull. Soc. Hist. nat. Doubs* **84**: 9, 1991; keys), Kristiansen (*SA* **14**: 61, 1995), Moravec (*Czech Mycol.* **49**: 149, 1997; sect. *Neottiellae*), Benkert (*Z. Mykol.* **64**: 153, 1998; Germany), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Neottiopezis Clem. (1903) ≡ Neottiella fide Clements (*Gen. Fung.*: 90, 1909).

Neottiospora Desm. (1843), anamorphic *Pezizomycotina*, Cpd.0eH/1eP.15. 2, widespread.

Neottiosporella Höhn. ex Falck (1923) nom. dub., anamorphic *Pezizomycotina*. No spp. included.

Neottiosporina Subram. (1961), anamorphic *Pezizomycotina*, Cpd.≡ eH.1. 10, widespread. See Sutton & Alcorn (*Aust. J. Bot.* **22**: 517, 1974; key), Sutton & Wu (*MR* **99**: 831, 1995; on *Sorghum*).

Neottiosporis Clem. & Shear (1931) ≡ Neottiosporella.

neotype, see type.

Neotyphodium Glenn, C.W. Bacon & Hanlin (1996), anamorphic *Epichloë*. 4 (endosymbiotic in grasses), widespread (esp. temperate). See Glenn *et al.* (*Mycol.* **88**: 369, 1996; phylogeny), Glenn & Bacon (*Neotyphodium/Grass Interactions Proceedings of the Third International Symposium on Acremonium/Grass Interactions, held May 28-31, 1997, in Athens, Georgia*: 53, 1997; chemistry), Kuldau *et al.* (*Mycol.* **89**: 431, 1997; phylogeny), Leuchtmann (*Neotyphodium/Grass Interactions Proceedings of the Third International Symposium on Acremonium/Grass Interactions, held May 28-31, 1997, in Athens, Georgia*: 93, 1997; ecology), White (*Neotyphodium/Grass Interactions Proceedings of the Third International Symposium on Acremonium/Grass Interactions, held May 28-31, 1997, in Athens, Georgia*: 27, 1997), Wilkinson & Schardl (*Neotyphodium/Grass Interactions Proceedings of the Third International Symposium on Acremonium/Grass Interactions, held May 28-31, 1997, in Athens, Georgia*: 13, 1997; mutualism), Leuchtmann & Schardl (*MR* **102**: 1169, 1998; genetics, phylogeny), Miles *et al.* (*Appl. Environm. Microbiol.* **64**: 601, 1998; Australasia), Naffaa *et al.* (*Ann. appl. Biol.* **132**: 211, 1998; Europe), White & Reddy (*Mycol.* **90**: 226, 1998; phylogeny), Kuldau *et al.* (*Mycol.* **91**: 776, 1999; hybridisation), Schardl & Leuchtmann (*Mycol.* **91**: 95, 1999; N America), Tredway *et al.* (*MR* **103**: 1593, 1999; phylogeny), Lane *et al.* (*Microbial Endophytes*: 341, 2000; coevolution, chemistry), Moon *et al.* (*Mycol.* **92**: 1103, 2000; evolution), Schardl (*Fungal Genetics Biol.* **33**: 69, 2001; on *Festuca*), Moon *et al.* (*Mycol.* **94**: 694, 2002; S hemisphere), Brem & Leuchtmann (*Evolution* Lancaster, Pa. **57**: 37, 2003; on *Bromus*), Moon *et al.* (*Mol. Ecol.* **13**: 1455, 2004; hybridisation), Sullivan & Faeth (*Mol. Ecol.* **13**: 649, 2004; gene flow), Yokoyama *et al.* (*FEMS Microbiol. Lett.* **264**: 182, 2006; genetics), Moon *et al.* (*Mycol.* **99**: 895, 2007; on *Stipeae* and *Meliceae*).

Neotyphula Wakef. (1934), Basidiomycota. 1, Guyana. See Martin (*Lloydia* **11**: 121, 1948).

Neournula Paden & Tylutki (1969), Chorioactidaceae. 2, USA; Europe; N. Africa. See Paden (*Mycol.* **64**: 457, 1972; nomencl.), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Pfister *et al.* (*MR* **112**: 513, 2008).

Neoventuria Syd. & P. Syd. (1919), Dothideomycetes. 1, S. America.

Neovossia Körn. (1879), Tilletiaceae. 1 (on *Poaceae*), widespread. See Vánky (*Illustrated genera of smut fungi*, 1987), Castlebury *et al.* (*Mycol.* **97**: 888, 2005; phylog.) cf. *Tilletia*.

Neoxenophila Apinis & B.M. Clark (1974) = Aphanoascus fide Cano & Guarro (*MR* **94**, 1990), Cano *et al.* (*Stud. Mycol.* **47**: 153, 2002).

Neozimmermannia Koord. (1907) = Glomerella fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1,

1954).

Neozygitaceae Ben Ze'ev, R.G. Kenneth & Uziel (1987), Entomophthorales. 3 gen., 21 spp.

Lit.: Ben-Ze'ev *et al.* (*Mycotaxon* **28**: 313, 1987), Humber (*Mycotaxon* **34**: 441, 1989), Keller (*Sydowia* **43**: 39, 1991), Delalibera *et al.* (*Can. J. Microbiol.* **50**: 579, 2004), Delalibera *et al.* (*Mycol.* **96**: 1002, 2004), Keller & Petrini (*Sydowia* **57**: 23, 2005).

Neozygites Witlaczil (1885), Neozygitaceae. 18 (on *Arthropoda*), widespread. See Keller & Wuest (*Entomophaga* **28**: 123, 1983), Butt & Heath (*Eur. J. Cell. Biol.* **46**: 499, 1988; cell division), Butt & Humber (*Protoplasma* **151**: 115, 1989; mitosis), Keller (*Sydowia* **43**: 39, 1991; key Swiss spp.), Dick *et al.* (*Mycol.* **84**: 729, 1992), Steenberg *et al.* (*J. Invert. Path.* **68**: 97, 1996), Keller (*Sydowia* **49**: 118, 1997), Keller & Steenberg (*Sydowia* **49**: 21, 1997), Delalibera *et al.* (*Mycol.* **96**: 1002, 2004; *Neozygites tanajoae* n.sp. pathogenic on cassava green mite), Keller & Petrini (*Sydowia* **57**: 23, 2005; key), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

Neozythia Petr. (1958), anamorphic *Helotiales*, St.0eH.38. 1, Iran. See Petrak (*Sydowia* **11**: 351, 1957).

Nephlyctis Arthur (1907) = Prospodium fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Nephrochytrium Karling (1938), Endochytriaceae. 4, N. America.

Nephroma Ach. (1809), Nephromataceae (L). 36, widespread. See Wetmore (*Publs Mich. St. Univ. Mus., ser. biol.* **1**: 369, 1960; N. Am.), White & James (*Lichenologist* **20**: 103, 1988; key 15 S. temp. spp.), Eriksson & Strans (*SA* **14**: 33, 1995; molec. phylogeny), Goffinet & Bayer (*Fungal Genetics Biol.* **21**: 228, 1997; DNA), Burgaz & Martínez (*Cryptog. Mycol.* **20**: 225, 1999; Iberian spp.), Lohtander *et al.* (*MR* **106**: 777, 2002; phylogeny), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny), Louwhoff (*Muelleria* **22**: 3, 2005; Australia), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Piercey-Normore *et al.* (*Lichenologist* **38**: 441, 2006; Pacific NW).

Nephromataceae Wetmore ex J.C. David & D. Hawksw. (1991), Peltigerales (L). 1 gen. (+ 6 syn.), 36 spp.

Lit.: James & White (*Lichenologist* **19**: 215, 1987), White & James (*Lichenologist* **20**: 103, 1988), Galloway (*Symbiosis* **11**: 327, 1991), Eriksson & Strand (*SA* **14**: 33, 1995), Eriksson & Strans (*SA* **14**: 33, 1995; molec. phylogeny), Goffinet & Bayer (*Fungal Genetics Biol.* **21**: 228, 1997; DNA), Goffinet & Goward (*Lichenogr. Thomsoniana* North American Lichenology in Honor of John W. Thomson: 41, 1998), Burgaz & Martínez (*Cryptog. Mycol.* **20**: 225, 1999), Wiklund & Wedin (*Cladistics* **19**: 419, 2003), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Vitikainen (*Nordic Lichen Flora* **3**: Cyanolichens: 91, 2007).

Nephromatomyces E.A. Thomas (1939) nom. inval. = Nephroma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Nephromiomyces E.A. Thomas ex Cif. & Tomas. (1953) = Nephroma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Nephromium Nyl. (1860) = Nephroma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Nephromopsis Müll. Arg. (1891), Parmeliaceae (L). 26, Asia. See Kärnefelt *et al.* (*Pl. Syst. Evol.* **183**: 113, 1992), Randlane & Saag (*Mycotaxon* **44**: 485, 1992), Randlane (*Cryptog. Bryol.-Lichénol.* **16**: 35, 1995), Randlane & Saag (*Cryptog. Bryol.-Lichénol.* **19**: 175, 1998), Chen & Gao (*Mycotaxon* **77**: 491, 2001), Thell *et al.* (*Mycol. Progr.* **4**: 303, 2005; revision).

Nephromyces Giard (1888), ? Cladochytriaceae. 3 (in ascidians), Europe. See Saffo & Nelson (*CJB* **61**: 3230, 1983), Beakes *in* Coombs *et al.* (Eds) (*Evolutionary Relationships Among Protozoa*: 351, 1998), Cavalier-Smith *in* Coombs *et al.* (Eds) (*Evolutionary Relationships Among Protozoa*: 375, 1998).

Nephromyces Sideris (1927) ≡ Rhizidiocystis.

Nephrospora Loubière (1923) = Microascus Zukal fide von Arx (*Persoonia* **8**: 191, 1975).

Nepotatus Lloyd (1925) = Scleroderma fide Stevenson & Cash (*Bull. Lloyd Libr. Mus.* **35**: 130, 1936).

Neptunella K.L. Pang & E.B.G. Jones (2003), Halosphaeriaceae. 1. See Pang *et al.* (*Mycol. Progr.* **2**: 35, 2003).

Nereiospora E.B.G. Jones, R.G. Johnson & S.T. Moss (1983), Halosphaeriaceae. Anamorph *Monodictys*-like. 2 (marine), widespread (northern hemisphere). See Mouzouras & Jones (*CJB* **63**: 2444, 1985), Jones & Moss (*SA* **6**: 179, 1987), Hyde & Jones (*Bot. Mar.* **32**: 205, 1989; ultrastr.), Anderson *et al.* (*Mycol.* **93**: 897, 2001; phylogeny), Chatmala *et al.* (*Fungal Diversity Res. Ser.* **7**: 59, 2002; anamorph), Campbell *et al.* (*Mycol.* **95**: 530, 2003; phylogeny).

nervicolous, living on veins of leaves or stems.

Nervostroma Narumi & Y. Harada (2006), Sclerotiniaceae. Anamorph *Cristulariella*. 1, widespread (temperate). See Narumi-Saito *et al.* (*Mycoscience* **47**: 351, 2007).

Nesolechia A. Massal. (1856), Parmeliaceae. 1 (lichenicolous), widespread. See Triebel *et al.* (*Bryologist* **98**: 71, 1995), Peršoh & Rambold (*Mycol. Progr.* **1**: 43, 2002; phylogeny), Doré *et al.* (*Lichenologist* **38**: 425, 2006; biometrics), Crespo *et al.* (*Mol. Phylogen. Evol.* **44**: 812, 2007; phylogeny).

Nesolechiaceae Arnold (1858) = Parmeliaceae.

Nesophloea Fr. (1849) nom. dub., Fungi.

Neta Shearer & J.L. Crane (1971), anamorphic *Pezizomycotina*, Hso.1-≡ eH.10. 6 (terrestrial and aquatic), widespread (north temperate). See de Hoog (*Stud. Mycol.* **26**: 44, 1985; key), Castañeda Ruiz & Heredia (*Mycotaxon* **76**: 131, 2000; Mexico).

Neural networks (Artificial Neural Networks, ANNs), allow for the identification or classification of input patterns (characters). In practice this approach generally requires a considerable amount of data in order to set up the network. Final placement is arrived at after the passage of the input values through a series of nodes arranged in layers. The method has not yet been used widely with fungal data, but has potential for more use, particularly in classification and data mining; examples include Acuña *et al.* (*Biotechnology techniques* **12**: 515, 1998; estimation of fungal biomass), Boddy & Morris (*Binary* **5**: 17, 1991), Bridge *et al.* (*in* Hawksworth (Ed.), *Identification and characterization of pest organisms*: 153, 1994), Morgan *et al* (*MR* **102**: 975, 1998), Morris *et al.* (*MR* **96**: 967, 1992), Nie *et al.* (*J. Phytopath.* **155**: 364, 2007; identification of *Fusarium*). For methodology see Boddy *et al.* (*Binary* **2**: 179, 1990), Specht (*Neu-

ral networks **3**: 109, 1990), Zaruda (*Artificial neural systems*, 1992). Successful use requires a good understanding of underlying theory. See Numerical taxonomy.

Neuroecium Kunze (1823) nom. dub., Fungi. Not a fungus fide Juel (*Dansk. bot. Ark.* **5**: 1, 1928).

Neuronectria Munk (1957) ≡ Hydropisphaera fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Neurophyllum, see *Neurophyllum*.

Neuropogon Nees & Flot. (1835) = Usnea fide Lamb (*Index Nom. Lich.*, 1963), Articus (*Taxon* **53**: 925, 2004), Wirtz *et al.* (*Taxon* **55**: 367, 2006; phylogeny, synonymy with *Usnea*).

Neurospora Shear & B.O. Dodge (1927), Sordariaceae. Anamorph *Chrysonilia*. 51, widespread. See mould, bread, Genetics. See Frederick *et al.* (*Mycol.* **61**: 1083, 1970; key), Perkins & Turner (*Exp. Mycol.* **12**: 91, 1988; natural populations), Raju (*Mycol.* **80**: 825, 1988; multipored ascus apices), Perkins (*Genetics* Bethesda **130**: 687, 1992; history as a model organism), Raju (*MR* **96**: 241, 1992; genetic control of sexual cycle), Beatty *et al.* (*MR* **98**: 1309, 1994; genetics), Skupski*et al.* (*Fungal Genetics Biol.* **21**: 153, 1997; phylogeny), Pöggeler (*Curr. Genet.* **36**: 222, 1999; mating type genes), Turner *et al.* (*Fungal Genetics Biol.* **32**: 67, 2001; natural populations, review), Dettman *et al.* (*Evolution* Lancaster, Pa. **57**: 2703, 2003; phylogeny), Dettman *et al.* (*Evolution* Lancaster, Pa. **57**: 2721, 2003; species concepts), Galagan (*Nature* Lond. **422** no. 6934: 859, 2003; genome sequence), Braun *et al.* (*Applied Mycology and Biotechnology* **4**: 295, 2004; genetics review), Dettman & Taylor (*Genetics* Bethesda **168**: 1231, 2004; microsatellites), García *et al.* (*MR* **108**: 1119, 2004; wide concept including *Gelasinospora*), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005; phylogeny, wall structure), Dettman *et al.* (*Mycol.* **98**: 436, 2006; *N. discreta* agg.), Jacobson *et al.* (*Mycol.* **98**: 550, 2006; biogeography), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny), Wik *et al.* (*BMC Evolutionary Biology* **8**: 109, 2008; mating type genes).

neurotoxin, a toxin which affects the nervous system.

Nevodovsky (Gavril Stepanovich; 1874-1952; Ukraine, later Georgia, Kazakhstan, Russia). Schoolteacher (1897-1903); student, Novo-Aleksandiysky Institute of Agriculture and Forestry, Pulavy, now Poland (1903-1911); Head, Phytopathological Laboratory, Tbilisi Botanic Garden (1911-1913); mycologist, Smelianskaya Mycological-Entomological Station, later the Ukrainian Scientific Research Institute of Sugar Beet (1913-1930); mycologist, Alma Ata Station of Plant Protection (1930-1940); Lecturer, Tomsk Forest Technical School, and mycologist, Tomsk Zonal Flax Experiment Station (1940-1946). A pioneer mycologist in the Caucasus and Central Asia, particularly noted for his compilation of exsiccati. Collections are in the Kazakh State University, Alma Ata (**AA**) [about 17,000 specimens] and the V.I. Komarov Botanical Institute, St Petersburg (**LE**). *Publs.* [Fungal diseases of cultivated and wild useful plants of the Caucasus in 1912. Second year]. *Trudy Tiflisskogo Botanicheskogo Sada* (1914) [in Russian] [*Flora of the Sporing Plants of Kazakhastan. Rust Fungi*] (1956) [published posthumously, in Russian].

Nevrophyllum Pat. (1886) [non *Neurophyllum* Torrey & A. Gray 1840, *Umbelliferae*] ≡ Gomphus Pers.

Newinia Thaung (1973), ? Phakopsoraceae. 3 (on *Bignoniaceae*), Asia; Africa. See Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; placed in *Uropyxidaceae*) Cf. *Phragmidiella*.

Nia R.T. Moore & Meyers (1961), Niaceae. 3 (marine), widespread (northern hemisphere). See Doguet (*BSMF* **85**: 93, 1969; cultures, development), Doguet (*BSMF* **84**: 343, 1969), Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979), Leightley & Eaton (*TBMS* **73**: 35, 1979), Jones & Jones (*MR* **97**: 1, 1993), Rosello *et al.* (*MR* **97**: 68, 1993; key), Binder *et al.* (*Mycol.* **93**: 679, 2001; phylogeny).

Niaceae Jülich (1982), Agaricales. 6 gen. (+3 syn.), 56 spp.

Lit.: Kohlmeyer & Kohlmeyer (*Marine Mycology*: 690 pp., 1979), Jones & Jones (*MR* **97**: 1, 1993), Barata *et al.* (*MR* **101**: 687, 1997), Binder *et al.* (*Mycol.* **93**: 679, 2001), Bodensteiner *et al.* (*Mol. Phylogen. Evol.* **33**: 501, 2004), Sivichai & Jones (*Sydowia* **56**: 132, 2004).

Nicholsoniella Kuntze (1891) ≡ Libertiella.

nidose (nidorose), having an unpleasant smell.

Nidula V.S. White (1902), Agaricaceae. 4, widespread.

nidulant, lying free in a cavity.

Nidularia Bull. (1791) nom. rej. = Cyathus fide Stalpers (*in litt.*).

Nidularia Fr. (1817) nom. cons., Agaricaceae. 3, widespread. See Cejp & Palmer (*Česká Mykol.* **17**: 125, 1963; key), Baseia & Milanez (*Revista Brasileira de Botânica* **24**: 479, 2001; Brazil), Sarasini (*Gasteromiceti Epigei*: 406 pp., 2005).

Nidulariaceae Dumort. (1822) = Agaricaceae.

Nidulariales = Agaricales.

Nidulariopsis Greis (1935), Geastraceae. 2, Europe; N. America. See Zeller (*Mycol.* **40**: 639, 1948), Miller & Miller (*Gasteromycetes. Morphological and Development Features with Keys to the Orders, Families, and Genera*: 157 pp., 1988).

Nidulispora Nawawi & Kuthub. (1990), anamorphic *Pezizomycotina*, Hso.1bH.1. 1 (aquatic), Malaysia. See Nawawi & Kuthubutheen (*Mycotaxon* **36**: 329, 1990), Ho *et al.* (*Mycol.* **92**: 582, 2000).

Niebla Rundel & Bowler (1978), Ramalinaceae (L). 1, California; Mexico. Perhaps synonymous with *Ramalina*. See Bowler *et al.* (*Phytologia* **77**: 23, 1994), Marsh & Nash (*Phytologia* **76**: 458, 1994; Mexico), Riefner *et al.* (*Mycotaxon* **54**: 397, 1995; USA), Nash *et al.* (*Lichen Flora of the Greater Sonoran Desert Region* **2**, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

NIEC, see RIEC.

Nielsenia Syd. (1921) = Uromyces fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Niessl (von Meyendorf, Gustav; 1839-1919; Italy, later Austria, Moravia). Born in Verona; Geometrist, Vienna (1857-1865); Professor of Geodesy and Astronomy, University of Brno (1865-1906); retired to Vienna (1906 onwards). A major contributor to early understanding of the mycotas of central Europe. Most collections are in **M**. *Publs.* Vorarbeiten zu einer Kryptogamenflora von Mähren und Oest Schlesiens. II. Pilze und Myxomyceten. *Verhandlungen des Naturforschender Vereins in Brunn* (1865); Über Myxomyceten. *Verhandlungen des Naturforschender Vereins in Brunn* (1868); Notizen über neue und kritische Pyrenomyceten. *Verhandlungen des Naturforschender Vereins in Brunn* (1875). *Biogs, obits etc.* Grummann (1974: 436); Nožička (*Česká Mykologie* **18**: 185, 1964) [portrait].

Niesslella Höhn. (1919) = Micropeziza fide Nannfeldt

(*Bot. Notiser* **129**: 323, 1976).

Niesslella Speg. (1880) ? = Sporormiella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Niesslia Auersw. (1869), Niessliaceae. Anamorph *Monocillium*. 23, widespread. See Gams (*Cephalosporium-artige Schimmelpilze*, 1971), Samuels & Barr (*CJB* **75**: 2165, 1998), Tretiach (*Nova Hedwigia* **75**: 357, 2002; on lichens), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Niessliaceae Kirschst. (1939), Hypocreales. 12 gen. (+ 4 syn.), 51 spp.

Lit.: Barr (*Mycotaxon* **39**: 43, 1990), Scheuer (*MR* **97**: 543, 1993), Crous *et al.* (*Mycol.* **88**: 789, 1996), Gams & Turhan (*Mycotaxon* **59**: 343, 1996), Samuels & Barr (*CJB* **75**: 2165, 1997), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Castlebury *et al.* (*MR* **108**: 864, 2004).

nietsuki, a product of failure in the drying of *Lentinula edodes* basidiomata (Kawai & Kawai, *Rep. Tottori mycol. Inst.* **1**: 29, 1961).

nigeran, see mycodextran.

Nigredo (Pers.) Roussel (1806) nom. rej. prop. ≡ Uredo.

Nigrococcus E.K. Novák & Zsolt (1961) [non *Nigrococcus* Castell. & Chalm. 1919, *Bacteria*] = Phaeococcus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Nigrocornus Ryley & Langdon (2003), Clavicipitaceae. 1, widespread (old world). See Ryley (*Mycology Series* **19**: 266, 2003), Ryley (*Mycotaxon* **95**: 97, 2006).

Nigrocupula Sawada (1944) = Graphiola fide Mordue (*in litt.*).

Nigrodiplodia Kravtzev (1955) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Nigrofomes Murrill (1904), Polyporaceae. 1, widespread (pantropical). See Corner (*Beih. Nova Hedwigia* **86**: 124, 1987), Roberts & Ryvarden (*Kew Bull.* **61**: 55, 2006; Cameroon).

Nigrofomitaceae Jülich (1982) = Polyporaceae.

Nigrohydnum Ryvarden (1987), Polyporales. 1, S. America. See Ryvarden (*Mycotaxon* **28**: 531, 1987).

Nigrolentilocus R.F. Castañeda & Heredia (2001), anamorphic *Melanomma*, Hso.?.?. 5, widespread. See Castañeda Ruiz *et al.* (*Cryptog. Mycol.* **22**: 13, 2001).

Nigromacula Etayo (2002), anamorphic *Pezizomycotina*, H?.?.?. 2, Colombia; British Isles. See Etayo (*Biblthca Lichenol.* **84**: 87, 2002).

Nigromammilla K.D. Hyde & J. Fröhl. (2003), Sordariomycetes. 1, Hong Kong. See Hyde & Fröhlich (*Cryptog. Mycol.* **24**: 17, 2003).

Nigropogon Coker & Couch (1928) = Entoloma fide Kuyper (*in litt.*).

Nigroporus Murrill (1905), Polyporaceae. 3, widespread. See Pegler (*The polypores [Bull. BMS Suppl.]*, 1973), Ryvarden & Iturriaga (*Mycol.* **95**: 1066, 2003; Venezuela).

Nigropuncta D. Hawksw. (1981), anamorphic *Pezizomycotina*, Cpd.0eP.23. 1 (on lichens), Austria. See Hawksworth (*Bull. Br. Mus. nat. Hist.* Bot. **9**: 46, 1981).

Nigrosabulum Malloch & Cain (1970), Hypocreales. Anamorph *Acremonium*-like. 1 (coprophilous), widespread. See Suh & Blackwell (*Mycol.* **91**: 836, 1999; phylogeny), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny).

Nigrosphaeria N.L. Gardner (1905) ? = Melanospora Corda fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Nigrospora Zimm. (1902), anamorphic *Khuskia*, Hso.0eP.1. 6, widespread. *N. oryzae* on maize (*Zea*) and other hosts. See Standen (*Iowa St. Coll. J. Sci.* **17**: 263, 1943), Minter (*Proc. Indian Acad. Sci.* Pl. Sci. **94**: 281, 1985).

Nimbomollisia Nannf. (1983) = Niptera fide Baral (*SA* **13**: 113, 1994).

Nimbospora J. Koch (1982), Halosphaeriaceae. 3 (marine), pantropical. See Hyde & Jones (*CJB* **63**: 611, 1985), Read *et al.* (*Phil. Trans. Roy. Soc. London* ser. B **339**: 483, 1993; ultrastr.), Jones (*CJB* **74** Suppl. 1: S790, 1995; ultrastr.), Spatafora *et al.* (*Am. J. Bot.* **85**: 1569, 1998; phylogenetic analysis), Campbell *et al.* (*Mycol.* **95**: 530, 2003; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

nimbospore, a spore having a gelatinous, apparently many-layered wall, e.g. *Histoplasma capsulatum* (Nielsen & Evans, *J. Bact.* **68**: 261, 1954).

Nimbya E.G. Simmons (1989), anamorphic *Macrospora*, Hso.≡ eP.26. 12, widespread. See Simmons (*Sydowia* **41**: 316, 1989), Harada *et al.* (*Ann. phytopath. Soc. Japan* **58**: 766, 1992; on *Eleocharis*), Johnson *et al.* (*Mycotaxon* **84**: 413, 2002; on *Scirpus*), Pryor & Bigelow (*Mycol.* **95**: 1141, 2003; phylogeny), Zhao & Zhang (*Fungal Diversity* **19**: 201, 2005; China).

Nimisia Kärnefelt & A. Thell (1993) = Himantormia fide Kärnefelt & Thell (*Lichenologist* **25**: 370, 1993), Thell *et al.* (*Mycol. Progr.* **1**: 335, 2002; phylogeny), Fryday (*Lichenologist* **37**: 313, 2005; nomencl.), Thell *et al.* (*Biblthca Lichenol.* **95**: 531, 2007; phylogeny).

Nimisiostella Calat., Barreno & O.E. Erikss. (1997), Lecanorales (L). 1, Spain. See Calatayud *et al.* (*SA* **15**: 112, 1997).

Niopsora A. Massal. (1861) = Caloplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Niorma A. Massal. (1861) = Teloschistes fide Zahlbruckner (*Catalogus Lichenum Universalis* **7**, 1931).

Niospora Kremp. (1869) ≡ Niopsora.

Nipholepis Syd. (1935), Arthoniales. 1, S. America.

Nipicola K.D. Hyde (1992), Sordariomycetes. 2, Brunei; Hong Kong. See Eriksson & Hawksworth (*SA* **13**: 198, 1994; posn), Hyde (*Sydowia* **46**: 257, 1995), Hyde & Taylor (*Nova Hedwigia* **63**: 417, 1996).

Niptera Fr. (1849), Helotiales. Anamorph *Cystodendron*. 5, Europe. See Dennis (*Kew Bull.* **26**: 439, 1972), Nannfeldt (*Sydowia* **38**: 194, 1986), Nauta & Spooner (*Mycologist* **14**: 65, 2000; UK).

Nipterella Starbäck ex Dennis (1962), ? Helotiaceae. 3, Europe; N. America. See Starbäck ex Dennis (*Persoonia* **2**: 189, 1962).

nitid (adj. **nitidous**), smooth and clear; lustrous.

nitrophilous, having a preference for habitats rich in nitrogen; chionophilous; **nitrophobous**, having a preference for habitats poor in nitrogen.

Nitschkia G.H. Otth ex P. Karst. (1873), Nitschkiaceae. *c.* 22 (from wood), widespread. See Nannfeldt (*Svensk bot. Tidskr.* **65**: 49, 1971), Subramanian & Sekar (*Kavaka* **18**: 19, 1993), Bianchinotti (*Mycol.* **96**: 911, 2004; Argentina), Huhndorf *et al.* (*MR* **108**: 1384, 2004; phylogeny), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny).

Nitschkiaceae Nannf. (1932), Coronophorales. 16 gen. (+ 27 syn.), 59 spp.

Lit.: Sivanesan (*TBMS* **62**: 40, 1974), Nannfeldt (*Svensk bot. Tidskr.* **69**: 49, 1975), Nannfeldt (*Svensk bot. Tidskr.* **69**: 289, 1975), Corlett & Krug (*CJB* **62**: 2561, 1984), Jensen (*Mycol.* **77**: 688, 1985), Eriksson & Santesson (*Mycotaxon* **25**: 569, 1986), Subramanian & Sekar (*Kavaka* **18**: 19, 1990), Hyde (*Nova Hedwigia* **61**: 141, 1995), Linde & Botha (*S. Afr. J. Bot.* **63**: 66, 1997), Petersen (*Bot. Mar.* **40**: 71, 1997), Navarro-Rosinés *et al.* (*Bull. Soc. linn. Provence* **50**: 233, 1999), Bianchinotti (*Mycol.* **96**: 911, 2004), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004), Huhndorf *et al.* (*MR* **108**: 1384, 2004).

Nitschkiopsis Nannf. & R. Sant. (1975) = Niesslia fide Samuels & Barr (*CJB* **75**: 2165, 1998).

Nivatogastrium Singer & A.H. Sm. (1959), Strophariaceae. 4, N. America. Basidioma gasteroid. See Singer & Smith (*Brittonia* **11**: 224, 1959).

Niveostoma Svrček (1988) = Solenopezia fide Raitviir *et al.* (*Sydowia* **43**: 219, 1991).

nm, nanometer; one billionth of a metre.

noble rot, a condition in which the mould *Botrytis* grows on overripe grapes. A rich, sweet wine is made in small quantities from the affected grapes (Sauternes, Trockenbeerenlauslese, Botrytis-wine).

Nocardia Trevis. (1889), Actinobacteria. q.v.

Nocardioides Prauser (1976), Actinobacteria. q.v.

Nocardiopsis (Brocq-Rouss.) J. Mey. (1976), Actinobacteria. q.v.

Nochascypha Agerer (1983), Marasmiaceae. 6, S. America. See Agerer (*Mitt. bot. StSamml.* Münch. **19**: 262, 1983), Bodensteiner & Agerer (*Mycol. Progr.* **2**: 297, 2003).

node cell, see hyphopodium.

Nodobryoria Common & Brodo (1995), Parmeliaceae (L). 3, N. America; Greenland. See Common & Brodo (*Bryologist* **98**: 198, 1995).

nodose-septum, see clamp-connexion.

Nodotia Hjortstam (1987) = Hypochnicium fide Hjortstam & Larsson (*Windahlia* **21**, 1994).

nodular bodies (of dermatophytes), rounded bodies made up of massed hyphae.

Nodularia Peck (1872) [non *Nodularia* Link ex Lyngb. 1819, *Algae*] = Aleurodiscus fide Rogers & Jackson (*Farlowia* **1**: 263, 1943).

Nodulisporium Preuss (1849), anamorphic *Xylaria, Annulohypoxylon, Biscogniauxia, Daldinia, Pulveria, Thamnomyces*, Hso.0eP.10. *c.* 200, widespread. Most anamorphic taxa are unnamed. See Deighton (*TBMS* **85**: 391, 1985), Glawe & Rogers (*CJB* **64**: 1493, 1986), Polishook *et al.* (*Mycol.* **93**: 1125, 2001; biogeography, chemistry).

nodulose (of spores), having broad-based, blunt, wart-like excrescences.

Nodulosphaeria Rabenh. (1858) nom. cons., Phaeosphaeriaceae. *c.* 48, widespread. See Holm (*Svensk bot. Tidskr.* **55**: 63, 1961), Crivelli (*Über die heterogene Ascomycetengattung Pleospora Rbh.*, 1983), Barr & Holm (*Taxon* **33**: 109, 1984; nomencl.), Shoemaker (*CJB* **62**: 2730, 1985; key 23 spp.), Shoemaker & Babcock (*CJB* **65**: 1921, 1987; key 5-septate spp.), Ahn & Shearer (*CJB* **76**: 258, 1998; on *Ranunculaceae*).

Nodulospora Marvanová & Bärl. (2000), anamorphic *Basidiomycota*. 1 (freshwater), Canada. See Marvanová & Bärlocher (*Mycotaxon* **75**: 416, 2000).

nodum (pl. **noda**) (in phytosociology), particular well-defined plant communities. See also Phytosociology.

Nohea Kohlm. & Volkm.-Kohlm. (1991), Halosphaeriaceae. 1 (marine), Hawaii. See Kohlmeyer & Volkmann-Kohlmeyer (*SA* **10**: 121, 1991), Spatafora *et al.* (*Am. J. Bot.* **85**: 1569, 1998; phylogeny), Campbell *et al.* (*Mycol.* **95**: 530, 2003; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Nolanea (Fr.) P. Kumm. (1871) = Entoloma fide Kuyper (*in litt.*).

Nolleria C.B. Beard, J.F. Butler & J.J. Becnel (1990), Microsporidia. 1.

nomen (Latin), name; **- ambiguum**, one having different senses; **- anamorphosis**, see States of fungi; **- confusum**, one of a taxonomic group based on two or more different elements; **- conservandum**, one authorized for used by a decision of an International Botanical Congress (see Nomenclature); **-- propositum**, one put up for conservation; **- dubium**, one of uncertain sense; **- holomorphosis**, see States of fungi; **- illegitimum (nom. illegit.)**, a validly published name contravening particular Articles in the *Code* (see Nomenclature); **- invalidum (nom. inval.)**, one not validly published (see Nomenclature); **- monstrositatis**, one based on an abnormality; **- novum**, a new name; a replacement [nom. nov. should replace the author's name only at the first publication]; **- nudum**, one for a taxon having no description; **- provisorium**, one proposed provisionally; **- rejiciendum**, one rejected by a Botanical Congress. A generic name may be a nomen ambiguum (etc.), but a binomial under such a name may be without ambiguity. **- species** (of bacteria), a type species.

Nomenclature. The allocation of scientific names to units which a systematist considers merit formal recognition. The nomenclature of fungi (including chromistans, lichen-forming fungi, slime-moulds and yeasts) is governed by the *International code of botanical nomenclature* (latest edn, McNeill *et al.* (Eds) [*Regnum veg.* **138**], 2006), as adopted by each International Botanical Congress. The tradition of treating fungi, chromistans and slime-moulds under the 'Botanical' Code, although none have been classified in the Kingdom *Plantae* for many years has been criticized by some and supported by others, but undoubtedly exerts a strong influence on mycology. Any proposals to change the Code are published in *Taxon*, debated, and voted on at the Nomenclature Section of such a Congress. As rules can change in different editions, the latest should always be consulted. The Congress appoints the Committee for Fungi (CF) which advises on action to be taken on proposals concerned with fungi. The Code aims to provide a stable method of naming taxonomic groups, avoiding and rejecting use of names which may cause error or ambiguity or throw science into confusion.

The Code comprises six **Principles**, 62 **Articles** (which are mandatory), **Recommendations** (non-mandatory but good practice) and various Appendices. The Code is designed to allow any taxon to have as many correct names as there may be opinions as to its classification. When the taxonomic decisions have been taken, the Code provides the rules to determine the name that should be applied; each taxon in a given position and rank can have only one nomenclaturally correct name.

In determining the correct name for a taxon, five steps must be followed in what is in effect a nomenclatural filter.

Effective publication (A): To be effectively published names must be in printed matter (journals,

books) distributed to the public or at least botanical institutions through sale, exchange, or gift. See Nicolson (*Taxon* **29**: 485, 1980) for categories and special provisions.

Valid publication (B): To be validly published, names of newly described taxa must also simultaneously fulfil the following requirements: (1) have a correct form; (2) have a description or diagnosis (in Latin (q.v.) after 1 Jan. 1935); (3) be accepted by the author and comply with any relevant special provisions elsewhere in the Code; (4) have a clear indication of rank (after 1 Jan. 1953); and (5) indicate the type (after 1 Jan. 1958) and its place of conservation (after 1 Jan. 1990). Replacement names and combinations have to give full bibliographic details of the place of publication of and cite the replaced name or basionym (after 1 Jan. 1953). Names which are not validly published (**nom. inval.**) need not be considered further. Many are knowingly included in this *Dictionary* as an alert so that future workers can avoid them and also as they can be encountered in the literature. The inclusion of a name in the *Dictionary* does not therefore automatically mean that the name is validly published and available for use.

Typification (C): The linking of each name to a nomenclatural type is the keystone of stability in the application of names. All ranks from fam. downwards are ultimately based on a single collection; e.g. *Erysiphaceae* on *Erysiphe* on *E. polygoni* on a single collection. A holotype is required (see type) but where none exists, the order of priority is isotype - lectotype - neotype. Should the type not be critically identifiable, an interpretative type (epitype) can be designated. An epitype may also be used to change the status of names of pleomorphic fungi that formerly applied to the anamorph only to be usable for all morphs (i.e. the holomorph). See 'type' for definitions of kinds of types. Type specimens must be dried specimens, specimens in a liquid preservative, dried cultures preserved in a fungal dried reference collection, cultures preserved in a metabolically inactive state (e.g. freeze-dried, in liquid nitrogen) or microscopic preparations; actively growing cultures are not permitted. If a specimen cannot be preserved an illustration or description can suffice. If a type collection is mixed, one part must be selected as lectotype.

Legitimacy (D): Validly published names not in accordance with certain provisions of the Code are **illegitimate (nom. illegit.)** and to be rejected, i.e. (1) **superfluous**, i.e. including the type of a name that should have been used; or (2) **homonyms**, i.e. spelled like a previously validly published name.

Priority (E): Priority of publication determines the correct name for a taxon. The **correct name** (i.e. name in accordance with the Code) of a species is the combination of the earliest available legitimate epithet in the same rank with the correct generic name. This may change if the generic placement or rank is altered; i.e. a species can have more than one correct name according to different taxonomies. The principle of priority can only be set aside through **conservation**, or where the rules on pleomorphic fungi apply (see below). Names for a taxon other than the correct one are **synonyms**; **heterotypic synonyms** (also known as facultative or taxonomic synonyms) are names based on different nomenclatural types, and **homotypic synonyms** (obligate or nomenclatural synonyms) are names based on the same type. Where a name change is considered desirable as a result of to former misinterpretation or competition between unfamiliar (but priorable) and familiar names, conservation proposals must be published in *Taxon*, receive a positive vote from the Special Committee for Fungi and be ratified at the next nomenclatural Congress.

In the code, the starting point for nomenclature is Linnaeus' *Species plantorum* (1 May 1753), with later exceptions for some groups. Prior to 1981, different groups of fungi had dates later than 1753: 31 Dec. 1801 (Persoon, *Synopsis methodica fungorum*) for *Gasteromycetes* (s.l.), *Pucciniales* and *Ustilaginales*; and 1 Jan. 1821 (Fries, *Systema mycologicum* **1** (1)) for the remaining fungi (other than slime-moulds and lichen-forming species). Reasons for the change in starting point dates are discussed in Demoulin *et al.* (*Taxon* **30**: 52, 1981). Names used in the previous starting point books of Fries and Persoon are **sanctioned** and not affected by, and take priority over, homonymous and synonymous names published earlier (listed by Gams, *Mycotaxon* **19**: 219, 1984). Names given to lichens are ruled as applying only to their fungal components, i.e. to the lichen-forming fungus. Algae in lichens have separate names, and the composite 'lichen' strictly has no name. Many names ending in *-myces* introduced for lichen mycobionts by Thomas (*Beitr. Kryptog.-Fl. Schweiz.* **9** (1), 1939) and Ciferri & Tomaselli (*Atti Ist. Bot. Univ. Lab. crittog. Pavia* ser. V **10**, 1953) are thus superfluous (see Lücking & Hawksworth, *Taxon* **56**: 1274, 2007).

Pleomorphic fungi:

The Code permits the different states of fungi (q.v.), other than lichen-forming fungi, with pleomorphic life-cycles to be given separate names; it does not apply to fungi in which pleomorphism is not confirmed (Reynolds & Taylor, *Taxon* **41**: 98, 1992). Whether a name can be considered as that of an anamorph or teleomorph depends on its original description and nomenclatural type, *not* the genus in which it was placed; if a teleomorph is present, the name automatically refers to that morph even if the anamorph is also evident (e.g. *Penicillium brefeldianum* B.O. Dodge (1933) included both states in its type and description and is thus a teleomorph name that has correctly been combined as *Eupenicillium brefeldianum* (B.O. Dodge) Stolk & D.B. Scott (1967); the name of the anamorph is *P. dodgei* Pitt (1980), the type and description of which are only of the anamorph). The correct name of a holomorph is that of its teleomorph.

Name changing:

In order to avoid name changes for nomenclatural reasons through a strict application of the Code, special provisions have been made. Names of families, genera and species can be **conserved (nomina conservanda, nom. cons.)** against names threatening their retention, and names in any rank can be **rejected (nomina rejicienda, nom. rej.)** if their use would cause disadvantageous nomenclatural change. If a name has been widely used for a taxon in a sense conflicting with its type, it is not to be used unless and until a proposal to deal with it has been submitted and the name rejected. If a particular work would cause instability if it were used as a source of valid names, it can be proposed for inclusion in a list of **suppressed works**. Proposals for conservation, rejec-

tion, or suppression have to be published in *Taxon* and voted on by appropriate Committees. Appendices to the Code list names and works in these categories.

Lists of Names in Current Use (NCUs) were developed through a Committee appointed by the 1994 Congress; those published include those for names of fungal families (David, *Regnum Veg.* **126**: 71, 1993; NCU-1), genera (Greuter *et al.*, *Regnum Veg.* **129**, 1993, NCU-3), and species in *Cladoniaceae* (Ahti, *Regnum Veg.* **128**: 58, 1983) and *Trichocomaceae* (Pitt & Samson, *Regnum Veg.* **128**: 13, 1993; subject of a special Nomenclatural Section Resolution). The 1993 Congress, noting improvements being made in the systems of nomenclature to promote stability, urged taxonomists 'to avoid displacing well established names for purely nomenclatural reasons' (see Greuter & Nicolson, *Taxon* **42**: 925, 1993; Hawksworth, *SA* **12**: 1, 1993).

Authorities:

The authority of a name, usually abbreviated (see Authors' names) is cited after a name for precision and is intended to be a much abbreviated bibliographic reference. If a species is move from one genus to another, or has its rank changed, the original author, i.e. of the basionym (q.v.), is given in brackets and the one making the change cited outside the brackets (e.g. *Fusarium poae* (Peck) Wollenw., based on the earlier *Sporotrichum poae* Peck). Where a name not validly published by one author is taken up and validated by a second, '**ex**' is used to link the names of the two authors. In the case of names sanctioned by Persoon or Fries (see above), a colon (:) can be used where it is considered approporiate to indicate the special status of that name or epithet (see Korf, *Mycol.* **74**: 250, 1982; *Mycotaxon* **14**: 476, 1982); 'ex', 'per' or '[ ]' had previously been used for devalidated names taken up again after the former later starting dates; '**in**' was sometimes formerly used where one author contributed an account of a taxon to the work of another but this was ruled to be part of the bibliographic reference by the 1994 Code and does not form a part of author citations. The Code now emphasizes that the authority is not part of the name itself and there is no reason to use it in works other than formal systematic treatments, unless homonyms are involved.

Registration:

The time and effort needed to maintain formal nomenclators of fungal names (i.e. the *Index of Fungi*, see under *Literature*, and its web-based counterpart *Index Fungorum*, see Internet) are considerable, and scientific names can currently be effectively published in almost any non-ephemeral publicly available printed product. Some of these may only become apparent to the taxonomic community years after publication, potentially causing great confusion and nomenclatural instability. There have been several initiatives over the past ten years or so, developing partly from the Names in Current Use scheme, to make registration of fungal (and plant) names mandatory so that priority of publication is determined by the date of receipt of the information or publication by a Registration Authority. A similar scheme is already in use for the Bacteriological *Code*. The proposals received a very mixed response from the nomenclatural community, with concerns expressed about the potential for nomenclatural censorship and over the possible continuing use of non-registered names in contravention of the Code. References in the Tokyo *Code* (1994) to registration as a future requirement were summarily removed by the St Louis Congress (2000). Some pilot schemes have nevertheless taken place. Under defined conditions, unique IndexFungorum-compatible identifier numbers for new scientific fungal names can now be obtained via the internet (at the time of writing, the only 'registration' website in operation is **Mycobank**, www.mycobank.org). Although the numbers themselves currently have no formal nomenclatural status, the names 'registered' in this manner are then passed automatically to *Index Fungorum*. Such a system ('registration' websites issuing numbers on behalf of a single internationally recognized nomenclator) may suit the needs of mycology, but ultimately innovations in Internet searching may make all of these initiatives superfluous, especially as the average age continues to increase of those who have in-depth knowledge of nomenclature, and the ability to write Latin decriptions declines.

Other Codes:

Separate Codes exist for zoology, bacteriology, cultivated plants, and viruses. These are independent of the Botanical Code, but there has been extensive discussion as to how harmonization between the Codes can be improved (Hawksworth *et al.*, 1994). See also ambiregnal organisms. A draft International Code of Bionomenclature (the *BioCode*) was planned to apply to names in all groups introduced after (provisionally) 1 Jan. 2000 (see Hawksworth, *Taxon* **44**: 447, 1995) but its proponents have to date been unable to gain sufficient support to see it into reality. A further challenge to the *status quo* has been development of a draft *PhyloCode* (http://www.ohiou.edu/phylocode/) which proposes a formal nomenclature system for nodes and branches of phylogenies. There is effectively an almost infinite number of ranks in a phylogenetic classification if these are measured by evolutionary age, and it is often difficult to map these onto a traditional system. Molecular tools will increasingly dominate research into systematics, diagnostics etc., and it is important to embrace new technologies while building on rather than rejecting current knowledge.

Numbers of fungi. Numbers of fungi. The development of reliable estimates of both the numbers of accepted species of fungi and the actual number on Earth is fraught with uncertainties. The difficulties involved in the enumeration of fungi as individuals, kinds (i.e. as genera and species) or even names are considerable (Ainsworth, 1968). The early edns of this *Dictionary* estimated the number of known 'good' species to be 38,000, rising to 50,000 in the fifth edn. For the seventh edn of this *Dictionary*, the numbers of genera and species accepted were derived by upwards summation of the totals from the generic entries; this gave a total of 64,200 species. For the eighth edn the number was 72,065, and for the ninth edn the number was 80060. The editors of that edition commented that this figure was within the limits of error expected in an exercise of this type. Since the start of 2001, new species of fungi have been catalogued in the *Index of Fungi* at the rate of c. 1200 each year. Assuming that mycologists still inadvertently redescribe already known species at the rate of about 2.5:1 (Hawksworth, 1991) this means that an additional c. 2,200 'good' species would be expected to have been added in the period 2001-2007; i.e. a

TABLE 4. The Numbers of Fungi.

	gen.	spp.	gen.	spp.
FUNGI				
Ascomycota			5674	64056
Arthoniomycetes	78	1608		
Dothideomycetes	1302	19010		
Eurotiomycetes	281	3401

Mucoromycotina	61	325		
Zoopagomycotina	22	190		
incertae sedis	3	9		
TOTAL			**75337**	**97330**

total of 82,060 species. The figure of just over 97,000 in Table 4 obtained by upwards addition in entries in this edn of the *Dictionary* is substantially larger. Reasons for this include possible double counting (because of the on-going process of incorporating the conidial fungi in a single holomorphic system), and an increase in the number of species accepted in some groups (perhaps partly as a result of molecular studies); in addition, it is now evident that the earlier estimates were probably very conservative. These figures show a clear upward trend over more than half a century in the number of species discovered, described and accepted by the scientific community.

It is also important to note that amongst the over 338,000 names at species rank proposed for fungi, many have never been reassessed since their first description nor have they been adopted by modem workers. Names in many accepted genera, especially some of the larger, have not been critically revised; in this edn of the *Dictionary* we have not added in all species names proposed and catalogued in the *Index of Fungi* in the absence of the opinions of specialists. In the absence of a world checklist of accepted fungi (a topic starting to be addressed through the IUBS/IUMS SPECIES 2000 project), the possibility that as many as 100,000 'good' species are already described seems quite believable, and as many as 150,000 (Rossman, 1994) 'good' species already described cannot be excluded.

Estimating the total number of fungi on Earth is even more problematic. Bisby & Ainsworth (1943) estimated that there are at least 100,000 species of fungi. Martin (*Proc. Iowa Acad. Sci.* **58**: 175, 1951) considered this estimate 'excessively conservative' and suggested that the number of species of fungi is at least as great as the number of 'good' species of phanerogams, then believed to be not less than 250,000. Based on extrapolations from three independent data sets (ratios of the numbers of fungi in all habitats to plants in the British Isles, numbers restricted to particular hosts, and a community studied in depth) Hawksworth (1991) suggested that a 'conservative' working figure of c. 1.5 million be adopted. Although Hammond (1992) recommended 1 million for general use, this 1.5 million estimate has been supported by subsequent data (Hawksworth, 1993; Cannon & Hawksworth, 1995). Schmit & Mueller (*Biodiversity conservation* **16**: 99, 2007) suggested that 712,000 species of fungi worldwide was a very conservative lower limit of global fungal diversity. Currently Hawksworth's estimate of 1.5 million species remains the most widely accepted (Heywood, *Global biodiversity assessment*, 1995; Rossman, 1994).

The gap between described and estimated species of fungi is immense, and new species are regularly found in all countries of the world. Of the 16,013 new species recorded in the *Index of Fungi* in 1981-90, 51% were from countries outside the tropics; the individual countries providing most species were India and the USA (c. 10% each) (Hawksworth, 1993). In the tropics, around 15-25% of the fungi collected in short studies can be expected to be undescribed, the percentage rising to 60-85% in more prolonged intensive investigations (depending on the groups and habitats). Examination of more recent issues of the *Index of Fungi* suggests this pattern continues. Pirozynski (*Mycol. Pap.* 129, 1972) reported a ratio of micro-fungi *alone* to plants of at least 3:1 (and possibly 5:1) in Tanzania, and detailed (but still incomplete) site inventories in temperate regions yield ratios of 3-4:1 when all groups are considered (Hawksworth, 1991).

Lit.: Ainsworth (*in* Ainsworth & Sussman, *The Fungi* **3**: 505, 1968), Bisby (*Am. J. Bot.* **20**: 246, 1933), Bisby & Ainsworth (*TBMS* **26**: 16, 1943), Cannon & Hawksworth (*Adv. Pl. Path.* **11**: 277, 1995), Hammond (in Groombridge, *Global biodiversity*: 17, 1992), Hawksworth (*MR* **95**: 641, 1991; *in* Isaac *et al.*, *Aspects of tropical mycology*: 265, 1994), Kirk (*MR* 104: 516, 2000), Pascoe (*in* Short, *History of systematic mycology in Australia*: 259, 1990), Rossman (*in* Hawksworth (Ed.), *Identification and characterization of pest organisms*: 35, 1994).

Numerical taxonomy (phenetics, taxometrics). Now largely replaced by phylogenetic analysis (q.v.). The entry from the previous edn of this *Dictionary*, retained for historical interest, follows. The derivation of computer-based assessments of resemblance, for both classification and identification, has not been as widely used for fungi as for bacteria. Examples of this approach applied to fungal classification are the papers by Bridge *et al.* (*J. Gen. Microbiol.* **135**: 2941, 1989; *Penicillium*), Hõls & Raitviir (*Scripta mycol.* **6**, 1974; morphometrics), Ibrahim & Threlfall (*Proc. R. Soc.* **B165**: 362, 1966; graminicolous *Helminthosporium*), Joly (*BSMF* **85**: 213, 1969; *Alternaria*), Kendrick & Proctor (*CJB* **42**:65, 1964; anamorphic fungi), Kendrick & Weresub (*Syst. Zool.* **15**: 307, 1966; ordinal level in basidiomycetes), Kiefer (*Mycol.* **71**: 343, 1979; methodology of Machol & Singer, *Nova Hedw.* **21**: 353, 1971), Parker-Rhodes & Jackson (*in* Cole (Ed.), 1969: 181; ecology of basidiomycetes). For examples of identification schemes see Barnett *et al.* (*Yeasts: characteristics and identification*, edn 2, 1990), Bridge *et al.* (*Mycol. Pap.* **165**, 1992), Pankhurst (*Nature* **227**: 1269, 1970; *Biological identification*, 1978; key generation).
For methods see Bridge & Sackin (*Mycopath.* **115**: 105, 1991), Carmichael & Sneath (*Syst. Zool.* **18**:402, 1969), Cole (Ed.) (*Numerical taxonomy*, 1969), Cutbill (Ed.) (*Data processing in biology and geology*, 1971), Felsenstein (*Numerical taxonomy*, 1983), Sneath & Sokal (*Numerical taxonomy*, edn 2, 1973).

Nummospora E. Müll. & Shoemaker (1964), anamorphic *Pezizomycotina*, Cpd.#eP.?. 1, Switzerland. See Müller & Shoemaker (*Nova Hedwigia* **7**: 1, 1964), Wu *et al.* (*MR* **102**: 179, 1998).

Nummularia Tul. & C. Tul. (1863) [non *Nummularia* Hill 1756, *Primulaceae*] ≡ Biscogniauxia fide Jong & Benjamin (*Mycol.* **63**: 862, 1971; N. Am. spp.), Ju *et al.* (*Mycotaxon* **66**: 1, 1998).

Nummulariella Eckblad & Granmo (1978) = Biscogniauxia fide Pouzar (*Česká Mykol.* **33**: 129, 1979), Læssøe (*SA* **13**: 43, 1994; ? synonym of *Xylaria*).

Nummularioidea (Cooke & Massee) Lloyd (1924) = Camillea fide Læssøe *et al.* (*MR* **93**: 121, 1989), Læssøe (*SA* **13**: 43, 1994; ? synonym of *Xylaria*).

Nummularoidea, see *Nummularioidea*.

Numulariola House (1925) ≡ Biscogniauxia.

nurse cells (in *Scleroderma*), hyphae supplying food material to spores which have come away from the basidia.

TABLE 4 (cont.). The Numbers of protozoan and chromistan analogues.

	gen.	spp.	gen.	spp.
PROTOZOA				
Percolozoa (*Acrasida*)			6	14
Amoebozoa			82	1019
Dictyostelia	4	93		
Myxogastria	62	888		
Protostelia	16	38		
Cercozoa (*Plasmodiophorida*)			15	50
Choanozoa (*Amoebidiales, Eccrinales*)			19	78
Incertae sedis			3	4
TOTAL			**125**	**1165**
CHROMISTA				
Hyphochytriomycota	6	24		
Labyrinthista	12	56		
Oomycota	106	956		
Incertae sedis	2	3		
TOTAL			**1264**	**1036**

Nusia Subram. (1995), anamorphic *Pezizomycotina*, Hso.≡ eP.24. 2, Singapore. See Subramanian (*Cryptog. Mycol.* **14**: 109, 1993), Subramanian (*Kavaka* **20/21**: 57, 1992/1993).

nutant, nodding.

nutrilite, any organic compound necessary in small amounts for the nutrition of an organism (Williams, *Biol. Rev.* **16**: 49, 1941).

nutriocyte (of *Ascosphaera*), the inflated part of the ascogonium which eventually develops into a spore cyst (Spiltoir & Olive, *Mycol.* **47**: 240, 1955).

Nutrition. Fungi are able to degrade and subsequently metabolize many widely different materials. Some parasites (obligate parasites, e.g. *Pucciniales*, *Erysiphales*, *Peronosporaceae*) have such special needs that full development takes place only on the right host; but growth of other parasites, like that of most fungi, will take place on a synthetic medium (see Methods). The growth of fungi is dependent on carbon (C), hydrogen (H), oxygen (O), nitrogen (N), potassium (K), phosphorus (P), magnesium (Mg), and sulphur (S), together with very small amounts of iron (Fe), zinc (Zn), copper (Cu), and/or possibly other minor (or trace) elements. Calcium (Ca) is probably a necessary element but it is not always possible to demonstrate that this is so. In addition, complex 'growth substances' are sometimes needed.

Fungi are heterotrophic in needing their carbon in a complex (organic) form. In general, aliphatic carbon compounds (esp. carbohydrates) are more readily used by fungi than aromatic ones. Nevertheless, basidiomycete fungi are the key organisms in breaking down the ubiquitous aromatic polymer lignin. There are some yeasts which can grow on the one carbon methanol. Some fungi are dependent on organic nitrogen (esp. amino acids and proteins), others can use ammonium or nitrate nitrogen. Fungi are able to adapt and regulate their metabolism according to the nutrients available. The complex bios (q.v.) was the first '**growth substance**' to be noted for fungi, yeast making better growth with it. Thiamin [aneurin, vitamin B_1] is one of the substances necessary for the growth of some fungi; for certain species the complete molecule is needed but others are able to synthesize thiamin if given one, or both, of its components (thiazole and pyrimidine). Fungi are often able to tolerate high concentrations of toxic metals and high concentrations of salt and sugar (which can be lethal to many other organisms) and the species which are able to do this cause spoilage of food.

Lichen-forming fungi obtain the carbohydrates they require in the form of sugars and sugar-alcohols (polyols) produced by the algal partner; the nature of the mobile carbohydrate depends on the kind of alga present (e.g. glucose with *Nostoc*, ribitol with *Myrmecia* and *Trebouxia*, erythritol with *Trentepohlia*); cyanobacteria fix atmospheric nitrogen. The carbohydrates are commonly stored as mannitol by the fungal component. The mineral requirements of lichen fungi are met by ions dissolved in rain and from the deposition of dust; in some cases diffusion from the substrate can occur but is usually very limited in extent.

See Jennings (*The physiology of fungal nutrition*, 1995), Lichens, Physiology.

NY, New York Botanical Garden (Bronx, New York, USA); founded 1891; a private institution.

Nyctalidaceae Jülich (1982) nom. rej. = Lyophyllaceae.

Nyctalina Arnaud (1952), anamorphic *Agaricomycetes*, Hso.0eH.?. 1 (with clamp connexions), Europe. See Arnaud (*BSMF* **68**: 189, 1952).

Nyctalis Fr. (1825) = Asterophora fide Stalpers (*in litt.*).

Nyctalospora E.F. Morris (1972), anamorphic *Pezizomycotina*, Hsy.≡ eP.1. 1, Costa Rica. See Morris (*Mycol.* **64**: 890, 1972).

Nycteromyces Thaxt. (1917), Laboulbeniaceae. 1, S. America.

Nyctomyces Hartig (1833), Fossil Fungi (mycel.) Fungi. 4 (Tertiary), Europe; N. Africa.

Nylander (William; 1822-1899; Finland). Practising medic (1852-1858; Professor of Botany, Helsinki University (1858-1863); living in Paris (1863 onwards). Visited England to examine Hooker's lichen collection [now in the British Museum (Natural History), London **BM**] (1857); published *c.* 330 works [of which the first few were on ants]; introduced the use of chemical reagents (C, I and K) into lichenology (see Metabolic products); described over 5,000 new species of lichen-forming fungi from all parts of the world. Main collections in Helsinki (**H**), but material in most major European institutions with mycological collections. *Publs. Synopsis Methodica Lichenum Omnium hucusque Cognitorum, Praemissa Introductione Lingua Gallica* **1** (1), **1** (2) and **2** (1858, 1860, 1863); Lichenes Scandinaviae sive prodromus lichenographiae Scandinaviae. *Notiser ur Sällskapets pro Fauna et Flora Fennica Förhandlingar* (1861); *Lichenes Japoniae. Accedunt Observationibus Lichenes Insulae Labuan* (1890). *Biogs, obits etc.* Ahti [ed.] (*Collected Papers of William Nylander* 6 vols, 1967-1990) [biography in **1**: viii, 1990]; Grummann (1974: 611); Hue (*Bulletin de la Société Botanique de France* **46**: 153, 1899) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **3**: 788, 1981).

Nylanderaria Kuntze (1891) = Letharia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Nylanderiella Hue (1914) = Siphula Fr. (1831) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Nylanderopsis Gyeln. (1935) = Heppia fide Henssen (*Acta Bot. Fenn.* **150**: 57, 1994).

Nymanomyces Henn. (1899), Rhytismataceae. 1, Java.

Nypaella K.D. Hyde & B. Sutton (1992), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1, Brunei. See Hyde & Sutton (*MR* **96**: 210, 1992).

Nyssopsora Arthur (1906), Raveneliaceae. 9 (on dicots, esp. *Araliales*), widespread. See Lütjeharms (*Blumea*, 1937), Lohsomboon *et al.* (*MR* **94**: 907, 1990; key).

Nyssopsorella Syd. (1921) = Triphragmiopsis fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

nystatin (mycostatin), an antibiotic from the actinomycete *Streptomyces noursei*; antifungal, widely used against *Candida albicans* infections of man. See Brown & Hazen (*Trans. N.Y. Acad. Sci.* ser. 2 **19**: 447, 1957), Baldwin (*The fungus fighters*, 1981).

Nyungwea Sérus., Eb. Fischer & Killmann (2006), ? Arthoniales (L). 1, E. Africa. See Sérusiaux *et al.* (*Lichenologist* **38**: 115, 2006).

O, Botanical Garden and Museum, University of Oslo (Norway); founded 1812.

OA, see Media.

oak-moss (**oakmoss, oak moss**), *Evernia prunastri* (mousse de chêne); extracts of which are used in perfumes to reduce the rate of evaporation of other ingredients. Cf. tree hair.

ob- (prefix), inversely or oppositely.

obclavate, inversely clavate (widest at the base) (Fig. 23.17).

Obconicum Velen. (1939), ? Helotiales. 2, former Czechoslovakia.

Obelidium Nowak. (1877), Chytridiaceae. 3, widespread (north temperate).

Obeliospora Nawawi & Kuthub. (1990), anamorphic *Pezizomycotina*, Hso.0bH.15. 1 (on submerged decaying wood), Malaysia. See Nawawi & Kuthubutheen (*Mycotaxon* **37**: 395, 1990), Kuthubutheen & Nawawi (*MR* **98**: 677, 1994), Wu & McKenzie (*Fungal Diversity* **12**: 223, 2003).

Oberwinkleria Vánky & R. Bauer (1995), Tilletiaceae. 1 (in seeds of *Poaceae*), Venezuela. See Vánky & Bauer (*Mycotaxon* **53**: 363, 1995).

oblate, with the equatorial diameter greater than the polar diameter; **- spheroidal**, shaped like the earth.

obligate (1) necessary; essential; (2) (of a parasite), living as a parasite in nature, sometimes of one that has not been cultured on laboratory media, cf. facultative; see synonym.

oblique septum, see septum.

oblong (of spores), twice as long as wide and having somewhat truncate ends (Fig. 23.4*b*, *c*); **- ellipsoid** (of spores), rounded-oblong; having long sides parallel and ends almost hemispherical.

Oblongichytrium R. Yokoy. & D. Honda (2007), Thraustochytriaceae. 3 (marine), widespread. See Yokoyama, R.; Honda, D. (*Mycoscience* **48**: 199, 2007).

Obolarina Pouzar (1986), Xylariaceae. Anamorph *Rhinocladiella*-like. 1, Europe. See Hawksworth (*SA* **13**: 198, 1985), Candoussau & Rogers (*Mycotaxon* **39**: 345, 1990), Læssøe & Spooner (*Kew Bull.* **49**: 1, 1994; as *Rosellinia*), Eriksson (*SA* **14**: 61, 1995; posn), Nordén & Sunhede (*Svensk bot. Tidskr.* **94**: 331, 2001; ecology).

obovate, inversely ovate.

obovoid, inversely ovoid (Fig. 23.12).

obpyriform, the reverse of pyriform (Fig. 23.15).

Obryzaceae Körb. (1855), Sordariomycetes (inc. sed.). 1 gen., 3 spp.

Lit.: Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 181 pp., 2000).

Obryzum Wallr. (1825), Obryzaceae. 3 (lichenicolous, on *Leptogium*), Europe. See Eriksson (*Op. Bot.* **60**, 1981), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000).

Obscurodiscus Raitv. (2002), Helotiales. 1, Europe. See Raitviir (*Mycotaxon* **81**: 49, 2002).

obsolete (1) (of organs or parts), rudimentary or absent; (2) (of terms), no longer in use.

Obstipipilus B. Sutton (1968), anamorphic *Pezizomycotina*, Cac.1eP.19. 1, India. See Sutton (*CJB* **46**: 187, 1968).

Obstipispora R.C. Sinclair & Morgan-Jones (1979), anamorphic *Pezizomycotina*, Hso.0fH.1. 1 (aquatic), USA. See Sinclair & Morgan-Jones (*Mycotaxon* **8**: 152, 1979).

obsubulate, very narrow; pointed at the base and a little wider at the tip.

Obtectodiscus E. Müll., Petrini & Samuels (1980), Helotiales. 2, Switzerland; S. America. See Samuels & Rogerson (*Acta Amazon.* Supl. **14**: 81, 1984), Scheuer (*Biblthca Mycol.* **123**: 274, 1988).

obtuse (1) rounded or blunt (Fig. 23.4*b*); (2) greater than a right angle.

occluded, closed; often used of the lumina of hyphae or pseudoparenchymatous cells.

Occultifur Oberw. (1990), Cystobasidiaceae. 4, widespread (north temperate). See Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny).

Occultitheca J.D. Rogers & Y.-M. Ju (2003), Xylariaceae. 1, Costa Rica. See Rogers & Ju (*Sydowia* **55**: 359, 2003).

Oceanites Kohlm. (1977), ? Halosphaeriaceae. 1, Atlantic. See Kohlmeyer (*Revue Mycol.* Paris **41**: 193,

1977).

Ocellaria (Tul. & C. Tul.) P. Karst. (1871) = Pezicula Tul. & C. Tul. fide Verkley (*Stud. Mycol.* **44**: 180 pp., 1999), Abeln (*Mycol.* **92**: 685, 2000; phylogeny).

Ocellariella Petr. (1947) ? = Naevia Fr. (1849) fide Korf *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 249, 1973).

ocellate, having rounded marks, like eyes.

Ocellis Clem. (1909) = Ocellularia fide Zahlbruckner (*Catalogus Lichenum Universalis* **2**, 1923).

Ocellularia G. Mey. (1825) nom. cons., Thelotremataceae (L). 249, widespread (esp. tropical). See Hale (*Mycotaxon* **11**: 130, 1980; limits), Nagarkar *et al.* (*Biovigyanam* **14**: 24, 1988; key 32 spp. India), Matsumoto & Deguchi (*Bryologist* **102**: 86, 1999; anamorphs), Sipman (*Biblthca Lichenol.* **86**: 177, 2003; Singapore), Frisch (*Biblthca Lichenol.* **92**: 3, 2006; Africa), Frisch & Kalb (*Biblthca Lichenol.* **92**: 371, 2006; anatomy), Frisch *et al.* (*Biblthca Lichenol.* **92**: 517, 2006; phylogeny), Mangold *et al.* (*Biblthca Lichenol.* **96**: 193, 2007; Australia).

ocellus, an eyespot functioning as a lens and concentrating light rays on a sensitive spot.

Ochotrichobolus Kimbr. & Korf (1983), Pezizales. 1, USA. See Brummelin (*Persoonia* **16**: 425, 1998; possible placement in *Pyronemataceae*).

Ochraceospora Fiore (1930) nom. dub., Hypocreales. Possibly an earlier name for *Haematonectria* (*Nectriaceae*), but type material is lost. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

ochratoxin (A, B), toxins of *Aspergillus ochraceus*, *Penicillium viridicatum*, etc.; the cause of nephrotoxicosis in sheep, cattle, and pigs; also carcinogenic and has been found in coffee.

Ochrocladosporium Crous & U. Braun (2007), anamorphic *Pleosporales*. 2, Sweden; Germany. See Crous *et al.* (*Stud. Mycol.* **58**: 33, 2007).

Ochroconis de Hoog & Arx (1974), anamorphic *Pezizomycotina*, Hso.1eP.11. 8, widespread. See de Hoog (*Stud. Mycol.* **26**: 51, 1985), Fukushiro *et al.* (*J. Med. Vet. Mycol.* **24**: 175, 1986; subcutaneous abscesses), Sides *et al.* (*J. Med. Vet. Mycol.* **29**: 317, 1991; phaeohyphomycosis), Padhye *et al.* (*J. Med. Vet. Mycol.* **32**: 141, 1994; in cat), Schaumann & Priebe (*CJB* **72**: 1629, 1994; in salmon), Horré *et al.* (*Stud. Mycol.* **43**: 194, 1999; DNA, physiology).

Ochroglossum S. Imai (1955) = Microglossum Gillet fide Maas Geesteranus (*Persoonia* **3**: 89, 1964).

Ochrolechia A. Massal. (1852), Ochrolechiaceae (L). 58, widespread (esp. temperate). See Verseghy (*Beih. Nova Hedwigia* **1**, 1962; monogr., keys), Poelt (*Ergebn. Forsch.-Unternehmen Nepal Himal.* **1**: 251, 1966; Himalaya), Brodo (*CJB* **66**: 1264, 1988; N. Am.), Awasthi & Tewari (*Kavaka* **15**: 23, 1989; key 12 spp. Indian subcont.), Schmitz *et al.* (*Acta Bot. Fenn.* **150**: 153, 1994; gen. concept), Archer (*Biblthca Lichenol.* **69**, 1997; Australia), Boqueras *et al.* (*Cryptog. Mycol.* **20**: 303, 1999; Iberian spp.), Messuti & Lumbsch (*Biblthca Lichenol.* **75**: 33, 2000; S America), Schmitt & Lumbsch (*Mol. Phylogen. Evol.* **33**: 43, 2004; phylogeny, chemistry), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**: 753, 2006; phylogeny).

Ochrolechiaceae R.C. Harris ex Lumbsch & I. Schmitt (2006), Pertusariales. 2 gen. (+ 2 syn.), 61 spp.

Lit.: Brodo (*CJB* **69**: 733, 1991), Lumbsch *et al.* (*Biblthca Lichenol.* **57**: 355, 1995), Schmitt *et al.* (*Biblthca Lichenol.* **86**: 147, 2003), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**: 753, 2006).

Ochromitra Velen. (1934) = Pseudorhizina fide Petrak (*Sydowia* **1**: 61, 1947).

Ochronectria Rossman & Samuels (1999), Bionectriaceae. 1, widespread (tropical). See Rossman *et al.* (*Stud. Mycol.* **42**: 53, 1999), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny).

Ochroporus J. Schröt. (1888) = Phellinus fide Donk (*Persoonia* **1**: 173, 1960).

Ochropsora Dietel (1895), ? Uropyxidaceae. 4 (on dicots), widespread (north temperate). See Soong (*Flora* **133**: 345, 1939; morphology), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; under *Chaconiaceae*), Ono (*Mycoscience* **47**: 145, 2006; life cycle, basidium morph.).

Ochrosphaera Sawada (1959), Pezizomycotina. 1, Taiwan. See Sawada (*Special Publication College of Agriculture, National Taiwan University* **8**: 50, 1959).

Ochrosporellus (Bondartseva & S. Herrera) Bondartseva & S. Herrera (1992) = Phellinus fide Ryvarden (*Syn. Fung.* **5**: 312, 1991).

ochrosporous, having yellow or yellow-brown spores.

Ocostaspora E.B.G. Jones, R.G. Johnson & S.T. Moss (1983), Halosphaeriaceae. 1 (marine), widespread. See Jones *et al.* (*Bot. Mar.* **26**: 353, 1983), Pang *et al.* (*CJB* **82**: 485, 2004).

Ocotomyces H.C. Evans & Minter (1985), ? Rhytismatales. Anamorph *Uyucamyces*. 1 (on *Pinus*), Honduras. See Evans & Minter (*TBMS* **84**: 57, 1985).

Octaviania Vittad. (1831), Boletaceae. 15, widespread.

Octavianiaceae Locq. ex Pegler & T.W.K. Young (1979) = Boletaceae.

Octavianina, see *Octaviania*.

octo- (in combinations), 8.

Octojuga Fayod (1889) = Crepidotus fide Kuyper (*in litt.*).

Octomyces Mello & L.G. Fern. (1918) ? = Saccharomyces fide Batra *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 187, 1978).

octophore, see haerangium.

Octopodotus Kohlm. & Volkm.-Kohlm. (2003), anamorphic *Pezizomycotina*. 1, USA. See Kohlmeyer & Volkmann-Kohlmeyer (*Mycol.* **95**: 117, 2003).

octopolar (of incompatability systems), having 3 loci, as in *Psathyrella coprobia* (Jurand & Kemp, *Genetical Res., Cambr.* **22**: 125, 1973); cf. tetrapolar.

Octospora Hedw. (1789), Pyronemataceae. *c.* 84 (often bryophilous), widespread. See Dennis & Itzerott (*Kew Bull.* **28**: 5, 1973; key), Khare & Tewari (*Mycol.* **67**: 972, 1975), Dennis & Itzerott (*Kew Bull.* **31**: 497, 1977; W. Eur.), Döbbeler (*Nova Hedwigia* **31**: 817, 1980), Döbbeler & Itzerott (*Nova Hedwigia* **34**: 127, 1981; biology), Caillet & Moyne (*BSMF* **103**: 277, 1987; key 32 spp.), Caillet & Moyne (*Bull. Soc. Hist. nat. Doubs* **84**: 9, 1991; keys), Wang (*NMNS Spec. Publ.*, 1992; key, N. American spp.), Yao & Spooner (*MR* **100**: 175, 1996; key Brit. spp.), Moravec (*Czech Mycol.* **49**: 149, 1997; sect. *Neottiellae*), Benkert (*Z. Pilzk.* **7**: 39, 1998), Jakobson *et al.* (*Karstenia* **38**: 1, 1998), Khare (*Nova Hedwigia* **77**: 445, 2003), Benkert & Brouwer (*Persoonia* **18**: 381, 2004; Netherlands), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

octospore, one spore of an 8-spored ascus.

Octosporea Flu (1911), Microsporidia. 3.

Octosporella Döbbeler (1980), Pyronemataceae. 7 (on mosses and liverworts), Europe; Venezuela. See Döbbeler (*Mitt. bot. StSamml., München* **16**: 471, 1980), Yao & Spooner (*Kew Bull.* **51**: 193, 1996), Yao *et al.* (*Nova Hedwigia* **82**: 483, 2006; key).

Octosporomyces Kudrjanzev (1960) = Schizosaccharomyces fide Sipiczki *in* Nasim *et al.* (Eds) (*Molecular biology of the fission yeast*, 1989), Kurtzman & Robnett (*Yeast* Chichester **7**: 61, 1991).

Octosporonites Locq. & Sal.-Cheb. (1980), Fossil Fungi. 1, Cameroon.

octosporous, producing spores in 8s.

Octotetraspora I.V. Issi, Kadyrova, Pushkar, Khodzhaeva & S.V. Krylova (1990), Microsporidia. 1.

ocular chamber, see ascus.

Oculimacula Crous & W. Gams (2003), Helotiales. Anamorph *Helgardia*. 2 (causing eyespot disease of cereals), widespread. See Crous *et al.* (*Eur. J. Pl. Path.* **109**: 845, 2003), Walsh *et al.* (*J. Phytopath.* **153**: 715, 2005; molecular diagnostics).

Odontia Fr. (1835) = Steccherinum fide Donk (*Persoonia* **3**: 199, 1964) but used by, Furukawa (*Bull. Govt For. Exp. Stn* **261**, 1974).

OdontiaGray (1821) nom. dub. fide Stalpers (*in litt.*).

Odontia Pers. (1794) nom. rej. = Caldesiella fide Stalpers (*in litt.*).

Odonticium Parmasto (1968), Agaricomycetes. 6, widespread. *Hymenochaetales* or *Agaricales* (*Rickenella* clade). See Parmasto (*Consp. System. Corticiac.*: 126, 1968), Zmitrovich (*Mikol. Fitopatol.* **35**: 9, 2001).

Odontina Pat. (1887) = Steccherinum fide Donk (*Taxon* **5**: 69, 1956).

Odontiochaete Rick (1940) nom. dub., Cantharellales. See Donk (*Taxon* **5**: 107, 1956).

Odontiopsis Hjortstam & Ryvarden (1980), Schizoporaceae. 2, widespread (tropical). See Hjortstam & Ryvarden (*Mycotaxon* **12**: 180, 1980).

Odontium Raf. (1817) ≡ Caldesiella fide Donk (*Taxon* **5**: 107, 1956).

Odontodictyospora Mercado (1984), anamorphic *Pezizomycotina*, Hso.#eH.11. 1, Cuba. See Mercado (*Acta Bot. Cubana* **22**: 1, 1984).

odontoid, tooth-like; dentate.

Odontoschizon Syd. & P. Syd. (1914) = Patinella fide Clements & Shear (*Gen. Fung.*, 1931).

Odontotrema Nyl. (1858), Odontotremataceae. *c.* 18, widespread (temperate). See Sherwood-Pike (*Mycotaxon* **28**: 137, 1987), Diederich *et al.* (*Lichenologist* **34**: 479, 2002; lichenicolous spp.), Wedin *et al.* (*Lichenologist* **37**: 67, 2005; phylogeny).

Odontotremataceae D. Hawksw. & Sherwood (1982), Ostropales. 15 gen. (+ 7 syn.), 78 spp.

Lit.: Sherwood-Pike (*Mycotaxon* **28**: 137, 1987; cellulases), Triebel (*Biblthca Lichenol.* **35**: 278 pp., 1989), Lumbsch & Hawksworth (*Biblthca Lichenol.* **38**: 325, 1990), Döbbeler (*Nova Hedwigia* **62**: 61, 1996), Holien & Triebel (*Lichenologist* **28**: 307, 1996), Wedin *et al.* (*Lichenologist* **37**: 67, 2005).

Odontotremella Rehm (1912) ≡ Odontura.

Odontura Clem. (1909), Odontotremataceae. 1, Europe. See Sherwood *et al.* (*TBMS* **75**: 479, 1980), Sherwood-Pike (*Mycotaxon* **28**: 137, 1987).

odour, see Smell.

Oedemium Link (1824), anamorphic *Chaetosphaerella*, Hso.1-≡ eP.9. 2, widespread. See Hughes & Hennebert (*CJB* **41**: 773, 1963), Réblová (*Mycotaxon* **70**: 387, 1999; teleomorph).

Oedemocarpus Trevis. (1857) = Mycoblastus fide Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1984).

Oedipus Bataille (1908) = Boletus Fr. fide Singer (*Farlowia* **2**: 223, 1945).

oedocephaloid, having a swelling at the end or tip, as conidiophores of *Oedocephalum* and *Cunninghamella*.

Oedocephalum Preuss (1851), anamorphic *Pezizales*, Hso.0eH.6. 9, widespread. Used for anamorphs of various genera in the *Pezizaceae* and *Pyronemataceae*. See Stalpers (*Proc. K. Ned. Akad. Wet.* C **77**: 383, 1974; key), Watanabe (*Mycol.* **83**: 524, 1991; Japan), Norman & Egger (*Mycol.* **91**: 820, 1999; phylogeny).

Oedogoniomyces Tak. Kobay. & M. Ôkubo (1954), Oedogoniomycetaceae. 1, widespread (north tropical). See Emerson & Whisler (*Arch. Mikrobiol.* **61**: 195, 1968), James *et al.* (*Mycol.* **98**: 860, 2006; phylogeny).

Oedogoniomycetaceae D.J.S. Barr (1990), Monoblepharidales. 1 gen., 1 spp.

Lit.: Emerson & Whisler (*Archs Microbiol.* **61**: 195, 1968), Barr *in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **7A**: 93, 2001).

Oedomyces Sacc. ex Trab. (1894) = Physoderma fide Karling (*Lloydia* **13**: 29, 1950) = Urophlyctis (Physodermat.) fide, Ciferri (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **20**: 246, 1963).

Oedothea Syd. (1930), anamorphic *Pezizomycotina*, Hsp.1eP.19. 1, S. America.

oenology, the study of wines; see wine making.

Oerskovia Prauser, M.P. Lechev. & H. Lechev. (1970), Actinobacteria. q.v.

Oesophagomyces Manier & Ormières (1980), Fungi. 1, France. See Manier & Ormières (*Annls Sci. Nat.* Zool., sér. 13 **2**: 154, 1980).

Oevstedalia Ertz & Diederich (2004), Verrucariaceae (L). 1, Antarctic. See Ertz & Diederich (*Mycol. Progr.* **3**: 232, 2004).

Ogataea Y. Yamada, K. Maeda & Mikata (1994), Saccharomycetales. Anamorph *Candida*. 1, widespread. See Mikata & Yamada (*Res. Commun.* Inst. Ferm., Osaka **17**: 99, 1995), Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 273, 1998), Morais *et al.* (*FEMS Yeast Res.* **5**: 81, 2004; phylogeny), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny), Limtong *et al.* (*Int. J. Syst. Evol. Microbiol.* **58**: 302, 2008; phylogeny).

Ohleria Fuckel (1868), Melanommataceae. Anamorph *Monodictys*. 4 (on wood), widespread. See Samuels (*N.Z. Jl Bot.* **18**: 515, 1980).

Ohleriella Earle (1902), ? Delitschiaceae. 1, N. America. See Ahmed & Cain (*CJB* **50**: 419, 1972; synonym of *Sporormiella*), Barr (*SA* **6**: 142, 1987), Barr (*N. Amer. Fl.* ser. 2 **13**: 129 pp., 1990), Barr (*Mycotaxon* **76**: 105, 2000).

Oichitonium Durieu & Mont. [not traced] nom. dub., ? Fungi.

-oid (suffix), like; having the form of. Most of the many mycological terms ending in this suffix (e.g. achlyoid, as in *Achlya*; daedaleoid, as *Daedalea*) have not been compiled in this *Dictionary*.

Oideum Ehrenb. (1818) ≡ Oidium Link (1824).

Oidiaceae Link (1826) = Erysiphaceae.

Oidiodendron Robak (1932), anamorphic *Byssoascus, Myxotrichum*, Hsy.0eP.38. 28, widespread (north

temperate). See Barron (*CJB* **40**: 589, 1962; key), Morrall (*CJB* **46**: 204, 1968), Currah *et al.* (*CJB* **71**: 1481, 1993; conidiogenesis), Hambleton *et al.* (*Mycol.* **90**: 854, 1998; phylogeny), Lacourt *et al.* (*New Phytol.* **149**: 565, 2001; phylogeny), Rice & Currah (*Mycotaxon* **79**: 383, 2001; physiology, morphology), Rice & Currah (*MR* **106**: 1463, 2002; ecology), Calduch *et al.* (*Stud. Mycol.* **50**: 159, 2004; Spain), Rice & Currah (*Stud. Mycol.* **53**: 83, 2005; review).

oidiomycin, an antigen prepared from *Candida albicans*, esp. for skin testing.

oidiophore, a structure producing oidia.

Oidiopsis Scalia (1902), anamorphic *Leveillula*, Hso.0eH.1. 7, widespread. See Braun (*Beih. Nova Hedwigia* **89**: 700 pp., 1987; monogr.), Saenz & Taylor (*CJB* **77**: 150, 1999; phylogeny), Liberato *et al.* (*Australas. Pl. Path.* **34**: 409, 2005; on *Euphorbia*, Australasia).

oidiospore, see oidium.

Oidites Mesch. (1892), Fossil Fungi. 2 (Oligocene), Baltic.

oidium (pl. **oidia**), (1) spermatia formed on hyphal branches, esp. in heterothallic hymenomycetes; (2) flat-ended conidia formed by the breaking up (usually centripetally) of a hypha into cells, as in *Geotrichum candidum*; arthrospore; (3) a mildew.

Oidium Link (1809) nom. rej. = Oidium Link (1824) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Oidium Link (1824) nom. cons., anamorphic *Erysiphe*, Hso.0eH.23. *c.* 212, widespread. See Carmichael *et al.* (*Genera of Hyphomycetes*, 1980), Braun (*Beih. Nova Hedwigia* **89**: 700 pp., 1987; monogr.), Gorter (*Phytophylactica* **20**: 113, 1988; S Africa), Ialongo (*Mycotaxon* **47**: 193, 1993; statistical characterization), Cook *et al.* (*MR* **101**: 975, 1997; SEM, host range), Braun (*Schlechtendalia* **3**: 48, 1999; gen. concept), Saenz & Taylor (*CJB* **77**: 150, 1999; phylogeny), Braun *et al.* (*The Powdery Mildews* A Comprehensive Treatise: 13, 2001; review), Cunnington *et al.* (*Australas. Pl. Path.* **32**: 421, 2003; molecular identification), Cunnington *et al.* (*Australas. Pl. Path.* **33**: 281, 2004; on *Fabaceae*, Australia), Bolay (*Cryptogamica Helvetica* **20**, 2005), Limkaisang *et al.* (*Mycoscience* **46**: 220, 2005; on *Hevea*), Cook *et al.* (*MR* **110**: 672, 2006; on Catalpa).

Oidium Sacc. (1880) nom. rej. prop. = Oidium Link (1824) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

oidization, dikaryotization by the fusion of an oidium with a haploid hypha.

Oidospora Will. (1878), Fossil Fungi ? Fungi. 1 (Carboniferous).

Ojibwaya B. Sutton (1973), anamorphic *Pezizomycotina*, Ccu.0eP.23. 1, widespread. See Sutton (*Mycol. Pap.* **132**: 82, 1973), Mel'nik & Belomesyatseva (*Mikol. Fitopatol.* **35**: 40, 2001; Belorus).

Okeanomyces K.L. Pang & E.B.G. Jones (2004), Halosphaeriaceae. 1 (marine), pantropical. See Pang *et al.* (*J. Linn. Soc.* Bot. **146**: 228, 2004).

old man's beard, see beard moss.

Oleina Tiegh. (1887), ? Saccharomycetales. 2, Europe.

Oleinis Clem. (1931) ≡ Oleina fide Batra *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 187, 1978).

oleocystidium, see cystidium.

oleoso-locular (of spores), having cells like drops of oil.

Oletheriostrigula Huhndorf & R.C. Harris (1996), Strigulaceae. 1, widespread (esp. mediterranean). See Huhndorf & Harris (*Brittonia* **48**: 551, 1996), Liew *et al.* (*Mycol.* **94**: 803, 2002; phylogeny).

Oligoporus Bref. (1888), Polyporaceae. Anamorph *Ptychogaster*. 10, Europe. See Niemelä & Kinnunen (*Karstenia* **45**: 76, 2005).

Oligosporidium Codreanu-Balcescu, Codreanu & Traciuc (1981), Microsporidia. 1.

oligosporous, having few spores. Cf. myriosporous.

Oligostroma Syd. & P. Syd. (1914) = Mycosphaerella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Aptroot (*CBS Diversity Ser.* **5**, 2006).

oligotrophic, poor in nutrients; cf. eutrophic.

Olivea Arthur (1917), Chaconiaceae. 8 (on dicots, esp. *Verbenaceae*), widespread (tropical). See Ono & Hennen (*TMSJ* **24**: 369, 1983).

Oliveonia Donk (1958), ? Auriculariales. Anamorph *Oliveorhiza*. 5, widespread. See Roberts (*Rhizoctonia-forming fungi*, 1999), Grosse-Brauckmann (*Z. Mykol.* **68**: 135, 2002; Germany), Kotiranta & Saarenoksa (*Ann. bot. fenn.* **42**: 237, 2005; Finland).

Oliveoniaceae P. Roberts (1998) ? = Auriculariales.

Oliveorhiza P. Roberts (1998), anamorphic *Oliveonia*. 1, Europe. See Roberts (*Rhizoctonia-forming fungi*, 1999).

Olla Velen. (1934), Hyaloscyphaceae. *c.* 12, Europe. See Baral (*SA* **13**: 113, 1994; concept), Baral (*Nova Hedwigia* **69**: 1, 1999).

Ollula Lév. (1863) = Tubercularia Tode fide Sutton (*Mycol. Pap.* **141**, 1977).

Olpidiaceae J. Schröt. (1889), Chytridiomycetes (inc. sed.). 5 gen. (+ 7 syn.), 45 spp.

Lit.: Sampson (*TBMS* **23**: 199, 1939), Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960), Sahtiyanci (*Archs Microbiol.* **41**: 187, 1962), Karling (*Chytriomyc. Iconogr.*: 414 pp., 1977), Lange & Insunza (*TBMS* **69**: 377, 1977), Barr (*CJB* **58**: 2380, 1980).

Olpidiaster Pascher (1917) ≡ Asterocystis.

Olpidiella Lagerh. (1888) = Olpidium fide Minden (*Krypt.-Fl. Brandenburg augr. Gebiete*, 1911).

Olpidium (A. Braun) J. Schröt. (1886), Olpidiaceae. *c.* 40 (in algae, aquatic fungi, rotifers etc.), widespread. *O. brassicae* (lettuce big vein virus vector); *O. uredinis* on rust spores. See Sampson (*TBMS* **23**: 199, 1939), Litvinov (*Trudy Bot. Inst. Akad. nauk URSS* ser. 2 **12**: 188, 1959), Sparrow (*Aquatic Phycomycetes* Edn 2: 128, 1960; key), Sahtiyanci (*Arch. Mikrobiol.* **41**: 187, 1962), Karling (*Chytriomyc. Iconogr.*, 1977), Lange & Insunza (*TBMS* **69**: 377, 1977), Jiang & Hiruki (*Journal of Microbiological Methods* **26**: 87, 1996; PCR on *Olpidium radicale*), Glockling (*MR* **102**: 206, 1998; on rotifer), Koganezawa *et al.* (*Japanese Journal of Phytopathology* **70**: 307, 2004; on crucifers), James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny suggests relationship with *Basidiobolus*).

Olpitrichum G.F. Atk. (1894), anamorphic *Pezizomycotina*, Hso.0eH.10. 3, widespread. See Holubová-Jechová (*Folia geobot. phytotax.* **9**: 425, 1974), Chen *et al.* (*J. Phytopath.* **153**: 124, 2005; China).

Omalycus Raf. (1814) nom. rej. ? = Calvatia fide Stalpers (*in litt.*).

Ombrophila Fr. (1849), Helotiaceae. *c.* 11, widespread. See Verkley (*Persoonia* **15**: 3, 1992; ultrastr.), Gamundí & Romero (*Fl. criptog. Tierra del Fuego* **10**: 130 pp., 1998), Verkley (*Nova Hedwigia* **77**: 271, 2003; ultrastr.), Wang *et al.* (*Mycol.* **98**:

1065, 2006; phylogeny).

Ombrophila Quél. (1892) nom. conf., Fungi. See Donk (*Persoonia* **4**: 219, 1966).

Omega B. Sutton & Minter (1988), anamorphic *Pezizomycotina*, Ccu.0fH.19. 1, Greece. See Sutton & Minter (*TBMS* **91**: 715, 1988).

Ommatomyces Kohlm., Volkm.-Kohlm. & O.E. Erikss. (1995), Clypeosphaeriaceae. 3 (marine, on *Juncus*), N. America. See Kohlmeyer *et al.* (*Mycol.* **87**: 532, 1995), Wang *et al.* (*Fungal Diversity* **4**: 125, 2000).

Ommatospora Bat. & Cavalc. (1964) = Microclava fide Deighton (*TBMS* **52**: 315, 1969).

Ommatosporella Bat., J.L. Bezerra & Poroca (1967), anamorphic *Pezizomycotina*, Hso.1eP.1. 1, Brazil. See Batista *et al.* (*Atas Inst. Micol. Univ. Pernambuco* **5**: 424, 1967).

Omnidemptus P.F. Cannon & Alcorn (1994), Magnaporthaceae. Anamorph *Mycoleptodiscus*. 1, Australia. See Cannon & Alcorn (*Mycotaxon* **51**: 483, 1994).

omnivorous (of parasites), attacking a number of different hosts.

Omoriza Paulet (1812) nom. conf., Fungi. Used for a range of *Ascomycota* and *Basidiomycota*. See Donk (*Taxon* **6**: 85, 1957).

Omorrhiza, see *Omoriza*.

Omphalaria A. Massal. (1855) nom. rej. = Anema fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Omphalaria R. Girard & Dunal ex Nyl. (1855) = Thyrea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Omphalariaceae Körb. (1855) = Lichinaceae.

Omphalia (Fr.) Staude (1857) ≡ Omphalina.

Omphalia (Pers.) Gray (1821) [non *Omphalea* L. 1759) nom. cons., *Euphorbiaceae*] = Pseudoclitocybe fide Donk (*Beih. Nova Hedwigia* **5**: 203, 1963), Redhead & Weresub (*Mycol.* **70**: 556, 1978).

Omphaliaster Lamoure (1971), Tricholomataceae. 7, widespread (north temperate). See Lamoure (*Svensk bot. Tidskr.* **65**: 281, 1971).

Omphalina Quél. (1886) nom. cons., Tricholomataceae. *c.* (s.lat.) 50, widespread (esp. temperate). The genus is polyphyletic. See Bigelow (*Mycol.* **62**: 1, 1970; key (s.lat.)), Lutzoni & Vilgalys (*CJB* **73**: S649, 1995; phylogeny), Lutzoni (*Syst. Biol.* **46**: 373, 1997; phylogeny), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000; phylogeny), Redhead *et al.* (*Mycotaxon* **83**: 19, 2002; phylogeny (s.str.)).

Omphaliopsis (Noordel.) P.D. Orton (1991) = Entoloma fide Kuyper (*in litt.*).

Omphalius Roussel (1806) = Pseudoclitocybe fide Kuyper (*in litt.*) A proposal to conserve *Pseudoclitocybe* over *Omphalius* has not been published.

Omphalocystis Balbiani (1889), Fungi. 1 (on *Cryptopus*), France.

Omphalodiella Henssen (1991), Parmeliaceae (L). 1, Argentina. See Henssen (*Lichenologist* **23**: 334, 1991).

Omphalodina M. Choisy (1929) = Rhizoplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

omphalodisc (1) an orbicular conical shaped disk; (2) (of *Umbilicaria* [*Omphalodiscus*]), an apothecium with a central knob of sterile hyphae.

Omphalodiscus Schol. (1934) = Umbilicaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Omphalodium Meyen & Flot. (1843), Parmeliaceae (L). *c.* 4, N. & S. America. See Henssen (*Lichenologist* **24**: 27, 1992), Thell *et al.* (*Mycol. Progr.* **1**: 335, 2002; phylogeny).

Omphalodium Rabenh. (1845) = Umbilicaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Omphalomyces Battarra ex Earle (1909) = Russula fide Singer (*Agaric. mod. Tax.*, 1951).

Omphalophallus Kalchbr. (1883) = Phallus fide Stalpers (*in litt.*).

Omphalopsis Earle (1909) [non *Omphalopsis* Grev. 1863, *Algae*] ≡ Xeromphalina.

Omphalora T.H. Nash & Hafellner (1990), Parmeliaceae (L). 1, N. America. See Henssen (*Lichenologist* **24**: 27, 1992).

Omphalosia Neck. ex Kremp. (1869) = Umbilicaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Omphalospora Theiss. & Syd. (1915), Dothideaceae. Anamorph *Podoplaconema*. 4, Europe. See Obrist (*Phytopath. Z.* **35**: 383, 1959).

Omphalotaceae Bresinsky (1985) = Marasmiaceae.

Omphalotus Fayod (1889), Marasmiaceae. 5, widespread. *O. olearius* is luminescent when fresh, and poisonous (Maretic, *Toxicon* **13**: 379, 1975). See Bigelow *et al.* (*Mycotaxon* **3**: 363, 1976; discussion), Kirchmair *et al.* (*Persoonia* **17**: 583, 2002; chemotaxonomy, morphology), Kirchmair *et al.* (*Mycol.* **96**: 1253, 2004; phylogeny).

Onakawananus Radforth (1958), Fossil Fungi (mycel.) Fungi. 1 (Cretaceous), Canada.

Onchopus P. Karst. (1879) = Coprinus fide Redhead *et al.* (*Mycotaxon* **50**: 203, 2001).

Oncidium Nees (1823) [non *Oncidium* Sw. 1800, *Orchidaceae*] ≡ Myxotrichum.

Oncobasidium P.H.B. Talbot & Keane (1971) = Thanatephorus. *O. theobromae*, vascular-streak dieback. fide Keane & Prior (*Phytopath. Pap.* **33**, 1991), Roberts (*Rhizoctonia-forming fungi*, 1999).

Oncobyrsa C. Agardh (1827) nom. dub., ? Fungi.

Oncocladium Wallr. (1833), anamorphic *Gymnoascus*, Hso.0eH.38. 1 (from soil), Europe; Canada. See Hughes (*CJB* **46**: 941, 1968), Sigler *et al.* (*Mycotaxon* **28**: 119, 1987; relationship to *Malbranchea flava*).

oncom merah (oncom hitah), Javanese fermented soya bean products in which the principal fungi are *Neurospora sitophila* and *Rhizopus oligosporus*, respectively (Hedger, *Bull. BMS* **12**: 53, 1978); see Fermented food and drinks.

Oncomyces Klotzsch (1843) = Auricularia fide Saccardo (*Syll. fung.* **6**: 762, 1888).

Oncopodiella G. Arnaud ex Rifai (1965), anamorphic *Pezizomycotina*, Hso.#eP.10. 7, Europe. See Rifai (*Persoonia* **3**: 409, 1965), Révay (*Mycotaxon* **56**: 479, 1995; Hungary), Zhao & Zhang (*Nova Hedwigia* **81**: 421, 2005; China).

Oncopodium Sacc. (1904), anamorphic *Pezizomycotina*, Hsy.#eP.1. 7, Europe; N. America. See Hudson (*TBMS* **44**: 406, 1961), Sutton (*Mycol.* **70**: 793, 1978), Castañeda Ruíz *et al.* (*Mycotaxon* **61**: 319, 1997), Zhao & Zhang (*Mycosystema* **22**: 351, 2003; China).

Oncopus, see *Onchopus*.

Oncospora Kalchbr. (1880), anamorphic *Pezizomycotina*, Ccu.1eP.1. 7, widespread. See Chevassut

(*BSMF* **106**: 107, 1990; genus rev.).

Oncosporella P. Karst. (1887), anamorphic *Pezizomycotina*, Ccu.≡ eH.10. 1, Finland.

Oncosporomyces Bat. (1965) nom. dub., anamorphic *Pezizomycotina*, St.0fH.? (L). 1, Brazil. See Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Oncostroma Bat. & Marasas (1966), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, S. Africa. See Batista & Marasas (*Bothalia* **9**: 209, 1966).

Ondiniella E.B.G. Jones, R.G. Johnson & S.T. Moss (1984), Halosphaeriaceae. 1 (marine), widespread. See Jones *et al.* (*Bot. Mar.* **27**: 136, 1984).

Onnia P. Karst. (1889), Hymenochaetaceae. 5, widespread. See Wagner & Fischer (*Mycol.* **94**: 998, 2002).

ontjom, an Indonesian fermented food prepared from peanut press cake, surface inoculated with *Neurospora sitophila*.

ontomycosis, see mycosis.

Ontostheca Bat. (1963) = Eudimeriolum fide von Arx (*in litt.*).

Ontotelium Syd. (1921) = Uromyces fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Onychocola Sigler (1990), anamorphic *Arachnomyces*, Hso.0-1eH.38. 1 (from humans), widespread. See Sigler (*J. Med. Vet. Mycol.* **28**: 409, 1990), Sigler *et al.* (*J. Med. Vet. Mycol.* **32**: 275, 1994; teleomorph), Midgley & Moore (*Revta Iberoamer. Micol.* **15**: 113, 1998; review), Gibas *et al.* (*Stud. Mycol.* **47**: 131, 2002; phylogeny), Gibas *et al.* (*Stud. Mycol.* **50**: 525, 2004; mating type).

onychomycosis, see mycosis.

Onychophora W. Gams, P.J. Fisher & J. Webster (1984), anamorphic *Pezizomycotina*, Hso.0eH.15. 1 (coprophilous), British Isles. See Gams *et al.* (*TBMS* **82**: 174, 1984), Hoog *et al.* (*Stud. Mycol.* **43**: 107, 1999; phylogeny).

Onygena Pers. (1800), Onygenaceae. 5 (on feathers, bones, etc.), Europe; N. America. See Rammeloo (*Dumort.* **6**: 1, 1977), Currah (*Mycotaxon* **24**: 1, 1985), Sugiyama *et al.* (*Stud. Mycol.* **47**: 5, 2002; phylogeny).

Onygenaceae Berk. (1857), Onygenales. 23 gen. (+ 16 syn.), 134 spp.

Lit.: Currah (*Mycotaxon* **24**: 1, 1985), Currah (*SA* **7**: 1, 1988), Cano & Guarro (*MR* **94**: 355, 1990), Cano *et al.* (*MR* **100**: 343, 1996), Guého *et al.* (*Mycoses* **40**: 69, 1997), Hoog *et al.* (*Medical Mycology* **36** Suppl. 1: 52, 1998), Peterson & Sigler (*J. Clin. Microbiol.* **36**: 2918, 1998), Sigler *et al.* (*CJB* **76**: 1624, 1998), Sugiyama *et al.* (*Mycoscience* **40**: 251, 1999), Bialek *et al.* (*J. Clin. Microbiol.* **38**: 3190, 2000), Sugiyama *et al.* (*Stud. Mycol.* **47**: 5, 2002), Untereiner *et al.* (*Stud. Mycol.* **47**: 25, 2002), Untereiner *et al.* (*Mycol.* **96**: 812, 2004), Stchigel & Guarro (*MR* **111**: 1100, 2007).

Onygenales Cif. ex Benny & Kimbr. (1980). Eurotiomycetidae. 4 fam., 52 gen., 271 spp. Stromata absent. Ascomata formed from coiled initials, cleistothecial, sometimes agrregated, rarely stipitate, pale; peridium composed of loosely woven usually thick-walled hyphae, sometimes with complex appendages. Interascal tissue absent. Asci ? formed from croziers, ± globose, small, evanescent, 8-spored. Ascospores small, often brightly coloured, usually oblate, often ornamented, esp. with equatorial ridges. Anamorphs prominent, hyphomycetous, arthric. Keratinophilic or cellulolytic, some parasitic on humans and other animals (see ringworm, dermatophytes), also in soil, cosmop.

The *Myxotrichaceae* is now excluded from the *Onygenales*. Fams:

(1) **Ajellomycetaceae**
(2) **Arthrodermataceae**
(3) **Gymnoascaceae**
(4) **Onygenaceae**

Lit.: Currah (*Mycotaxon* **24**: 1, 1985; *SA* **7**: 1, 1988; key gen.; *in* Hawksworth, 1994: 281), Geiser *et al.* (*Mycol* **98**: 1051, 2006), Geiser & LoBuglio (*in* McLaughlin *et al.* (Eds), *The Mycota* **7A**: 201, 2001), Landvik *et al.* (*Mycoscience* **37**: 237, 1997; phylogeny), Malloch & Cain (*CJB* **50**: 61, 1972), Orr (*Mycotaxon* **5**: 283, 1977; gen. septal swellings, *et al.*, **5**: 466, 1977; gen. discoid-oblate spores), Sigler & Carmichael (*Mycotaxon* **4**: 349, 1976; anamorphs), Sugiyama *et al.* (*Mycoscience* **40**: 251, 1999; phylogeny), Takizawa *et al.* (*Mycoscience* **35**: 327, 1994; ubiquinones).

Onygenopsis Henn. [not traced], Sordariomycetes. 1, widespread (tropical). See Petch (*Ann. R. bot. Gdns Peradeniya* **5**: 265, 1912), Eriksson & Hawksworth (*SA* **5**: 147, 1986; posn).

Oochytrium Renault (1895), Fossil Fungi, Chytridiomycetes. 1 (Carboniferous), France.

oocyst, the product of aposporous spore development in *Oomycetes* (Dick, *New Phytol.* **71**: 1151, 1972).

oogamy, heterogamy in which the gametes are a nonmotile egg and a small, motile sperm.

Oogaster Corda (1854) = Tuber fide Fischer (*Nat. Pflanzenfam.* **5b**: viii, 1938), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

oogenesis, the development of the oogonium after being fertilized.

oogoniols, *Achlya* hormones which induce oogonial formation. Cf. antheridiol.

oogonium (oogone), uninucleate or coenocytic cell producing female gametes (oospheres).

Oolithinia M. Choisy & Werner (1932) = Protoblastenia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Oomyces Berk. & Broome (1851), Acrospermaceae. 1, Europe. See Petch (*J. Bot., Lond.* **75**: 217, 1937), Eriksson (*Op. Bot.* **60**, 1981; posn).

ooplasm (of *Peronosporales*), the protoplasm, at the centre of the oogonium, which becomes the oosphere; cf. periplasm and gonoplasm.

ooplast (of *Saprolegniaceae*), a large membrane bound inclusion of oospores formed by the fusion of dense body vesicles. See Howard & Moore (*Bot. Gaz.* **131**: 311, 1970).

oosphere (of *Oomycetes*), the female gamete; the 'egg' of the oogonium; **compound -**, one having many functional nuclei.

Oospora Wallr. (1833) ≡ Oidium Link (1824) fide Donk (*Taxon* **12**: 270, 1963), Sigler & Carmichael (*Mycotaxon* **4**: 349, 1976).

oospore (of *Oomycetes*), the resting spore from a fertilized oosphere; a like structure produced by parthenogenesis.

Oosporidium Stautz (1931), anamorphic *Saccharomycetes*, Hso.0eH.10. 1, Europe; N. America. See Smith *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 598, 1998).

Oosporoidea Sumst. (1913) = Geotrichum fide Carmichael (*Mycol.* **49**: 820, 1957).

Oostroma Bonord. (1864) = Pseudovalsa fide Læssøe

(*SA* **13**: 43, 1994).

Oothecium Speg. (1919) = Asterostomella fide Farr (*Biblthca Mycol.* **35**, 1973).

Oothyrium Syd. (1939), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Africa.

Oovorus Entz (1930) nom. dub., Fungi. 'phycomycetes'.

Opadorhiza T.F. Andersen & R.T. Moore (1996), anamorphic *Sebacina*. 1, N. America. See Moore *in* Sneh *et al.* (Eds) (*Rhizoctonia Species* Taxonomy, Molecular Biology, Ecology, Pathology and Disease Control: 25, 1996).

Opasterinella Speg. (1917) = Asterinella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Opeasterina Speg. (1919) = Asterina fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Opegrapha Ach. (1809) nom. cons., Roccellaceae (±L). *c.* 361 (some on lichens), widespread. See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952; foliicolous spp.), Sérusiaux (*Lichenologist* **17**: 1, 1985; spp. with goniocysts), Torrente-Paños (*Cryptog. Mycol.* **8**: 159, 1987; asci), Torrente & Egea (*Biblthca Lichenol.* **32**, 1989), Tehler (*CJB* **68**: 2458, 1990; cladistics), Hawksworth (*J. Linn. Soc.* Bot. **109**: 543, 1992; gen. nomencl.), Hafellner (*Herzogia* **10**: 1, 1994; key 19 spp. on lichens), Letrouit-Galinou *et al.* (*Bull. Soc. linn. Provence* **45**: 389, 1994; ultrastr.), Bartók & Crisan (*Studia Universitatis Babeş-Bolyai* Ser. Biol. **49**: 33, 2004; Romania), Ertz *et al.* (*J. Linn. Soc.* Bot. **144**: 235, 2004; spp. on *Pertusaria* and *Ochrolechia*), Ertz & Diederich (*Lichenologist* **39**: 143, 2007; muriform-spored spp.).

Opegrapha Humb. (1793) nom. rej. = Graphis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Opegraphaceae Stizenb. (1862) = Roccellaceae.

Opegraphales M. Choisy ex D. Hawksw. & O.E. Erikss. (1986) = Arthoniales.

Opegraphella Müll. Arg. (1890) = Opegrapha Ach. fide Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Opegraphellomyces Cif. & Tomas. (1953) = Leptopeltis.

Opegraphites Debey & Ettingsh. (1859), Fossil Fungi, Ascomycota (L). 1 (Cretaceous), Belgium.

Opegraphoidea Fink (1933) = Opegrapha Ach. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Opegraphomyces E.A. Thomas ex Cif. & Tomas. (1953) = Opegrapha Ach. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Opercularia Stirt. (1878) [non *Opercularia* Gaertn. 1788, *Rubiaceae*] = Phyllobathelium fide Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

operculate (of an ascus or sporangium), opening by an apical lid to discharge the spores, as in the ascus of the *Pezizales*; see ascus; cf. inoperculate.

Operculella Khesw. (1941) = Phacidiopycnis fide Sutton (*Mycol. Pap.* **141**, 1977).

operculum, a cover or lid.

Opethyrium Speg. (1919) nom. dub., Fungi. No spp. listed.

ophiobolin (cochliobolin), an antibiotic from *Cochliobolus miyabeanus* and *C. heterostrophus*; antibacterial, antifungal, anti-*Trichomonas vaginalis* (Ishibashi, *J. agric. Chem. Soc. Japan* **35**: 257, 1961); phytotoxic to rice (Orsenigo, *Phytopath. Z.* **29**: 189, 1957). See Tsuda *et al.* (*Tetrahedron Lett.* **35**: 3369, 1967; nomencl.).

Ophiobolus Riess (1854), Leptosphaeriaceae. Anamorphs *Coniothyrium, Phoma, Rhabdospora*. *c.* 101, widespread. *O. herpotrichus* (on cereals), *O. heterostrophus*. See Berthet & Korf (*Nat. can.* **96**: 247, 1969), Shoemaker (*CJB* **54**: 2365, 1976; key 31 Can. spp.), Walker (*Mycotaxon* **11**: 1, 1980; type, disposition 60 names), Scheuer (*Mycotaxon* **47**: 67, 1993; nomencl.), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny).

Ophiocapnocoma Bat. & Cif. (1963) = Metacapnodium fide Reynolds (*Mycotaxon* **23**: 153, 1985; = synonymy with *Limacinia*), Eriksson & Hawksworth (*SA* **6**: 124, 1987).

Ophiocapnodium Speg. (1918) ? = Euantennaria fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ophiocarpella Theiss. & Syd. (1915) = Sphaerulina fide Barr (*Contr. Univ. Mich. Herb.* **9**, 1972).

Ophioceras Sacc. (1883), Magnaporthaceae. 15 (wood etc., many spp. aquatic), widespread. See Conway & Barr (*Mycotaxon* **5**: 376, 1977), Chen *et al.* (*Mycol.* **91**: 84, 1999; phylogeny), Shearer *et al.* (*Mycol.* **91**: 145, 1999), Tsui *et al.* (*Mycoscience* **42**: 321, 2001; tropical spp.).

Ophiochaeta (Sacc.) Sacc. (1895) ≡ Acanthophiobolus.

Ophiociliomyces Bat. & I.H. Lima (1955), Pseudoperisporiaceae. 4 (from living leaves), widespread (tropical). See Barreto & Evans (*MR* **98**: 1107, 1994).

Ophiocladium Cavara (1893) = Ramularia Unger fide Sutton & Waller (*TBMS* **90**: 55, 1988).

Ophiocordyceps Petch (1931), Ophiocordycipitaceae. Anamorphs *Syngliocladium, Hymenostilbe, Paraisaria*. *c.* 140 (on insects), widespread. See Seifert & Boulay (*Mycol.* **96**: 929, 2004), Chaverri *et al.* (*Mycol.* **97**: 433, 2005), Sung *et al.* (*Stud. Mycol.* **57**, 2007; phylogeny).

Ophiocordycipitaceae G.H. Sung, J.M. Sung, Hywel-Jones & Spatafora (2007), Hypocreales. 10 gen. (+ 7 syn.), 260 spp. See Sung *et al.* (*Stud. Mycol.* **57**: 1, 2007; phylogeny, monogr.), Sung *et al.* (*Mol. Phylogenet. Evol.* **44**: 1204, 2007; phylogeny).

Ophiodeira Kohlm. & Volkm.-Kohlm. (1988), Halosphaeriaceae. 1 (marine), Caribbean. See Kohlmeyer & Volkmann-Kohlmeyer (*CJB* **66**: 2062, 1988), Spatafora *et al.* (*Am. J. Bot.* **85**: 1569, 1998; phylogeny), Campbell *et al.* (*Mycol.* **95**: 530, 2003).

Ophiodendron Arnaud (1952) nom. dub., anamorphic *Pezizomycotina*. See Hennebert (*TBMS* **51**: 13, 1968).

Ophiodictyon Sacc. & P. Syd. (1902) = Trichothelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Ophiodothella (Henn.) Höhn. (1910), Phyllachoraceae. Anamorph *Acerviclypeatus*. 29, widespread (tropical). See Boyd (*Mycol.* **26**: 456, 1934), Hanlin (*Mycotaxon* **39**: 1, 1990), Hanlin *et al.* (*Mycotaxon* **44**: 103, 1992; key 26 spp.), Pearce & Hyde (*MR* **97**: 1272, 1993; spp. from Australia), Hyde & Cannon (*Mycol. Pap.* **175**: 114 pp., 1999; on palms), Hanlin *et al.* (*Mycoscience* **43**: 321, 2002; Venezuela), Hanlin (*Mycol.* **95**: 506, 2003; conidiomatal development).

Ophiodothis Sacc. (1883) ? = Balansia fide Diehl (*USDA agric. Monogr.* **4**, 1950), Ryley (*Mycotaxon* **95**: 97, 2006).

Ophiogene Petr. (1931) = Nematothecium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ophiogloea Clem. (1903) = Vibrissea fide Sánchez &

Korf (*Mycol.* **58**: 733, 1966).

Ophiognomonia (Sacc.) Sacc. (1899), Diaporthales. 3, Europe; N. America. See Barr (*Mycol. Mem.* **7**, 1978), Monod (*Beih. Sydowia* **9**: 1, 1983), Wilson *et al.* (*Mycol.* **89**: 537, 1997).

Ophioirenina Sawada & W. Yamam. (1959), Meliolaceae. 1 (from leaves), India; Taiwan. See Patil & Mahamulkar (*Indian Phytopath.* **52**: 245, 1999).

Ophiomassaria Jacz. (1894), Pezizomycotina. 1 (on *Alnus*), Europe. See von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ophiomeliola Starbäck (1899), ? Parodiopsidaceae. 1 or 2, widespread (tropical). Material of the type species is effete fide Cannon (*in litt.*, 2001); possibly a synonym of *Ophioparodia* but probably based on discordant elements.

Ophionectria Sacc. (1878), Nectriaceae. Anamorph *Antipodium*. 2, widespread (tropical). See Rossman (*Mycol.* **69**: 355, 1977; key redisposed spp.), Subramanian & Bhat (*Kavaka* **6**: 55, 1979; anamorph, ontogeny), Rossman (*Mycol. Pap.* **150**, 1983), Rossman *et al.* (*Stud. Mycol.* **42**: 159, 1999), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny).

Ophioparma Norman (1852), Ophioparmaceae (L). 10, widespread (northern hemisphere). See Rogers & Hafellner (*Lichenologist* **20**: 167, 1988), Kalb & Staiger (*Biblthca Lichenol.* **58**: 191, 1995; America), Skult (*Ann. bot. fenn.* **34**: 291, 1997), May *in* Glenn *et al.* (Eds) (*Lichenogr. Thomsoniana*: 77, 1998; N. Am.), Martínez & Aragón (*Bryologist* **106**: 528, 2003; Spain), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Lumbsch *et al.* (*Nova Hedwigia* **86**: 105, 2008; phylogeny, chemistry).

Ophioparmaceae R.W. Rogers & Hafellner (1988), Umbilicariales (L). 3 gen. (+ 1 syn.), 25 spp.

Lit.: Rogers & Hafellner (*Lichenologist* **20**: 167, 1988), Kalb & Staiger (*Biblthca Lichenol.* **58**: 191, 1995), Printzen & Rambold (*Herzogia* **12**: 23, 1996), Skult (*Ann. bot. fenn.* **34**: 291, 1997), Wedin *et al.* (*MR* **109**: 159, 2005), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Lumbsch *et al.* (*Nova Hedwigia* **86**: 105, 2008; phylogeny, chemistry).

Ophioparodia Petr. & Cif. (1932), Parodiopsidaceae. Anamorph *Septoideum*. 1, West Indies.

Ophiopeltis J.V. Almeida & Sousa da Câmara (1903) ? = Micropeltis fide Clements & Shear (*Gen. Fung.*, 1931).

Ophiopodium Arnaud (1954) nom. inval. = Grallomyces fide Deighton & Pirozynski (*Mycol. Pap.* **105**, 1966).

Ophiorosellinia J.D. Rogers, A. Hidalgo, F.A. Fern. & Huhndorf (2004), Xylariaceae. 1, Costa Rica. See Rogers *et al.* (*Mycol.* **96**: 172, 2004).

Ophiosira Petr. (1955), anamorphic *Pezizomycotina*, St.0fH.?. 1, Austria. See Petrak (*Sydowia* **9**: 510, 1955).

Ophiosphaerella Speg. (1909), Phaeosphaeriaceae. Anamorph *Scolecosporiella*. *c.* 9, widespread. See Walker (*Mycotaxon* **11**: 1, 1980), Dong *et al.* (*MR* **102**: 151, 1998), Wetzel *et al.* (*Pl. Dis.* **83**: 1160, 1999; distrib.), Wetzel *et al.* (*MR* **103**: 981, 1999; N. Am.), Câmara *et al.* (*Mycol.* **92**: 317, 2000; phylogeny), Hsiang *et al.* (*CJB* **81**: 307, 2003; mating types), Iriarte *et al.* (*Pl. Dis.* **88**: 1341, 2004; genetic diversity), Kaminski *et al.* (*Pl. Dis.* **89**: 980, 2005; molecular detection), Kaminski *et al.* (*Pl. Dis.* **90**: 146, 2006; genetic diversity), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Ophiosphaeria Kirschst. (1906) = Acanthophiobolus fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ophiosporella Petr. (1947) = Phloeosporina fide Sutton (*Mycol. Pap.* **141**, 1977).

Ophiostoma Syd. & P. Syd. (1919), Ophiostomataceae. Anamorphs *Graphilbum*, *Leptographium*, *Pesotum*, *Sporothrix*, *Hyalorhinocladiella*, *Phialocephala*. 188 (in wood and bark, usually associated with beetles), widespread. *O. novo-ulmi* (Dutch elm disease; Brasier *Mycopath.* **115**: 151, 1991). See van Wyk & Wingfield (*Mycol.* **83**: 698, 1991; ascospores), Berbee & Taylor (*Exp. Mycol.* **16**: 87, 1992; 18S rRNA), Hausner *et al.* (*Mycol.* **84**: 870, 1992; posn), Wolfaardt *et al.* (*S. Afr. J. Bot.* **58**: 277, 1992; synoptic key, database), Grylls & Seifert *in* Wingfield *et al.* (Eds) (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 261, 1993; key), Hausner *et al.* (*CJB* **71**: 52, 1993; gen. concept), Seifert *et al.* *in* Wingfield *et al.* (Eds) (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 269, 1993), Wingfield *et al.* (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity, 1993; many papers), Spatafora & Blackwell (*MR* **91**: 1, 1994; posn), Benade *et al.* (*CJB* **74**: 891, 1996), Benade *et al.* (*Mycotaxon* **68**: 251, 1998; anam.), Jacobs *et al.* (*MR* **102**: 289, 1998), Hintz (*Gene* **237**: 215, 1999; chitin synthase gene), Wingfield *et al.* (*MR* **103**: 1616, 1999; phylogeny), Hausner *et al.* (*CJB* **78**: 903, 2000; phylogeny), Okada *et al.* (*Stud. Mycol.* **45**: 169, 2000; anams), Brasier & Kirk (*MR* **105**: 547, 2001; subspecies of *O. novo-ulmi*), Harrington *et al.* (*Mycol.* **93**: 111, 2001; phylogeny, *O. piceae* complex), Kim & Breuil (*MR* **105**: 331, 2001; sibling species), Marais & Wingfield (*MR* **105**: 240, 2001; spp. on *Protea*), Beer *et al.* (*MR* **107**: 469, 2003; *O. piceae* complex), Beer *et al.* (*Mycol.* **95**: 434, 2003; phylogeny of *O. stenoceras* complex), Lim *et al.* (*FEMS Microbiol. Lett.* **237**: 89, 2004; *O. clavigerum* agg.), Zhou *et al.* (*Mycol.* **96**: 1306, 2004; typification, phylogeny), Roets *et al.* (*Stud. Mycol.* **55**: 199, 2006; on *Proteaceae*), Spatafora *et al.* (*Mycol.* **98**: 1018, 2006; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny), Zipfel *et al.* (*Stud. Mycol.* **55**: 75, 2006; generic limit).

Ophiostomataceae Nannf. (1932), Ophiostomatales. 12 gen. (+ 4 syn.), 341 spp.

Lit.: Harrington (*Leptographium Root Diseases on Conifers*: 1, 1988), Malloch & Blackwell (*CJB* **68**: 1712, 1990), Brasier (*Mycopathologia* **115**: 151, 1991), Bates *et al.* (*MR* **97**: 449, 1993), Grylls & Seifert *in* Wingfield *et al.* (Eds) (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 261, 1993), Hausner *et al.* (*CJB* **71**: 1249, 1993), Hausner *et al.* (*CJB* **71**: 52, 1993), Samuels (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 15, 1993), Seifert & Okada (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 27, 1993), Wingfield *et al.* (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity, 1993), Wyk *et al.* (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 133, 1993), Benade *et al.* (*MR* **101**: 1108, 1997), Blackwell & Jones (*Biodiv. Cons.* **6**: 689, 1997), Okada *et al.* (*Stud. Mycol.* **45**: 169, 2000), Gorton *et al.* (*MR* **108**: 759, 2004), Zipfel *et al.* (*Stud. Mycol.* **55**: 75, 2006).

Ophiostomatales Benny & Kimbr. (1980). Sordariomycetidae. 1 fam., 12 gen., 341 spp. Stromata absent.

Ascomata perithecial, rarely cleistothecial, hyaline or black, thin-walled, membranous, usually long-necked, with ostiolar setae. Interascal tissue absent. Asci small, evanescent, formed in chains. Ascospores usually small, hyaline, mostly aseptate, often with eccentric wall thickening or sheaths. Anamorphs hyphomycetous, very varied. Necrotrophs of a wide range of plants, many economically important; some arthropod-associated, a few coprophilous; cosmop. Fam.:

Ophiostomataceae

Ceratocystis (*Ceratocystidaceae*) has almost indistinguishable teleomorphs, but quite different asexual forms, and is now considered to be allied to the *Microascales*.

Lit: Wingfield *et al.* (*Ceratocystis and Ophiostoma*, 1993; *in* Hawksworth, *Ascomycete Systematics*: 333, 1994).

Ophiostomella Petr. (1925) ? = Scopinella fide Cannon (*in litt.*).

Ophiotexis Theiss. (1916) = Schweinitziella fide von Arx (*Acta Bot. Neerl.* **7**: 503, 1958).

Ophiotrichia Berl. (1893) = Acanthophiobolus fide Walker (*Mycotaxon* **11**: 1, 1980).

Ophiotrichum Kunze (1849) nom. dub., anamorphic *Pezizomycotina*, Hso.≡ eP.?. 2, Europe; West Indies. See Nannfeldt (*in litt.*).

Ophiovalsa Petr. (1966) = Cryptosporella fide Glawe & Jensen (*Mycotaxon* **25**: 645, 1986), Reid & Booth (*CJB* **65**: 1320, 1987), Castlebury *et al.* (*Mycol.* **94**: 1017, 2002; phylogeny), Mejía *et al.* (*MR* **112**: 23, 2008; phylogeny).

Ophisthomastigomycota,see *Chytridiomycota*.

Ophryomyces L. Léger & E. Hesse (1909) nom. dub., ? Fungi.

Ophthalmidium Eschw. (1824) = Porina Müll. Arg. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Opisteria (Ach.) Vain. (1909) ≡ Nephroma.

opisthokont, having one or more flagella at the posterior end.

Opisthokonta, Rankless term introduced by Cavalier-Smith & Chao (*Proc. R. Soc. Lond.* B **261**: 1, 1995) to include Animalia, Choanozoa and Fungi. The group is characterized by the presence of a single posterior cilium (or flagellum) together with non-discoid mitochondrial cristae. Based on current molecular phylogenies it would seem that the DRIPs clade and the Microsporidia should belong here also. This name was also used by Copeland (1956), at the rank of Phylum, for the Chytridiomycetes.

Oplophora Syd. (1921) = Nyssopsora fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Oplotheciaceae Bat. & Cif. (1963) = Trichosphaeriaceae.

Oplotheciopsis Bat. & Cif. (1963) = Neorehmia fide Samuels & Barr (*CJB* **75**: 2165, 1998).

Oplothecium P. Syd. (1923) = Neorehmia fide Samuels & Barr (*CJB* **75**: 2165, 1998).

opportunistic (of fungi), normally saprobic and frequently common but on occasion able to cause disease in or grow on a host (esp. of humans or other animals), rendered susceptible by some predisposing factor(s).

opsis-form, see *Pucciniales*.

Opuntiella L. Léger & M. Gauthier (1932) nom. dub., Harpellales.

Oramasia Urries (1956) = Vermiculariopsiella fide Nawawi *et al.* (*Mycotaxon* **37**: 173, 1990).

Oraniella Speg. (1909), Pleosporales. 1, S. America. See Bose (*Phytopath. Z.* **41**, 1961), Aptroot (*Nova Hedwigia* **66**: 89, 1998).

Orbicula Cooke (1871), Pyronemataceae. 1, widespread (north temperate). See Hughes (*Mycol. Pap.* **42**, 1951), Campbell *et al.* (*Mycologist* **5**: 113, 1991), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Hansen *et al.* (*Mycol.* **97**: 1023, 2005; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Orbilia Fr. (1849), Orbiliaceae (±L). Anamorphs *Arthrobotrys*, *Dactylella*, *Dicranidion*, *Dwayaangam*, *Helicoön*, *Monacrosporium*, *Trinacrium*. c. 58 (on wood etc., sometimes nematode-trapping), widespread. See Benny *et al.* (*CJB* **56**: 2006, 1978; biol.), Spooner (*Biblthca Mycol.* **116**, 1987; 7 spp. Australasia), Baral (*SA* **13**: 113, 1994; concept), Pfister (*Mycol.* **86**: 451, 1994; anamorph), Liou & Tzean (*Mycol.* **89**: 876, 1997; DNA), Pfister (*Mycol.* **89**: 1, 1997; review), Kohlmeyer *et al.* (*Mycol.* **90**: 303, 1998), Webster *et al.* (*MR* **102**: 99, 1998; anamorph), Hagedorn & Scholler (*Sydowia* **51**: 27, 1999; DNA), Spatafora *et al.* (*Mycol.* **98**: 1018, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny).

Orbiliaceae Nannf. (1932), Orbiliales (±L). 12 gen. (+ 12 syn.), 288 spp.

Lit.: Spooner (*Biblthca Mycol.* **116**, 1987; key gen.), Spooner (*Biblthca Mycol.* **116**: 711 pp., 1987), Pfister (*Mycol.* **86**: 451, 1994; anamorphs), Liou & Tzean (*Mycol.* **89**: 876, 1997), Pfister (*Mycol.* **89**: 1, 1997; review), Sugiyama (*Mycoscience* **39**: 487, 1998), Webster *et al.* (*MR* **102**: 99, 1998), Hagedorn & Scholler (*Sydowia* **51**: 27, 1999), Harrington *et al.* (*Mycol.* **91**: 41, 1999), Tehler *et al.* (*Mycol.* **92**: 459, 2000), Eriksson *et al.* (*Myconet* **9**: 1, 2003), Yang *et al.* (*Proc. natn Acad. Sci. U.S.A.* **104**: 8379, 2007; evolution).

Orbiliales Baral, O.E. Erikss., G. Marson & E. Weber (2003). Orbiliomycetes. 1 fam., 12 gen., 288 spp. Fam.:

Orbiliaceae

For *Lit.* see under fam.

Orbiliaster Dennis (1954) = Orbilia fide Baral (*SA* **13**, 1994).

Orbiliella Kirschst. (1938) = Orbilia fide Korf *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 249, 1973).

Orbiliomycetes O.E. Erikss. & Baral (2003), Pezizomycotina. 1 ord., 1 fam., 12 gen., 288 spp. Ord.:

Orbiliales

For *Lit.* see ord. and fam.

Orbiliomycetidae, see *Orbiliomycetes*.

Orbiliopsis (Sacc.) Syd. & P. Syd. (1924), ? Helotiales. 1, New Zealand.

Orbiliopsis Höhn. (1926) ? = Parorbiliopsis fide Spooner & Dennis (*Sydowia* **38**: 294, 1986).

orbilla (pl. **orbillae**), an apothecium (obsol.), (Sprengel, *Intr. study cryptog.*, 1807).

Orbiliopsis Velen. (1934), ? Helotiales. 1, former Czechoslovakia.

Orbimyces Linder (1944), anamorphic *Pezizomycotina*, Hso.0bP.10. 1 (marine), USA. See Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991).

Orcadia G.K. Sutherl. (1915), Pezizomycotina. 1 (on marine *Algae*), British Isles; Norway. Possibly allied to the *Pezizales*, but the ecology is quite different. See Kohlmeyer & Kohlmeyer (*Marine Mycology*: 454, 1979), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp.,

1999).

Orcella Kuntze ex Earle (1909) ≡ Clitopilus.

Orceolina Hertel (1970), Trapeliaceae (L). 1, subantarctic islands. See Hertel (*Vortrag. Gesamtgeb. Bot.* ser. 2 **4**: 182, 1970), Lumbsch (*J. Hattori bot. Lab.* **83**: 1, 1997), Poulsen *et al.* (*Lichenologist* **33**: 323, 2001; phylogeny, morphology), Schmitt *et al.* (*Mycol.* **95**: 827, 2003; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Orcheomyces Burgeff (1909) nom. dub., Basidiomycota. Used for sterile mycelium associated with orchids; most of these belong in *Ceratobasidium* or *Thanatephorus*.

Orchesellaria Manier ex Manier & Lichtw. (1968), Asellariaceae. 4 (in *Collembola*), widespread. See Moss (*TBMS* **65**: 115, 1975; ultrastr.), Manier (*Revue Mycol.* Paris **43**: 341, 1979), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), Valle (*Fungal Diversity* **21**: 167, 2006; Spain), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

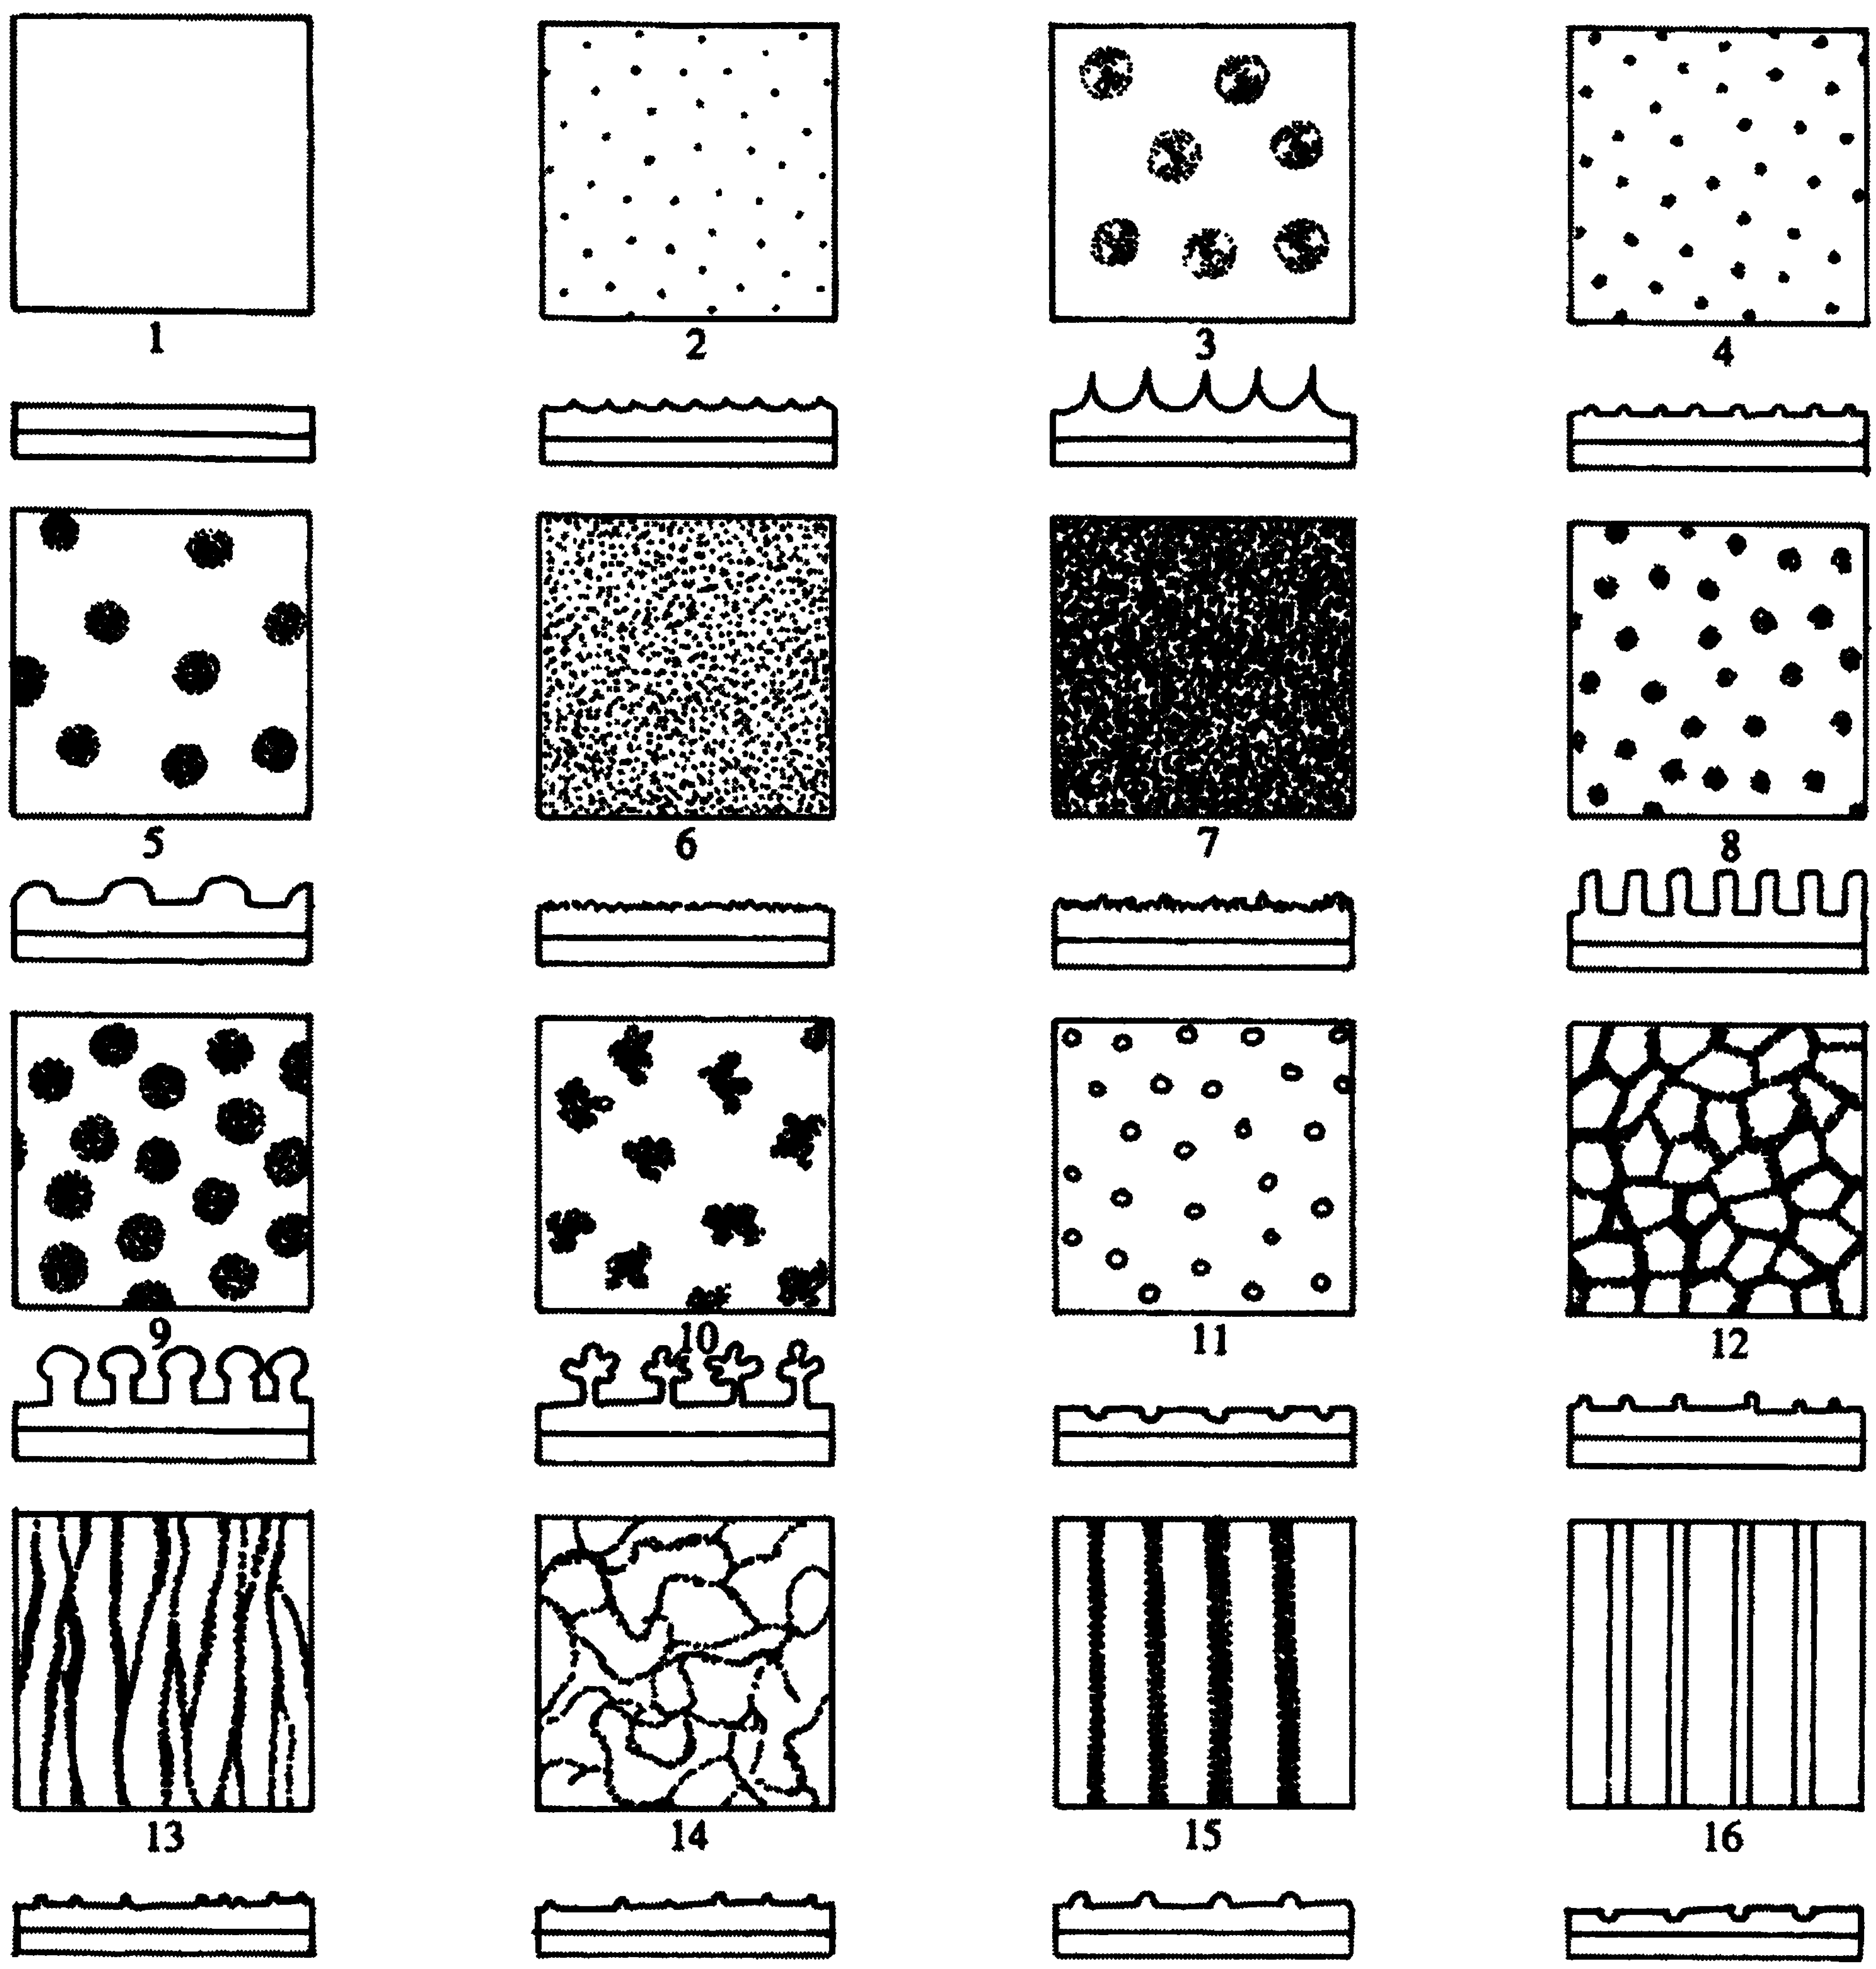

Fig. 20. Terminology for ornamentation (upper in surface view, lower in side view). 1, smooth (laevigate); 2, spinose (echinate); 3, aculeate; 4, granulate; 5, punctate (tuberculate); 6, verruculose; 7, verrucose; 8, baculate; 9, capitate; 10, irregularly projecting (see Sato & Sato, *Trans. Mycol. Soc. Jap.* **23**: 51, 1982, for additional terms, esp. for aeciospores); 11, foveate; 12, reticulate; 13, striate; 14, rugose; 15, cicatricose; 16, canaliculate.

orchil (**orchill**), see Dyeing.

orchinol (and **hircinol**), dihydrophenanthrenes produced by orchids as a response to infection by my-

corrhizal fungi (Gäumann, *Phytopath. Z.* **49**: 212, 1964).

orculiform, see polarilocular.

Ordonia Racib. (1909), Septobasidiaceae. 2, N. Americe; Indonesia. See Oberwinkler (*Op. Bot.* **100**: 185, 1989).

Ordospora J.I.R. Larsson, D. Ebert & J. Vavra (1997), Microsporidia. 1. See Larsson *et al.* (*Eur. J. Protist.* **33**: 432, 1997).

Ordovicimyces M.K. Elias (1966), Fossil Fungi ? Fungi. 2 (Ordovician, ? Recent), USA.

Ordus K. Ando & Tubaki (1983), anamorphic *Pezizomycotina*, Hso.1bH.1. 1, Japan. See Ando & Tubaki (*TMSJ* **24**: 274, 1983), Ando *et al.* (*Mycoscience* **38**: 95, 1997), Watanabe *et al.* (*Mycoscience* **40**: 383, 1999).

orellanine, see Mycetism (1).

Oreophylla Cif. (1954) = Passalora fide Ciferri (*Sydowia* **8**: 253, 1954), Braun *et al.* (*N.Z. Jl Bot.* **37**: 297, 1999), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Organizations, see Societies and organizations.

Ormathodium Syd. (1928) nom. dub., anamorphic *Pezizomycotina*. See Deighton (*Mycol. Pap.* **137**: 4, 1974).

Ormieresia Vivarès, Bouix & Manier (1977), Microsporidia. 1.

Ormomyces I.I. Tav. (1985), Laboulbeniaceae. 1, Africa; Indonesia. See Tavares (*Mycol. Mem.* **9**: 266, 1985).

ornamented (of organs, esp. spores), having the surface marked or sculptured with lines, wrinkles, warts, striations, ridges, reticulations, fibrils, scales etc.; not smooth. See Fig. 20 for terminology; also basidiospore, LO-analysis.

Ornasporonites Ramanujam & Rao (1979), Fossil Fungi. 1 (Miocene), India.

Ornatinephroma Gyeln. (1934) = Nephroma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Ornatispora K.D. Hyde, Goh, Joanne E. Taylor, J. Fröhl. (1999), Sordariomycetes. Anamorph *Didymostilbe*-like. 5, S.E. Asia. See Hyde *et al.* (*MR* **103**: 1432, 1999).

Ornatisporites M.G. Parsons & G. Norris (1999), Fossil Fungi. 1. See Parsons & Norris (*Palaeontographica* Abt. B **250**: 117, 1999).

Ornatopyrenis Aptroot (1991) = Mycomicrothelia fide Aptroot *et al.* (*Biblthca Lichenol.* **64**, 1997), Sipman & Aptroot (*Lichenologist* **37**: 307, 2005).

Ornithascus Velen. (1934) = Saccobolus fide van Brummelen (*Persoonia* Suppl. **1**: 1, 1967).

ornithocoprophilous, preferring habitats rich in bird droppings.

Oropogon Th. Fr. (1861), Parmeliaceae (L). 30, widespread. See Esslinger (*Syst. Bot. Monogr.* **28**, 1989; key), Chen (*Acta Mycol. Sin.* **15**: 173, 1996; China).

Orphanocoela Nag Raj (1989), anamorphic *Pezizomycotina*, Cpd.#eH-P.1. 3 (on *Poaceae*), widespread. See Nag Raj (*CJB* **67**: 3176, 1989).

Orphanomyces Savile (1974), ? Anthracoideaceae. 3 (on leaves of *Cyperaceae*), Europe; N. Americe; Asia. See Vánky (*Europ. Smut Fungi*: 570 pp., 1994; key), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002; New Zealand).

Orphella L. Léger & M. Gauthier (1932), Legeriomycetaceae. 7 (in *Plecoptera*), Europe; N. America. See Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986), Williams & Lichtwardt (*Mycol.* **79**: 473, 1987), Lichtwardt *et al.* (*Mycol.* **83**: 214, 1991), Santamaría & Girbal (*MR* **102**: 174, 1998; Spain), Lichtwardt *et al.* (*Mycol.* **93**: 764, 2001; Canada), Strongman & White (*CJB* **84**: 1478, 2006; Canada), Valle & Santamaría (*Mycol.* **97**: 1335, 2005; zygospores), White *et al.* (*Mycol.* **98**: 872, 2006; some species with possible affinities to *Kickxellales*).

Orphniospora Körb. (1874), ? Fuscideaceae (L). 3, widespread. See Hertel & Rambold (*Mitt. bot. StSamml., München* **27**: 111, 1988; posn).

Orphniosporaceae Bellem. & Hafellner (1984) ? = Fuscideaceae.

Orphniosporomyces Cif. & Tomas. (1953) ≡ Orphniospora.

Orphnodactylus Malloch & A. Mallik (1998), Phyllachoraceae. Anamorph *Hysterodiscula*. 2 (from living stems), widespread (circumboreal). See Malloch & Malik (*CJB* **76**: 1265, 1998).

Orpinomyces D.J.S. Barr, H. Kudo, Jakober & K.J. Cheng (1989), Neocallimastigaceae. 2 (anaerobic rumen fungi), widespread. See Ho & Barr (*Mycol.* **87**: 656, 1995; emend.), Ho *et al.* (*Fungal Diversity* **4**: 37, 2000).

Orromyces B. Sur & G.R. Ghosh (1987), Gymnoascaceae. Anamorph *Chrysosporium*-like. 1, India. See Sur & Ghosh (*Kavaka* **13**: 63, 1985).

orthidium (obsol.), conidiomata of *Pyrenotrichum*, sometimes incorrectly listed as if a generic name. See Hawksworth (*Bull. Br. Mus. nat. Hist., Bot.* **9**: 59, 1981).

Orthobellus A.A. Silva & Cavalc. (1973), ? Schizothyriaceae. 2, S. America. See Silva & Cavalcanti (*Publções Inst. Micol. Recife* **691**: 4, 1973).

Orthochaeta Sawada (1943) = Erysiphe fide Zheng (*Mycotaxon* **22**: 209, 1985).

orthographic variant, a variant spelling; under the Code the original spelling must be retained but typographic or orthographic errors should be corrected; orthographic variants should not be listed as synonyms, but when two or more generic names are so similar as to be confused they are treated as orthographic variants or, when based on different types, as homonyms. See Nomenclature.

Orthomyces Steinkr., Humber & J.B. Oliv. (1998), Entomophthoraceae. 1, USA. See Steinkraus *et al.* (*J. Invert. Path.* **72**: 5, 1998), Keller & Petrini (*Sydowia* **57**: 23, 2005; key).

Orthomycotina Steinkr., Humber & J.B. Oliv. (1998), Entomophthoraceae. 1, USA. See Steinkraus *et al.* (*J. Invert. Path.* **72**: 5, 1998), Keller & Petrini (*Sydowia* **57**: 23, 2005; key).

Orthoscypha Syd. (1927) = Pocillum fide Petrak (*Sydowia* **5**: 328, 1951).

Orthosomella E.U. Canning, Wigley & R.J. Barker (1983), Microsporidia. 2.

Orthothelohania Codreanu & Codreanu-Balcescu (1974), Microsporidia. 1.

orthotrophy, Corda's (1842) term for the condition in which a basidiospore primordium develops at the apex of the apophysis in contrast to **heterotrophy** when the primordium develops laterally.

Oscarbrefeldia Holterm. (1898), Saccharomycetes. 1, Java.

oscule (obsol.) a pore of a rust spore (Tulasne).

-osis (suffix), condition of; state caused by.

osmophily (adj. **-ilic**, **-ilous**), making growth under conditions of high osmotic pressure, as in *Xeromyces*

(q.v.) and some yeasts on conc. sugar solutions. See Moustafa (*Can. J. Microbiol.* **21**: 1573, 1975; osmophilous spp. of Kuwait).

Osmoporus Singer (1944) = Gloeophyllum fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

osmotolerant, capable of growing in high osmotic pressure, e.g. some yeasts and filamentous fungi on concentrated sugar solutions.

osmotrophic, exhibiting absorptive nutrition as do fungi.

Osoriomyces Terada (1981), Laboulbeniaceae. 1, Taiwan. See Terada (*Mycotaxon* **13**: 412, 1981), Santamaría (*Mycol.* **96**: 761, 2004).

Ospriosporium Corda (1831) nom. dub., ? Fungi.

Ossicaulis Redhead & Ginns (1985), Lyophyllaceae. 2, widespread (north temperate). See Redhead & Ginns (*TMSJ* **26**: 362, 1985), Contu (*Bollettino dell'Associazione Micologica ed Ecologica Romana* **15**: 3, 1999), Clémençon (*Mycol. Progr.* **4**: 167, 2005; rhizomorph anatomy *Ossicaulis lignatilis*).

Osteina Donk (1966) = Postia fide Ryvarden (*Syn. Fung.* **5**, 1991).

Osteomorpha G. Arnaud ex Watling & W.B. Kendr. (1979), anamorphic *Sistotrema*. 1, Europe. See Markovskaja *et al.* (*Botanica Lithuanica* **8**: 179, 2002; Lithuania).

ostiole (sing. **ostiolum**), the schizogenous, paraphysis-lined cavity, ending in a pore, in the papilla or neck of a perithecium (Miller, *Mycol.* **20**: 196, 1928); any pore by which spores are freed from an ascigerous or pycnidial fruit-body. See von Arx (*K. ned. Akad. Wet.*, C, **76**: 289, 1973; taxonomic importance in *Ascomycota*).

Ostracoblabe Bornet & Flahault (1891), ? Fungi. 1, Europe. *O. implexa* (hinge disease of European oysters). See Alderman *in* Jones (Ed) (*Recent Advances in Aquatic Mycology*: 223, 1973; morphology, disease), Eckblad & Kirstiansen (*MR* **94**: 706, 1990) Excluded from *Chromista* by Dick (*in press*.

Ostracoderma Fr. (1825), anamorphic *Peziza*, St.0eH.6. 3, widespread. See Hennebert (*Persoonia* **7**: 183, 1973), Martinez & Godeas (*Mycotaxon* **65**: 453, 1997).

Ostracodermataceae Malençon (1964) = Pezizaceae.

Ostracodermidium Mukerji (1973), anamorphic *Pezizomycotina*, Hso.0eP.6. 1, India. See Mukerji (*TMSJ* **14**: 175, 1973).

Ostracodermis Locq. (1982), Fossil Fungi. 1, Libya.

Ostreichnion Duby (1862), Mytilinidiaceae. 3, widespread. See Barr (*Mycotaxon* **3**: 81, 1975; key), Checa & Blanco (*Mycotaxon* **94**: 225, 2005; Spain).

Ostreion Sacc. (1883) ≡ Ostreichnion.

Ostreionella Seaver (1926) = Actidium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ostreola Darker (1963), Mytilinidiaceae. 4, Canada; India. See Tilak & Kale (*Indian Phytopath.* **21**: 289, 1968; key).

Ostropa Fr. (1825), Stictidaceae. 1, widespread (north temperate). See Sherwood (*Mycotaxon* **5**: 1, 1977).

Ostropaceae Rehm (1888) = Stictidaceae.

ostropalean (of asci), ones essentially unitunicate in structure and with a thickened apex penetrated by a narrow pore; see ascus.

Ostropales Nannf. (1932), (±L). Ostropomycetidae. 11 fam., 131 gen., 2753 spp. Stromatic development usually weak, reduced to intramatrical hyphae, or absent, or with usually crustose thalli. Ascomata ± apothecial, often deeply immersed and appearing perithecial, with rather varied peridial structure. Interascal tissue of ± simple paraphyses, occ. gelatinized. Asci usually narrow, cylindrical, with a well-developed capitate apical thickening often pierced by a J- pore. Ascospores varied, often filiform. Anamorphs pycnidial, varied, sometimes absent. Usually saprobic on stems, bark or wood, some lichenized with green algae or lichenicolous, cosmop. A polymorphic order in both biology and morphology, and molecular studies suggest that further subdivision may be justified. Fams:

(1) **Asterothyriaceae**
(2) **Coeonogoniaceae**
(3) **Gomphillaceae**
(4) **Graphidaceae**
(5) **Gyalectaceae**
(6) **Myeloconidiaceae**
(7) **Odontotremataceae**
(8) **Phlyctidaceae**
(9) **Porinaceae**
(10) **Stictidaceae**
(11) **Thelotremataceae**.

Lit.: Grube *et al.* (*MR* **108**: 1111, 2004), Lücking *et al.* (*Mycol.* **96**: 283, 2004), Lumbsch *et al.* (*MR* **111**: 257, 2007; phylogeny), Sherwood (*Mycotaxon* **5**: 1, 1977; monogr., keys), Winka *et al.* (*Lichenologist* **30**: 455, 1998; DNA; lichenized taxa).

Ostropella (Sacc.) Höhn. (1918), Melanommataceae. 5, widespread. See Huhndorf (*Mycol.* **85**: 490, 1993), Vasil'eva (*Mycoscience* **38**: 341, 1997), Huhndorf (*Mycol.* **90**: 527, 1998).

Ostropomycetidae Reeb, Lutzoni & Cl. Roux (2004), Lecanoromycetes. The second major subdivision of the *Lecanoromycetes*, including a number of non-lichenized taxa. Ords:

(1) **Agyriales**
(2) **Baeomycetales**
(3) **Ostropales**
(4) **Pertusariales**

Lit.: Grube *et al.* (*MR* **108**: 1111, 2004), Hofstetter *et al.* (*Mol. Phylogenet. Evol.* **44**: 412, 2007), Lumbsch *et al.* (*Mol. Phylogenet. Evol.* **31**: 822, 2004), Lumbsch *et al.* (*MR* **111**: 257, 2007; phylogeny), Lutzoni *et al.* (*Am. J. Bot.* **91**: 1446, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006), Wedin *et al.* (*MR* **109**: 159, 2005).

Oswaldia Rangel (1921) = Apiosphaeria fide Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973).

Oswaldina Rangel (1921), anamorphic *Apiosphaeria*, St.0fH.15. 1, Brazil. See Dianese *et al.* (*Sydowia* **46**: 233, 1994; reinstatement gen.).

Oswaldoa Bat. & I.H. Lima (1959) ? = Myriangiella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Otagoa Lloyd (1922) nom. nud., ? Fungi.

Otidea (Pers.) Bonord. (1851), Pyronemataceae. *c.* 23, widespread (north temperate). See Kanouse (*Mycol.* **41**: 660, 1949), Harmaja (*Karstenia* **14**: 138, 1974; gen. concept), Cao *et al.* (*Mycol.* **82**: 734, 1990; key Chinese spp.), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Liu & Zhuang (*Fungal Diversity* **23**: 181, 2006), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Otideaceae Eckblad (1968) = Pyronemataceae.

Lit.: Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997).

Otidella Sacc. (1889) ≡ Caloscypha.

Otideopsis B. Liu & J.Z. Cao (1987), Pyronemataceae. 2, China; Europe. See Moravec (*Mycol. Helv.* **3**: 135, 1988), Liu & Zhuang (*Fungal Diversity* **23**: 181, 2006), Liu & Zhuang (*Mycosystema* **25**: 546, 2006; phylogeny).

Otomyces Hallier (1869) nom. dub., anamorphic *Pezizomycotina.*

Otomyces Wreden (1874) ? = Aspergillus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

otomycosis, see mycosis.

Otthia Nitschke ex Fuckel (1870), Botryosphaeriaceae. Anamorph *Diplodia*-like. *c.* 11, widespread. See Scheinpflug (*Ber. schweiz. bot. Ges.* **68**: 325, 1958), Van Niekerk *et al.* (*Mycol.* **96**: 781, 2004; phylogeny), Phillips *et al.* (*Mycol.* **97**: 513, 2005).

Otthiella (Sacc.) Sacc. & D. Sacc. (1905) = Otthia fide Barr (*Rept. Kevo Subarct. Res. Stn* **11**: 12, 1974).

Otwaya G.W. Beaton (1978), Hyaloscyphaceae. 1 (on *Nothofagus*), Australia. See Beaton (*TBMS* **71**: 219, 1978).

Oudemans (Cornelius Anton Jan Abraham; 1825-1906; Netherlands). Medical degree, Leiden (1847); Lecturer, Rotterdam Medical School (1848-1859); Professor of Medicine & Botany, Amsterdam Athenaeum (1859-1877); Professor of Botany & Pharmacognosy, Amsterdam University (1877-1896); General Secretary, Royal Netherlands Academy of Sciences (1879-1895). Produced a great and still valuable catalogue of European fungi arranged by associated organisms. *Publs. Catalogue Raisonné des Champignons des Pays-Bas* (1905); *Enumeratio Systematica Fungorum* 5 vols (1919-1925) [published posthumously]. *Biogs, obits etc.* Moll (*Bericht der Deutschen Botanischen Gesellschaft* **26a**: 12, 1908).

Oudemansia Speg. (1880) [non *Oudemansia* Miq. 1854, *Byttneriaceae*] ≡ Oudemansiella.

Oudemansiella Speg. (1881), Physalacriaceae. *c.* 15, widespread (tropical; temperate). See Pegler & Young (*TBMS* **87**: 583, 1987; key), Baroni & Ortiz (*Mycotaxon* **82**: 269, 2002; Puerto Rico), Mizuta (*Nippon Kingakukai Kaiho* **46**: 25, 2005; Japan).

Outhovia Nieuwl. (1916) ≡ Scopularia.

Ovadendron Sigler & J.W. Carmich. (1976), anamorphic *Pezizomycotina*, Hso.0eH.38. 1 (from humans), Europe. See Sigler & Carmichael (*Mycotaxon* **4**: 391, 1976).

oval, widely elliptical (Fig. 23.1).

ovariicolous, living in ovaries.

ovate (of a surface [or sometimes a solid]), **ovoid** (of a solid) (Fig. 23.11), like a hen's egg with the narrower end at the top (Fig. 23.1).

Ovavesicula T.G. Andreadis & J.L. Hanula (1987), Microsporidia. 1. See Andreadis & J.L. Hanula (*J. Protozool.* **34**: 21, 1987), Vossbrinck & Andreadis (*J. Invert. Path.* **96**: 270, 2007; phylogeny).

Overeemia Arnaud (1954) = Brooksia fide Deighton & Pirozynski (*Mycol. Pap.* **105**, 1966).

Oviascoma Y.J. Yao & Spooner (1996), Pyronemataceae. 1, British Isles. See Yao & Spooner (*MR* **100**: 102, 1996).

Ovinus (Lloyd) Torrend (1920) ≡ Albatrellus.

Ovipleistophora M. Pekkarinen, J. Lom & F. Nilsen (2002), Microsporidia. 1. See Pekkarinen *et al.* (*Dis. Aq. Organ.* **48**: 133, 2002).

Ovosphaerella Laib. (1922) = Mycosphaerella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ovularia Sacc. (1880) = Ramularia Unger fide Hughes (*TBMS* **32**: 34, 1949).

Ovulariella Bubák & Kabát (1912) nom. nud., anamorphic *Pezizomycotina.*

Ovulariopsis Pat. & Har. (1900), anamorphic *Phyllactinia*, Hsy.0eH.1. 9, widespread. See Braun (*Beih. Nova Hedwigia* **89**: 700 pp., 1987).

Ovularites A.C. Whitford (1916), Fossil Fungi. 1 (Cretaceous), USA.

Ovulinia F.A. Weiss (1940), Sclerotiniaceae. Anamorph *Ovulitis*. 2, Europe; N. America. See Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Holst-Jensen *et al.* (*Nordic Jl Bot.* **18**: 705, 1999; phylogeny).

Ovulitis N.F. Buchw. (1970), anamorphic *Ovulinia*, Hso.0eH.10. 2, USA; British Isles. See Buchwald (*Friesia* **9**: 328, 1970).

Oxneria S.Y. Kondr. & Kärnefelt (2003) = Xanthomendoza fide Kondratyuk & Kärnefelt (*Ukrainian Jour. Bot.* **60**: 427, 2003), Gaya *et al.* (*MR* **112**: 528, 2008).

Oxodeora K.D. Hyde & P.F. Cannon (1999), Phyllachoraceae. 1 (living palm leaves), Caribbean. See Hyde & Cannon (*Mycol. Pap.* **175**: 114, 1999).

oxydated (of crustose lichens), having thalli tinged rust-red by iron oxides; oxydized.

Oxydontia L.W. Mill. (1933) ≡ Sarcodontia fide Donk (*Taxon* **5**: 69, 1956).

Oxydothis Penz. & Sacc. (1898), Xylariales. Anamorph *Selenosporella*. 41 (saprobic on palms etc.), widespread (esp. tropical). See Hyde (*Sydowia* **45**: 226, 1993; Australia), Hyde (*Sydowia* **45**: 204, 1993), Hyde (*Sydowia* **46**: 265, 1994; revision), Wong & Hyde (*Fungal Diversity* **2**: 181, 1999; ultrastr.), Shenoy *et al.* (*Nova Hedwigia* **80**: 511, 2005; Hong Kong), Hidayat *et al.* (*Fungal Diversity* **23**: 159, 2006; phylogeny).

Oxyflavus Ryvarden (1973) = Leucophellinus fide Ryvarden (*Syn. Fung.* **5**, 1991).

Oxyporus (Bourdot & Galzin) Donk (1933), Agaricomycetes. 10, widespread. *Hymenochaetales* or *Agaricales* (*Oxyporus* clade). See Gilbertson & Ryvarden (*N. Amer. Polyp.* Vol. **2** *Megasporoporia - Wrightoporia*: 437, 1987), Ryvarden (*Syn. Fung.* **5**: 363 pp., 1991), Martín & Montón (*Boletín de Sanidad Vegetal, Plagas* **30**: 93, 2004; molecular identification *Oxyporus latemarginatus*).

Oxysporium Lév. (1863) = Helminthosporium fide Saccardo (*Syll. fung.* **10**: 613, 1892).

Oxystoma Eschw. (1824) = Graphis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

oyster mushroom (- cap fungus), basidiomata of the edible *Pleurotus ostreatus.*

Ozocladium Mont. (1851) = Polistroma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Ozonium Link (1809) nom. dub., anamorphic *Agaricomycotina*. Used for anamorphs of *Coprinus* and similar genera. See Hughes (*CJB* **36**: 727, 1958).

P, see Metabolic products, Steiner's Stable PD solution.

Paathramaya Subram. (1956), anamorphic *Pezizomycotina*, Hsp.0eP.10. 3, India. See Bhat (*TBMS* **85**: 101, 1985; key).

Pachnocybaceae Oberw. & R. Bauer (1989), Pachnocybales. 1 gen., 1 spp.

Lit.: Oberwinkler & Bandoni (*CJB* **60**: 1726, 1982), Kropp & Corden (*Mycol.* **78**: 334, 1986), Kleven & McLaughlin (*CJB* **67**: 1336, 1989), Oberwinkler & Bauer (*Sydowia* **41**: 224, 1989), McLaughlin *et al.* (*Mycol. Soc. Amer. Newsl.* **41**: 28, 1990),

Berres *et al.* (*Mycol.* **87**: 821, 1995), Begerow *et al.* (*CJB* **75**: 2045, 1998).

Pachnocybales R. Bauer, Begerow, J.P. Samp., M. Weiss & Oberw. (2006). Pucciniomycetes. 1 fam., 1 gen., 1 spp. Fam.:
Pachnocybaceae
For *Lit.* see under fam.

Pachnocybe Berk. (1836), Pachnocybaceae. 1, Europe. See Begerow *et al.* (*CJB* **75**: 2045, 1998; phylogeny), Bauer *et al.* (*Mycol. Progr.* **5**: 41, 2006).

Pachnodium H.P. Upadhyay & W.B. Kendr. (1975) = Pesotum fide Upadhyay & Kendrick (*Mycol.* **67**: 802, 1975), Okada *et al.* (*CJB* **76**: 1495, 1998).

Pachnolepia A. Massal. (1855) = Arthonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pachyascaceae Poelt ex P.M. Kirk, P.F. Cannon & J.C. David (2001), Lecanoromycetes (inc. sed.) (L). 1 gen., 1 spp.
Lit.: Poelt (*Sydowia* **38**: 241, 1985).

Pachyascus Poelt & Hertel (1968), Pachyascaceae (L). 1 (in leaf axils of *Andreaea*), Europe. See Poelt & Hertel (*Ber. dt. bot. Ges.* **81**: 210, 1968), Poelt (*Sydowia* **38**: 241, 1985).

Pachybasidiella Bubák & Syd. (1915) = Aureobasidium fide de Hoog & Hermanides-Nijhof (*Stud. Mycol.* **15**, 1977).

Pachybasium Sacc. (1885) = Trichoderma Pers. (1794) fide Hughes (*CJB* **36**: 727, 1958), Bissett (*CJB* **69**: 2373, 1991).

Pachycladina Marvanová (1987), anamorphic *Pezizomycotina*, Hso.1bH.10. 1 (from foam), Europe; N. America. See Marvanová (*TBMS* **87**: 617, 1986), Marvanová & Bärlocher (*MR* **102**: 750, 1998; Canada).

Pachycudonia S. Imai (1950), ? Helotiales. 3, Japan. See Imai (*Bot. Mag.* Tokyo **63**: 235, 1950).

Pachyderma Schulzer (1876) [non *Pachyderma* Blume 1826, *Oleaceae*] = Mycenastrum fide Stalpers (*in litt.*).

pachydermatous (1) thick-skinned; (2) (of hyphae), having the outer wall thicker than the lumen.

Pachydisca Boud. (1885), ? Helotiaceae. 1, Europe. See Dumont (*Mycol.* **67**: 162, 1975).

Pachydiscula Höhn. (1915) = Cryptosporiopsis fide Petrak (*Annls mycol.* **21**: 182, 1923).

Pachyella Boud. (1907), Pezizaceae. *c.* 19, widespread. See Pfister (*CJB* **51**: 2009, 1973; key), Pfister & Candoussau (*Mycotaxon* **13**: 457, 1981), Häffner (*Rheinl.-Pfälz. Pilzj.* **2**: 118, 1992), Pfister (*Mycotaxon* **54**: 393, 1995), Norman & Egger (*Mycol.* **91**: 820, 1999; phylogeny), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Harrington & Pfister (*Harvard Pap. Bot.* **6**: 113, 2001; in culture), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny).

Pachykytospora Kotl. & Pouzar (1963), Polyporaceae. 3, widespread. See Kotlaba & Pouzar (*Česká Mykol.* **33**: 129, 1979; key), Piątek (*Ann. bot. fenn.* **42**: 23, 2005; *Pachykytospora nanospora*).

Pachykytosporaceae Jülich (1982) = Polyporaceae.

Pachylepyrium Singer (1958), Strophariaceae. 7, widespread (north temperate). See Singer (*Sydowia* **11**: 321, 1957), Moser (*Hoppea* **61**: 267, 2000).

Pachyma Fr. (1822), anamorphic *Macrohyporia, Lentinus, Polyporus*. 1, N. America. See Weber (*Mycol.* **21**: 113, 1929; sclerotia), Ginns & Lowe (*CJB* **61**: 1672, 1984).

Pachyospora A. Massal. (1852), Hymeneliaceae (L). 1, widespread (arctic-alpine). See Hertel (*Willdenowia* **6**: 225, 1971).

Pachypatella Theiss. & Syd. (1915), Parmulariaceae. 2, Asia.

Pachyphiale Lönnr. (1858), Gyalectaceae (L). 7, widespread. See Vězda (*Sborn. Vysoké Školy Zeměd. Lesn. Brno* C **1**: 22, 1958), Vězda (*Ergebn. Forsch. Unternehmens Nepal Himalaya* **6**: 127, 1974; key 5 spp.), Alvarez Andrés (*Nova Hedwigia* **77**: 139, 2003; Iberian peninsula), Kauff & Büdel (*Bryologist* **108**: 272, 2005; ontogeny).

Pachyphlodes Zobel (1854) = Pachyphloeus fide Fischer (*Nat. Pflanzenfam.* **5b**: viii, 1938).

Pachyphloeus Tul. & C. Tul. (1844), Pezizaceae. 11 (hypogeous), widespread. See Gilkey (*N. Amer. Fl.* **2**, 1954; key N. Am. spp.), Lange (*Dansk bot. Ark.* **16**: 32, 1956; key Eur. spp.), Norman & Egger (*Mycol.* **91**: 820, 1999; phylogeny), Percudani *et al.* (*Mol. Phylogen. Evol.* **13**: 169, 1999; phylogeny), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Calonge *et al.* (*Boll. Gruppo Micol. 'G. Bresadola'* **45**: 51, 2002; Spain), Colgan & Trappe (*Mycotaxon* **90**: 281, 2004; USA), Frank *et al.* (*Mycotaxon* **98**: 253, 2006; USA), Tedersoo *et al.* (*New Phytol.* **170**: 581, 2006; mycorrhizas), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Pachyphysis R.C. Harris & Ladd (2007), Porpidiaceae (L). 1, USA. See Harris & Ladd (*Opuscula Philolichenum* **4**: 57, 2007).

pachypleurous, thick-walled.

Pachyrhytisma Höhn. (1917) = Rhytisma fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Pachysacca Syd. (1930), Dothideaceae. 1, Australia. See Swart (*TBMS* **79**: 261, 1982).

Pachysolen Boidin & Adzet (1958), Saccharomycetales. 1, Europe. See Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Pachyspora Kirschst. (1906) = Delitschia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pachysporaria (Malme) M. Choisy (1949) ? = Rinodina fide Marbach (*Biblthca Lichenol.* **74**, 2000).

Pachysterigma Johan-Olsen ex Bref. (1888) = Tulasnella fide Rogers (*Annls mycol.* **31**: 183, 1933).

Pachythyrium G. Arnaud ex Spooner & P.M. Kirk (1990), Microthyriaceae. 1, Europe. See Spooner & Kirk (*MR* **94**: 223, 1990).

Pachytichospora Van der Walt (1978) = Kazachstania fide Augustyn *et al.* (*Syst. Appl. Microbiol.* **13**: 44, 1990; fatty acid analysis), Kurtzman & Robnett (*FEMS Yeast Res.* **3**: 417, 2003).

Pachytrichum Syd. (1925) = Periconia fide Linder (*Mycol.* **29**: 659, 1937).

Pachytrype Berl. ex M.E. Barr, J.D. Rogers & Y.M. Ju (1993), ? Calosphaeriaceae. Anamorph *Cytospora*-like. 2 (bark and wood), widespread. See Barr *et al.* (*Mycotaxon* **48**: 529, 1993), Fernández *et al.* (*Mycol.* **96**: 175, 2004; Costa Rica), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006).

Pacispora Oehl & E. Sieverd. (2004), Pacisporaceae. 3, widespread. See Oehl & Sieverding (*J. Appl. Bot.* Angew. Bot. **78**: 74, 2004), Redecker & Raab (*Mycol.* **98**: 885, 2006; phylogeny), Walker *et al.* (*MR* **111**: 253, 2007; nomencl.).

Pacisporaceae C. Walker, Błaszk., A. Schüssler & Schwarzott (2004), Diversisporales. 1 gen. (+ 1 syn.), 3 spp.
Lit.: Azcon-Aguilar & Barea (*Mycorrhiza* **6**: 457, 1996), van der Heijden *et al.* (*Nature* Lond. **396**: 69, 1998), Schüßler *et al.* (*MR* **105**: 1413, 2001), Oehl &

Sieverding (*J. Appl. Bot.* Angew. Bot. **78**: 74, 2004), Walker & Schüssler (*MR* **108**: 982, 2004), Walker *et al.* (*MR* **108**: 707, 2004), Redecker (*Glomeromycota* Arbuscular mycorrhizal fungi and their relative(s), *in* The Tree of Life Web Project, http://tolweb.org: [unpaginated], 2005).

Pactilia Fr. (1837), anamorphic *Pezizomycotina*, Hsp.?.?. 2 or 3, Europe; S. America.

PAD, Istituto di Botanica e Fisiologia Vegetale, Padova (Italy); founded 1837; a state institution; see Montemartini Corte (*in* Minelli (Ed.), *The botanical garden of Padua 1545-1995*: 271, 1995; mycol. collns esp. Saccardo).

paddy (paddi) straw mushroom, see straw mushrooms.

Padixonia Subram. (1972), anamorphic *Xylaria*, Hsy.0eH.9. 1, Ghana. The connection with termiticolous *Xylaria* needs confirmation. See Subramanian (*Curr. Sci.* **41**: 282, 1972), Dixon (*J. Linn. Soc.* Bot. **91**: 203, 1985).

Paecilomyces Bainier (1907), anamorphic *Byssochlamys*, Hso.0eH.15. *c.* 76, widespread. See also *Isaria*. See Samson (*Stud. Mycol.* **6**, 1974; key), Castro *et al.* (*J. Med. Vet. Mycol.* **28**: 15, 1990; review of *Paecilomyces* in human infections), Mountfort & Rhodes (*Appl. Environm. Palaeoleptosphaeria Barlinge & Paradkar (1982), Fossil Fungi, Ascomycota. 1 (Cretaceous), India.

Palaeomycelites Bystrov (1956), Fossil Fungi (mycel.) Fungi. 1 (Devonian), former USSR.

Palaeomyces Renault (1896), Fossil Fungi (mycorrhizal endomycobiont) Fungi. 3 (Carboniferous), France; British Isles. See Butler (*TBMS* **22**: 274, 1939).

Palaeomycites Mesch. (1902) ≡ Palaeomyces.

Palaeopede D.E. Ether. (1899), Fossil Fungi ? Fungi. 1 (Devonian), Australia.

Palaeopericonia C.G. Ibáñez & Zamuner (1996), Fossil Fungi. 1, Argentina. See Ibáñez & Zamuner (*Mycotaxon* **59**: 138, 1996).

Palaeoperone D.E. Ether. (1891), Fossil Fungi ? Fungi. 1 (Permo-Carboniferous), Australia.

Palaeophoma Singhai (1975), Fossil Fungi, anamorphic *Pezizomycotina.* 1 (Eocene), India.

Palaeophthora Singhai (1978), Fossil Fungi, Oomycota. 1 (Eocene), India. See Singhai (*Palaeobotanist* **25**: 481, 1978).

Palaeosclerotium G.W. Rothwell (1972), Fossil Fungi ? Ascomycota. 1 (Carboniferous), USA. See Dennis (*Science* N.Y. **192**: 66, 1976), Singer (*Mycol.* **69**: 850, 1977), Pirozynski & Weresub *in* Kendrick (Ed.) (*The Whole Fungus* **1**: 687, 1979).

Palaeosordaria Sahni & H.S. Rao (1943), Fossil *Fungi, Xylariales. 1 (Tertiary), India.*

Palambages Whetzel (1961), Fossil Fungi (? sclerotia) Fungi. 3 (Cretaceous, Tertiary), Canada; Europe; Malaysia.

Palavasciaceae Manier ex Manier & Lichtw. (1968), Eccrinales. 1 gen., 3 spp.

Palawania Syd. & P. Syd. (1914), Microthyriaceae. 1, Asia.

Palawaniella Doidge (1921), Parmulariaceae. 5, S. America; S. Africa. See Inácio *et al.* (*Mycol. Progr.*

4: 133, 2005).

Palawaniopsis Bat., Cif. & Nascim. (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, S. Africa. See Batista *et al.* (*Mycopath. Mycol. appl.* **11**: 75, 1959).

Paleoarcyria M. Jacq.-Fél., C.N. Mill. & Locq. (1983), Fossil Fungi. 1, France.

Paleobasidiospora Locq. (1983), Fossil Fungi. 1, France.

Paleoblastocladia W. Remy, T.N. Taylor & Hass (1994), Fossil Fungi. 1 (lower Devonian). See Remy *et al.* (*Am. J. Bot.* **81**: 690, 1994).

Paleocatenaria Locq. (1983), Fossil Fungi. 1, British Isles.

Paleoguttulina Locq. & Mišík (1983), Fossil Fungi. 1, former Czechoslovakia.

Paleomastigomycetes, Form class name proposed (Taylor *et al. Mycol.* **84**: 901, 1992) for fossil chytrid-like fungi.

paleomycology, the study of fossil fungi (q.v.).

Paleopyrenomycites Taylor, Hass, Kerp, M. Krings & Hanlin (2004), Fossil Fungi. 1, British Isles. See Taylor *et al.* (*Mycol.* **96**: 1404, 2004).

Paleoserenomyces Currah, Stockey & B.A. LePage (1998), Fossil Fungi. 1. See Currah *et al.* (*Mycol.* **90**: 668, 1998).

Paleoslimacomyces Kalgutkar & Sigler (1995), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Palaeocene – Eocene), Canada. See Kalgutkar & Sigler (*MR* **99**: 521, 1995).

Palifer Stalpers & P.K. Buchanan (1991), Schizoporaceae. 4, widespread. See Hjortstam & Ryvarden (*Syn. Fung.* **22**: 9, 2007).

Paliphora Sivan. & B. Sutton (1985), anamorphic *Pezizomycotina*, Hso.0-1eH.27. 3, Australia; Malaysia. See Sivanesan & Sutton (*TBMS* **85**: 249, 1985), Kuthubutheen (*TBMS* **89**: 270, 1987), Alcorn (*Mycotaxon* **59**: 145, 1996).

palisade fungi, see *Agaricomycotina*.

palisade plectenchyma, plectenchyma in the cortex of a lichen thallus composed of hyphae arranged perpendicular to the surface.

palisade-cells (of lichens), the end cells of the hyphae of a fastigiate cortex.

palisoderm (of basidiomata), an outer layer composed of several strata of cells or hyphal tips; see derm.

pallid, light-coloured; pale.

pallisadoplectenchyma, see plectenchyma.

palmate, having lobes radiating from a common centre but not extending to the point of insertion. Cf. chiroid, digitate.

Palmella Lyngb. (1819), Algae. Algae.

Palmellathyrites Locq., D. Pons & Sal.-Cheb. (1981), Fossil Fungi. 1, France.

Palmicola K.D. Hyde (1993), Xylariales. 1, Australia; Ecuador. Affinities uncertain. See Hyde (*Sydowia* **45**: 15, 1993), Goh & Hyde (*MR* **100**: 714, 1996).

Palmomyces K.D. Hyde, J. Fröhl. & Joanne E. Taylor (1998) nom. illegit., ? Phyllachorales. 1 (on living *Palmae* leaf), Australia. See Hyde *et al.* (*Sydowia* **50**: 21, 1998), Wang & Hyde (*Fungal Diversity* **3**: 159, 1999; posn).

Palmomyces Maire (1926) ≡ Andreaeana.

Palomyces Höhnk (1955) = Halosphaeria fide Kohlmeyer (*CJB* **50**: 1951, 1972).

paludal, living in wet places (marshes).

Palynomorphites L.R. Moore (1963), Fossil Fungi. 1 (Carboniferous), British Isles.

Pampolysporium Magnus (1900) = Guignardia fide Eriksson (*SA* **5**: 147, 1986).

Panaeolina Maire (1933), Agaricales. 2, widespread. Belongs either to the *Inocybaceae* or the *Psathyrellaceae*. See Gerhardt (*Biblthca Botanica* **147**: 149 pp., 1996), He (*Mycosystema* **23**: 150, 2004; China).

Panaeolopsis Singer (1969), Agaricaceae. 4, widespread. See Singer (*Nova Hedwigia* Beihefte **29**: 367, 1969).

Panaeolus (Fr.) Quél. (1872) nom. cons., Agaricales. *c.* 15 (coprophilous), widespread. Belongs either to the *Inocybaceae* or the *Psathyrellaceae*. See Hora (*Naturalist* Hull: 77, 1957), Ola'h (*Revue Mycol.* Mém. Hors Sér. **10**, 1970), Pegler (*Kew Bull.* Addit. Ser. **6**, 1977; E. Afr. spp.), Gerhardt (*Taxonomische Revision der Gattungen Panaeolus und Panaeolina*, 1996), Bon & Courtecuisse (*Docums Mycol.* **32**: 75, 2003; key).

Panama disease, A disease of banana caused by *Fusarium oxysporum* f.sp. *cubense*. See Stover (*Phytopath. Pap.* **4**, 1962), Stover & Buddenhagen (*Fruits* **41**: 175-191, 1986), Pegg & Langdon (*in* Persley & De Langhe (Eds), *Banana and plantain breeding strategies*: 119, 1987), Ploetz (Ed.) (*Fusarium wilt of banana*, 1990, *Int. Jl of Pest Manag.* **40**: 326, 1994).

Panchanania Subram. & N.G. Nair (1966), anamorphic *Pezizomycotina*, Hsy.1eP.10. 1, India. See Bhat (*TBMS* **85**: 101, 1985; synonymy with *Paathramaya*).

Pandanicola K.D. Hyde (1994), Xylariales. 2, pantropical. See Hyde (*Sydowia* **46**: 35, 1994), Lu & Hyde (*Mycoscience* **41**: 83, 2000).

Pandora Humber (1989), Entomophthoraceae. 32, widespread. See Humber (*Mycotaxon* **34**: 441, 1989), Miller & Keil (*Mycotaxon* **38**: 227, 1990), Keller & Petrini (*Sydowia* **57**: 23, 2005; key), Keller (*Sydowia* **59**: 75, 2007; Switzerland, n.sp.).

Panellaceae Jülich (1982) = Mycenaceae.

Panellus P. Karst. (1879), Mycenaceae. *c.* 55, widespread. See Miller (*Mich. Bot.* **9**: 17, 1970), Burdsall & Miller (*Beih. Nova Hedwigia* **51**, 1975), Corner (*Gdns' Bull.* Singapore **39**: 103, 1986; Malaysian spp.), O'Kane *et al.* (*Mycol.* **82**: 595, 1990; bioluminescence), Hibbett *et al.* (*Nature* **407**: 506, 2000; relationship with *Clavariaceae* suggested), Jin *et al.* (*Mycotaxon* **79**: 7, 2001; phylogeny), Jin *et al.* (*Mycol.* **93**: 309, 2001; biogeography *Panellus stypticus*).

Pannaria Delise ex Bory (1828), Pannariaceae (L). 51, widespread (esp. tropical). See Jørgensen (*Op. Bot.* **45**, 1978; Eur. spp.), Jørgensen (*J. Hattori bot. Lab.* **76**: 197, 1994), Jørgensen (*N.Z. Jl Bot.* **37**: 257, 1999; NZ spp.), Jørgensen (*Nova Hedwigia* **71**: 405, 2000; subg. *Chrysopannaria*), Jørgensen (*Bryologist* **103**: 670, 2000; N America), Jørgensen (*Biblthca Lichenol.* **78**: 109, 2001; Australia), Jørgensen & Kashiwadani (*J. Jap. Bot.* **76**: 1, 2001; Japan), Ekman & Jørgensen (*CJB* **80**: 625, 2002; phylogeny), Jørgensen (*Lichenologist* **35**: 11, 2003; Africa), Jørgensen (*Nova Hedwigia* **76**: 245, 2003; isidiate taxa), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Jørgensen (*Biblthca Lichenol.* **88**: 229, 2004; S hemisphere), Jørgensen & Arvidsson (*Symb. bot. upsal.* **34** no. 1: 113, 2004; Ecuador), Jørgensen & Sipman (*Nova Hedwigia* **78**: 311, 2004; S America), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny), Jørgensen & Sipman (*J. Hattori bot. Lab.* **100**: 695, 2006; New Guinea), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Pannariaceae Tuck. (1872), Peltigerales (L). 18 gen.

(+ 8 syn.), 328 spp.

Lit.: Galloway & James (*Lichenologist* **17**: 173, 1985), Galloway & Jørgensen (*Lichenologist* **19**: 345, 1987), Jørgensen & Galloway (*Lichenologist* **21**: 295, 1989), Lumbsch & Kothe (*Mycotaxon* **43**: 277, 1992), Øvstedal & Smith (*Cryptog. Bryol.-Lichénol.* **14**: 337, 1993), Jørgensen (*J. Jap. Bot.* **69**: 383, 1994), Henssen (*Symb. bot. upsal.* **32**: 75, 1997), Jørgensen (*Lichenologist* **30**: 533, 1998), Jørgensen (*N.Z. Jl Bot.* **37**: 257, 1999), Jørgensen & Wedin (*Lichenologist* **31**: 341, 1999), Makhija & Adawadkar (*Mycotaxon* **71**: 323, 1999), Jørgensen (*Bryologist* **103**: 104, 2000), Jørgensen (*Bryologist* **103**: 670, 2000; N. Am.), Ekman & Jørgensen (*CJB* **80**: 625, 2002), Wiklund & Wedin (*Cladistics* **19**: 419, 2003), Wedin & Wiklund (*Symb. bot. upsal.* **34** no. 1: 469, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny), Jørgensen (*Nordic Lichen Flora* **3**: Cyanolichens: 96, 2007).

Pannariella (Vain.) Gyeln. (1935) = Heppia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pannoparmelia (Müll. Arg.) Darb. (1912), Parmeliaceae (L). 5, widespread. See Sato (*Miscnea bryol. lichen., Nichinan* **4**: 45, 1966), Yoshimura (*Biblthca Lichenol.* **25**: 185, 1987), Yoshimura & Elix (*J. Hattori bot. Lab.* **74**: 287, 1993), Galloway & Sammy (*Flora of Australia* **55**: 86, 1994), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny).

pannose (panniform), having the appearance of felt or woollen cloth.

Pannucia P. Karst. (1879) = Psathyrella fide Singer (*Agaric. mod. Tax.*, 1951).

Pannularia Nyl. (1886) = Placynthium fide Jørgensen (*Op. Bot.* **45**, 1986).

Panomycetes Nyl. (1886) = Placynthium fide Jørgensen (*Op. Bot.* **45**, 1986).

Panorbis J. Campb., J.L. Anderson & Shearer (2003), Halosphaeriaceae. 1. See Campbell *et al.* (*Mycol.* **95**: 544, 2003).

pantherine, a metabolite of *Amanita pantherina*, etc., toxic to humans and flies (*Musca* sp.); muscimol; amanita factor B.

pantonemic (of e.g. *Oomycota*, *Hyphochytriomycota*), presumed to have evolved from algae. Pantonemic 'fungi' exhibit the diaminopimelate pathway for lysine synthesis; the dominant sterols are cholesterols (not ergosterol); and the storage product is mycolaminarin (not glycogen).

Pantonemomycota. Phylum proposed by Olive (*The mycetozoans*, 1975) for the fungi placed in *Oomycota* and *Hyphochytriomycota* in this *Dictionary*.

Pantospora Cif. (1938) = Pseudocercospora fide Deighton (*Mycol. Pap.* **140**, 1976), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Panus Fr. (1838) nom. cons., Polyporaceae. 25 (on wood), widespread. See Corner (*Beih. Nova Hedwigia* **69**, 1981), Pegler (*Kew Bull.* Addit. Ser. **10**, 1983; world monogr., as *Lentinus* subgen. *Panus*), Hibbett & Vilgalys (*Mycol.* **83**: 425, 1991; phylogeny), Hibbett & Vilgalys (*Syst. Bot.* **18**: 409, 1993; phylogeny) See also Luminescent fungi.

Paoayensis Cabanela, Jeewon & K.D. Hyde (2007), Sordariomycetes. 1, Philippines. See Cabanela *et al.* (*Cryptog. Mycol.* **28**: 301, 2007).

paper (fungi on), see Biodeterioration.

papilionaceous, variegated; mottled; marked with different colours as the lamellae of certain *Panaeolus* spp.

Papilionospora V.G. Rao & B. Sutton (1976), anamorphic *Pezizomycotina*, Hsy.0eP.10. 1, Myanmar; Italy. See Rao & Sutton (*Kavaka* **3**: 23, 1975).

Papilionovela Aptroot (1997), Ostropales. 1 (from bark), Papua New Guinea. See Aptroot (*MR* **101**: 266, 1997).

Papiliotrema J.P. Samp., M. Weiss & R. Bauer (2002), Tremellaceae. 1, Portugal. See Sampaio *et al.* (*Mycol.* **94**: 875, 2002), Sampaio (*Frontiers in Basidiomycote Mycology*: 49, 2004).

papilla, a small rounded process.

papillae (of host tissue), localized wall thickenings on the inner surface of plant cell walls at sites penetrated by fungi; callosity, lignituber, callus, 'sheath', are whole or part synonyms (Aist, *Ann. Rev. Phytopath.* **14**: 145, 1976).

Papillaria J. Kickx f. (1835) nom. rej. prop. ≡ Pycnothelia.

papillate, having a papilla (Fig. 23.40).

Pappimyces B. Sutton & Hodges (1975), anamorphic *Pezizomycotina*, Hso.0fH.6. 1, Brazil. See Sutton & Hodges (*Nova Hedwigia* **26**: 527, 1975).

Papulare Tomas. & Cif. (1952) ≡ Phragmothele.

Papularia Fr. (1825) [non *Papularia* Forssk. 1775, *Aizoaceae*] = Arthrinium fide Ellis (*Mycol. Pap.* **103**, 1965).

Papulariomyces Cif. & Tomas. (1953) ≡ Papulare.

Papulaspora Preuss (1851), anamorphic *Chaetomium*, *Melanospora*, Hso.#eP.1. *c.* 24, widespread. *P. byssina* is the brown plaster mould of mushroom beds; wood pulp is damaged by other spp.; *P. stoveri* is a mycoparasite of *Rhizoctonia*. The hyphae bear 'papulospores' (q.v.), small rounded propagules comprising one or more enlarged central cells surrounded by a sheath of smaller cells. Forms having 'bulbils' (q.v.) are excluded as *Burgoa* and *Minimedusa* by Weresub & LeClair (*CJB* **49**: 2203, 1971; gen. key). See Tubaki *et al.* (*TMSJ* **32**: 31, 1991).

Papulasporites Shete & A.R. Kulk. (1978), Fossil Fungi. 1 (Tertiary), India.

Papulosa Kohlm. & Volkm.-Kohlm. (1993), Papulosaceae. 1 (*Juncus* culms), USA. See Kohlmeyer & Volkmann-Kohlmeyer (*SA* **11**: 95, 1993), Winka & Eriksson (*Mycoscience* **41**: 97, 2000; DNA), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Papulosaceae Winka & O.E. Erikss. (2000), Sordariomycetidae (inc. sed.). 1 gen., 1 spp.

Lit.: Winka & Eriksson (*Mycoscience* **41**: 97, 2000; DNA).

papulose, covered with pimples or pustules.

Papulospora, see *Papulaspora*.

papulospore, asexual spore in e.g. *Papulaspora sepedonioides* (Weresub & LeClair, *CJB* **49**: 2203, 1971).

Papulosporonites Schmied. & A.J. Schwab (1964), Fossil Fungi. 1 (Eocene), Germany.

Papyrodiscaceae Jülich (1982) = Corticiaceae.

Papyrodiscus D.A. Reid (1979), ? Corticiaceae. 1, Papua New Guinea. See Reid (*Beih. Sydowia* **8**: 333, 1979).

Paraaoria R.K. Verma & Kamal (1987), anamorphic *Pezizomycotina*, St.0eP.19. 1, Nepal. See Verma & Kamal (*TBMS* **87**: 645, 1986).

Paraarthrocladium Matsush. (1993), anamorphic *Pezizomycotina*, Hso.≡ eH.1/10. 1, Peru. See Matsushima (*Matsush. Mycol. Mem.* **7**: 58, 1993).

Parabotryon Syd. (1926) ? = Eudarluca fide Müller &

von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Paracainiella Lar.N. Vassiljeva (1983), Amphisphaeriaceae. 1 (on *Dryas*), Siberia. See Kang *et al.* (*MR* **103**: 53, 1999).

paracapillitium (of *Lycoperdales*), a capillitium composed of thin-walled, hyaline, septate hyphae in contrast to a true capillitium of thick-walled, brown, aseptate hyphae (Kreisel, 1962).

Paracapnodium Speg. (1909) = Scorias fide Hughes (*Mycol.* **68**: 693, 1976).

Paracarpidium Müll. Arg. (1883) = Endocarpon fide Zahlbruckner (*Catalogus Lichenum Universalis* **1**, 1921).

paracephalodium (pl. **-ia**), a hyphal mat covering cyanobacteria arising from a squamulose lichen thallus which has a green alga as the photobiont (Poelt & Mayrhofer, *Pl. Syst. Evol.* **158**: 265, 1988).

Paraceratocladium R.F. Castañeda (1987), anamorphic *Pezizomycotina*, Hso.1eH.15. 2, pantropical. See Castañeda (*Fungi Cubenses* **2**: 8, 1987), Goh & Hyde (*Nova Hedwigia* **71**: 95, 2000; Malaysia), Whitton *et al.* (*Fungal Diversity* **7**: 175, 2001; Seychelles), Calduch *et al.* (*Mycol.* **94**: 1071, 2002; Brazil).

Paracercospora Deighton (1979) = Pseudocercospora. Widely used for the causal organisms of Sigatoka disease of banana. fide Deighton (*Mycol. Pap.* **144**: 47, 1979), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Paracesatiella Petr. (1929) = Schweinitziella fide von Arx (*Acta Bot. Neerl.* **7**: 503, 1958).

Parachinomyces Thaung (1979), anamorphic *Pezizomycotina*, Hso.≡ eH.10. 1 (on *Acroconidiellina*), Myanmar. See Thaung (*TBMS* **72**: 333, 1979).

Parachionomyces Thaung (1979), anamorphic *Pezizomycotina*, Hso.≡ eH.10. 1 (on *Acroconidiellina*), Myanmar.

Parachnopeziza Korf (1978), Hyaloscyphaceae. 8, widespread. See Arendholz & Sharma (*Mycotaxon* **20**: 633, 1984), Korf & Zhuang (*Mycotaxon* **22**: 483., 1985), Gamundí & Giaiotti (*Sydowia* **46**: 12, 1994), Zhuang (*Mycotaxon* **69**: 359, 1998; 2 spp. China).

Paracoccidioidaceae Redaelli & Cif. (1937) = Ajellomycetaceae.

Paracoccidioides F.P. Almeida (1930), anamorphic *Ajellomycetaceae*, Hso.0eH.3. 1 (on humans), S. America. *P. brasiliensis* (paracoccidioidomycosis; q.v.). See Restrepo *et al.* (*RMVM* **8**: 97, 1973; 183 refs), Takeo *et al.* (*MR* **94**: 1118, 1990; cytoplasmic and plasma membrane ultrastructure), San-Blas & San-Blas (*Jap. J. Med. Mycol.* **32**: 75, 1991; morphogenesis), Franco *et al.* (Eds) (*Paracoccidioidomycosis*, 1994), Le Clerc *et al.* (*J. Med. Vet. Mycol.* **32**: 331, 1994; syst. posn), Vidal *et al.* (*Revista do Instituto de Medicina Tropical de São Paulo* **37**: 43, 1995; from armadillo), San-Blas *et al.* (*Microbiology* Reading **143**: 197, 1997; biometrics), Sandhu *et al.* (*J. Clin. Microbiol.* **35**: 1894, 1997; molecular detection), Calcagno *et al.* (*J. Clin. Microbiol.* **36**: 1733, 1998; biogeography), Cano *et al.* (*J. Clin. Microbiol.* **36**: 742, 1998; karyotypes), Hamilton (*Medical Mycology* **36**: 351, 1998; serological diagnostics), Wanke & Londero (*Topley & Wilson's Microbiology and Microbial Infections* Edn 9. Vol. **4** Medical Mycology: 395, 1998; review), Montoya *et al.* (*Medical Mycology* **37**: 219, 1999; karyotypes), Sano *et al.* (*Mycopathologia* **143**: 165, 1998; comparison between human and armadillo strains), Bialek *et al.* (*J. Clin. Microbiol.* **38**: 3190, 2000; phylogeny), Niño-Vega *et al.* (*Medical Mycology* **38**: 437, 2000; geographical isolation), Hahn *et al.* (*Revta Iberoamer. Micol.* **19**: 49, 2002; RAPD characterization), San-Blas *et al.* (*Medical Mycology* **40**: 225, 2002; molecular approaches), Feitosa *et al.* (*Fungal Genetics Biol.* **39**: 60, 2003; chromosomes), Hebeler-Barbosa *et al.* (*J. Clin. Microbiol.* **41**: 5733, 2003; phylogeny), Nascimento *et al.* (*J. Clin. Microbiol.* **42**: 5007, 2004; microsatellites), Borba *et al.* (*Antonie van Leeuwenhoek* **88**: 257, 2005; polyphasic characterization), Oliveira *et al.* (*MR* **109**: 707, 2005; cDNA), San-Blas *et al.* (*J. Clin. Microbiol.* **43**: 4255, 2005; molecular detection), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Matute *et al.* (*J. Clin. Microbiol.* **44**: 2153, 2006; microsatellites, phylogenetic species), Matute *et al.* (*Mol. Biol. Evol.* **23**: 65, 2006; cryptic speciation), Soares *et al.* (*Mycopathologia* **165**: 179, 2008; review).

paracoccidiomycosis, see *Paracoccidioides*.

Paraconiothyrium Verkley (2004), anamorphic *Montagnulaceae*. Anamorph *Paraphaeosphaeria*. 6, widespread. See Verkley *et al.* (*Stud. Mycol.* **50**: 327, 2004), Damm *et al.* (*Persoonia* **20**: 9, 2008; on woody plants).

Paracoreomyces R.A. Poiss. (1929) = Coreomyces fide Thaxter (*Memoirs of the American Academy of Arts and Sciences* **16**: 1, 1931).

Paracostantinella Subram. & Sudha (1989), anamorphic *Pezizomycotina*, Hso.0eH.10. 1, India. See Subramanian & Sudha (*Kavaka* **15**: 12, 1987).

Paracryptophiale Kuthub. & Nawawi (1994), anamorphic *Pezizomycotina*, Hso.#eH-P.15. 2, Malaysia; China. See Kuthubutheen & Nawawi (*MR* **98**: 125, 1994), Wu & Sutton (*Fungal Diversity* **14**: 265, 2003).

Paracudonia Petr. (1927) = Roesleria fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Paracytospora Petr. (1925), anamorphic *Pezizomycotina*, St.0eH.?. 1, N. America.

Paradactylaria Subram. & Sudha (1989), anamorphic *Pezizomycotina*, Hsy.1eH.10. 1, India. See Subramanian & Sudha (*Kavaka* **15**: 16, 1987).

Paradactylella Matsush. (1993), anamorphic *Pezizomycotina*, Hso.≡ eH.2. 1, Peru. See Matsushima (*Matsush. Mycol. Mem.* **7**: 59, 1993).

Paradendryphiopsis M.B. Ellis (1976), anamorphic *Pezizomycotina*, Hso.≡ eP.25. 3, Europe; S. Africa. See Révay (*Stud. Bot. Hung.* **18**: 65, 1985).

Paradictyoarthrinium Matsush. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Transvaal. See Matsushima (*Matsush. Mycol. Mem.* **9**: 18, 1996).

Paradidymella Petr. (1927) = Discostroma fide Dennis (*British Ascomycetes*, 1968), Hawksworth & Sivanesan (*TBMS* **67**: 39, 1976).

Paradidymobotryum C.J.K. Wang & B. Sutton (1984), anamorphic *Pezizomycotina*, Hsy.1eP.4. 1, USA. See Wang & Sutton (*Mycol.* **76**: 570, 1984).

Paradiplodia Speg. ex Trotter (1931), anamorphic *Pezizomycotina*, St.1eP.?. 7, widespread. See Zambettakis (*BSMF* **70**: 219, 1955; as *Paradiplodiella*), Petrak (*Sydowia* **16**, 1963).

Paradiplodiella Zambett. (1955) = Botryodiplodia fide Sutton (*Mycol. Pap.* **141**, 1977).

Paradischloridium Bhat & B. Sutton (1985), anamorphic *Pezizomycotina*, Hso.≡ eP.15. 1, Ethiopia; New Zealand. See Bhat & Sutton (*TBMS* **84**: 723, 1985).

Paradiscina Benedix (1969) = Gyromitra fide Benedix

(*Kulturpflanz.* **19**: 163, 1972), Harmaja (*Karstenia* **15**: 33, 1976).

Paradiscula Petr. (1941), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1, Europe. See Morgan-Jones (*Mycotaxon* **2**: 167, 1975).

Paradoxa Mattir. (1935), Tuberaceae. 1 (hypogeous), Italy. See Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Paradoxomyces Matzer (1996), Arthoniaceae (L). 1 (on lichens), Indonesia. See Matzer (*Mycol. Pap.* **171**: 93, 1996), Grube (*Bryologist* **101**: 377, 1998).

Paraeccilia Largent (1994) = Entoloma fide Kuyper (*in litt.*).

Paraepicoccum Matsush. (1993), anamorphic *Pezizomycotina*, Hsp.#eP.2. 1, Peru. See Matsushima (*Matsush. Mycol. Mem.* **7**: 59, 1993).

Paraeutypa Subram. & Ananthap. (1988) = Leptoperidia fide Rappaz (*Mycol. Helv.* **3**: 281, 1989).

Parafulvia Kamal, A.N. Rai & Morgan-Jones (1983), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 1, India. See Kamal *et al.* (*Mycotaxon* **18**: 67, 1983).

Paragaeumannomyces Matsush. (2003), Sordariomycetes. 1, Japan. See Matsushima (*Matsush. Mycol. Mem.* **10**: 156, 2001).

Paraglomeraceae J.B. Morton & D. Redecker (2001), Paraglomerales. 1 gen., 3 spp.

Lit.: Azcon-Aguilar & Barea (*Mycorrhiza* **6**: 457, 1996), van der Heijden *et al.* (*Nature* Lond. **396**: 69, 1998), Morton & Redecker (*Mycol.* **93**: 183, 2001), Schüßler *et al.* (*MR* **105**: 1413, 2001), Redecker (*Glomeromycota* Arbuscular mycorrhizal fungi and their relative(s). Version 01 July 2005. http://tolweb.org/Glomeromycota/28715/2005.07.01 in The Tree of Life Web Project, http://tolweb.org: [unpaginated], 2005).

Paraglomerales C. Walker & A. Schüssler (2001). Glomeromycetes. 1 fam., 1 gen., 3 spp. Fam.: **Paraglomeraceae**

For *Lit.* see under fam.

Paraglomus J.B. Morton & D. Redecker (2001), Paraglomeraceae. 3, widespread. See Morton & Redecker (*Mycol.* **93**: 188, 2001), Redecker & Raab (*Mycol.* **98**: 885, 2006; phylogeny), Walker *et al.* (*MR* **111**: 253, 2007; nomencl.).

Paragranatisporites Kalgutkar & Janson. (2000), Fossil Fungi. 1.

Paragranatisporites Zhong Y. Zhang (1980), Fossil Fungi. 1. See Zhang (*Acta Palaeont. Sin.* **19**: 298, 1980).

paragynous (of *Pythiaceae*), having the antheridium at the side of the oogonium.

Paragyrodon (Singer) Singer (1942), Paxillaceae. 1, N. America. See Bruns *et al.* (*Mol. Ecol.* **7**: 257, 1998; phylogeny).

Parahaplotrichum W.A. Baker & Partridge (2001), anamorphic *Botryobasidium*. 1, USA. See Partridge *et al.* (*Mycotaxon* **77**: 360, 2001).

Paraharknessia Matsush. (2003), anamorphic *Pezizomycotina*, Hso.?.?. 1, Japan. See Matsushima (*Matsush. Mycol. Mem.* **10**: 30, 2001).

Parahelminthosporium Subram. & Bhat (1989) = Polytretophora fide Sutton (*in litt.*).

Parahendersonia A.W. Ramaley (1995), anamorphic *Chaetoplea*, Cpd.?.?. 2, USA. See Ramaley (*Aliso* **14**: 152, 1995).

Parahyalotiopsis Nag Raj (1976), anamorphic *Pezizomycotina*, Cpd.≡ eP.19. 1, Myanmar. See Nag Raj (*CJB* **54**: 1370, 1976).

Parahydraeomyces Speg. (1915) = Hydraeomyces fide Siemaszko & Siemaszko (*Polsk. Pismo Entom.* **12**: 125, 1933).

Paraisaria Samson & B.L. Brady (1983), anamorphic *Ophiocordyceps*, Hsy.0eH.15. 1 (on larvae of *Hepialus*), British Isles; Germany. See Samson & Brady (*TBMS* **81**: 285, 1983).

Paralaestadia Sacc. ex Vain. (1921) nom. rej. prop. ? = Lichenochora fide Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000).

Paralepista Raithelh. (1981) = Lepista fide Kuyper (*in litt.*).

Paraleptonia (Romagn. ex Noordel.) P.D. Orton (1991) = Entoloma fide Kuyper (*in litt.*).

Paralethariicola Calatayud, Etayo & Diederich (2001), Odontotremataceae. 1, Spain. See Calatayud *et al.* (*Lichenologist* **33**: 478, 2001), Diederich *et al.* (*Lichenologist* **34**: 479, 2002).

84: 159, 2003).

Paranthostomella Speg. (1910) ? = Anthostomella fide Francis (*Mycol. Pap.* **139**, 1975), Læssøe (*SA* **13**: 43, 1994), Lu & Hyde (*Fungal Diversity Res. Ser.* **4**, 2000).

Paraparmelia Elix & J. Johnst. (1986) = Xanthoparmelia fide Elix & Johnston (*Mycotaxon* **32**: 399, 1988; 15 spp. S. Hemisph.), Elix (*Bryologist* **96**: 359, 1993), Elix (*Biblthca Lichenol.* **80**, 2001; revision), Elix (*Mycotaxon* **87**: 395, 2003), Blanco *et al.* (*Taxon* **53**: 959, 2004).

Parapaxillus Singer (1942) nom. inval.; nom. prov. = Paxillus fide Kuyper (*in litt.*).

Parapeltella Speg. (1919) = Micropeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Parapericonia M.B. Ellis (1976), anamorphic *Pezizomycotina*, Hsp.0eP.1/10. 2, Africa; Australia. See Alcorn & Kirk (*TBMS* **85**: 561, 1985; amendment gen.).

Parapericoniella U. Braun, Heuchert & K. Schub. (2006), anamorphic *Pezizomycotina*, H?.?.?. 1, W. Africa. See Braun *et al.* (*Schlechtendalia* **13**: 59, 2006).

Paraphaeoisaria de Hoog & Morgan-Jones (1978), anamorphic *Pezizomycotina*, Hso.0eH.10. 1, USA. See de Hoog & Morgan-Jones (*Mycotaxon* **7**: 133, 1978).

Paraphaeosphaeria O.E. Erikss. (1967), Montagnulaceae. Anamorph *Paraconiothyrium*. 23, Europe; N. America. See Crivelli (*Über die heterogene Ascomycetengattung Pleospora Rbh.*, 1983; key), Shoemaker & Babcock (*CJB* **63**: 1284, 1985; key), Ramaley (*Mycotaxon* **61**: 347, 1997), Câmara *et al.* (*MR* **105**: 41, 2001; morphology, DNA), Câmara *et al.* (*MR* **107**: 516, 2003; revision, phylogeny), Verkley *et al.* (*Stud. Mycol.* **50**: 323, 2004; anamorph).

Paraphelaria Corner (1966), Pucciniomycotina. 2, Java; south Pacific. See Corner (*Persoonia* **4**: 346, 1966).

Paraphelariaceae Jülich (1982) = Auriculariaceae.

Paraphialocephala Budathoki (1997), anamorphic *Pezizomycotina*, Hso.?.?. 1, Nepal. See Budathoki (*Himalayan Microbial Biodiversity* Part **1** *Recent Researches in Ecology, Environment and Pollution* **10**: 122, 1997).

Paraphoma Morgan-Jones & J.F. White (1983) = Phoma Sacc. fide van der Aa *et al.* (*Stud. Mycol.* **32**: 1, 1990).

paraphysis (pl. **paraphyses**), a sterile upward growing, basally attached hyphal element in a hymenium, esp. in ascomycetes where they are generally filiform, unbranched or branched, and the free ends frequently make an epithecium over the asci, see hamathecium; in basidiomycetes, see hyphidium; **apical paraphyses**, the downward growing hyphae with free tips in the centrum of hypocrealean fungi (Luttrell, *TBMS* **48**: 135, 1965), periphysoids; **asco-**, a multicellular diploid storage hypha originating from the base of the ascus in *Erysiphaceae* (Speer, *Sydowia* **27**: 1, 1976); **paraphysate**, having paraphyses.

paraphysoid (1) (of ascomycetes), see hamathecium; (2) (of basidiomycetes), a sterile accessory hymenial structure; see basidiole, cystidiole, hyphidium; **-network**, branched and anastomosing paraphysoids surrounding asci in some ascolocular ascomycetes.

Paraphysorma A. Massal. (1852) nom. rej. = Staurothele fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Paraphysotheca Bat. (1961) = Schizothyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Paraphysothele Zschacke (1934) = Thelidium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parapithomyces Thaung (1976), anamorphic *Pezizomycotina*, Hso.#eP.10. 2, Myanmar; Australia. See Alcorn (*Aust. Syst. Bot.* **5**: 711, 1992).

Paraplacidiopsis Servít (1953) = Placidiopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Paraplacodium Motyka (1996) nom. inval. = Aspicilia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

paraplectenchyma, plectenchyma (q.v.) composed of cells which have isodiametric lumina and unthickened walls (see Yoshimura & Shimada, *Bull. Kochi Gakuen Jun. Coll.* **11**: 13, 1980).

Parapleistophora I.V. Issi, Kadyrova, Pushkar, Khodzhaeva & S.V. Krylova (1990), Microsporidia. 1.

Parapleurotheciopsis P.M. Kirk (1982), anamorphic *Pezizomycotina*, Hso.≡ eH-P.3. 3, British Isles; Japan; Cuba. See Castañeda Ruíz *et al.* (*Mycotaxon* **59**: 203, 1996).

Parapolyporites Tanai (1987), Fossil Fungi. 1, Japan.

Paraporpidia Rambold & Pietschm. (1989), Porpidiaceae (L). 3, Australasia; China; Indonesia. See Rambold & Pietschmann (*Biblthca Lichenol.* **34**: 243, 1989).

Parapterulicium Corner (1952), Pterulaceae. 3, Brazil. See Corner (*Ann. Bot., Lond.* n.s. **16**: 285, 1952).

Parapyricularia M.B. Ellis (1972), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 2, Asia; Brazil. See Ellis (*Mycol. Pap.* **131**: 12, 1972), Silva *et al.* (*Mycotaxon* **92**: 43, 2005).

Pararobillarda Matsush. (1996), anamorphic *Pezizomycotina*, Cpd.?.?. 1, Cape Province. See Matsushima (*Matsush. Mycol. Mem.* **9**: 18, 1996).

Parasaccharomyces Beurm. & Gougerot (1909) nom. rej. = Candida fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parasarcopodium Melnik, S.J. Lee & Crous (2004), anamorphic *Pezizomycotina*. 1, S. Africa. See Mel'nik *et al.* (*Mycol. Progr.* **3**: 22, 2004).

Parascedosporium Gilgado, Gené, Cano & Guarro (2007), anamorphic *Microascaceae*. 1. See Gilgado *et al.* (*Int. J. Syst. Evol. Microbiol.* **57**: 2171, 2007).

Parasclerophoma Petr. (1924) ? = Dothichiza fide Clements & Shear (*Gen. Fung.*, 1931).

Parascorias J.M. Mend. (1930) = Rizalia fide Pirozynski (*Kew Bull.* **31**: 595, 1977).

Parascutellinia Svrček (1975), Pyronemataceae. 3, Europe. See Benkert (*Gleditschia* **13**: 147, 1985), Donadini (*Boll. Gruppo Micol. 'G. Bresadola'* **29**: 273, 1986), Schumacher (*Mycotaxon* **33**: 149, 1988), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

parasexual cycle. A mechanism discovered by Pontecorvo (q.v.) & Roper in 1952 in filamentous fungi by which re-combination of hereditary properties is based not on sexual reproduction (meiosis) but on the mitotic cycle. The essential features of the process are: (1) the production of diploid nuclei in a heterokaryotic haploid mycelium; (2) the multiplication of

the diploid nuclei along with haploid nuclei in a heterokaryotic mycelium; (3) the sorting out of a diploid homokaryon; (4) segregation and recombination by crossing-over at mitosis; (5) haploidization of the diploid nuclei.

The results are similar to those achieved by meiosis but instead of a regular sequence of events in time as in the meiotic cycle, in the parasexual cycle the various processes may all be occurring at one time in one mycelium, at rates which have been estimated. The parasexual cycle may (as in *Aspergillus nidulans*) or may not (*A. niger*) be accompanied by a sexual cycle. Although the details of the mechanism of the parasexual cycle are unknown, Pontecorvo and his school obtained data from the parasexual cycle for mapping the 8 chromosomes of *Aspergillus nidulans*, results which showed good agreement with those for the same fungus obtained by the analysis of the sexual cycle. See Pontecorvo *et al.* (*Advances in genetics* **5**: 141, 1953), Pontecorvo & Käfer (*Advances in Genetics* **9**: 71, 1958). For other aspects see Pontecorvo (*Ann. Rev. Microbiol.* **10**: 393, 1956), Pontecorvo *et al.* (*J. gen. Microbiol.* **8**: 198, 1953; *Aspergillus niger*, **11**: 94, 1954; *Penicillium chrysogenum*), Buxton (*J. gen. Microbiol.* **15**: 133, 1956; *Fusarium oxysporum*). See protosexual.

Parasiphula Kantvilas & Grube (2006), Coccotremataceae (L). 1, Australasia. See Grube & Kantvilas (*Lichenologist* **38**: 241, 2006).

parasite, an organism living on or in, and obtaining its nutrients from, its host, another living organism; a biotroph or necrotroph. Cf. parasymbiont, pathogen, symbiosis.

Parasitella Bainier (1903), Mucoraceae. 1 (facultative parasite of *Mucorales*), widespread (north temperate). See Schipper (*Stud. Mycol.* **17**: 65, 1978), Kellner *et al.* (*Mycologist* **5**: 120, 1990; parasitism, genetic transfer), Burmester & Wöstemeyer (*Curr. Genet.* **26**: 456, 1994; genetics), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Schultze *et al.* (*Gene* **348**: 33, 2005; sexuality & parasitism), Wöstemeyer & Schimek *in* Heitman *et al.* (Eds.) (*Sex in Fungi*: 431, 2007; trisporic acid & mating).

parasol mushroom, basidioma of the edible *Macrolepiota procera* (syn. *Lepiota procera*).

Parasola Redhead, Vilgalys & Hopple (2001), Psathyrellaceae. 20, widespread. See Jørgensen & Stalpers (*Taxon* **50**: 909, 2001; nomencl.), Redhead *et al.* (*Taxon* **50**: 203, 2001; nomencl.), Keirle *et al.* (*Fungal Diversity* **15**: 33, 2004; Hawaii), Gams (*Taxon* **54**: 520, 2005; nomencl.).

parasoredium, soredium-like structure, originally used for a structured plectenchyma in the upper thallus layer of the *Umbilicaria hirsuta* aggr. (see Codogno *et al.*, *Pl. Syst. Evol.* **165**: 55, 1989).

Parasphaeria Syd. (1924) nom. dub. ? = Massarina fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Aptroot (*Nova Hedwigia* **66**: 89, 1998).

Parasphaeropsis Petr. (1953), anamorphic *Pezizomycotina*, Cpd.0fH.?. 1, Hawaii. See Petrak (*Sydowia* **7**: 364, 1953).

Paraspora Grove (1884), anamorphic *Pezizomycotina*, Hsp.≡ eH.?. 2, Europe.

Parastempellia Khodzhaeva (1988), Microsporidia. 1.

Parastenella J.C. David (1991), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 1, USA. See Morgan-Jones (*Mycotaxon* **66**: 421, 1998), Schubert & Braun (*Mycol. Progr.* **4**: 101, 2005).

Parastereopsis Corner (1976), Cantharellaceae. 1, Borneo. See Corner (*Nova Hedwigia* **27**: 331, 1976).

Parasteridiella H. Maia (1960) = Asteridiella fide Hughes (*in litt.*).

Parasteridium Speg. (1923) nom. dub., ? Meliolaceae. No species included. See Eriksson & Hawksworth (*SA* **7**: 59, 1988).

Parasterina Theiss. & Syd. (1917) = Asterina fide Doidge (*Bothalia* **4**: 273, 1942).

Parasterinella Speg. (1924), Asterinaceae. 2, S. America. See Arambarri (*Sydowia* **38**: 1, 1986).

Parasterinopsis Bat. (1960), Asterinaceae. 3, widespread (tropical). See Batista (*Atas Inst. Micol. Univ. Recife* **1**: 327, 1960).

Parastigmatea Doidge (1921), ? Polystomellaceae. 3, widespread (tropical).

Parastigmatellina Bat. & C.A.A. Costa (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Philippines; Australia. See Batista & Costa (*Mycopath. Mycol. appl.* **11**: 61, 1959), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005).

parasymbiont (obsol.), a fungus or lichen living on a lichen thallus but not causing any obvious damage (Zopf, *Ber. dtsch. bot. Ges.* **15**: 90, 1897); a commensalistic or gall-forming lichenicolous fungus (Hawksworth, *Bot. J. Linn. Soc.* **96**: 3, 1988). See Fungicolous fungi, Lichenicolous fungi.

Parasympodiella Ponnappa (1975), anamorphic *Pezizomycotina*, Hso.≡ eH.39. 6, widespread. See Tokumasu (*TMSJ* **28**: 19, 1987), Castañeda Ruíz *et al.* (*Mycotaxon* **65**: 93, 1997).

Parataeniellaceae Manier & Lichtw. (1968), Eccrinales. 2 gen., 7 spp.

Paratalaromyces Matsush. (2003), Trichocomaceae. Anamorph *Penicillium*. 1, Taiwan. See Matsushima (*Matsush. Mycol. Mem.* **10**: 111, 2001).

Paratetraploa M.K.M. Wong & K.D. Hyde (2002), anamorphic *Pezizomycotina*, H?.?.?. 1, Hong Kong. See Wong *et al.* (*Cryptog. Mycol.* **23**: 196, 2002).

Parathalle Clem. (1909) = Arthrorhaphis fide Poelt & Hafellner (*Phyton* Horn **17**: 213, 1976).

parathecium (1) (of apothecia), the outside hyphal layer, esp. if darker in colour (obsol.); (2) ectal excipulum (q.v.).

Paratheliaceae Zahlbr. (1903) = Pyrenulaceae.

Parathelium Nyl. (1862) = Pyrenula Ach. (1809) fide Upreti & Singh (*J. Econ. Taxon. Bot.* **10**: 236, 1987; India), Harris (*Mem. N. Y. bot. Gdn* **49**, 1989).

Parathelohania Codreanu (1966), Microsporidia. 9.

Paratomenticola M.B. Ellis (1976), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 1, USA. See Ellis (*More Dematiaceous Hyphomycetes*: 175, 1976).

Paratorulopsis E.K. Novák & Zsolt (1961) = Candida fide Lodder (*Yeasts, a taxonomic study* 2nd edn, 1970).

Paratrichaegum Faurel & Schotter (1966) = Epicoccum fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Paratrichaptum Corner (1987), Schizoporaceae. 1, Sumatra. See Corner (*Beih. Nova Hedwigia* **86**: 136, 1987), Hattori (*Mycoscience* **42**: 19, 2001).

Paratricharia Lücking (1997), Gomphillaceae (L). 1, Costa Rica. See Lücking (*Biblthca Lichenol.* **65**: 77, 1997).

Paratrichoconis Deighton & Piroz. (1972), anamorphic *Pezizomycotina*, Hso.≡ eH.11. 4, widespread (esp. tropical).

Paratrichophaea Trigaux (1985), Pyronemataceae. 4,

Europe; N. America. See Pfister (*Mycol.* **80**: 515, 1988; key 3 spp.), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

paratype, see type.

Paraulocladium R.F. Castañeda (1986), anamorphic *Pezizomycotina*, Hso.#eP.26. 1, Cuba. See Castañeda (*Fungi Cubenses* **1**: 12, 1986).

Parauncinula S. Takam. & U. Braun (2005), Erysiphaceae. 2, Japan. See Takamatsu *et al.* (*Mycoscience* **46**: 14, 2005), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Paravalsa Ananthap. (1990), ? Valsaceae. 1, India. See Ananthapadmanaban (*MR* **94**: 275, 1990).

paraxonemal body (PAR), proteinaceous structure restricted to particular region of the flagellum in chromophytes and euglenoids; also manifest as flagellar spines in male gametes of oogamous phaeophytes.

Parberya C.A. Pearce & K.D. Hyde (2001), Phyllachoraceae. 2, Australia. See Pearce & Hyde (*Fungal Diversity* **6**: 83, 2001).

Parencoelia Petr. (1950), Helotiaceae. 4 (on *Phyllachoraceae*), C. America; West Indies. See Zhuang (*Mycotaxon* **32**: 85, 1988), Zhuang (*Mycotaxon* **38**: 117, 1990).

Parendomyces Queyrat & Laroche (1909) nom. rej. = Candida fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parenglerula Höhn. (1910), Englerulaceae. 5, widespread (tropical).

parenthesome, a curved double membrane (which may be perforate, imperforate, or vesiculate; see Moore, *Bot. Marina* **23**: 362, 1980) on each side of a dolipore septum (Moore & McAlear, *Am. J. Bot.* **49**: 86, 1962); see Fig. 13 'dolipore'; septal pore cap.

Parepichloë J.F. White & P.V. Reddy (1998), Clavicipitaceae. 7 (Epibiotic on grasses), pantropical. See White & Reddy (*Mycol.* **90**: 226, 1998), White *et al.* (*Stud. Mycol.* **45**: 95, 2000).

Pareutypella Y.M. Ju & J.D. Rogers (1996), Xylariales. 2, Taiwan. See Ju & Rogers (*Mycol.* **88**: 6, 1996).

parietal, fixed to the wall, e.g. of asci in a perithecium.

parietin (physcion), a bright yellow-orange to red anthraquinone pigment (in *Teloschistaceae*) giving a crimson-purple reaction with K (q.v.). Also known in some species of *Aspergillus*, *Penicillium*, *Polygonum* (Angiosp.), *Rheum* (Angiosp.) and *Ventilago* (Angiosp.). See Metabolic products, Pigments.

pariobasidium, see basidium.

Paris inch (Paris line), see line.

Parkerella A. Funk (1976) = Lahmia fide Eriksson (*Mycotaxon* **27**: 347, 1986).

Parksia E.K. Cash (1945) = Chloroscypha fide Korf *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 249, 1973).

Parmastomyces Kotl. & Pouzar (1964), Fomitopsidaceae. 7, widespread. See Kotlaba & Pouzar (*Reprium nov. Spec. Regni. veg.* **69**: 138, 1964).

Parmathyrites K.P. Jain & R.C. Gupta (1970), Fossil Fungi, Microthyriaceae. 2 (Tertiary), India.

Parmelaria D.D. Awasthi (1987), Parmeliaceae (L). 2, Himalaya. See Blanco *et al.* (*Mycol.* **97**: 150, 2005; phylogeny), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny).

Parmelia Ach. (1803) nom. cons., Parmeliaceae (L). 1322 s.lat.; s.str. 95, widespread (esp. temperate). This genus has been segregated into many smaller genera, not all of which are of value. See also *Lit.* under segregate names, esp. *Bulbothrix*, *Flavoparmelia*, *Hypotrachyna*, *Melanelia*, *Parmelina*, *Parmotrema*, *Pseudoparmelia*, *Punctelia*, *Relicina* and *Xanthoparmelia*. See Krog (*J. Hattori bot. Lab.* **52**: 303, 1982; conidia, gen. concepts), Galloway & Elix (*N.Z. Jl Bot.* **21**: 397, 1983), Hale (*Smithson. Contr. bot.* **66**, 1987; monogr. s. str., key), Eriksson & Hawksworth (*SA* **8**: 72, 1989; typification), Adler (*Mycotaxon* **38**: 331, 1990; key to segregates), Elix (*Bryologist* **96**: 359, 1993), Eriksson & Hawksworth (*SA* **13**: 146, 1994; concept), Hawksworth *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269**: 383, 1994; gen. concepts), Kurokawa (*J. Jap. Bot.* **69**: 121, 1994; Japan spp.), Kurokawa (*J. Jap. Bot.* **69**: 204, 1994; Japan spp.), Kurokawa (*J. Jap. Bot.* **69**: 61, 1994; Japan spp.), Crespo *et al.* (*Lichenologist* **29**: 275, 1997; DNA), Crespo & Cubero (*Lichenologist* **30**: 369, 1998; segregate genera), Crespo *et al.* (*Pl. Syst. Evol.* **217**: 177, 1999; genetics, recolonization), Hale & DePriest (*Bryologist* **102**: 462, 1999; checklist parmelioid species), Wedin *et al.* (*MR* **103**: 1152, 1999; phylogeny), Smith & Hyde (*Fungal Diversity* **7**: 89, 2001; mtDNA phylogeny), Adler & Calvelo (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **30-32**: 9, 2002; S America), Crespo *et al.* (*MR* **106**: 788, 2002; phylogeny, *P. saxatilis*), Thell *et al.* (*Mycol. Progr.* **1**: 335, 2002; phylogeny), Molina *et al.* (*Lichenologist* **36**: 37, 2004; phylogeny), Thell *et al.* (*Mycol. Progr.* **3**: 297, 2004; phylogeny), Thell *et al.* (*Symb. bot. upsal.* **34** no. 1: 429, 2004; Scandinavia), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Honegger & Zippler (*MR* **111**: 424, 2007; mating systems).

Parmeliaceae Zenker (1827), Lecanorales (L). 88 gen. (+ 38 syn.), 2489 spp.

Lit.: Beltman (*Biblthca Lichenol.* **11**, 1978; thallus str.), Awasthi (*J. Hattori bot. Lab.* **65**: 207, 1989), Adler (*Mycotaxon* **38**: 331, 1990; key gen. *Parmelia* s.l.), Grgurinovic (Ed.) Evol.* **40**: 448, 2006; phylogeny, synonymy).

Parmeliomyces E.A. Thomas ex Cif. & Tomas. (1953) = Parmelina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parmeliopsis (Nyl. ex Stizenb.) Nyl. (1866) nom. cons., Parmeliaceae (L). 8, widespread (north temperate). See Meyer (*Mycol.* **74**: 592, 1982), Hinds (*Mycotaxon* **72**: 271, 1999; N. Am.), Crespo *et al.* (*Taxon* **50**: 807, 2001; mtDNA phylogeny), Tehler & Källersjö (*Lichenologist* **33**: 403, 2001), Thell *et al.* (*Symb. bot. upsal.* **34** no. 1: 429, 2004; Scandinavia), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny).

Parmentaria Fée (1824) = Pyrenula Ach. (1809) fide Upreti & Singh (*Candollea* **43**: 109, 1988; key 11 spp. India), Harris (*Mem. N. Y. bot. Gdn* **49**, 1989).

Parmentariomyces Cif. & Tomas. (1953) ≡ Parmentaria.

Parmentieria Trevis. (1860) ≡ Parmentaria.

Parmocarpus Trevis. (1861) = Xanthoria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parmophora M. Choisy (1950) = Umbilicaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parmosticta Nyl. (1875) ≡ Crocodia.

Parmostictina Nyl. (1875) nom. rej. = Pseudocyphellaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parmotrema A. Massal. (1860), Parmeliaceae (L). *c.* 348, widespread (esp. tropical). See Hale (*Contr. US natn Herb.* **36**: 193, 1965), Krog & Swinscow (*Bull. Br. Mus. nat. hist.* Bot. **9**: 143, 1981), Krog & Swinscow (*Lichenologist* **15**: 127, 1983), Louwhoff & Elix (*Biblthca Lichenol.* **73**, 1999; New Guinea), Louwhoff & Crisp (*Bryologist* **103**: 541, 2000), Kurokawa & Lai (*Mycotaxon* **77**: 225, 2001; Taiwan), Louwhoff (*Biblthca Lichenol.* **78**: 223, 2001; biogeography), Eliasaro & Donha (*Revista Brasileira de Botânica* **26**: 239, 2003; Brazil), Blanco *et al.* (*Mycol.* **97**: 150, 2005; phylogeny), Divakar *et al.* (*Lichenologist* **37**: 55, 2005; phylogeny), Egan *et al.* (*Bryologist* **108**: 402, 2005; Americas), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Ohmura *et al.* (*Bryologist* **109**: 43, 2006; genetics).

Parmotremopsis Elix & Hale (1987), Parmeliaceae (L). 2, C. America; West Indies. See Elix & Hale (*Mycotaxon* **29**: 243, 1987), Louwhoff & Crisp (*Bryologist* **103**: 541, 2000; phylogeny, ? synonymy with *Parmotrema*).

Parmularia Lév. (1846), Parmulariaceae. 2, S. America. See Batista & Vital (*Atas Inst. Micol. Univ. Recife* **1**: 159, 1960), Inácio & Cannon (*MR* **107**: 82, 2003).

Parmularia Nilson (1907) = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Ryan & Nash (*Nova Hedwigia* **64**: 111, 1997).

Parmulariaceae E. Müll. & Arx ex M.E. Barr (1979), ? Dothideomycetes (inc. sed.). 34 gen. (+ 24 syn.), 119 spp.

Lit.: Stevens & Ryan (*Ill. biol. monogr.* **17** no. 2: 1, 1939), Doidge (*Bothalia* **4**: 273, 1942; S. Afr.), von Arx & Müller (*Stud. Mycol.* **9**, 1975; connexion), Butin & Marmolejo (*Revta Mex. Micol.* **4**: 9, 1988), Vasil'eva (*Mikol. Fitopatol.* **22**: 388, 1988), Zhuang (*Mycotaxon* **32**: 85, 1988), Sivanesan & Sinha (*MR* **92**: 246, 1989), Inácio (*A monograph of the* Parmulariaceae [Thesis (PhD), University of London]: 417 pp., 2003), Inácio & Cannon (*MR* **107**: 82, 2003).

Parmulariella Henn. (1904), Dothideomycetes. 1, S. America.

Parmulariopsella Sivan. (1970), Parmulariaceae. 1, Sierra Leone. See Sivanesan (*TBMS* **55**: 509, 1970).

Parmulariopsis Petr. (1954), Parmulariaceae. 1, Borneo. See Petrak (*Sydowia* **8**: 186, 1954).

parmuliform, shield-shaped with the margins slightly upturned.

Parmulina Theiss. & Syd. (1914), Parmulariaceae. 5, Asia; America.

Parodiella Speg. (1880), Parodiellaceae. Anamorph *Ascochytopsis*. 1 (on *Leguminosae*), widespread. See Sydow & Petrak (*Annls mycol.* **29**: 190, 1931), von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Parodiellaceae Theiss. & Syd. ex M.E. Barr (1987), Pleosporales. 2 gen. (+ 3 syn.), 5 spp.

Lit.: Cannon (*IMI Descr. Fungi Bact.* **141**: [22] pp.,

1999).

Parodiellina Henn. ex G. Arnaud (1918), Parodiopsidaceae. Anamorph *Exosporinella*. 1, widespread (tropical).

Parodiellina Viégas (1944) = Botryostroma fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Parodiellinaceae G. Arnaud (1918) = Parodiopsidaceae.

Parodiellinopsis Hansf. (1946) ? = Chevalieropsis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Parodiodia Bat. (1960) = Apiosporina Höhn. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Parodiopsidaceae Toro (1952), ? Dothideomycetes (inc. sed.). 20 gen. (+ 32 syn.), 94 spp.

Lit.: Sivanesan (*Mycol. Pap.* **146**: 38 pp., 1981), von Arx & Müller (*Sydowia* **37**: 6, 1984), Farr (*Sydowia* **38**: 65, 1985), Hughes (*Mycol. Pap.* **166**: 255 pp., 1993), Rodríguez Hernández (*Revta Jardín bot. Nac.* Univ. Habana **21**: 127, 2000).

Parodiopsis Maubl. (1915) = Perisporiopsis Henn. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Paropodia Cif. & Bat. (1956) = Triposporiopsis fide Hughes (*Mycol.* **68**: 693, 1976).

Paropsis Speg. (1918) = Treubiomyces fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Parorbiliopsis Spooner & Dennis (1986), Helotiaceae. *c.* 5, Europe. See Svrček (*Česká Mykol.* **45**: 134, 1992), Svrček (*Česká Mykol.* **46**: 149, 1993).

parsimonious (parsimony), see Cladistics.

part spore, one of the 1-celled spores resulting from the breaking up of a 2 or more celled ascospore.

parthenogamy, the state of an oospore formed with a diploid nucleus resulting from restitution at telophase I or telophase II of meiosis (note that the parthenogametic state cannot be presumed from the absence of an antheridium).

parthenogenesis, the apomitic development of haploid cells (Gäumann).

parthenomixis, see parthenogamy.

Parthenope Velen. (1934), ? Helotiales. 1, former Czechoslovakia.

parthenospore, an oospore (aboospore) or zygospore (azygospore) produced by parthenogenesis.

partial veil (or **inner veil**) (of agarics), a layer of tissue, developed from the stipe, which joins the stipe to the pileus edge during hymenium development, and which later may become an annulus or cortina; = velum (Persoon).

partridge wood (1) wood attacked by a pocket rot, e.g. one caused by *Stereum frustulatum*; [(2) wood of *Caesalpinia*].

Paruephaedria Zukal (1891) = Dactylospora fide Döbbeler & Triebel (*Bot. Jahrb. Syst.* **107**: 503, 1985).

Parvacoccum R.S. Hunt & A. Funk (1988), Rhytismataceae. 1, Canada. See Hunt & Funk (*Mycotaxon* **33**: 51, 1988).

Parvobasidium Jülich (1975), Cystostereaceae. 3, widespread. See Jülich (*Persoonia* **8**: 302, 1975).

Parvodontia Hjortstam & Ryvarden (2004), ? Cystostereaceae. 1, Brazil. See Hjortstam & Ryvarden (*Syn. Fung.* **18**: 28, 2004).

Parvomyces Santam. (1995), Laboulbeniaceae. 1, Spain. See Santamaría (*MR* **99**: 1071, 1995).

Parvosympodium A.W. Ramaley (2002), anamorphic *Pezizomycotina*, H?.?.?. 1, USA. Synanamorph *Stomiopeltopsis*. See Ramaley (*Mycotaxon* **83**: 329, 2002).

Parvulago R. Bauer, M. Lutz, Piątek, Vánky & Oberw. (2007), Ustilaginaceae. 1 (on *Eleocharis* (*Cyperaceae*)), Europe (southern). See Bauer *et al.* (*MR* **111**: 1199, 2007).

Paryphydria, see *Paruephaedria*.

Pasania fungus, the edible *Cortinellus shiitake*. See shiitake.

Paschelkiella Sherwood (1987), Odontotremataceae. 1, Europe; N. America. See Sherwood-Pike (*Mycotaxon* **28**: 137, 1987).

Pascherinema De Toni (1936) nom. dub., anamorphic *Pezizomycotina*.

Pasithoe M.J. Decne. (1840) ≡ Paulia Fée.

paspalitrem, a tremorgenic mycotoxin from *Phomopsis* sp. (Bills *et al.*, *MR* **96**: 977, 1992).

Paspalomyces Linder (1933), anamorphic *Pezizomycotina*, Hso.1eP.10. 1, USA.

paspalum staggers, see ergot.

passage, the experimental infection of a host with a parasite which is subsequently re-isolated; [a method used to increase the virulence of the parasite].

Passalora Fr. (1849), anamorphic *Mycosphaerella*, Hso.1-≡ eP.10. 581, Europe; N. America. *P. graminis* (leaf spot of cerials and grasses). See Deighton (*Mycol. Pap.* **112**, 1967; key), Medeiros & Dianese (*Mycotaxon* **51**: 509, 1994; key), Braun (*Schlechtendalia* **2**: 1, 1999), Braun (*Cryptog. Passerinula Sacc. (1875), Pleosporales. 1 or 2 (on stromata of other fungi), Europe. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Pasteur (Louis; 1822-1895; France). Born in Dole, Jura; student, École Normale Supérieure, Paris; Professor of Physics, Dijon Lycée (1848); Professor of Chemistry, Stassbourg University (1849); Dean, Faculty of Sciences, University of Lille (1854); Director of Scientific Studies, École Normale Supérieure, Paris (1855). The work of this noted scientist, who was by training a chemist, has strongly affected biological thought and work. Among Pasteur's early investigations was a study of the isomeric forms of tartaric acid from which he discovered that only one of the two forms (the *d*-) in a racemic (*dl*-) mixture was used by '*Penicillium glaucum*'. This gave him an interest in fermenting processes and from 1854 onwards he made detailed studies on wine and beer making. One important outcome of this work was demonstration by experiment of the general principle

'omne vivum e vivo' (every living thing from a living thing). In 1865-1869, as a result of an investigation suggested by the chemist Dumas, he made clear the nature of the 'pébrine' and 'flacherie' diseases of silkworms and methods for their control. Pasteur's most important work was a development from Jenner's vaccination against small-pox (1796). His studies on chicken cholera (*Pasteurella aviseptica*), anthrax (*Bacillus anthracis*), and rabies in dogs and man made it clear that active immunization of man and animals against pathogenic organisms and viruses could be a generally applicable method. In 1888 the Institut Pasteur opened in Paris for development of his discoveries. *Publs*. Note relative au *Penicillium glaucum* et à la dissymétrie moléculaire des produit organiques naturelles. *Comptes Rendus Hebdomadaire des Séances de l'Académie des Sciences, Paris* (1860); *Études sur le Vin* (1866); *Études sur le Vinaigre* (1868); *Études sur la Maladie des Vers à Soie* (1870); *Études sur la Bière* (1876). *Biogs, obits etc*. Debré & Forster (*Louis Pasteur*, 1998); Dubos (*Louis Pasteur*,., 1951); Tiner (*Louis Pasteur, Founder of Modern Medicine*, 1990); Valléry-Radot (*Vie de Pasteur*, 1900) [English translation Devonshire, 1911].

Pasteur effect, Increased respiration and decreased fermentation in the presence of oxygen and vice versa in the absence of oxygen; **- filter**, an unglazed porcelain tube for sterilization by filtration; **- pipette**, a short length of glass tubing with one end drawn out into a sealed capillary and the other plugged with cotton wool and sterilized, the tip of the capillary is broken before use; **pasteurization**, freeing a liquid or other material from pathogenic microorganisms by heat.

Patella F.H. Wigg. (1780) nom. rej. ≡ Scutellinia fide Korf (*Taxon* **35**: 378, 1986).

Patellaria Fr. (1822), Patellariaceae. *c*. 10, widespread (esp. temperate). See Butler (*Mycol*. **331**: 612, 1939), Tilak & Srinivasulu (*Beih. Nova Hedwigia* **47**: 459, 1974; Indian spp.), Bellemère *et al*. (*Cryptog. Mycol*. **7**: 47, 1986; asci), Hawksworth (*Taxon* **35**: 787, 1986; nomencl.), Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Patellaria Hoffm. (1789) = Diploschistes fide Santesson *in* Eriksson (*Op. Bot*. **60**, 1981).

Patellaria Pers. (1794) = Caloplaca fide Riedl (*Taxon* **27**: 302, 1978).

Patellariaceae Corda (1838), Patellariales. 15 gen. (+ 7 syn.), 38 spp.

Lit.: Bellemère (*Annls Sci. Nat*. Bot., sér. 12 **12**: 429, 1971; ultrastr.), Kamat *et al*. *in* Subramanian (Ed.) (*Taxonomy of fungi*, 1978; ascocarp structure), Bellemère *et al*. (*Cryptog. Mycol*. **7**: 113, 1986), Kutorga & Hawksworth (*SA* **15**: 1, 1997), Magnes *et al*. (*Mycotaxon* **68**: 321, 1998), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999; DNA), Liew *et al*. (*Mol. Phylogen. Evol*. **16**: 392, 2000).

Patellariales D. Hawksw. & O.E. Erikss. (1986), (±L). Dothideomycetes. 1 fam., 15 gen., 38 spp. Thallus crustose or immersed within the host tissues, or absent. Stromata absent or weakly developed, composed of intramatrical hyphae. Ascomata erumpent, eventually apothecial, sometimes strongly cupulate, sometimes elongated, the margin well-developed, frequently inrolled when dry. Interascal tissue of narrow anastomosing pseudoparaphyses, initially attached at apex and base but eventually becoming free at the apex. Asci cylindrical, fissitunicate, J-, often with a well-developed ocular chamber. Ascospores hyaline or brown, transversely septate or muriform, usually without a sheath. Anamorphs coelomycetous where known. Saprobes on bark or wood or lichenized with green algae, a few lichenicolous, cosmop. Fam.:

Patellariaceae (syn. *Lecanidiaceae*)

Lit.: Bellemère (*Ann. Sci. nat., Bot*. sér. 12 **12**: 429, 1971; asci), Honegger (*Ber. dtsch. bot. Ges*. **91**: 579, 1978, *Lichenologist* **12**: 157, 1980; asci), Kamat (*in* Subramanian (Ed.), *Taxonomy of fungi* **1**: 292, 1978; ontogeny), Pirozynski & Reid (*CJB* **44**: 655, 1966).

Patellariopsis Dennis (1964), Helotiales. 5, Europe; Australia. See Dennis (*Kew Bull*. **19**: 114, 1964), Nauta & Spooner (*Mycologist* **14**: 65, 2000; UK).

Patellea (Fr.) Sacc. (1884) = Xylogramma fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal*., 1932).

patelliform, like a round plate having a well-marked edge.

Patellina Grove ex Petch (1943) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap*. **141**, 1977).

Patellina Speg. (1880) = Catinula fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **124**: 49, 1915).

Patellonectria Speg. (1919) = Aspidothelium fide Santesson (*Symb. bot. upsal*. **12** no. 1: 1, 1952).

patent, stretching out; spreading.

Patent protection. The principle under which an 'inventor' of a new product or process by publicly disclosing details of his/her 'invention' is granted for a limited period a legally enforceable right to exclude others from exploiting the invention. Procedures, requirements and rights vary considerably in different countries. In general, it is possible to patent discoveries (and under certain circumstances organisms, including fungi) which are novel, show evidence of an inventive step, and are of utility (industrial applicability). The procedure for taking out a patent is complex and professional advice should be sought. It is recommended that the patent disclosure procedure should include the depositing in a genetic resource collection of a culture any fungus or other organism which forms part of the 'invention'. The Budapest Treaty allows for a single deposit in a recognized International Depository Authority (IDA), removing the need for deposits to be made in all countries where patent protection is sought. For fungi, recognized depositories include the American Type Culture Collection (www.atcc.org), Centralbureau voor Schimmelcultures (www.cbs.knaw.nl) and IMI (q.v.).

The Convention on Biological Diversity (1992) also has implications for the patenting of genetic material from nature (Fritze, 1994).

Peckia Clinton (1878) [non *Peckia* Vell. 1825, *Myrsinaceae*] ≡ Drudeola.
Peckiella (Sacc.) Sacc. (1891) = Hypomyces fide Rogerson & Samuels (*Mycol.* **81**: 413, 1, 1989), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).
Peckifungus Kuntze (1891) ≡ Appendiculina.
Peckiomyces Sacc. & Trotter (1913) nom. nud., Fungi. See Welch (*Mycol.* **18**: 82, 1926).
pecky cypress, decay of *Taxodium distichum* by *Stereum taxodii* (Davidson *et al.*, *Mycol.* **52**: 260, 1961).
pectic enzymes, components of the macerating enzymes of a number of fungal parasites; two types distinguished by Wood (*Physiological plant pathology*, 1967: 138; q.v. for details) are **pectinesterases** (syn. pectinmethylesterases), specific enzymes which saponify methyl ester groups of pectinic acid; and **polygalacturonases**, which break polygalacturonide chains by hydrolysis at the glycosidic linkages.
pectinate, like the teeth of a comb.
pectinate hyphae, comb-like hyphae of e.g. *Microsporum audouinii*.
Pectinotrichum Varsavsky & G.F. Orr (1971), Onygenaceae. Anamorph *Chrysosporium*. 1, Venezuela. See Sugiyama *et al.* (*Mycoscience* **40**: 251, 1999; DNA), Sugiyama & Mikawa (*Mycoscience* **42**: 413, 2001; phylogeny).
Pediascus Chardón & Toro (1934) = Vestergrenia Rehm fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
pedicel, a small stalk.
pedicellate, having a pedicel.
Pedilospora Höhn. (1902) = Dicranidion fide Hughes (*CJB* **31**: 607, 1953).
pedogamy, pseudomixis between mature and immature cells, e.g. copulation between a yeast mother cell and its bud.
pedogenesis (1) reproduction in young or immature organisms; (2) soil formation (see Weathering).
Pedumispora K.D. Hyde & E.B.G. Jones (1992), Diaporthales. 1 (on *Rhizophora*), Seychelles. See Hyde & Jones (*MR* **96**: 78, 1992).
Peethambara Subram. & Bhat (1978), Hypocreales. Anamorph *Didymostilbe*. 1 (from decaying wood), widespread (pantropical). See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).
Peethasthabeeja P. Rag. Rao (1981), anamorphic *Pezizomycotina*, Hso.0eP.10. 1, India. See Rao (*Indian J. Bot.* **4**: 132, 1981).
peg, see hyphal peg.
Peglerochaete Sarwal & Locq. (1983), Tricholomataceae. 1, Sikkim. See Sarwal & Locquin (*Compt. Rend. Congr. Natl. Soc. Savantes* Sec. Sci., 1983: 193, 1983).
Pegleromyces Singer (1981), Tricholomataceae. 1, Brazil. See Singer (*Mycol.* **73**: 500, 1981).
Peglionia Goid. (1937) = Gyrothrix fide Hughes & Pirozynski (*N.Z. Jl Bot.* **9**: 39, 1971).
Pegmatheca E.I. Hazard & Oldacre (1975), Microsporidia. 2.
peitschengeissel (obsol.) unornamented flagellum.
Pekilo, protein from *Paecilomyces* sp. used in animal feeds.
Pelicothallos Dilcher (1965), Fossil Fungi, Microthyriaceae. 1 (Eocene), USA. See Pirozynski (*Ann. Rev. Phytopath.* **14**: 237, 1976), Sherwood-Pike (*Lichenologist* **17**: 114, 1985).
pellet, a three dimensional colony in a liquid culture (particularly a shaken culture).
pellicle (1) outermost living layer lying below any nonliving secreted material, containing plasma membrane plus underlying epiplasm or other membranes and may show ridges, folds or distinct crests; (2) a growth on the surface of a liquid culture; (3) (of agaric basidiomata), a detachable, skin-like cuticle of the pileus.
pellicular veil, a very thin partial veil of a sporophore not having a stipe (Singer, 1962). Cf. cortina.
Pellicularia Cooke (1876) = Ceratobasidium fide Roberts (*Rhizoctonia-forming fungi*, 1999).
pelliculose, like a thin crust, as is the hymenial layer in *Thelephoraceae*.
Pellidiscus Donk (1959), Inocybaceae. 3, Europe. See Donk (*Persoonia* **1**: 89, 1959), Hjortstam (*Windahlia* **15**: 59, 1985).
Pellionella (Sacc.) Petch (1924) nom. inval., anamorphic *Pezizomycotina*. Cited in *ING* (1979) but Petch (*Ann. R. bot. Gdn Peradeniya* **8**: 170, 1924) did not make the transfer.
Pellionella Sacc. (1902), anamorphic *Pezizomycotina*, St.1eP.1. 1, Java.
pellis, the cellular cortical layers, not belonging to the veils, of a basidioma (Bas, *Persoonia* **5**: 327, 1969); cuticle. Bas distinguished different layers of the pellis as **supra-**, **medio-**, and **sub-**, and different topographies of the pellis as **pilei-**, etc.
Pelloporus Quél. (1886) ≡ Coltricia.
Pellucida Dulym., Sivan., P.F. Cannon & Peerally (2001), Hyponectriaceae. 1, Mauritius. See Dulyma-

mode *et al.* (*MR* **105**: 247, 2001).

pellucid-striate (of a pileus), having a somewhat transparent top so that the gills are seen through it as rays.

Pelodiscus Clem. (1901) nom. dub., ? Fungi. See Seaver (*North American Cup Fungi* (Operculates), 1928; synonym of *Patella*), Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Peloronectria Möller (1901) nom. dub., ? Hypocreales. 1 or 2, S. America. Type material is lost. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Peloronectriella Yoshim. Doi (1968) = Nectriopsis fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

peloton, see mycorrhiza.

Peltaster Syd. & P. Syd. (1917), anamorphic *Dothideomycetes*, Cpt.0eH.?. 6, Philippines; S. America. See Johnson *et al.* (*Mycol.* **88**: 114, 1996), Williamson & Sutton (*Pl. Dis.* **84**: 714, 2000; pathology), Williamson *et al.* (*Mycol.* **96**: 885, 2004), Batzer *et al.* (*Mycol.* **97**: 1268, 2005; phylogeny).

Peltasterales (obsol.). Anamorphic fungi with superficial shield-like conidiomata; anamorphs of *Microthyriaceae*. Batista & Ciferri (*Mycopath.* **11**: 6, 1959; 6 fam., keys, host index), Batista & Ciferri (*Atti Ist. bot. Univ. Pavia* ser. 5 **16**: 86, 1959).

Peltasterella Bat. & H. Maia (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 6, widespread (tropical). See Batista & Maia (*Mycopath. Mycol. appl.* **11**: 37, 1959).

Peltasterinostroma Punith. (1975), anamorphic *Pezizomycotina*, Cpt.0eH.15. 1, British Isles. See Punithalingam (*TBMS* **64**: 541, 1975).

Peltasteropsis Bat. & H. Maia (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 7, widespread (tropical). See Batista & Maia (*Mycopath. Mycol. appl.* **11**: 29, 1959).

peltate, in the form of a round plate with a stalk from the centre of the underside (Fig. 23.29).

Peltella Syd. & P. Syd. (1917) = Muyocopron fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Peltidea Ach. (1803) = Peltigera fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Peltideaceae Körb. (1846) = Peltigeraceae.

Peltideomyces E.A. Thomas (1939) nom. inval. = Peltigera fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Peltidium Kalchbr. (1862) [non *Peltidium* Zollik. 1820, *Compositae*] ≡ Pachyella.

Peltigera Willd. (1787) nom. cons., Peltigeraceae (L). *c.* 91, widespread. See Thomson (*Am. midl. Nat.* **44**: 1, 1950), Kurokawa *et al.* (*Bull. natn. Sci. Mus. Tokyo*, B **9**: 101, 1966), Chen (*Acta Mycol. Sin.* **5**: 18, 1986; key 28 spp., China), Holtan-Hartwig (*Sommerfeltia* **15**, 1993; key 17 spp. Norway), Vitikainen (*Acta Bot. Fenn.* **152**: 1, 1994; key 29 spp. Eur.), Eriksson & Strand (*SA* **14**: 33, 1995; DNA), Goward *et al.* (*CJB* **73**: 91, 1995; key 28 N. Am. spp.), Martínez & Burgaz (*Ann. bot. fenn.* **33**: 223, 1996; anatomy), Goffinet & Bayer (*Fungal Genetics Biol.* **21**: 228, 1997; DNA, species pairs), Martínez & Burgaz (*Clementeana* **3**: 29, 1997; key), Martínez Moreno (*Ruizia* **15**, 1999; Iberian spp.), Miądlikowska & Lutzoni (*Int. J. Pl. Sci.* **161**: 925, 2000; phylogeny), Vitikainen (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **30-32**: 297, 2002; S America, Antarctica), Goffinet *et al.* (*Bryologist* **106**: 349, 2003; phylogeny, morphospecies), Martínez *et al.* (*Lichenologist* **35**: 301, 2003; biogeography), Miądlikowska *et al.* (*Mycol.* **95**: 1181, 2003; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Peltigeraceae Dumort. (1822), Peltigerales (L). 2 gen. (+ 15 syn.), 101 spp.

Lit.: Hawksworth (*J. Linn. Soc.* Bot. **96**: 3, 1988), Galloway (*Symbiosis* **11**: 327, 1991), Czeczuga & Upreti (*Bull. bot. Surv. India* **32**: 80, 1990), Holtan-Hartwig (*Sommerfeltia* **15**: 1, 1993), Smith & Øvstedal (*Lichenologist* **26**: 209, 1994), Vitikainen (*Acta Bot. Sci.* **161**: 925, 2000), Miądlikowska *et al.* (*Mycol.* **95**: 1181, 2003), Wiklund & Wedin (*Cladistics* **19**: 419, 2003), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny), Vitikainen (*Nordic Lichen Flora* **3**: Cyanolichens: 113, 2007).

Peltigerales Walt. Watson (1929), (L). Lecanoromycetidae. 8 fam., 50 gen., 1208 spp. Thallus usually foliose, occ. crustose, fruticose or squamulose, corticate on the upper or both surfaces, the lower surface sometimes characteristically areolate. Ascomata apothecial, initially immersed, usually with a covering layer which splits to expose the hymenium at a late stage. Interascal tissue of simple paraphyses. Asci usually with a thickened apex (usually not capitate), a J+ apical ring, a well-developed ocular chamber and a J+ gelatinized outer coat. Ascospores hyaline or brown, often elongated, often multiseptate. Anamorphs pycnidial. Lichenized with green algae or cyanobacteria, if the former then often with cyanobacteria in cephalodia, widespr. esp. temp. Fams:

(1) **Coccocarpiaceae**
(2) **Collemataceae**
(3) **Lobariaceae** (syn. *Stictaceae*)
(4) **Massalongiaceae**
(5) **Nephromataceae**
(6) **Pannariaceae**
(7) **Peltigeraceae** (syn. *Solorinaceae*)
(8) **Placynthiaceae** (syn. *Lecotheciaceae*)

Two suborders have been recognized based on molecular data, the *Peltigerineae* (containing *Lobariaceae*, *Massalongiaceae*, *Nephromataceae* and *Peltigeraceae*) and *Collematineae* which contains the other 4 fams.

Lit.: Galloway (*Symbiosis* **11**: 327, 1991; chemical evol.), Hawksworth (*J. Hattori bot. Lab.* **52**: 323, 1982; evolutionary significance), Hofstetter *et al.* (*Mol. Phylogenet. Evol.* **44**: 412, 2007), Honegger (*Lichenologist* **10**: 47, 1978; asci), Letrouit-Galinou & Lallement (*Lichenologist* **5**: 59, 1971; asci, ontogeny), Matsubara *et al.* (*Bryologist* **102**: 196, 1999; chemistry), Miądlikowska & Lutzoni (*Am. Peltigeromyces Möller (1901), Helotiales. 3, Africa. See Le Gal (*Bull. Jard. Bot. État* **29**: 73, 1959).

Peltigeromyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Peltigera.

Peltigeropsis V. Marcano & A. Morales (1994) nom. inval., Peltigerales (L). 1, Europe. See Marcano *et al.* (*Libro de Resúmenes, Sesiones Técnicas, VI Congreso Latinoamericano de Botánica* Mar del Plata,

Argentina, 2 al 8 de Octubre de 1994: 192, 1994), Eriksson & Hawksworth (*SA* **15**: 139, 1997).

Peltiphylla M. Choisy (1950) = Psora Hoffm. (1796) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Peltistroma Henn. (1904), anamorphic *Pezizomycotina*, Cpt.0eP.?. 1, Brazil.

Peltistromella Höhn. (1907), anamorphic *Pezizomycotina*, Cpt.≡ eP.?. 2, Brazil; Sri Lanka.

Peltophora Clem. (1909) ≡ Peltigera.

Peltophoromyces Clem. (1909) ≡ Peltigeromyces A. Møller.

Peltopsis Bat. (1960) = Muyocopron fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Peltosoma Syd. (1925), anamorphic *Pezizomycotina*, Cpt.≡ eP.?1. 1, Philippines. See Sutton & Pascoe (*MR* **92**: 210, 1989; re-evaluation).

Peltosphaeria Berl. (1888) = Julella fide Mayrhofer (*Biblthca Lichenol.* **26**, 1987).

Peltostromellina Bat. & A.F. Vital (1959), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Sri Lanka. See Batista & Vital (*Revista Soc. Brazil agron.* **13**: 79, 1959).

Peltostromopsis Bat. & A.F. Vital (1959), anamorphic *Pezizomycotina*, Cpt.1eP.?. 1, Sri Lanka. See Batista & Vital (*Revista Soc. Brazil agron.* **13**: 77, 1959).

Peltula Nyl. (1853), Peltulaceae (L). 31, widespread (esp. temperate). See Wetmore (*Ann. Mo. Bot. Gdn* **57**: 158, 1970; N. Am.), Swinscow & Krog (*Norw. Jl Bot.* **26**: 213, 1979; key 10 E. Afr. spp.), Büdel & Henssen (*Int. J. Mycol. Lichenol.* **2**: 235, 1986), Filson (*Muelleria* **6**: 495, 1988; 10 Australian spp.), Egea (*Biblthca Lichenol.* **31**, 1989; W. Eur. & N. Afr.), Büdel & Elix (*Biblthca Lichenol.* **67**: 3, 1997), Schultz *et al.* (*Pl. Biol.* **3**: 116, 2001), Büdel & Schultz (*Biblthca Lichenol.* **86**: 225, 2003; drought resistance), Schultz & Büdel (*Lichenologist* **35**: 151, 2003), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Peltulaceae Büdel (1986), Lichinales (L). 3 gen., 35 spp.

Lit.: Büdel (*Biblthca Lichenol.* **25**: 209, 1987; ontogeny), Filson (*Muelleria* **6**: 495, 1988), Büdel (*Biblthca Lichenol.* **38**: 47, 1990), Upreti & Büdel (*J. Hattori bot. Lab.* **68**: 279, 1990), Büdel (*Mycotaxon* **54**: 137, 1995), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004), Jørgensen (*Nordic Lichen Flora* **3**: Cyanolichens: 132, 2007).

Peltularia R. Sant. (1944), Coccocarpiaceae (L). 2, S. America; Australia. See Jørgensen & Galloway (*Lichenologist* **16**: 189, 1984), Henssen & Jørgensen (*Biblthca Lichenol.* **78**: 85, 2001; S America).

Pemphidium Mont. (1840), Xylariales. 6 (monocots), S. America (tropical). See Petrak (*Sydowia* **7**: 354, 1953), Hyde (*Sydowia* **45**: 204, 1993; posn), Hyde (*Sydowia* **48**: 122, 1996).

Penardia Cash (1904), Cercozoa. q.v.

penatin (corylophillin, notatin, penicillin B), an antibiotic from *Penicillium notatum* and *P. chrysogenum*; antibacterial (Kocholary, *J. Bact.* **44**: 143, 1942).

pendant (1) (of a fruticose lichen), one hanging downwards; (2) (in an ascus) see ascus.

Pendulispora M.B. Ellis (1961), anamorphic *Tubeufia*, Hso.#eP.10. 1, Venezuela. See Ellis (*Mycol. Pap.* **82**: 41, 1961).

penicidin, see patulin.

Penicillaria Chevall. (1826) [non *Penicillaria* Willd. 1809, *Gramineae*] = Pterula fide Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**, 1950).

penicillate, like a little brush.

penicillic acid, a tetronic acid from *Penicillium puberulum*, *P. cyclopium*, etc. and antibacterial (Birkinshaw *et al.*, *Biochem. J.* **30**: 394, 1936).

Penicillifer Emden (1968), anamorphic *Viridispora*, Hso.≡ eP.32/33. 7, widespread. See Samuels (*Mycol.* **81**: 347, 1989; key), Polishook *et al.* (*Mycol.* **83**: 797, 1991).

penicillin, one of a group of antibiotic substances (q.v.) produced by *Penicillium chrysogenum* (syn. *P. notatum*), active against Gram+ bacteria and of low toxicity to humans. Discovered by Fleming (*Br. J. exp. Path.* **10**: 226, 1929). See Hare (*The birth of penicillin*, 1970), *Penicillin 1929-43* [*Br. med. Bull.* **2**, 1944], Fleming (Ed.) (*Penicillin; its practical application*, 1946), Waksman (*Microbial antagonisms and anti-bacterial substances*, edn 2, 1947), Knox (*Nature* **192**: 492, 1961; survey of new penicillins).

penicillin B, **B**, see penatin; **F**, see flavicin; **dihydro-F**, see gigantic acid; **N**, see cephalosporin N. See Knox (1961) under penicillin.

penicillinase, a bacterial enzyme which inhibits the action of penicillin.

Penicilliopsis Solms (1887), Trichocomaceae. Anamorphs *Stilbodendron*, *Sarophorum*, *Pseudocordyceps*. 3, widespread (tropical). See Udagawa & Takada (*Bull. natn. Sci. Mus.* Tokyo, B **14**: 501, 1971), Samson & Seifert *in* Samson & Pitt (Eds) (*Advances in Penicillium and Aspergillus systematics* **102**: 397, 1985), Kuraishi *et al.* (*MR* **95**: 705, 1991; ubiquinones), Pitt *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 9, 2000; nomenclator), Hsieh & Ju (*Mycol.* **94**: 539, 2002).

Penicillites Mesch. (1892), Fossil Fungi. 1 (Oligocene), Europe.

Penicillium Fr. (1832) ? = Botrytis fide Hawksworth *et al.* (*Taxon* **25**: 665, 1976).

Penicillium Link (1809), anamorphic *Eupenicillium*, *Talaromyces*, Hso.0eP.15. 304, widespread. Common moulds, many first named on cultural, biochemical, or pathogenic characters. See Fig. 30. *P. expansum* (blue mould of apples), *P. digitatum* and *P. italicum* (green and blue moulds of citrus fruits), *P. gladioli* (storage rot of *Gladiolus*). See Pitt (*CJB* **52**: 2231, 1974; sclerotial spp.), Pitt (*The genus Penicillium and its teleomorphic states Eupenicillium and Talaromyces*, 1979; revision), Frisvad & Filtenborg (*Appl. Environm. Microbiol.* **46**: 1301, 1983; secondary metabolites and classification), Frisvad (*Toxigenic Fungi: their toxins and health hazard*: 98, 1984; chemistry and taxonomy), Pitt (*Toxigenic Fungi: their toxins and health hazard*: 107, 1984; physiology and taxonomy), Bridge (*J. gen. U.S.A.* **104**: 3901, 2007; phylogenetic barcodes), Horn & Peterson (*Mycol.* **100**: 12, 2008; on *Aspergillus* heads).

penicillus, the brush-like conidiogenous apparatus of *Penicillium* and related genera composed of a stipe bearing a tuft of conidiogenous cells and other elements formerly on the rami and metulae (Fig. 30).

Penidiella Crous & U. Braun (2007), anamorphic *Teratosphaeriaceae*. 7, widespread. See Crous *et al.* (*Stud. Mycol.* **58**: 1, 2007), Mafia *et al.* (*Mycol. Progr.* **7**: 49, 2007).

Peniophora Cooke (1879), Peniophoraceae. 62, widespread. See Eriksson (*Symb. bot. upsal.* **10** no. 5, 1950), Slysh (*Tech. Pub. Sta. Univ. Coll. Forestry, Syracuse* **83**, 1960; N.Y. State), Boidin (*Bull. Soc. linn. Lyon* **34**: 161, 1965), Boidin (*Bull. Soc. linn. Lyon* **34**: 213, 1965; key), Hayashi (*Bull. Govt For. Exp. Stn* **260**, 1974; Japan), Leger (*BSMF* **92**: 377, 1976; electrophoresis) Many authors use *Peniophora* s.s. for *Peniophora* sect. *Coloratae*; see, Leger & Poncet (*BSMF* **92**: 229, 1976; numerical tax.), Eriksson *et al.* (*Cortic. N. Europ.* **5**: 916, 1978; key 21 Eur. spp.) ? ≡ Corticium Pers. (Cortic.), Wu (*Mycotaxon* **85**: 187, 2003; Taiwan).

Peniophoraceae Lotsy (1907), Russulales. 7 gen. (+ 6 syn.), 88 spp.

Lit.: Donk (*Reinwardtia* **1**, 1951; gen. names), Reid (*Beih. Nova Hedwigia* **18**: 484 pp., 1965; stipitate steroid spp.), Liberta (*Mycol.* **60**: 827, 1968; *Peniophora*), Ginns (*Mycol.* **60**: 1211, 1969; *Merulius*), Rattan (*Biblthca Mycol.* **60**, 1977; NW Himalayas), Jülich & Stalpers (*Verh. Kon. Ned. Akad. Wetensch., Afd. Natuurk.* sect. 2 **74**, 1980; temp. N. Hemisph.), Boidin *et al.* (*BSMF* **107**: 91, 1991; trop. spp.), Wu & Chen (*Bull. natn. Mus. Nat. Sci.* Taiwan **4**: 101, 1993), Hallenberg *et al.* (*MR* **100**: 179, 1996), Ginns (*Mycol.* **90**: 19, 1998), Yurchenko (*Mikol. Fitopatol.* **34**: 37, 2000), Larsson & Larsson (*Mycol.* **95**: 1037, 2003), Hjortstam & Ryvarden (*Syn. Fung.* **18**: 20, 2004), Larsson *et al.* (*MR* **108**: 983, 2004), Binder *et al.* (*Systematics and Biodiversity* **3**: 113, 2005), Küffer & Senn-Irlet (*Mycol. Progr.* **4**: 77, 2005).

Peniophorella P. Karst. (1889) nom. dub., Agaricomycetes. 35, widespread. *Hymenochaetales* or *Agaricales* (*Rickenella* clade). See Larsson (*MR* **111**, 2007).

Peniophorina Höhn. (1917) nom. dub., Fungi. See Donk (*Reinwardtia* **1**: 216, 1951).

penitrem A, a mycotoxin produced by some *Penicillium* spp., including *P. cyclopium*, which affects the nervous system, causing tremors; see neurotoxin, tremorgen.

Pennella Manier (1968), Legeriomycetaceae. 7 (in *Diptera*), widespread. See Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), Williams & Lichtwardt (*CJB* **68**: 1045, 1990), Sato (*Mycoscience* **43**: 33, 2002; ultrastr. *Pennella angustispora*), Nelder *et al.* (*Fungal Diversity* **22**: 121, 2006; ecology and taxonomy), White (*MR* **110**: 1011, 2006; phylogeny).

Penomyces Giard ex Sacc. & Trotter (1913) nom. dub., anamorphic *Pezizomycotina*, Hso.?.?. 2, Europe. See Petch (*TBMS* **19**: 190, 1935).

Pentagenella Darb. (1897), Roccellaceae (L). 3, Chile. See Follmann *et al.* (*J. Hattori bot. Lab.* **85**: 245, 1998), Tehler & Irestedt (*Cladistics* **23**: 432, 2007).

Pentaposporium Bat. (1957) ? = Tripospermum fide Hughes (*Mycol.* **68**: 810, 1976).

Pentasporium, see *Pentaposporium*.

Penzigia Sacc. (1888) = Xylaria Hill ex Schrank fide Læssøe (*SA* **8**: 25, 1989), Læssøe (*SA* **13**: 43, 1994).

Penzigina Kuntze (1891) ≡ Eriosphaeria.

Penzigomyces Subram. (1992), anamorphic *Pezizomycotina*, Hso.≡ eP.19. 13, widespread. See Subramanian (*Proc. Indian natn Sci. Acad.* Part B. Biol. Sci. **58**: 186, 1992), Mercado-Sierra *et al.* (*Mycol.* **96**: 424, 2004; Spain).

Peplopus (Quél.) Quél. ex Moug. & Ferry (1887) ≡ Suillus Gray.

per (in author citations) (obsol.), see Nomenclature.

percurrent (1) extending throughout the entire length, as of the columella of a gasteromycete basidioma; (2) growing through in the direction of the long axis, as of a conidial germ tube emerging through the hilum or of a proliferation growing through the tip of the conidiogenous cell (Luttrell, 1963).

Perelegamyces R.F. Castañeda & W.B. Kendr. (1990), anamorphic *Pezizomycotina*, Hso.0eP.11. 1, Cuba. See Castañeda & Kendrick (*Univ. Waterloo Biol. Ser.* **32**: 34, 1990).

perennial, living for a number of years.

Perenniporia Murrill (1942) nom. cons. prop., Polyporaceae. *c.* 60, widespread. See Donk (*Persoonia* **1**: 266, 1960; nomencl. of *Poria*), Lowe (*Mycol.* **55**: 453, 1963; key 162 trop. spp., as *Poria*), Wright (*Mycol.* **56**: 694, 1964; dextrinoid reaction; as *Poria*), Lowe (*Tech. Pub. Sta. Univ. Coll. Forestry, Syracuse* **90**, 1966; syns, key 133 N. Am. spp., as *Poria*), Ryvarden (*Polyp. N. Eur.* **2**: 305, 1978; key Eur. spp.), Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 463, 1980; key 10 Afr. spp.), Decock & Mossebo (*Systematics and Geography of Plants* **71**: 607, 2002; African taxa), Decock & Mossebo (*Systematics and Geography of Plants* **73**: 161, 2003; African taxa), Decock & Ryvarden (*MR* **107**: 94, 2003; key Afr. spp.), Decock & Stalpers (*Taxon* **55**: 227, 759, 2006; nomencl.).

Perenniporiaceae Jülich (1982) = Polyporaceae.

Perenniporiella Decock & Ryvarden (2003), Polyporaceae. 3, S. America. See Decock & Ryvarden (*MR* **107**: 94, 2003).

Peresia H. Maia (1960) = Colletotrichum fide Sutton (*Mycol. Pap.* **141**, 1977).

Peresiopsis Bat. (1960) = Yamamotoa fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Perezia L. Léger & Duboscq (1909), Microsporidia. 9.

perfect state, see States of fungi.

Perforaria Müll. Arg. (1891) = Coccotrema fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Perforariomyces Cif. & Tomas. (1953) ≡ Perforaria.

perforation lysis, the process by which degradation of resistant fungus propagules in soil is initiated (Old & Wong, *Soil Biol. Biochem.* **8**: 285, 1976; review).

perfume, see oak-moss, smell.

pergameneous (pergamenous, pergamentaceous), like paper.

Periamphispora J.C. Krug (1989), Lasiosphaeriaceae. 1, Spain. See Krug (*Mycol.* **81**: 475, 1989), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004).

Periascomycetes. Class introduced for *Protascus*, *Protomyces*, *Ashbya*, and other 'primitive' ascomycetes (Moreau, 1953).

Periaster Theiss. & Syd. (1917) = Erikssonia fide Petrak (*Annls mycol.* **29**: 390, 1931).

Peribotryon Fr. (1832) nom. rej. = Chrysothrix fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pericauda.

Perichlamys Clem. & Shear (1931) ≡ Kuntzeomyces.

Pericladium Pass. (1875), ? Ustilaginaceae. 3 (forming galls on *Grewia*), Africa; Asia; Australia. See Mordue (*Mycopathologia* **103**: 173, 1988), Vánky (*Mycotaxon* **95**: 1, 2006).

periclinal, curved in the direction of, or parallel to, the surface or the circumference; cf. anticlinal; **-thickening**, zone of increased material surrounding the protoplasmic channel at the apex of a 'phialide' (see Sutton, *The Coelomycetes*, 1980).

Pericoccis Clem. (1931) = Leptogium fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Pericoelium Bonord. (1851) = Ustilago fide Saccardo (*Syll. fung.* **7**: 1, 1888).

Periconia Tode (1791), anamorphic *Pleosporales*, Hso.0eP.10. 36, widespread. See Mason & Ellis (*Mycol. Pap.* **56**, 1953; Brit. spp., key), Bunning & Griffiths (*TBMS* **78**: 147, 1984; ultrastr.), Carmarán & Novas (*Fungal Diversity* **14**: 67, 2003; spp. described by Spegazzini).

Periconiella Sacc. (1885), anamorphic *Mycosphaerellaceae*, Hso.0eP/≡ eP.10. 50 (some fungicolous), widespread. See Ellis (*Mycol. Pap.* **111**, 1967; key), McKenzie (*Mycotaxon* **39**: 229, 1990), Priest (*MR* **95**: 924, 1991; spp. on *Proteaceae*), Braun (*Feddes Repert.* **115**: 50, 2004; on ferns), Kirschner & Piepenbring (*Mycol. Progr.* **7**: 21, 2008; Panama, generic limits).

Pericystales = Ascosphaerales.

Pericystis Betts (1912) [non *Pericystis* J. Agardh 1847, Algae] ≡ Ascosphaera.

Peridermium (Link) J.C. Schmidt & Kunze (1817) nom. cons., anamorphic *Cronartium, Chrysomyxa, Pucciniastrum*. *c.* 20 (on gymnosperms (I)), widespread. Anamorph name for (I). See Arthur & Kern (*Bull. Torrey bot. Club* **33**: 403, 1906), Peterson (*Bull. Torrey bot. Club* **94**: 511, 1967; pine stem rust), Laundon (*Taxon* **25**: 186, 1976; taxonomy) Cf. *Endocronartium*.

peridermium, an aecium as in the form genus *Peridermium*.

peridiole (peridiolum) (esp. of *Nidulariaceae*), a division of the gleba having a separate wall, frequently acting as a unit for distribution.

Peridiomyces H. Karst. (1843) nom. dub., anamorphic *Pezizomycotina*.

Peridiopsora Kamat & Sathe (1969), anamorphic *Milesina*. 1 (on *Adelocaryum* (*Boraginaceae*)), India. Anamorph name for (II).

Peridiospora C.G. Wu & S.J. Lin (1997), Endogonaceae. 2, Brazil; Taiwan. See Wu & Lin (*Mycotaxon* **64**: 180, 1997), Goto & Maia (*Mycotaxon* **96**: 327, 2006; Brazil).

Peridiothelia D. Hawksw. (1985), Pleomassariaceae. 3, Europe. See Barr (*Mycotaxon* **43**: 371, 1992; posn).

Peridipes Buriticá & J.F. Hennen (1994) nom. inval., Pucciniales. 2 (on *Arachis*, *Hymenaea*), S. America. Anamorph name for (II). See Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; as syn. of *Milesia*).

peridium, the wall or limiting membrane of a sporangium or other fruit-body, an excipule; **peridial cells** (esp. of aecia), the cells of the peridium.

Peridoxylon Shear (1923) = Camarops fide Nannfeldt (*Svensk bot. Tidskr.* **66**: 335, 1972), Dargan & Thind (*J. Indian bot. Soc.* **63**: 177, 1984; India).

Peridoxylum Clem. & Shear (1931) ≡ Peridoxylon.

perifulcrium, the wall of a pycnidium in a lichen thallus (obsol.).

Perigrapha Hafellner (1996), Roccellaceae (L). 1, Europe; Australasia. See Hafellner (*Nova Hedwigia* **63**: 174, 1996), Grube (*Bryologist* **101**: 377, 1998), Ertz *et al.* (*Biblthca Lichenol.* **91**: 155 pp., 2005).

Periline Syd. (1939) = Antennularia fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Perinidium Cromb. (1870) ≡ Pyrenidium.

Periola Fr. (1822), anamorphic *Pezizomycotina*, Hsp.?.?. 1 or 2, Europe; America.

Periolopsis Maire (1913) = Sarcopodium fide Sutton (*TBMS* **76**: 97, 1981).

Periperidium Darker (1963), anamorphic *Micraspis*, St.≡ eH.15. 1, Canada. See Darker (*CJB* **41**: 1392, 1963).

Peripherostoma Gray (1821) nom. rej. ≡ Daldinia.
periphysis (pl. **periphyses**), an upward pointing hypha inside, or near, the ostiole of a perithecium, pycnidium, or pycnium; see hamathecium.
periphysoid, see hamathecium.
periphyton, the 'assemblage of organisms growing upon free surfaces of submerged objects in water and covering them with a slimy coat.' Young (1945) fide Cooke (*Bot. Rev.* **22**: 616, 1956).
periplasm (of *Peronosporales*), the outer, non-functional protoplasm of an oogonium or antheridium; cf. gonoplasm, ooplasm.
Perirhiza Karling (1946) = Catenophlyctis fide Karling (*Chytriomyc. Iconogr.*, 1977).
Perischizon Syd. & P. Syd. (1914), Parmulariaceae. 1, S. Africa.
Perisperma, see *Pyrisperma*.
Perisphaeria Roussel (1806) = Hypoxylon Bull. fide Læssøe (*SA* **13**: 43, 1994).
perispore (perisporium), sheath outside the true spore wall. See Harmaja (*Karstenia* **14**: 123, 1974; cyanophilic in *Pezizales*); ascospore, spore wall.
Perisporiacites Félix (1894), Fossil Fungi, Ascomycota. 2 (Cretaceous, Eocene), former USSR. See Sahni & Rao (*Proc. Indian natn Sci. Acad.* Part B. Biol. Sci. **13**: 45, 1943).
perisporial sac, a perispore forming a loose envelope around the spore as in *Coprinus* sp.
Perisporiales = Pleosporales.
Perisporiella Henn. (1902) = Hypocrella fide Clements & Shear (*Gen. Fung.*, 1931).
Perisporina Henn. (1904) = Perisporiopsis Henn. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).
Perisporiopsella Bat., J.L. Bezerra, Castr. & Matta (1964) = Pilgeriella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Perisporiopsidaceae E. Müll. & Arx (1962) = Parodiopsidaceae.
Perisporiopsis F. Stevens (1917) ≡ Stevensea.
Perisporiopsis Henn. (1904), Parodiopsidaceae. Anamorph *Septoidium*. *c.* 16, widespread (tropical).
Perisporites Pampal. (1902), Fossil Fungi. 2 (Miocene), Italy.
Perisporium Fr. (1821) nom. dub., Pezizomycotina. Sensu Corda (1842) = Preussia.
perisporium, see perispore.
Peristemma Syd. (1921) = Miyagia fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).
peristome, an edging round an opening, esp. of basidiomata of certain gasteromycetes.
Peristomialis (W. Phillips) Boud. (1907) = Ijuhya fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).
Peristomium Lechmere (1912) = Microascus Zukal fide von Arx (*Persoonia* **8**: 191, 1975).
perithecium (pl. **perithecia**), a subglobose or flask-like ostiolate ascoma; sometimes limited to ascohymenial types formed from the development of an ascogonium (not of stromatic origin), but now widely used as a general term regardless of the ontogenetic type. See Cherepanova (*Vestn. Leningrad Univ. Biol.* **3**: 39, 1986; types and evol. pathways).
Peritrichospora Linder (1944) = Corollospora fide Kohlmeyer (*Ber. dt. bot. Ges.* **75**: 125, 1962).
peritrichous (peritrichiate), having hairs or flagella all over the surface.
Perizomatium Syd. (1927) = Phaeofabraea fide Pfister (*Occ. Pap. Farlow Herb. Crypt. Bot.* **11**, 1977).
Perizomella Syd. (1927), anamorphic *Pezizomycotina*, St.0eP.1. 1, C. America.
Pernicivesicula E.K.C. Bylén & J.I.R. Larsson (1994), Microsporidia. 1. See Bylén & Larsson (*Eur. J. Protist.* **30**: 139, 1994).
Perona Pers. (1825) = Hemimycena fide Kuyper (*in litt.*) *Perona* is a superfluous name change for *Helotium* Tode, nom. utique rej.
peronate, sheathed; having a boot or covering, esp. of the lower part of a stipe covered by a volva or veil.
Peroneutypa Berl. (1902), Diatrypaceae. 1, widespread. See Rappaz (*Mycol. Helv.* **2**: 285, 1987), Carmarán *et al.* (*Fungal Diversity* **23**: 67, 2006; morphology).
Peroneutypella Berl. (1902) ≡ Scoptria.
Peronosporites W.G. Sm. (1877), Fossil Fungi. 3 (Carboniferous, Miocene), Italy; British Isles.
Peronosporoides E.W. Berry (1916), Fossil Fungi, Peronosporales. 1 (Oligocene), USA. See Berry (*Mycol.* **8**: 76, 1916).
Peronosporoides J. Sm. Dalry (1896), Fossil Fungi (mycel.) Fungi. 1 (Carboniferous), British Isles. See Smith (*Trans. Geol. Soc. Glasgow* **10**: 321, 1896).
Peroschaeta Bat. & A.F. Vital (1957), Dothideomycetes. 1, Philippines. See Batista & Vital (*An. Soc. Biol. Pernambuco* **15**: 500, 1957).
peroxisome, one of the subcellular organelles which have indispensable functions in the metabolism of *n*-alkalenes, fatty acids, methanol, and several nitrogen-containing compounds in eukaryotic microorganisms. See Tanaka & Ueda (*MR* **97**: 1025, 1993).
Perrotia Boud. (1901), Hyaloscyphaceae. *c.* 19, widespread. See Dennis (*Persoonia* **2**: 182, 1962), Spooner (*Biblthca Mycol.* **116**, 1987; 5 spp. Australasia), Cantrell & Hanlin (*Mycol.* **89**: 745, 1997; DNA), Wang (*Mycotaxon* **72**: 461, 1999), Zhuang & Hyde (*Mycol.* **93**: 606, 2001; Hong Kong), Zhuang & Yu (*Nova Hedwigia* **73**: 261, 2001; China), Verkley (*Mycotaxon* **89**: 205, 2004; New Zealand).
Perrotiella Naumov (1916) = Hydropisphaera fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).
perrumpent, breaking through. Cf. erumpent.
Persiciospora P.F. Cannon & D. Hawksw. (1982), Ceratostomataceae. 4, widespread. See Horie *et al.* (*Mycotaxon* **25**: 229, 1986), Krug (*Mycol.* **80**: 414, 1988; key 3 spp.).
persistent (1) (of interascal tissues) still evident at maturity; (2) (of spores), non-deciduous; (3) (of teliospore pedicels), remaining firmly attached to the spore after liberation.
Persoon (Christiaan Hendrik; 1761-1836; South Africa, later Germany, France). Born in Cape Province; at school, Lingen-on-Ems, Germany (1775); student in Halle (1783), then Leiden (1786) and Göttingen and Erlangen (1799), moving to Paris (*c.* 1803), living there for the rest of his life. With E.M. Fries (q.v.) the founder of Mycology. There had been little development in the taxonomy of fungi from its low level at the time of Linnaeus till the work of Persoon began to appear in 1793. His early works, including *Observationes Mycologicae* (1795-1799) and the *Synopsis Methodica Fungorum* (1801) formed the framework on which Fries and all later systematists based their classifications. Names of fungi belonging in the *Pucciniales*, *Ustilaginales* and 'gasteromycetes' which appear in *Synopsis Methodica Fungorum* have sanctioned status (see Nomenclature). Persoon's working conditions in Paris were hard, and his later work was

overshadowed by the simultaneous publication by E.M. Fries (q.v.) of the *Systema Mycologicum*. Persoon's collection, a very important one because it has nomenclatural types of a great number of common species, was taken over by the Dutch government before his death and is now in Leiden (L). *Publs. Observationes Mycologicae* (1795-1799); *Synopsis Methodica Fungorum* (1801) [reprint 1952; index by G.H. Lünemann, 1808]; *Mycologia Europaea* (1822-1828). *Biogs, obits etc.* Ainsworth (*Nature* **193**: 22, 1962); Grummann (1974: 704); Lloyd (*Mycological Notes* **1**: 158, 1903); Lloyd (*Mycological Notes* **7**: 1301, 1924); Petersen (*Kew Bulletin* **31**: 695, 1977); Stafleu & Cowan (*TL-2* **4**: 178, 1983).

Persooniana Britzelm. (1897) = Tyromyces fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Persooniella Syd. (1922) = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Perspicinora Riedl (1990) = Koerberiella fide Coppins (*SA* **10**: 48, 1991).

perthophyte (perthotroph), a necrophyte on dead tissues of living hosts (Münch); cf. saprophyte.

Pertusaria DC. (1805) nom. cons., Pertusariaceae (L). 525, widespread. See Brodo (*CJB* **66**: 1264, 1988), Takeshita *et al.* (*Pl. Syst. Evol.* **165**: 49, 1989; phycobionts), Kantvilas (*Lichenologist* **22**: 289, 1990; Tasmania), Archer (*Telopea* **4**: 165, 1991; 28 spp., Australia), Archer (*Mycotaxon* **41**: 223, 1991; key 63 Australian spp.), Niebel-Lohmann & Feuerer (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **24**: 199, 1992; Germany), Archer (*Biblthca Lichenol.* **53**: 1, 1993; subgen.), Archer & Elix (*N.Z. Jl Bot.* **31**: 111, 1993; Australasia), Awasthi & Srivastava (*Bryologist* **96**: 210, 1993; India), Archer *et al.* (*Mycotaxon* **56**: 387, 1995; Papua New Guinea), Elix *et al.* (*Flechten Follmann* Contributions to Lichenology in Honour of Gerhard Follmann: 15, 1995; chemistry), Elix *et al.* (*Mycotaxon* **53**: 273, 1995), Archer (*Biblthca Lichenol.* **69**, 1997; monogr. Pertusariales M. Choisy ex D. Hawksw. & O.E. Erikss. (1986), (L). Ostropomycetidae. 5 fam., 15 gen., 901 spp. Thallus crustose, rarely lobate or minutely foliose. Ascomata apothecial, often deeply cupulate, usually initially immersed, opening widely or with a poroid aperture and appearing perithecial, usually with a well-developed thalline margin. Interascal tissue of basal paraphyses, sometimes also with apical paraphyses in the poroid taxa. Asci short, widely cylindrical, with a thick multilayered usually J+ wall, the apex often more strongly thickened, releasing spores through a ± vertical apical split, often less than 8-spored. Ascospores very large, hyaline, aseptate, with a very thick multilayered wall. Anamorphs pycnidial. Lichenized with green algae, cosmop. Fams:

(1) **Coccotremataceae**
(2) **Icmadophilaceae**
(3) **Megasporaceae**
(4) **Ochrolechiaceae**
(5) **Pertusariaceae**

Many spp. reproduce mainly by soredia or isidia, forming 'species-pairs' with their meiotic counterparts. *Lit.*: Lumbsch *et al.* (*MR* **111**: 257, 2007; phylogeny).

Pertusariomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Pertusaria.

pervious (of lichenized scyphi), open or perforate basally.

Pesavis Elsik & Janson. (1974), Fossil Fungi, anamorphic *Pezizomycotina*. 2 (Paleogene), widespread. See Smith & Crane (*J. Linn. Soc.* Bot. **79**: 243, 1979).

Pesotum J.L. Crane & Schokn. (1973), anamorphic *Ophiostoma*, Hsy.0eH.10. 16, widespread. Petch (Thomas; 1870-1948; England, later Sri Lanka). Schoolmaster, Hull and King's Lynn (1890s); mycologist, Royal Botanic Gardens, Peradeniya (1905-1924); founder and first Director, Tea Research Institute (1925-1928). A leading student of tropical mycology (many works published in *Annals of the Royal Botanic Gardens, Peradeniya*, 1906-1926), entomogenous fungi (q.v.) and plant pathology; married a daughter of Charles Plowright and on retirement lived in Plowright's old house at North Wootton, near King's Lynn. His specimens are in the fungal reference collections of the Royal Botanic Gardens, Kew (**K**) and Peradeniya; slides in the British Museum (Natural History), London (**BM**). *Publs. Diseases and Pests of the Rubber Tree* (1921);*Diseases and Pests of the Tea Bush* (1923); British Hypocreales. *TBMS* **21**, **25**, **27** (1938-1945). *Biogs, obits etc.* Ainsworth (*TBMS* **67**: 179, 1976) [portrait]; Stafleu & Cowan (*TL-2* **4**: 168, 1983).

Petchiomyces E. Fisch. & Mattir. (1938), Pyronemataceae. 2, N. America; Sri Lanka. See Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Petelotia Pat. (1924) = Acanthonitschkea fide Nannfeldt (*Svensk bot. Tidskr.* **66**: 49, 1975).

Peterjamesia D. Hawksw. (2006), Roccellaceae. 2, widespread. See Hawksworth (*Lichenologist* **38**: 187, 2006).

Petersonia Cummins & Y. Hirats. (2003) nom. inval., anamorphic *Mikronegeria*. 1 (on *Araucaria*), Chile. Anamorph name for (I).

Petractis Fr. (1845), Ostropales (L). 5, widespread. See Vězda (*Preslia* **37**: 127, 1965), Kauff & Lutzoni (*Mol. Phylogen. Evol.* **25**: 138, 2002; phylogeny), Kauff & Büdel (*Bryologist* **108**: 272, 2005; ontogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Petrak (Franz; 1886-1973; Austria). Born in Mährisch-Weisskirchen [now Hranice, Czech Republic]; student, Vienna (1906-1913); school teacher (1913-1916); Austrian army (1916-1918); private scientist, living by selling exsiccati (1918-1938); contract employee, Natural History Museum, Vienna (1938-1951). Eminent and prolific taxonomist (especially ascomycetes and anamorphic fungi), bibliographer and indexer (see Literature); collector, distributing thousands of exsiccati specimens; contributor to the mycotas of many parts of the world; founded *Sydowia* (1947) to replace *Annales Mycologici*. *Publs. Petrak's Lists* (1930-1950) [these volumes are freely available on-line; see Internet: catalogues & thesauri]; see also full bibliography in Samuels. *Biogs, obits etc.* Arx (*Persoonia* **9**: 95, 1976); Grummann (1974: 938); Lohwag (*Beihefte zur Sydowia* **1**: IV, 1957) [portrait]; Riedl (*Sydowia* **26**: xxix, 1974); Samuels (*An Annotated Index to the Mycological Writings of Franz Petrak* **1-5** A-O, 1981-1986) [bibliography and biography in vol. 1]; Stafleu & Cowan *TL-2* **4**: 204, 1983).

Petrakia Syd. & P. Syd. (1913), anamorphic *Pezizomycotina*, Hsp.#eP.1. 3, Europe; Asia. See van der Aa (*Acta Bot. Neerl.* **17l**: 221, 1968), Carmichael *et al.* (*Genera of Hyphomycetes*, 1980; synonymy with *Echinosporium*), Wong *et al.* (*Cryptog. Mycol.* **23**: 195, 2002).

Petrakiella Syd. (1924), ? Sordariomycetes. 1 (from bark), Brazil. Affinities uncertain, no recent research is available.

Petrakina Cif. (1932), ? Asterinaceae. 2, C. America. See Farr & Palm (*Mycotaxon* **24**: 275, 1985).

Pezizales J. Schröt. (1894). Pezizomycetidae. 16 fam., 199 gen., 1683 spp. Operculate discomycetes; cup-fungi. Stroma absent. Ascomata apothecial or cleistothecial, rarely absent, often large, discoid, cupulate or ± globose, sometimes stalked, often brightly coloured; excipulum usually thick-walled, fleshy or membranous, composed of thin-walled pseudoparenchymatous cells. Interascal tissue of simple or moniliform paraphyses, often pigmented and swollen at the apices, absent in some cleistothecial taxa. Asci elongated, persistent, thin-walled, usually without

obvious apical thickening, opening by a circular pore (operculum) or vertical split, the wall sometimes blueing in iodine, the asci cylindrical to ± globose and usually indehiscent in cleistothecial taxa. Ascospores usually ellipsoidal, aseptate, hyaline to strongly pigmented, often ornamented, usually without a sheath. Anamorphs hyphomycetous where known, usually with sympodial proliferation. Saprobes on soil and very rotten wood, some coprophilous, mycorrhizal, some hypogeous (and then mycorrhizal); esp. temp. Fams:

Phaeodiscus L.R. Batra (1968) = Lambertella fide Dumont (*Mem. N. Y. bot. Gdn* **33**, 1971).

Phaeodochium M.L. Farr (1968) ? = Hymenopsis fide Sutton (*in litt.*).

Phaeodomus Höhn. (1909), anamorphic *Pezizomycotina*, St.0eP.19. 3, Cuba; S. America.

Phaeodon J. Schröt. (1888) = Hydnellum P. Karst. (1879) fide Donk (*Taxon* **5**: 69, 1956).

Phaeodothiopsis Theiss. & Syd. (1914) nom. dub., Pezizomycotina. 3, widespread (tropical). See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Phaeodothiora Petr. (1948) = Saccothecium fide Eriksson & Hawksworth (*in litt.*), von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Phaeodothis Syd. & P. Syd. (1904), Montagnulaceae. 5, widespread. See Aptroot (*Nova Hedwigia* **60**: 325, 1995; key), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; phylogeny), Câmara *et al.* (*MR* **107**: 516, 2003; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Phaeofabraea Rehm (1909), Helotiaceae. 2, S. America; Taiwan. See Pfister (*Occ. Pap. Farlow Herb. Crypt. Bot.* **11**, 1977; key).

Phaeogalera Kühner (1973) = Galerina fide Singer (*Nova Hedwigia* **26**: 436, 1975).

Phaeoglabrotricha W.B. Cooke (1961) = Pellidiscus fide Reid (*Persoonia* **3**: 97, 1964).

Phaeoglaena Clem. (1909) nom. dub., ? Dothideomycetes (?L). No spp. included. See Mayrhofer & Poelt (*Herzogia* **7**: 13, 1985).

Phaeoglossum Petch (1922), Geoglossaceae. 1, Sri Lanka. No recent research is available.

Phaeographidomyces Cif. & Tomas. (1953) = Phaeographis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phaeographina Müll. Arg. (1882) nom. illegit., Graphidaceae. *c.* 117. The correct name for most of the species appears to be *Thecographa* A. Massal. See Wirth & Hale (*Contr. US natn Herb.* **36**: 63, 1963; C. Am.), Nakanishi (*J. Sci. Hiroshima Univ.* B(2) **11**: 51, 1966; Japan), Awasthi & Singh (*Kavaka* **1**: 87, 1974; India), Archer & Elix (*Mycotaxon* **72**: 91, 1999; chemistry), Archer (*Telopea* **8**: 461, 2000; Australia), Archer (*Telopea* **9**: 329, 2001; Australia), Archer (*Mycotaxon* **83**: 361, 2002; Guadalcanal), Nakanishi *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **28**: 107, 2002; Vanuatu), Staiger (*Biblthca Lichenol.* **85**, 2002; monogr.), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is), Lücking *et al.* (*Taxon* **56**:

1296, 2007; nomencl.; ≡ Pliariona).

Phaeographinomyces Cif. & Tomas. (1953) = Phaeographina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phaeographis Müll. Arg. (1882) nom. cons. prop., Graphidaceae (L). *c.* 226, widespread (esp. tropical). See Wirth & Hale (*Contr. US natn Herb.* **36**: 63, 1963; C. Am.), Nakanishi (*J. Sci. Hiroshima Univ.* B(2) **11**: 51, 1966; Japan), Singh & Awasthi (*Bull. Bot. Surv. India* **21**: 97, 1981; key 28 Indian spp.), Ernst & Hauck (*Herzogia* **10**: 39, 1994; Germany), Archer & Elix (*Mycotaxon* **72**: 91, 1999; chemistry), Archer (*Telopea* **8**: 461, 2000; Australia), Archer (*Telopea* **9**: 663, 2001; Australia), Staiger (*Biblthca Lichenol.* **85**, 2002; revision), López de Silanes & Álvarez (*Nova Hedwigia* **77**: 147, 2003; Iberian peninsula), Archer (*Biblthca Lichenol.* **94**, 2006; Australia), Staiger *et al.* (*MR* **110**: 765, 2006; phylogeny), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is), Lücking *et al.* (*Taxon* **56**: 1296, 2007; nomencl.).

Phaeographopsis Sipman (1997), Graphidaceae (L). 3, pantropical. See Aptroot *et al.* (*Biblthca Lichenol.* **64**: 129, 1997), Kalb (*Biblthca Lichenol.* **88**: 301, 2004), Flakus & Wilk (*J. Hattori bot. Lab.* **99**: 307, 2006).

Phaeogyroporus Singer (1944) = Phlebopus fide Kuyper (*in litt.*).

Phaeoharziella Loubière (1924) ? = Arthrinium fide Sutton (*in litt.*).

Phaeohelotium Kanouse (1935), Helotiaceae. *c.* 16, widespread (north temperate). See Dennis (*Kew Bull.* **25**: 335, 1971; key Brit. spp.), Baral & Krieglsteiner (*Beih. Sydowia* **6**, 1985), Huhtinen (*Karstenia* **29**: 45, 1990), Svrček (*Česká Mykol.* **46**: 149, 1993), Gamundí & Messuti (*MR* **110**: 493, 2006; key S hemisphere spp.).

Phaeohendersonia Höhn. (1918) nom. dub., Pezizomycotina. ≡ 'Hendersonia *sensu* Sacc.' (Ascomycetes, inc. sed.) fide Sutton (*in litt.*).

Phaeohiratsukaea Udagawa & Iwatsu (1990), anamorphic *Pezizomycotina*, Hso.0eP.15. 1 (from a stained closet), Japan. See Udagawa & Iwatsu (*Rep. Tottori Mycol. Inst.* **28**: 151, 1990).

Phaeohydnochaete Lloyd (1916), Hymenochaetaceae. 1, N. America.

Phaeohygrocybe Henn. (1901) = Russula fide Pegler (*in litt.*).

Phaeohymenula Petr. (1954), anamorphic *Pezizomycotina*, Hsp.0eH.?. 1, Australia. See Petrak (*Sydowia* **8**: 77, 1954).

phaeohyphomycosis, a mycotic infection in humans or other animals caused by a dematiaceous fungus (Ajello *et al.*, *Mycol.* **66**: 490, 1974); cf. hyalohyphomycosis.

Phaeoidiomyces Dorn.-Silva & Dianese (2004), anamorphic *Pezizomycotina*. 1, Brazil. See Dornelo-Silva & Dianese (*Mycol.* **96**: 881, 2004).

Phaeoisaria Höhn. (1909), anamorphic *Pezizomycotina*, Hsy.0eH.10. 15, widespread. Anamorph links with *Scoptria* require confirmation. See de Hoog & Papendorf (*Persoonia* **8**: 407, 1976; key), Müller & Samuels (*Sydowia* **35**: 143, 1982; teleomorph), Mercado Sierra *et al.* (*Mycotaxon* **63**: 369, 1997; Cuba), Siboe *et al.* (*Mycotaxon* **73**: 283, 1999; Kenya), Guarro *et al.* (*J. Clin. Microbiol.* **38**: 2434, 2000; keratomycosis), Castaneda Ruiz *et al.* (*Cryptog. Mycol.* **23**: 9, 2002; Cuba).

Phaeoisariopsis Ferraris (1909) = Pseudocercospora fide Ellis (*MDH*, 1976), Deighton (*MR* **94**: 1096, 1990; redisposition spp. from *Cercospora*), Walker & White (*MR* **95**: 1005, 1991; on *Wikstroemia*), Busogoro *et al.* (*Eur. J. For. Path.* **105**: 559, 1999; mol. biol.), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Mahuku *et al.* (*Pl. Path.* **51**: 594, 2002; genetic diversity, C America), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003; reassignment of names), Sartorato (*J. Phytopath.* **152**: 385, 2004; genetic diversity, Brazil), Wagara *et al.* (*J. Phytopath.* **152**: 235, 2004; genetic diversity, Kenya), Crous *et al.* (*Stud. Mycol.* **55**: 173, 2006; phylogeny, synonymy with *Pseudocercospora*).

Phaeolabrella Speg. (1912), anamorphic *Pezizomycotina*, Cac.0eH.1. 1, S. America. See Petrak & Sydow (*Annls mycol.* **33**: 157, 1935).

Phaeolaceae Jülich (1982) = Polyporaceae.

Phaeolepiota Maire ex Konrad & Maubl. (1928), Agaricaceae. 1, widespread (north temperate). Probably a separate family is justified. See Stijve & Andrey (*Australasian Mycologist* **21**: 24, 2002).

Phaeolimacium Henn. (1899) ≡ Oudemansiella.

Phaeolopsis Murrill (1905) = Phylloporia fide Ryvarden (*Syn. Fung.* **5**, 1991).

Phaeolus (Pat.) Pat. (1900), Fomitopsidaceae. 2, widespread. See Pegler (*The polypores [Bull. BMS Suppl.]*, 1973), Simpson & May (*Australas. Pl. Path.* **31**: 99, 2002; Australia).

Phaeomacropus Henn. (1899) = Helvella fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Phaeomarasmius Scherff. (1897), Inocybaceae. *c.* 20, widespread. See Singer (*Schweiz. Z. Pilzk.* **34**: 44, 1956; monogr.), Singer (*Schweiz. Z. Pilzk.* **34**: 53, 1956; monogr.), Horak (*Sydowia* **32**: 167, 1979; key 8 Papua New Guinea spp.).

Phaeomarsonia (orthographic variant), see *Phaeomarssonia* Speg.

Phaeomarssonia Bubák (1915) = Didymosporina fide Sutton (*Mycol. Pap.* **141**, 1977).

Phaeomarssonia Speg. (1908) nom. dub., anamorphic *Pezizomycotina*. See Petrak & Sydow (*Annls mycol.* **34**: 32, 1936).

Phaeomassaria Speg. (1880) ? = Massaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phaeomeris Clem. (1909) = Spheconisca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phaeomoniella Crous & W. Gams (2000), anamorphic *Herpotrichiellaceae*. 1, widespread. See Crous & Gams (*Phytopath. Mediterr.* **39**: 113, 2000), Gams (*Stud. Mycol.* **45**: 187, 2000; morphology), Groenewald *et al.* (*S. Afr. J. Sci.* **96**: 43, 2000; PCR diagnostics), Groenewald *et al.* (*MR* **105**: 651, 2001; phylogeny), Whiting *et al.* (*Mycotaxon* **92**: 351, 2005; culture, phylogeny), Lee *et al.* (*Mycol.* **98**: 598, 2006; pine endophytes), Mostert *et al.* (*Australas. Pl. Path.* **35**: 453, 2006; genetic diversity), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006).

Phaeomonilia R.F. Castañeda, Heredia & R.M. Arias (2007), anamorphic *Pezizomycotina*. 2, Cuba; Mexico. See Castañeda Ruiz *et al.* (*Mycotaxon* **100**: 327, 2007).

Phaeomonostichella Keissl. ex Petr. (1941), anamorphic *Pezizomycotina*, Cpd/Cac.0eP.?. 1, China. See Sutton (*Mycol. Pap.* **141**, 1977).

Phaeomycena R. Heim ex Singer & Digilio (1966), Tricholomataceae. 5, Africa; Asia. See Singer & Digilio (*Lilloa* **25**: 175, 1966).

Phaeomyces E. Horak (2005), Inocybaceae. 2, Europe.

See Horak (*Röhrlinge und Blätterpilze in Europa*, 2005).

phaeomycosis, see phaeohyphomycoses.

Phaeonaevia L. Holm & K. Holm (1977), Helotiales. 1 (on *Rubus*), widespread (northern Europe). See Holm & Holm (*Kew Bull.* **31**: 576, 1977).

Phaeonectria (Sacc.) Sacc. & Trotter (1913) = Calostilbe fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Phaeonectriella R.A. Eaton & E.B.G. Jones (1971), Halosphaeriaceae. 1 (submerged wood), widespread. See Lowen (*SA* **5**: 150, 1986; posn), Chen *et al.* (*Mycol.* **91**: 84, 1999; phylogeny), Hyde *et al.* (*Mycoscience* **40**: 165, 1999), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Campbell *et al.* (*Mycol.* **95**: 530, 2003; phylogeny).

Phaeonema Kütz. (1843) nom. dub., ? Fungi.

Phaeonematoloma (Singer) Bon (1994) = Pholiota fide Kuyper (*in litt.*).

Phaeopeltis Clem. (1909) ≡ Phaeosaccardinula.

Phaeopeltis Petch (1919) ≡ Phaeaspis Clem. & Shear.

Phaeopeltium Clem. & Shear (1931) ≡ Phaeopeltosphaeria.

Phaeopeltosphaeria Berl. & Peglion (1892), Dothideomycetes. 2, widespread.

Phaeopezia (Vido) Sacc. (1884) = Peziza Fr. fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Phaeophacidium Henn. & Lindau (1897), Rhytismatales. 1, America.

Phaeophlebia W.B. Cooke (1956) = Punctularia fide Talbot (*Bothalia* **7**: 131, 1958).

Phaeophleospora Rangel (1916), anamorphic *Mycosphaerellaceae*. 18. See also *Kirramyces* for species on eucalypts. See Sutton (*Mycol. Pap.* **141**, 1977), Crous *et al.* (*S. Afr. J. Bot.* **63**: 111, 1997), Crous (*Mycol. Mem.* **21**: 170 pp., 1998), Taylor & Crous (*Fungal Diversity* **3**: 153, 1999; on *Proteaceae*), Crous *et al.* (*Stud. Mycol.* **45**: 107, 2000; review), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Taylor *et al.* (*S. Afr. J. Bot.* **67**: 39, 2001; on *Proteaceae*), Hunter *et al.* (*MR* **108**: 672, 2004; S Africa), Hunter *et al.* (*Stud. Mycol.* **55**: 147, 2006; phylogeny), Andjic *et al.* (*MR* **111**: 1184, 2007; phylogeny).

Phaeophloeosporella Crous & B. Sutton (1997), anamorphic *Pezizomycotina*, Cpd.?.?. 1, S. Africa. See Crous & Sutton (*S. Afr. J. Bot.* **63**: 281, 1997).

Phaeopholiota Locq. & Sarwal (1983), Agaricaceae. 1, Sikkim. See Locquin & Sarwal (*Compt. Rend. Congr. Natl. Soc. Savantes* Sec. Sci., 1983: 193, 1983).

Phaeophomatospora Speg. (1909) = Anthostomella fide Petrak & Sydow (*Annls mycol.* **23**: 209, 1925), Francis (*Mycol. Pap.* **139**, 1975), Lu & Hyde (*Fungal Diversity Res. Ser.* **4**, 2000).

Phaeophomopsis Höhn. (1917), anamorphic *Pezizomycotina*, St.0eP.?. 1, France. See Sutton (*Mycol. Pap.* **141**, 1977).

Phaeophragmeriella Hansf. (1944) = Leptomeliola fide Hughes (*Mycol. Pap.* **166**, 1993).

Phaeophragmocauma F. Stevens (1931) = Dermatodothis fide Müller (*Sydowia* **28**: 149, 1976).

Phaeophycopsis Bat. & Peres (1967) = Seuratia fide Meeker (*CJB* **53**: 2462, 1975).

Phaeophyscia Moberg (1977), Physciaceae (L). 28, widespread. See Esslinger (*Mycotaxon* **7**: 283, 1978; N. Am.), Hafellner *et al.* (*Herzogia* **5**: 39, 1979), Hale (*Lichenologist* **15**: 157, 1983), Moberg (*Nordic Jl Bot.* **3**: 509, 1983; E. Africa), Kashiwadani (*Bull. natn. Sci. Mus.* Tokyo, B **10**: 127, 1984; Japan), Moberg (*Op. Bot.* **121**: 281, 1993; S. Am.), Moberg (*Nordic Jl Bot.* **15**: 319, 1995; Far East), Lohtander *et al.* (*Mycol.* **92**: 728, 2000; Scandinavia, phylogeny), Dahlkild *et al.* (*Bryologist* **104**: 527, 2001; photobionts), Grube & Arup (*Lichenologist* **33**: 63, 2001; phylogeny), Helms *et al.* (*Mycol.* **95**: 1078, 2003; phylogeny), Simon *et al.* (*J. Mol. Evol.* **60**: 434, 2005; introns), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Phaeopolynema Speg. (1912) = Hymenopsis fide Sutton (*Mycol. Pap.* **141**, 1977).

Phaeopolystomella Bat. & H. Maia (1960) = Microdothella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Phaeoporotheleum (W.B. Cooke) W.B. Cooke (1961), Cyphellaceae. 2, Cuba; Argentina. See Cooke (*Beih. Sydowia* **4**: 129, 1961).

Phaeoporus Bataille (1908) = Tylopilus fide Kuyper (*in litt.*).

Phaeoporus J. Schröt. (1888) ? = Inonotus fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Phaeopterula (Henn.) Sacc. & D. Sacc. (1905) = Pterula fide Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**, 1950).

Phaeopyxis Rambold & Triebel (1990), Helotiales. 4 (mainly on lichens), widespread (north temperate). See Rambold & Triebel (*Notes R. bot. Gdn Edinb.* **46**: 375, 1990).

Phaeoradulum Pat. (1900), Boletales. 1, West Indies.

Phaeoramularia Munt.-Cvetk. (1960) = Passalora fide Ellis (*More Dematiaceous Hyphomycetes*, 1976), Deighton (*Mycol. Pap.* **144**: 26, 1979), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 382, 1998; key), Braun (*Schlechtendalia* **2**: 1, 1998), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Phaeorhytisma Henn. (1899) ? = Criella fide Müller (*Sydowia* **12**: 160, 1959; non-sporulating).

Phaeorobillarda Bat. & J.L. Bezerra (1961) = Robillarda Sacc. fide Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Phaeorrhiza H. Mayrhofer & Poelt (1979), Physciaceae (L). 2, widespread. See Mayrhofer & Poelt (*Nova Hedwigia* **30**: 783, 1979), Elvebakk & Moberg (*Lichenologist* **34**: 311, 2002; Chile), Helms *et al.* (*Mycol.* **95**: 1078, 2003; phylogeny), Golubkova (*Nov. sist. Niz. Rast.* **37**: 200, 2004; Russia).

Phaeosaccardinula Henn. (1905), Chaetothyriaceae. 14, widespread (tropical). See Eriksson & Yue (*Mycotaxon* **22**: 269, 1985).

Phaeoschiffnerula Theiss. (1914) = Schiffnerula. fide Petrak [not traced]. fide Petrak (*Annls mycol.* **25**: 193, 1927).

Phaeoschizophyllum W.B. Cooke (1962) = Schizophyllum fide Donk (*Persoonia* **3**: 199, 1964).

Phaeosclera Sigler, Tsuneda & J.W. Carmich. (1981), anamorphic *Dothideomycetes*, Hso.#eP.1. 1, Canada. See Sigler *et al.* (*Mycotaxon* **12**: 461, 1981), Hambleton *et al.* (*Mycol.* **95**: 959, 2003; phylogeny).

Phaeosclerotinia Hori (1916), Sclerotiniaceae. Anamorph *Monilia*. 1, Japan.

Phaeoscopulariopsis M. Ota (1928) nom. provis. = Scopulariopsis fide Morton & Smith (*Mycol. Pap.* **86**, 1963).

Phaeoscutella Henn. (1904) nom. dub., Fungi.

Phaeoscypha Spooner (1984), Hyaloscyphaceae. Anamorph *Chalara*-like. 1, British Isles. See Spooner

(*Kew Bull.* **38**: 574, 1984).

Phaeoseptoria Speg. (1908), anamorphic *Phaeosphaeria*, Cpd.≡ fP.?. 19, widespread. See Petrak (*Annls mycol.* **39**: 292, 1941), Punithalingam (*Nova Hedwigia* **32**: 585, 1980; key), Knipscheer *et al.* (*S. Afr. For. J.* **154**: 56, 1990; *P. eucalypti* in S. Afr.), Walker *et al.* (*MR* **96**: 911, 1992; redisp. of *P. eucalypti*, redescr. of *P. papayae*), Punithalingam & Spooner (*MR* **101**: 292, 1997; on lichens), Câmara *et al.* (*Mycol.* **94**: 630, 2002; phylogeny).

Phaeosiphonia Kütz. (1849) nom. dub., ? Fungi.

Phaeosolenia Speg. (1902), ? Inocybaceae. 8, S. America. See Cooke (*Sydowia* Beih. **4**, 1961), Siepe & Kasparek (*Z. Mykol.* **68**: 153, 2002; *Phaeosolenia densa* from Germany).

Phaeosperma (Sacc.) Traverso (1906) = Valsaria fide Shear (*Mycol.* **30**: 589, 1938).

Phaeosperma Nitschke ex Fuckel (1870), ? Dothideomycetes. 1 (on *Alnus*), Switzerland.

Phaeosperma Nitschke ex G.H. Otth (1869) [non *Phaiosperma* Raf. 1883] = Camarops fide Nannfeldt (*Svensk bot. Tidskr.* **66**: 335, 1972).

Phaeosphaera Bat. & Cif. (1963), anamorphic *Pezizomycotina*, Cpd.0eP.?. 2, Philippines; USA. See Batista & Ciferri (*Quaderno Ist. Bot. Univ. Pavia* **31**: 142, 1963).

Phaeosphaerella P. Karst. (1888) = Venturia Sacc. fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Phaeosphaeria I. Miyake (1909), Phaeosphaeriaceae. Anamorphs *Phaeoseptoria*, *Stagonospora*. *c.* 81 (esp. on *Poaceae*), widespread. See Holm (*Symb. bot. upsal.* **14** no. 3: 1, 1957), Eriksson (*Ark. Bot.* ser. 2 **6**: 339, 1967), Koponen & Mäkelä (*Ann. bot. fenn.* **12**: 141, 1975; Finland), Otani (*Bull. natn. Sci. Mus.* Tokyo, B **2**: 87, 1976; Japan), Leuchtmann (*Sydowia* **37**: 75, 1984; key 45 spp.), Leuchtmann *in* Laursen *et al.* (Eds) (*Arctic and Alpine Mycology* **2**: 153, 1987; key arctic alpine 16 spp.), Shoemaker & Babcock (*CJB* **67**: 1500, 1989; monogr., keys), Khashnobish & Shearer (*MR* **100**: 1355, 1996; phylogeny), Halama *in* Lucaset *al.* (Eds) (*Septoria on Cereals*: 70, 1999), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999), Czembor & Arseniuk (*MR* **104**: 919, 2000; recombination), Câmara *et al.* (*Mycol.* **94**: 630, 2002; phylogeny), Fukuhara (*Mycoscience* **43**: 375, 2002; on *Phragmites*), Eriksson & Hawksworth (*Mycol.* **95**: 426, 2003; phylogeny), Ueng *et al.* (*Curr. Genet.* **43**: 121, 2003; mating type genes), Ueng *et al.* (*Plant Pathology Bulletin* Taichung **12**: 255, 2003; on cereals), Solomon *et al.* (*Eur. J. Pl. Path.* **110**: 763, 2004; mating types), Stoykov (*Mycol. Balcanica* **1**: 125, 2004; Bulgaria), Tanaka (*Mycoscience* **45**: 377, 2004; Japan), Verkley *et al.* (*Mycol.* **96**: 558, 2004), Malkus *et al.* (*FEMS Microbiol. Lett.* **249**: 49, 2005; on cereals), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Adhikari *et al.* (*Phytopathology* **98**: 101, 2008; population biology, USA).

Phaeosphaeriaceae M.E. Barr (1979), Pleosporales. 19 gen. (+ 28 syn.), 394 spp.

Lit.: Leuchtmann (*Sydowia* **37**: 75, 1984), Shoemaker (*CJB* **62**: 2730, 1984), Shoemaker & Babcock (*CJB* **63**: 1284, 1985), Boise (*Mem. N. Y. bot. Gdn* **49**: 308, 1989), Shoemaker & Babcock (*CJB* **67**: 1500, 1989), Barr (*Mycotaxon* **43**: 371, 1992; keys 14 N. Am. gen.), Khashnobish & Shearer (*MR* **100**: 1355, 1996), Ramaley (*Mycotaxon* **61**: 351, 1997), Caten (*Septoria on Cereals* A Study of Pathosystems: 26, 1999), Cunfer & Ueng (*Ann. Rev. Phytopath.* **37**: 267, 1999), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000), Câmara *et al.* (*MR* **105**: 41, 2001), Câmara *et al.* (*Mycol.* **94**: 630, 2002), Câmara *et al.* (*MR* **107**: 516, 2003), Kodsueb *et al.* (*Mycol.* **98**: 571, 2006), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Phaeosphaeriopsis M.P.S. Câmara, M.E. Palm & A.W. Ramaley (2003), Pleosporales. Anamorph *Phaeostagonospora*. 6, widespread. See Câmara *et al.* (*MR* **107**: 519, 2003).

Phaeospora Hepp ex Stein (1879), ? Verrucariaceae. 15 (on lichens), widespread.

Phaeosporella Keissl. (1922) ≡ Phaeosphaerella.

Phaeosporis Clem. (1909), ? Sordariales. 2, France. See Hawksworth (*SA* **6**: 145, 1987), Krug *et al.* (*Mycol.* **86**: 581, 1994).

Phaeosporobolus D. Hawksw. & Hafellner (1986), anamorphic *Pezizomycotina*, St.0eP.3. 1 (on lichens), Europe; USA. See Hawksworth & Hafellner (*Nova Hedwigia* **43**: 525, 1986).

Phaeostagonospora A.W. Ramaley (1997), anamorphic *Phaeosphaeriopsis*, Cpd.?.?. 1, USA. See Ramaley (*Mycotaxon* **61**: 351, 1997).

Phaeostagonosporopsis Woron. (1925) = Stenocarpella fide Sutton (*Mycol. Pap.* **141**, 1977).

Phaeostalagmus W. Gams (1976), anamorphic *Chaetosphaeria*, Hso.0eH.15. 7, widespread. See Sutton & Mel'nik (*MR* **96**: 908, 1992), Réblová (*Stud. Mycol.* **50**: 171, 2004), Fernández & Huhndorf (*Fungal Diversity* **18**: 15, 2005; teleomorph).

Phaeosticta Trevis. (1869) nom. rej. = Pseudocyphellaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phaeostigme Syd. & P. Syd. (1917), Pseudoperisporiaceae. *c.* 20, widespread (tropical). See Hughes (*Mycol. Pap.* **166**, 1993).

Phaeostilbella Höhn. (1919) = Myrothecium fide Tulloch (*Mycol. Pap.* **130**, 1972).

Phaeostoma Arx & E. Müll. (1954) [non *Phaeostoma* Spach 1835, *Onagraceae*] ≡ Arxiomyces.

Phaeostomiopeltis Bat. & Cavalc. (1963) = Haplopeltheca fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Phaeotellus Kühner & Lamoure (1972) = Omphalina fide Kuyper (*in litt.*).

Phaeotheca Sigler, Tsuneda & J.W. Carmich. (1981), anamorphic *Capnodiales*, Hsp.0eP.endoconidia. 2, widespread. See DesRochers & Ouellette (*CJB* **72**: 808, 1994; sp. inhibiting *Ophiostoma ulmi*), Hoog *et al.* (*Antonie van Leeuwenhoek* **71**: 289, 1997; from humidifier), Hoog *et al.* (*Stud. Mycol.* **43**: 31, 1999; phylogeny), Zalar *et al.* (*Stud. Mycol.* **43**: 49, 1999; revision), Tsuneda *et al.* (*Mycol.* **96**: 1136, 2004; endoconidiogenesis).

Phaeothecium, see *Phacothecium*.

Phaeothecoidea Crous (2007), anamorphic *Mycosphaerellaceae*. 1, Australia. See Crous *et al.* (*Stud. Mycol.* **58**: 1, 2007), Crous *et al.* (*Fungal Diversity* **26**: 1, 2007).

Phaeothrombis Clem. (1909) = Thrombium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phaeothyriolum Syd. (1938), Microthyriaceae. 1 (on *Eucalyptus*), Australia. See Swart (*TBMS* **87**: 81, 1986).

Phaeothyrium Petr. (1947), anamorphic *Pezizomycotina*, Cpt.0eP.?. 1, China.

Phaeotomasellia Katum. (1981), Dothideomycetes. 1,

Uganda. See Katumoto (*J. Jap. Bot.* **56**: 389, 1981).

Phaeotrabutia Orejuela (1941) = Phyllachora Nitschke ex Fuckel (1870) fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Phaeotrabutiella Theiss. & Syd. (1915) = Phyllachora Nitschke ex Fuckel (1870) fide Hyde & Cannon (*Mycol. Pap.* **175**, 1999).

Phaeotrametaceae O.F. Popoff ex Piątek (2005) = Polyporaceae.

Phaeotrametes Lloyd ex J.E. Wright (1966), Polyporaceae. 1, southern hemisphere. See Wright (*Mycol.* **58**: 529, 1966), Piątek & Cabala (*Mycotaxon* **91**: 173, 2005; Poland).

Phaeotrema Müll. Arg. (1887), ? Dothideomycetes. 14. See Salisbury (*Nova Hedw.* **29**: 405, 1978), Matsumoto & Deguchi (*Bryologist* **102**: 86, 1999; anamorphs), Matsumoto (*J. Hattori bot. Lab.* **88**: 1, 2000).

Phaeotremella Rea (1912) = Tremella Pers. fide Donk (*Taxon* **7**: 238, 1958).

Phaeotrichaceae Cain (1956), Pleosporales. 3 gen., 7 spp.

Lit.: Cain (*CJB* **34**: 675, 1956), Ebersohn & Eicker (*S. Afr. J. Bot.* **58**: 145, 1992), Khan & Krug (*Proceedings of the Thirteenth Plenary Meeting of AETFAT* Zomba, Malawi, 2-11 April 1991, Vol. 1: 755, 1994), Lumbsch & Lindemuth (*MR* **105**: 901, 2001), Kruys *et al.* (*MR* **110**: 527, 2006).

Phaeotrichoconis Subram. (1956), anamorphic *Pezizomycotina*, Hso.≡ eP.26. 2, widespread. See Subramanian (*Proc. Indian Acad. Sci.* series B **44**: 2, 1956).

Phaeotrichosphaeria Sivan. (1983), ? Xylariales. Anamorph *Endophragmiella*. 4 (from wood etc.), India; British Isles; New Zealand. Perhaps related to *Iodosphaeria*. See Barr (*Mycotaxon* **39**: 43, 1990; posn), Réblová (*Mycotaxon* **71**: 13, 1999; posn), Romero & Carmarán (*Persoonia* **18**: 253, 2003).

Phaeotrichum Cain & M.E. Barr (1956), Phaeotrichaceae. 2, widespread. See Cain (*CJB* **34**: 675, 1956), Barr (*Mycotaxon* **76**: 105, 2000), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Phaeotrombis, see *Phaeothrombis*.

Phaeotrype Sacc. (1920) = Diatrype fide Petrak (*Annls mycol.* **23**: 46, 1925).

Phaeoxyphiella Bat. & Cif. (1963), anamorphic *Capnodium*, Cpd.≡ eP.?. 7, widespread. See Hughes (*Mycol.* **68**: 693, 1976).

Phaeoxyphium Bat. & Cif. (1963) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Phaeoxyphium Bat. & J.L. Bezerra (1960) ≡ Phaeoxyphium Bat. & Cif.

Phaffia M.W. Mill., Yoney. & Soneda (1976), anamorphic *Xanthophyllomyces*, Hso.0eH.3/19. 1, Japan; USA. See Nagy *et al.* (*FEMS Microbiol. Lett.* **123**: 315, 1994; PGFE), Adrio *et al.* (*Curr. Genet.* **27**: 447, 1995; PFGE), Johnson & Schroeder (*Stud. Mycol.* **38**: 81, 1995; production astaxanthin), Varga *et al.* (*Int. J. Syst. Bacteriol.* **45**: 173, 1995; isozymes, RAPD, RFLP), Kucsera *et al.* (*Antonie van Leeuwenhoek* **73**: 163, 1998; life cycle), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Fell *et al.* (*The Mycota, A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research* **7** B: 3, 2001).

Phaffomyces Y. Yamada (1997), Phaffomycetaceae. 3 (on cacti), widespread. See Yamada *et al.* (*Biosc., Biotechn., Biochem.* **63**: 827, 1999), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Phaffomycetaceae Y. Yamada, H. Kawas., Nagats., Mikata & T. Seki (1999), Saccharomycetales. 3 gen., 7 spp.

Lit.: Yamada *et al.* (*Bull. Fac. Agric. Shizuoka Univ.* **47**: 23, 1997), Yamada *et al.* (*Biosc., Biotechn., Biochem.* **63**: 827, 1999).

Phagodinium Kristiansen (1993) nom. dub., ? Fungi. 1. See Kristiansen (*Arch. Protistenk.* **143**: 213, 1993).

phagosome, a membrane surrounding an endosymbiont to form a distinctive structure, as *Nostoc*-containing vesicles of *Geosiphon*.

phagotrophic, feeding by ingestion, engulfing food.

Phakopsora Dietel (1895), Phakopsoraceae. *c.* 110 (on dicots esp. (› 30 families)), widespread (tropical). *P. pachyrhizi* (soybean rust), *P. euvitis* (vine (*Vitis*) rust); *P. gossypii* (cotton rust). See Thirumalachar & Kern (*Mycol.* **41**: 283, 1949), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983), Ono *et al.* (*MR* **96**: 825, 1992), Ono (*Mycol.* **92**: 154, 2000), Frederick *et al.* (*Phytopathology* **92**: 217, 2002; PCR soybean rust detection), Berndt (*Mycol. Progr.* **4**: 339, 2005; Tanzania), Aime (*Mycoscience* **47**: 112, 2006; family relationships).

Phakopsoraceae Cummins & Hirats. f. (1983), Pucciniales. 18 gen. (+ 8 syn.), 205 spp.

Lit.: Gjærum *et al.* (*Lidia* **5**: 13, 2000), Ono (*Mycol.* **92**: 154, 2000), Frederick *et al.* (*Phytopathology* **92**: 217, 2002), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003), Hüseyın & Selçuk (*Pakist. J. Bot.* **36**: 203, 2004), Tessmann *et al.* (*Fitopatol. Brasil* **29**: 338, 2004), Wingfield *et al.* (*Australas. Pl. Path.* **33**: 327, 2004), Aime (*Mycoscience* **47**: 112, 2006).

Phalacrichomyces R.K. Benj. (1992), Laboulbeniaceae. 2, Venezuela. See Benjamin (*Aliso* **13**: 428, 1992), Santamaria (*MR* **99**: 1071, 1995).

phalacrogenous, of conidiogenous cells arising at the same level from single hyphae to form a turf-like layer; velvety. See Gams (*Cephalosporium-artige Schimmelpilze*, 1971).

Phalangispora Nawawi & J. Webster (1982), anamorphic *Pezizomycotina*, Hsp.1bH.10. 2, pantropical. See Kuthubutheen (*TBMS* **89**: 414, 1987), Keshava Prasad & Bhat (*Mycotaxon* **83**: 405, 2002).

Phallaceae Corda (1842), Phallales. 21 gen. (+ 46 syn.), 77 spp.

Lit.: Boedijn (*Bull. Jard. bot. Buitenz. ser. 3* **12**: 71, 1932; Indonesia), Calonge (*Boln Soc. Micol. Castell.* **10**: 59, 1985), Beaton & Malajczuk (*TBMS* **86**: 478, 1986), Boa (*Mycologist* **2**: 107, 1988), Fan *et al.* (*Beih. Nova Hedwigia* **108**: 72 pp., 1994), Marren (*British Wildlife* **6**: 366, 1995), Kreisel (*Czech Mycol.* **48**: 273, 1996), Stijve (*Australas. Mycol. Newsl.* **16**: 11, 1997), Pine *et al.* (*Mycol.* **91**: 944, 1999), Bougher & Lebel (*Aust. Syst. Bot.* **14**: 439, 2001), Humpert *et al.* (*Mycol.* **93**: 465, 2001), Baseia *et al.* (*Mycotaxon* **85**: 77, 2003).

Phallales E. Fisch. (1898). Phallomycetidae. 2 fam., 26 gen., 88 spp. There may be some justification is recognizing *Gomphales* and *Phallales* as previously circumscribed at sub-ordinal level. Fams:

(1) **Claustulaceae**

(2) **Phallaceae**

For *Lit.* see fam.; see also under gasteromycetes.

Phallobata G. Cunn. (1926), Trappeaceae. 1, Australia.

Phalloboletus Adans. (1763) ≡ Morchella.
Phallogaster Morgan (1893), Phallogastraceae. 1, widespread (north temperate; ? introd.).
Phallogastraceae Locq. (1974) nom. inval., Hysterangiales. 2 gen. (+ 1 syn.), 14 spp.
phalloid, one of the *Phallales*.
Phalloidastrum Battarra (1755) nom. inval. = Phallus fide Stalpers (*in litt.*).
phallolysin, a protein of *Amanita phalloides*, has cytolytic effects *in vitro*, and is toxic to animals (Odenthal *et al.*, *Naunyn-Schmiederberg's Arch. Pharmacol.* **290l**: 133, 1975).
Phallomyces Bat. & Valle (1961) = Echinoplaca fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).
Phallomycetidae K. Hosaka, Castellano & Spatafora (2007), Agaricomycotina. Ords:
(1) **Geastrales**
(2) **Gomphales**
(3) **Hysterangiales**
(4) **Phallales**
For *Lit.* see ord. and fam.
phallotoxins, cyclic heptapeptides (phallcidin, phalloidin, phallicin, phallicidin, phallin B) toxic to humans from *Amanita phalloides* etc., see Wieland (*Science* **159**: 950, 1968; *Peptides of Amanita mushrooms*, 1986). Cf. amatoxins.
Phallus Junius ex L. (1753), Phallaceae. 18, widespread. See Baseia *et al.* (*Mycotaxon* **85**: 77, 2003; Brazil).
Phalodictyum Clem. (1909) = Rhizocarpon fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Phalomia Nieuwl. (1916) ≡ Omphalia (Fr.) Staude.
Phalostauris Clem. (1909) ≡ Willeya.
Phalothrix Clem. (1909) = Unguicularia fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).
Phaneroascus Baudyš (1919) = Cookella fide von Arx (*Persoonia* **2**: 421, 1963).
Phanerochaetaceae Jülich (1982), Polyporales. 19 gen. (+ 9 syn.), 249 spp.
Phanerochaete P. Karst. (1889), Phanerochaetaceae. Anamorph *Necator*. *c.* 65, widespread. See Donk (*Persoonia* **2**: 223, 1962), Eriksson *et al.* (*Taxon* **27**: 299, 1978; nomencl.), Eriksson *et al.* (*Cortic. N. Europ.* **5**: 987, 1978; key 12 Eur. spp.), Burdsall (*Mycol. Mem.* **10**: 165, 1985; key 46 spp.), Wu (*Acta Bot. Fenn.* **142**: 37, 1990; key Taiwan spp.), Martinez *et al.* (*Nature Biotechnology* **22**: 695, 2004; *Phanerochaete chrysosporium* genome), Martínez & Nakasone (*Sydowia* **57**: 94, 2005; Uruguay).
Phanerococculus Cif. (1954), anamorphic *Koordersiella*, Cpd.≡ eH.?. 1, Santo Domingo. See Ciferri (*Sydowia* **8**: 265, 1954).
Phanerococcus Theiss. & Syd. (1918) ? = Koordersiella fide Hansford (*Mycol. Pap.* **15**, 1946).
Phanerocorynella Höhn. (1923) ≡ Exosporiella.
Phanerocoryneum Höhn. (1923) = Clasterosporium fide Sutton (*Mycol. Pap.* **141**, 1977).
Phaneromyces Speg. & Hara (1889), Phaneromycetaceae. 1, S. America. See Gamundí & Spinedi (*Sydowia* **38**: 106, 1986), Kutorga & Hawksworth (*SA* **15**: 1, 1997).
Phaneromycetaceae Gamundí & Spinedi (1985), Pezizomycotina (inc. sed.). 1 gen., 1 spp.
Lit.: Gamundí & Spinedi (*Sydowia* **38**: 106, 1985), Kutorga & Hawksworth (*SA* **15**: 1, 1997).
phaneroplasmodium, see plasmodium.
Phanosticta Clem. (1909) = Pseudocyphellaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Phanotylium Clem. (1909) = Tremotylium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Pharcidia Körb. (1865) = Stigmidium fide Santesson (*Svensk bot. Tidskr.* **54**: 499, 1960), Roux & Triebel (*Bull. Soc. linn. Provence* **45**: 451, 1994).
Pharcidiella (Sacc.) Clem. & Shear (1931) = Phaeospora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Pharcidiopsis Sacc. (1905) = Stigmidium fide Keissler (*Rabenh. Krypt.-Fl.* **8**, 1930).
pharmaceutical prospecting, see Bioprospecting, Biotechnology, Screening.
Pharus Petch (1919) [non *Pharus* P. Browne 1756, *Gramineae*] ≡ Mycopharus.
Phascolomyces Boedijn ex Benny & R.K. Benj. (1976), Syncephalastraceae. 1, widespread. See Benny & Benjamin (*Aliso* **8**: 391, 1976), Jeffries & Young (*CJB* **56**: 747, 1978; sporangiolum ultrastr.), Jeffries & Young (*CJB* **56**: 2449, 1978; response to mycoparasitism), Balasubramanian & Manocha (*CJB* **64**: 2441, 1986; biochemistry), Benny *et al.* *in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **7A**: 113, 2001), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).
phaseolin, a phytoalexin (q.v.) from bean (*Phaseolus vulgaris*).
Phasya Syd. (1934) = Venturia Sacc. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).
Phaulomyces Thaxt. (1931), Laboulbeniaceae. 14, widespread. See De Kesel (*Mycotaxon* **50**: 191, 1994), Majewski (*Acta Mycologica* Warszawa **34**: 7, 1999; Poland), Santamaría & Rossi (*Pl. Biosystems* **133**: 163, 1999; Mediterranean).
Phellinaceae Jülich (1982) = Hymenochaetaceae.
Phellinidium (Kotl.) Fiasson & Niemelä (1984), Hymenochaetaceae. 3, Europe. See Fiasson & Niemelä (*Karstenia* **24**: 25, 1984), Wagner & Fischer (*MR* **105**: 773, 2001), Wagner & Fischer (*Mycol.* **94**: 998, 2002; phylogeny).
Phellinites Singer & S. Archang. (1958), Fossil Fungi, Basidiomycota. 1 (Jurassic), Argentina.
Phellinus Quél. (1886), Hymenochaetaceae. *c.* 180, widespread. s. str. *c.* 30 species. See Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 129, 1980; key 62 Afr. spp.), Wright & Blumenfeld (*Mycotaxon* **21**: 413, 1984; key 26 spp. Argentina), Larsen & Coldo-Poulle (*Syn. Fung.* **3**, 1990; world key), Wagner & Fischer (*MR* **105**: 773, 2001), Wagner & Fischer (*Mycol.* **94**: 998, 2002; phylogeny), Ryvarden (*Syn. Fung.* **19**: 229 pp., 2004).
Phellodon P. Karst. (1881), Bankeraceae. 16, Europe; N. America. See Stalpers (*Stud. Mycol.* **35**: 168 pp., 1993; key), Arnolds (*Coolia* **46** 3, Suppl.: 96 pp., 2003; Netherlands and Belgium), Parfitt *et al.* (*MR* **111**: 761, 2007; molecel. phylog. British spp.).
Phellomyces A.B. Frank (1898) = Colletotrichum fide Husz (*Z. Pflanzenkr. Pflanzensch.* **44**: 186, 1934).
Phellomycetes Renault (1896), Fossil Fungi (mycel.) Fungi. 1 (Carboniferous), France.
Phellomycites Mesch. (1896) ≡ Phellomycetes.
phellophagy, ability to attack cork cells (Speer, *Mycotaxon* **21**: 235, 1984).
Phellopilus Niemelä, T. Wagner & M. Fisch. (2001), Hymenochaetaceae. 1, widespread. See Niemelä *et al.* (*Ann. bot. fenn.* **38**: 53, 2001).

Phellorinia Berk. (1843), Phelloriniaceae. 1, widespread (subtropical dry areas). See Malençon (*Annals Cryptog. Exot.* **8**: 5, 1935), Long (*Lloydia* **9**: 132, 1946), Kreisel (*Česká Mykol.* **15**: 195, 1961), Martin *et al.* (*Cryptogamie, Mycologie* **21**: 3, 2000; phylogeny), Sarasini (*Rivista di Micologia* **46**: 7, 2003; mediterranean sp.), Fan & Liu (*Mycosystema* **23**: 306, 2004; China), Sarasini (*Gasteromiceti Epigei*: 406 pp., 2005).

Phelloriniaceae Ulbr. (1951), Agaricales. 2 gen. (+ 5 syn.), 2 spp.

Lit.: Wright *et al.* (*Cryptog. Mycol.* **14**: 77, 1993), Coetzee *et al.* (*Bothalia* **27**: 117, 1997), Moreno *et al.* (*Mycotaxon* **64**: 393, 1997), Calonge (*Fl. Mycol. Iberica* **3**: 271 pp., 1998), Martín *et al.* (*Cryptog. Mycol.* **21**: 3, 2000), Dios *et al.* (*Mycotaxon* **84**: 265, 2002).

Phellostroma Syd. & P. Syd. (1914), Pezizomycotina. 1, Philippines.

Phelonites Fresen. (1861), Fossil Fungi. 1 (Miocene), Germany.

Phelonitis Chevall. (1826) nom. dub., ? Dothideomycetes.

Phenacopodium Debey (1849) = Melanospora Corda fide Mussat (*Syll. fung.* **15**: 279, 1901).

Pherima Raf. (1819) ≡ Phorima.

pheromone, a substance secreted to the outside by an individual and received by a second individual of the same species, in which it induces a specific reaction, e.g. a definite behaviour or developmental process (Karlson & Luscher, *Nature* **183**: 55, 1959).

Phiala Raf. (1815) nom. dub., Fungi. No spp. included.

Phialastrum Sunhede (1989), Geastraceae. 1, Africa (tropical). See Sunhede (*Syn. Fung.* **1**: 66, 1989).

Phialea (Fr.) Gillet (1879) nom. dub., Pezizomycotina. See Dumont & Korf (*Taxon* **26**: 598, 1977).

Phialemonium W. Gams & McGinnis (1983), anamorphic *Cephalothecaceae*, Hso.0eH.15. 3, widespread. See King *et al.* (*J. Clin. Microbiol.* **31**: 1804, 1993; re-evaluation), Guarro *et al.* (*J. Clin. Microbiol.* **37**: 2493, 1999; clinical cases), Gavin *et al.* (*J. Clin. Microbiol.* **40**: 2207, 2002; endocarditis), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006; key), Weinberger *et al.* (*Medical Mycology* **44**: 253, 2006; endophthalmitis), Yaguchi *et al.* (*Mycotaxon* **96**: 309, 2006; phylogeny).

Phialetea Bat. & Nascim. (1960) = Grallomyces fide Deighton & Pirozynski (*Mycol. Pap.* **105**, 1966).

Phialicorona Subram. (1993) nom. inval. = Kionochaeta fide Sutton (*in litt.*).

phialide (after Vuillemin), a cell which develops one or more (the **polyphialide** of Hughes, *Mycol. Pap.* **45**, 1951) open ended conidiogenous loci from which a basipetal succession of conidia, **phialospores**, develops without an increase in length of the phialide itself (Hughes, *loc. cit.*); cf. annellophore; sterigma. In some fungi, e.g. *Acremonium*, the phialide may be the conidiophore; more frequently the phialide is either an end cell of a conidiophore or attached to a conidiophore (or **phialophore**). See Roquebert (*Rev. Myc.* **40**: 417, 1976; review), terminus phialospore, and Minter *et al.* (*TBMS* **81**: 109, 1983; history).

phialidic (of conidiogenesis, obsol.), the sort of conidiogenesis in which each conidium (**phialoconidium**, phialidic conidium, phialospore) originates by the laying down of new wall material not from existing walls or layers of the wall of the conidiogenous cell (**phialide**). A *basipetal* succession of conidia is formed from a *fixed* conidiogenous locus (cf. tretic). **mono-**, **poly-**, (of phialides), producing conidia through a single opening or a sympodial irregular or synchronous succession of openings, respectively, in the conidiogenous cell wall.

Phialina Höhn. (1926), Hyaloscyphaceae. 13, widespread (north temperate). See Huhtinen (*Karstenia* **29**: 545, 1990; key), Baral (*Z. Mykol.* **59**: 3, 1993; ? synonymy with *Calycellina*), Huhtinen & Scheuer (*Öst. Z. Pilzk.* **4**: 1, 1995), Raitviir & Schneller (*Sydowia* **55**: 306, 2003), Raitviir (*Scripta Mycol.* **20**, 2004).

Phialisphaera Dumort. (1822) nom. dub., Pezizomycotina.

Phialoarthrobotryum Matsush. (1975), anamorphic *Pezizomycotina*, Hsy.≡ eP.15. 1, Japan. See Matsushima (*Icon. microfung. Matsush. lect.*: 111, 1975), Okada & Tubaki (*Sydowia* **39**: 148, 1986).

Phialoascus Redhead & Malloch (1977), ? Endomycetaceae. 1, Canada. Has been linked to *Cephaloascus*, but similarities are probably superficial. See Malloch & Hoog *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 197, 1998), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Phialocephala W.B. Kendr. (1961), anamorphic *Vibrisseaceae*, Hso.0eP.15. 20, widespread. See Wingfield *et al.* (*TBMS* **89**: 509, 1987; classification), Currah & Tsuneda (*TMSJ* **34**: 345, 1993; sporulation *P. fortinii* in culture), Onofri *et al.* (*MR* **98**: 745, 1994; key), Kowalski & Kehr (*CJB* **73**: 26, 1995; n.spp.), Kirschner & Oberwinkler (*Sydowia* **50**: 205, 1998; n.sp.), Vujanovic *et al.* (*Mycol.* **92**: 571, 2000; on orchids), Jacobs *et al.* (*CJB* **79**: 110, 2001), Grünig *et al.* (*CJB* **80**: 1239, 2002; phylogeny), Vrålstad *et al.* (*New Phytol.* **155**: 131, 2002; phylogeny), Grünig *et al.* (*MR* **107**: 1332, 2003; population biology), Jacobs *et al.* (*Mycol.* **95**: 637, 2003; phylogeny), Grünig *et al.* (*Fungal Genetics Biol.* **41**: 676, 2004; cryptic species), Piercey *et al.* (*MR* **108**: 955, 2004; genetic diversity, Canada), Grünig *et al.* (*Fungal Genetics Biol.* **43**: 410, 2006; population genetics, Sweden), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Grünig *et al.* (*Mycol.* **100**: 47, 2008; cryptic speciation).

Phialocladus Kreisel (1972) nom. inval. ≡ Escovopsis.

Phialoconidiophora M. Moore & F.P. Almeida (1937) = Fonsecaea fide de Hoog (*Stud. Mycol.* **15**, 1977), Hoog *et al.* (*Medical Mycology* **42**: 405, 2004).

Phialocorona Subram. (1995) = Kionochaeta fide Sutton (*in litt.*).

Phialocybe P. Karst. (1879) ? = Crepidotus fide Singer (*Agaric. mod. Tax.*, 1951).

Phialogangliospora Udaiyan & V.S. Hosag. (1992), anamorphic *Pezizomycotina*, Hso.0eH.40+15. 1 (from cooling tower), India. See Udaiyan & Hosagoudar (*J. Econ. Taxon. Bot.* **15**: 654, 1991).

Phialogeniculata Matsush. (1971), anamorphic *Chaetosphaeriaceae*, Hso.≡ eH.15. 1, Guadaloupe. See Kuthubutheen & Nawawi (*MR* **95**: 1220, 1991; synonymy with *Dictyochaeta*).

Phialographium H.P. Upadhyay & W.B. Kendr. (1974), anamorphic *Ophiostoma*. See Wingfield *et al.* (*MR* **95**: 1328, 1991), Harrington *et al.* (*Mycol.* **93**: 111, 2001; morphology, phylogeny), Zhou *et al.* (*Mycol.* **96**: 1306, 2004).

Phialomyces P.C. Misra & P.H.B. Talbot (1964), anamorphic *Pezizomycotina*, Hso.0eH/1eP.32/33. 2, widespread. See Misra & Talbot (*CJB* **42**: 1287,

1964), Castañeda Ruiz & Gams (*Mycotaxon* **42**: 239, 1991), Delgado Rodriguez & Decock (*Mycol.* **95**: 896, 2003).

Phialophaeoisaria Matsush. (1995), anamorphic *Pezizomycotina*, Hsy.0eH.16. 1, Japan. See Matsushima (*Matsush. Mycol. Mem.* **8**: 29, 1995).

Phialophora Medlar (1915), anamorphic *Herpotrichiellaceae*, Hso.0eH/1eP.15. 2, widespread. *P. verrucosa* (a cause of chromoblastomycosis (q.v.) in humans). The genus in its traditional circumscription is grossly polyphyletic; see segregates including especially *Cadophora*, *Harpophora*, *Lecythophora* and *Phaeoacremonium*. See Cain (*CJB* **30**: 338, 1952), Schol-Schwarz (*Persoonia* **6**: 63, 1970; key), Gams & Holubová-Jechová (*Stud. Mycol.* **13**, 1976), Yamamoto *et al.* (*Ann. phytopath. Soc. Japan* **56**: 584, 1990; isozyme polymorphism in *P. gregata*), Kobayashi *et al.* (*Ann. phytopath. Soc. Japan* **57**: 225, 1991; f.spp. in *P. gregata*), Yamamoto *et al.* (*TMSJ* **34**: 465, 1993; RFLPs in *P. gregata*), Yan *et al.* (*Mycol.* **87**: 72, 1995; rDNA supports morphol. spp. separation), de Hoog *et al.* (*Stud. Mycol.* **43**: 107, 1999; *P. verrucosa* complex), Untereiner & Naveau (*Mycol.* **91**: 67, 1999), Gams (*Stud. Mycol.* **45**: 187, 2000; review, polyphyly), Hoog *et al.* (*Mycoses* **43**: 409, 2000; in humans).

phialophore, see phialide.

Phialophorophoma Linder (1944), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1 (marine), Europe; USA. See Hyde (*Beih. Sydowia* **43**: 31, 1991).

Phialophoropsis L.R. Batra (1968) ? = Ambrosiella fide Sutton & Brady (*TBMS* **72**: 337, 1979), Gebhardt *et al.* (*MR* **109**: 687, 2005).

Phialopsis Körb. (1855) = Gyalecta Ach. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phialoscypha Raitv. (1977) = Phialina fide Huhtinen (*Karstenia* **29**: 545, 1990).

Phialoselanospora Udaiyan (1992), anamorphic *Pezizomycotina*, Hso.0eH.15. 1 (from water cooling tower), India. See Udajyan (*J. Econ. Taxon. Bot.* **15**: 627, 1991).

Phialospora Raf. (1832) ≡ Cucurbitaria.

phialospore, see phialide.

Phialosporostilbe Mercado & J. Mena (1985), anamorphic *Pezizomycotina*, Hsy.0eH.15. 1, pantropical. See Mercado & Mena (*Revta Jardín bot. Nac.* Univ. Habana **6**: 57, 1985), Shirouzu & Harada (*Mycoscience* **45**: 390, 2004).

Phialostele Deighton (1969), anamorphic *Pezizomycotina*, Hsy/Hsp.0eH.15. 1, Africa. See Deighton (*Mycol. Pap.* **117**: 11, 1969).

Phialotubus R.Y. Roy & Leelav. (1966), anamorphic *Pezizomycotina*, Hso.0eH.32/33. 1, India. See Roy & Leelavathy (*TBMS* **49**: 495, 1966).

Phibalis Wallr. (1833) nom. rej. = Encoelia fide Korf & Kohn (*Mem. N. Y. bot. Gdn* **28**: 109, 1976).

Philately. More than 1400 postage stamps, of over 100 countries, illustrating 575 spp. fungi issued up to 1996 are catalogued by McKenzie (*Collect fungi on stamps*, 1997). Macromycetes predominate but some medically important fungi, lichens and mycorrhizas are covered. See also Ing (*Bull. BMS* **10**: 32, 1976), Moss & Dunkley (*Bull. BMS* **15**: 61, 1981), Moss (*Mycologist* **6**: 68, 1992, **7**: 28, 1993), Coetzee (*Mycologist* **7**: 29, 1993).

Phillippiregis Cif. & Tomas. (1953) ≡ Polyblastidea.

Phillipsia Berk. (1881) nom. cons., Sarcoscyphaceae. Anamorph *Molliardiomyces*. *c.* 17, widespread (subtropical; tropical). See Denison (*Mycol.* **61**: 289, 1969; key C. Am. spp.), Paden (*CJB* **55**: 2685, 1977), Paden (*Mycotaxon* **25**: 165, 1986; anamorph), Romero & Gamundí (*Darwiniana* **27**: 43, 1986; key 4 spp. Argentina, SEM), Li & Kimbrough (*CJB* **74**: 10, 1996; ontogeny), Hansen *et al.* (*Mycol.* **91**: 299, 1999; phylogeny, SEM), Weinstein *et al.* (*Mycol.* **94**: 673, 2002; phylogeny), Prasad & Pant (*Journal of Mycopathological Research* **41**: 99, 2003), Zhuang (*Mycotaxon* **86**: 291, 2003; China), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Phillipsiella Cooke (1878), Phillipsiellaceae. 7, America. See Rossman *et al.* (*Sydowia* **46**: 66, 1994).

Phillipsiellaceae Höhn. (1909), ? Dothideomycetes (inc. sed.). 1 gen. (+ 2 syn.), 7 spp.

Lit.: Rossman *et al.* (*Sydowia* **46**: 66, 1994) suggest a possible relationship with the *Schizothyriaceae*.

Lit.:, Kohlmeyer *et al.* (*CJB* **76**: 470, 1998).

Philliscidiopsis, see *Phylliscidiopsis*.

Philobryon Döbbeler (1988), Dothideomycetes. 1 (on *Bryophyta*), Papua New Guinea. See Döbbeler (*Pl. Syst. Evol.* **158**: 335, 1988).

Philocopra Speg. (1880) = Podospora fide Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972).

Philonectria Hara (1914), Dothideomycetes. 3, Japan; Uganda. See Eriksson & Hawksworth (*SA* **6**: 146, 1987).

Philophora Wallr. (1833) = Rhizopus fide Hesseltine (*Mycol.* **47**: 344, 1955).

Phlebia Fr. (1821), Meruliaceae. *c.* 50, widespread. See Cooke (*Mycol.* **48**: 386, 1956), Corner (*Gdns' Bull.* Singapore **25**: 355, 1971; Malaysian spp.), Ginns (*CJB* **54**: 100, 1976; disposition spp.), Nakasone & Burdsall (*Mycotaxon* **21**: 241, 1984; synonymy with *Merulius*), Wu (*Acta Bot. Fenn.* **142**: 25, 1990; key Taiwan spp.), Spirin & Zmitrovich (*Novosti Sistematiki Nizshikh Nov. sist. Niz. Rast.* **37**: 166, 2004).

Phlebiaceae Jülich (1982) = Meruliaceae.

Phlebiella P. Karst. (1890), Polyporales. *c.* 20, widespread. See Stalpers (*in litt.*), Hjortstam *et al.* (*Cortic. N. Europ.* **8**, 1988; key Eur. spp.) = *Xenasmatella* fide.

Phlebiopsis Jülich (1978), Phanerochaetaceae. 11, widespread. See Burdsall (*Mycol. Mem.* **10**, 1985), Vainio & Hantula (*Mycol.* **92**: 436, 2000; genetics *Phlebiopsis gigantea*), Hjortstam *et al.* (*Syn. Fung.* **20**: 42, 2005; Venezuela) = *Phanerochaete* fide.

Phlebogaster Fogel (1980), Claustulaceae. 2, Canary Islands; Asia. See Fogel (*Contr. Univ. Mich. Herb.* **14**: 79, 1980).

Phlebomarasmius R. Heim (1967) ? = Xeromphalina fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

Phlebomycena R. Heim (1966) = Mycena fide Singer (*Agaric. mod. Tax.*, 1951).

Phlebonema R. Heim (1929), ? Agaricaceae. 1, Madagascar. See Heim (*Compte rendu hebdomadaire des Sciences de l'Academie des sciences* Paris **188**: 1568, 1929).

Phlebophora Lév. (1841) nom. dub. = Tricholoma fide Boedijn (*Sydowia* **5**: 211, 1951).

Phlebophyllum R. Heim (1969), ? Agaricales. 1, Gabon. See Heim (*Revue Mycol.* Paris **33**: 38, 1968).

Phlebopus (R. Heim) Singer (1936), Boletinellaceae. 12 (saprotrophs, possibly ectomycorrhizal with exotic trees), widespread (pantropical). Saprotrophs, under exceptional conditions possibly ectomycorrhizal with exotic trees. See Groves (*Mycol.* **54**: 319, 1962), Groves (*Fl. Illustr. Champ. Afr. centr.* **7**: 128, 1980),

Groves (*Mycotaxon* **15**: 384, 1982), Thoen & Ducousso (*Agric., Ecosyst. Envir.* **28**: 519, 1989; possibly ectomycorrhizal), Bruns *et al.* (*Mol. Ecol.* **7**: 257, 1998; phylogeny), Deschamps & Moreno (*Mycotaxon* **72**: 205, 1999; Argentina).

Phleboscyphus Clem. (1903) = Helvella fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Phlebriella, see *Phlebiella*.

Phlegmacium (Fr.) Wünsche (1877) = Cortinarius fide Kauffman (*N. Amer. Fl.* **10**, 1932) but used by, Moser (*Die Gattung Phlegmacium*, 1960).

Phlegmatium Fr. (1819) nom. dub., Agaricomycetes. 'basidiomycetes', inc. sed. See Horníček (*Mykol. Sborn.* **4**: 121, 1984).

Phlegmophiale Zahlbr. (1926) = Arthonia fide Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Phlegographa, see *Flegographa*.

Phleogena Link (1833), Phleogenaceae. 1, widespread (north temperate). See Donk (*Persoonia* **4**: 160, 1966), McNabb *in* Ainsworth *et al.* (Eds) (*The Fungi* **4B**: 303, 1973), Holec (*Mykologické Listy* **84-85**: 33, 2003; Czech Republic), Aime *et al.* (*Mycol.* **98**: 896, 2006; phylogeny).

Phleogenaceae Gäum. (1926), Atractiellales. 6 gen. (+ 6 syn.), 30 spp.

Lit.: Oberwinkler & Bandoni (*CJB* **60**: 1726, 1982), Oberwinkler & Bandoni (*Mycol.* **74**: 634, 1982), Oberwinkler & Bauer (*Sydowia* **41**: 224, 1989), Cook (*Mycologist* **8**: 107, 1994), Hladun (*Clementeana* **4**: 48, 1999), Kirschner *et al.* (*Mycol.* **91**: 542, 1999), Bandoni & Inderbitzin (*Czech Mycol.* **53**: 265, 2002), Bauer *et al.* (*Mycol.* **95**: 756, 2003), Bauer *et al.* (*Mycol. Progr.* **5**: 41, 2006).

Phloeochora Höhn. (1917) = Phloeospora fide Sutton (*Mycol. Pap.* **141**, 1977).

Phloeoconis Fr. (1849), anamorphic *Pezizomycotina*, Hso.?.?. 3, widespread (temperate).

Phloeopannaria Zahlbr. (1941) = Psoroma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phloeopeccania J. Steiner (1902), Lichinaceae (L). 1, Arabia; N. America. See Moreno & Egea (*Acta Bot. Barcinon.* **41**: 1, 1992), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key), Schultz & Mies (*Nova Hedwigia* **77**: 73, 2003; Socotra), Schultz & Büdel (*Bryologist* **108**: 520, 2005; Mexico).

Phloeopeccaniomyces Cif. & Tomas. (1953) ≡ Phloeopeccania.

Phloeoscoria Wallr. (1825) ≡ Polymorphum.

Phloeospora Wallr. (1833), anamorphic *Mycosphaerella*, Cac.≡ eH.19. *c.* 160, widespread. See Sutton (*The Coelomycetes*, 1980), Evans *et al.* (*MR* **97**: 59, 1993; biocontrol), Fatehi & Punithalingam (*Kew Bull.* **54**: 571, 1999; on *Lens*), Verkley & Priest (*Stud. Mycol.* **45**: 123, 2000; review), Verkley *et al.* (*Mycol.* **96**: 558, 2004; phylogeny), Feau *et al.* (*Mol. Phylogen. Evol.* **40**: 808, 2006; phylogeny).

Phloeosporella Höhn. (1924), anamorphic *Blumeriella*, Cac.≡ eH.10. 13, widespread. See Sutton (*The Coelomycetes*, 1980), Williamson & Bernard (*CJB* **66**: 2048, 1988; teleomorph), Sutton *et al.* (*MR* **100**: 979, 1996; N America), Yip (*Australas. Pl. Path.* **26**: 26, 1997; on *Eucalyptus*), Taylor & Crous (*MR* **104**: 618, 2000; on *Proteaceae*).

Phloeosporina Höhn. (1924), anamorphic *Pezizomycotina*, Cac.≡ eH.?. 2, Europe (eastern). See Sameva (*Mycol. Balcanica* **1**: 55, 2004; Bulgaria).

Phloepeccania Henssen (1990), Lichinaceae (L). 1, Australasia. See Henssen (*Lichenes Cyanophili et Fungi Saxicolae Exsiccati* Fascicle **2** (nos 1-25): [10], 1990).

Phlogicylindrium Crous, Summerb. & Summerell (2006), anamorphic *Amphisphaeriaceae*. 2, Australia. See Summerell *et al.* (*Fungal Diversity* **23**: 340, 2006).

Phlogiotis Quél. (1886) = Guepinia Fr. fide Donk (*Persoonia* **4**: 185, 1966).

Phlyctaena, see *Phlyctema*.

Phlyctaeniella Petr. (1922), anamorphic *Pezizomycotina*, St.0fH.15. 1 or 3, Europe; Australia.

Phlyctella Kremp. (1876) = Phlyctis fide Galloway & Guzmán Grimaldi (*Lichenologist* **20**: 393, 1988).

Phlyctellomyces Cif. & Tomas. (1953) ≡ Phlyctella.

Phlyctema Desm. (1847), anamorphic *Neofabraea*, St.0eH.15. *c.* 30, widespread. See Sutton (*The Coelomycetes*, 1980), Spiers & Hopcroft (*N.Z. Jl Bot.* **28**: 67, 1990; TEM *P. vagabunda*), Verkley (*Stud. Mycol.* **44**: 180 pp., 1999; review), Abeln *et al.* (*Mycol.* **92**: 685, 2000; phylogeny), Jong *et al.* (*MR* **105**: 658, 2001; phylogeny), Gariépy *et al.* (*MR* **107**: 528, 2003; phylogeny).

Phlyctibasidium Jülich (1974), Agaricomycetidae. 1, Europe. See Vězda (*Folia geobot. phytotax.* **21**: 208, 215, 1986).

Phlyctidaceae Poelt ex J.C. David & D. Hawksw. (1991), Ostropales (L). 2 gen. (+ 9 syn.), 13 spp.

Lit.: Brusse (*Bothalia* **17**: 182, 1987), Galloway & Guzmán Grimaldi (*Lichenologist* **20**: 393, 1988), Wedin *et al.* (*MR* **109**: 159, 2005), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Phlyctidia Müll. Arg. (1895) = Phlyctis fide Galloway & Guzmán Grimaldi (*Lichenologist* **20**: 393, 1988).

Phlyctidiaceae Sparrow (1942) = Chytridiaceae.

Phlyctidium (A. Braun) Rabenh. (1868) [non *Phlyctidium* Wallr. 1833] = Rhizophydium fide Longcore (*in litt.*).

Phlyctidium Müll. Arg. (1888) [non *Phlyctidium* Wallr. 1833] = Calenia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phlyctidium Wallr. (1833) = Spilocaea fide Sutton (*Mycol. Pap.* **141**, 1977).

Phlyctidomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Phlyctis.

Phlyctis (Wallr.) Flot. (1850) nom. cons., Phlyctidaceae (L). *c.* 12, widespread. See Erichsen (*Hedwigia* **70**: 216, 1930), Galloway & Guzmán Grimaldi (*Lichenologist* **20**: 393, 1988), Wedin *et al.* (*MR* **109**: 159, 2005; phylogeny).

Phlyctochytrium J. Schröt. (1892), Chytridiaceae. *c.* 30, widespread (temperate). See Sparrow (*Aquatic Phycomycetes* Edn 2: 324, 1960; key), Barr (*CJB* **62**: 1171, 1984), Letcher & Powell (*Nova Hedwigia* **80**: 135, 2005).

Phlyctomia A. Massal. (1860) = Phlyctis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phlyctorhiza A.M. Hanson (1946), Chytridiaceae. 1, America.

Phlyctospora Corda (1841) = Scleroderma fide Stalpers (*in litt.*).

Phoebus R.C. Harris & Ladd (2007), Roccellaceae (L). 1, USA. See Harris & Ladd (*Opuscula Philolichenum* **4**: 57, 2007).

phoenicoid fungi, fungi growing amongst the ashes of former fires (Carpenter & Trappe, *Mycotaxon* **23**: 203, 1985); see Pyrophilous fungi.

Phoenicostroma Syd. (1925) = Coccostromopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8,

1995), Hyde & Cannon (*Mycol. Pap.* **175**, 1999).

Pholidotopsis Earle (1909) = Galerina fide Singer (*Agaric. mod. Tax.*, 1951).

Pholiota (Fr.) P. Kumm. (1871) nom. cons., Strophariaceae. *c.* 150 (lignicolous causing heartwood rot), widespread (esp. temperate). See Smith & Hesler (*The North American species of Pholiota*, 1968; 205 taxa, keys), Jacobsson (*Mycotaxon* **36**: 95, 1989; culture), Klán *et al.* (*Mycotaxon* **36**: 249, 1989; culture), Jacobsson (*Windahlia* **19**: 1, 1990; key Eur. spp.), Holec (*Libri Botanici* **20**: 220 pp., 2001), Bon & Roux (*Docums Mycol.* **33**: 3, 2003; key), Chang *et al.* (*Australasian Mycologist* **24**: 53, 2006; Tasmania) See nameko.

Pholiotella Speg. (1889) nom. rej. = Conocybe fide Kuyper (*in litt.*).

Pholiotina Fayod (1889), Bolbitiaceae. *ca*, cosmopolitan. See Singer (*Agaric. mod. Tax.* edn 2, 1962; 16 spp.).

Phoma Fr. (1821) nom. rej. = Plagiostoma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phoma Sacc. (1880) nom. cons., anamorphic *Didymella*, Cpd.0-1eH.15. *c.* 140, widespread. See Boerema (*Persoonia* **3**: 9, 1963; typification), Dorenbosch (*Persoonia* **6**: 1, 1970; soil spp.), Boerema & Dorenbosch (*Stud. Mycol.* **3**, 1973; fruit rotting spp.), Boerema & Bollen (*Persoonia* **8**: 111, 1975; sep. from *Ascochyta*), Boerema (*TBMS* **67**: 289, 1976; spp. studied by Dennis), Sutton (*The Coelomycetes*, 1980; key 27 spp.), Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 49, 1981; lichenicolous spp.), Morgan-Jones *et al.* (*Mycotaxon* **16**: 403, 1983; studies on *Phoma*), Rajak & Rai (*J. Econ. Taxon. Bot.* **7**: 588, 1986; key to spp. in culture), Monte & Garcia-Acha (*TBMS* **91**: 133, 1988; germination of *P. betae*), Monte & Garcia-Acha (*TBMS* **90**: 659, 1988; ultrastr. conidiogenesis *P. betae*), Pons (*Fitopat. Venez.* **3**: 34, 1990; spp. on *Saccharum*), Upadhyay *et al.* (*CJB* **68**: 2059, 1990; *P. cyperi* phytotoxin production), van der Aa *et al.* (*Stud. Mycol.* **32**: 1, 1990; sect. classn), Monte *et al.* (*Mycopathologia* **115**: 89, 1991; integrated systematics), de Gruyter & Nordeloos (*Persoonia* **15**: 71, 1992; sect. *Phoma*), Schäfer & Wöstemeyer (*J. Phytopath.* **136**: 124, 1992; aggressive and non-aggressive strains of *P. lingam* separated by PCR), Boerema (*Persoonia* **15**: 197, 1993; sect. *Peyronellaea*), de Gruyter *et al.* (*Persoonia* **15**: 369, 1993; sect. *Phoma*, taxa with small conidia), Nordeloos *et al.* (*MR* **97**: 1343, 1993; dendritic crystals and taxonomy), Boerema *et al.* (*Persoonia* **15**: 431, 1994; sect. *Plenodomus*), Boerema (*Mycotaxon* **64**: 321, 1997; infrageneric names), de Gruyter *et al.* (*Persoonia* **16**: 471, 1998), Voigt *et al.* (*J. Phytopath.* **146**: 567, 1998; population study), Boerema & Gruyter (*Persoonia* **17**: 273, 1999), Boerema *et al.* (*Persoonia* **17**: 281, 1999), Miric *et al.* (*Aust. J. agric. Res.* **50**: 325, 1999; on *Helianthus*), Aa *et al.* (*Persoonia* **17**: 435, 2000), Pedras & Biesenthal (*Can. J. Microbiol.* **46**: 685, 2000; chemistry), Voigt *et al.* (*Microbiol. Res.* **156**: 169, 2001; cryptic species), Abeln *et al.* (*MR* **106**: 419, 2002; population genetics), Gruyter (*Persoonia* **18**: 85, 2002), Gruyter & Boerema (*Persoonia* **17**: 541, 2002), Gruyter *et al.* (*Persoonia* **18**: 1, 2002), Hollingsworth *et al.* (*Mycotaxon* **81**: 331, 2002; cultural plasticity), Larsen *et al.* (*Pl. Dis.* **86**: 928, 2002; molecular detection), Boerema (*Persoonia* **18**: 153, 2003), Mendes-Pereira *et al.* (*MR* **107**: 1287, 2003; phylogeny), Arenal *et al.* (*Mycotaxon* **89**: 465, 2004; *Epicoccum* synanamorph), Barrins *et al.* (*Australas. Pl. Pl. Path.* **33**: 173, 2004; on *Chrysanthemum*), Balmas *et al.* (*Eur. J. Pl. Path.* **111**: 235, 2005; *P. tracheiphila*), Torres *et al.* (*Mycotaxon* **93**: 333, 2005; separation from *Plenodomus*), Voigt *et al.* (*Mol. Phylogen. Evol.* **37**: 541, 2005; phylogeny), Zhou *et al.* (*Mycol.* **97**: 612, 2005; biocontrol), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Phomachora Petr. & Syd. (1925), anamorphic *Pezizomycotina*, St.0eH.?. 2 or 3, America; Australia.

Phomachorella Petr. (1947), anamorphic *Pezizomycotina*, St.0eH.?. 1, S. Africa. See Swart (*TBMS* **48**: 463, 1965).

Phomatosphaeropsis Ribaldi (1953) = Sphaeropsis Sacc. fide Sutton (*The Coelomycetes*, 1980).

Phomatospora Sacc. (1875), Xylariales. Anamorph *Sporothrix*-like. 37 (on dead stems etc., sometimes aquatic), widespread. See Rappaz (*Mycotaxon* **45**: 323, 1992; anamorph), Barr (*Mycotaxon* **51**: 191, 1994), Fallah & Shearer (*Mycol.* **90**: 323, 1998), Jeewon *et al.* (*MR* **107**: 1392, 2003; phylogeny).

Phomatosporella Tak. Kobay. & K. Sasaki (1982), anamorphic *Phomatospora*, St.0eH.?. 1, Japan. See Kobayashi & Sasaki (*TMSJ* **23**: 254, 1982).

Phomatosporopsis Petr. (1925) = Phomatospora fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

phomin, a cytostatic antibiotic from *Phoma* sp. (S 298) (Rothweiler & Tamm, *Experientia* **22**: 750, 1966); cytochalasin B (q.v.).

Phomites Fritel (1910), Fossil Fungi. 2 (Cretaceous, Paleocene), France; India.

Phomopsella Höhn. (1920) = Phomopsis (Sacc.) Bubák. fide Petrak (*Annls mycol.* **23**: 1, 1925).

phomopsin, see lupinosis.

Phomopsina Petr. (1922) = Phoma Sacc. fide Clements & Shear (*Gen. Fung.*, 1931).

Phomopsioides M.E.A. Costa & Sousa da Câmara (1954) = Phomopsis (Sacc.) Bubák. fide Sutton (*Mycol. Pap.* **141**, 1977).

Phomopsis (Sacc.) Bubák (1905) nom. cons., anamorphic *Diaporthe*, St.0eH.15. *c.* 234, widespread. See Uecker (*Mycol. Mem.* **13**, 1988; list sp. names), Tomaz *et al.* (*Publ. Lab. Patol. Veg. 'Ver. de Alm.' Lisboa*: 54, 1989; *P. mali* on almonds), Brayford (*MR* **94**: 691 and 745, 1990; variation and vegetative incompatibility in spp. from *Ulmus*), Wechtl (*Linzer biol. Beitr.* **22**: 161, 1990; spp. on *Compositae* and *Umbelliferae*), Shivas *et al.* (*MR* **95**: 320, 1991; variation in *P. leptostromiformis* from lupin), Uecker & Johnson (*Mycol.* **83**: 192, 1991; spp. on *Asparagus*), Rehner & Uecker (*CJB* **72**: 1666, 1994; DNA and species concepts), Muntañola-Cvetković *et al.* (*J. Phytopath.* **144**: 285, 1996; growth patterns and incompatibility), Zhou *et al.* (*Mycosystema* **17**: 199, 1998; ontogeny), Farr *et al.* (*Mycol.* **91**: 1008, 1999; on *Prunus*), Kanematsu *et al.* (*Ann. phytopath. Soc. Japan* **65**: 264, 1999; Japan), Phillips (*Mycol.* **91**: 1001, 1999; on *Vitis*), Sutton *et al.* (*J. Clin. Microbiol.* **37**: 807, 1999; from human), Kajitani & Kanematsu (*Mycoscience* **41**: 111, 2000; on *Vitis*, Japan), Kanematsu *et al.* (*J. Gen. Pl. Path.* **66**: 191, 2000;

phylogeny, on fruit trees), Scheper *et al.* (*MR* **104**: 226, 2000; teleomorph, on *Vitis*), Mostert *et al.* (*Sydowia* **53**: 227, 2001; on *Protea*), Mostert *et al.* (*Mycol.* **93**: 146, 2001; on *Vitis*, S Africa), Roy *et al.* (*Mycopathologia* **150**: 15, 2001; on *Glycine*), Farr *et al.* (*Mycol.* **94**: 494, 2002; on *Vaccinium*, USA), Says-Lesage *et al.* (*Phytopathology* **92**: 308, 2002; on *Helianthus*, France), Castlebury *et al.* (*Mycoscience* **44**: 203, 2003; phylogeny, teleomorph), Phillips (*Sydowia* **55**: 274, 2003; on *Foeniculum*), Rekab *et al.* (*MR* **108**: 393, 2004; on *Helianthus*), Adams *et al.* (*Stud. Mycol.* **52**: 146 pp., 2005), Schilder *et al.* (*Pl. Dis.* **89**: 755, 2005; on *Vitis*, N America), Murali *et al.* (*Can. J. Microbiol.* **52**: 673, 2006; endophytes).

Phomopsis Sacc. & Roum. (1884) nom. rej. prop., Pezizomycotina.

Phomyces Clem. (1931), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1 (on *Meliola*), Brazil.

Phorcys Niessl (1876) = Amphisphaeria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phorima Raf. (1830) nom. dub. = Hexagonia Fr. fide Cooke (*Spec. Publ. Div. Myc. Dis. Surv. US Department of Agriculture* **3**, 1953).

phorophyte, the 'hcst' tree of an epiphyte.

photo- (prefix), pertaining to light.

photobiont, a photosynthetic symbiont in a lichen which may be a eukaryotic alga (phycobiont), see Gärtner (*in* Reisser (Ed.), *Algae and symbiosis*: 325, 1992; review systematics), or a cyanobacterium (bactobiont, cyanobiont) (Ahmadjian, *Internat. Lich. Newsl.* **15** (2): 19, 1982), Büdel (*in* Reisser (Ed.), *Algae and symbiosis*: 301, 1992; review systematics).

photomorph, an organism whose form is determined by the nature of its photosynthesis (Laundon, *Taxon* **44**: 387, 1995); see also Lichens, phycotype, phototype, photosymbiodeme, phycosymbiodeme.

photophilous, having a preference for well-illuminated habitats; cf. heliophilous, anheliophilous.

photophobous, having a preference for shaded habitats.

photosporogenic, requiring light for sporogenesis.

photosymbiodeme, a replacement term for phycosymbiodeme to allow for one biont being a cyanobacterium (Stocker-Wörgötter & Türk, *Crypt. Bot.* **4**: 300, 1994); a photomorph. See Lichens.

phototaxis, movement (e.g. of zoospores) influenced by light.

phototropism, see tropism.

Phragmaspidium Bat. (1960), ? Microthyriaceae. 3, widespread. See Batista (*Publçôes Inst. Micol. Recife* **260**: 109, 1960).

Phragmeriella Hansf. (1946), Pseudoperisporiaceae. 1 (on *Meliolaceae*), Africa.

Phragmidiaceae Corda (1837), Pucciniales. 14 gen. (+ 13 syn.), 164 spp.

Lit.: Eriksson (*Mycotaxon* **15**: 249, 1982), Wahyuno *et al.* (*Mycoscience* **42**: 519, 2001), Ono (*Mycoscience* **43**: 37, 2002), Wahyuno *et al.* (*Mycoscience* **43**: 159, 2002), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003), Maier *et al.* (*CJB* **81**: 12, 2003), Wingfield *et al.* (*Australas. Pl. Path.* **33**: 327, 2004), Ritz *et al.* (*MR* **109**: 603, 2005), Aime (*Mycoscience* **47**: 112, 2006), Gomez *et al.* (*MR* **110**: 423, 2006).

Phragmidiella Henn. (1905), Phakopsoraceae. *c.* 8 (on *Bignoniaceae*, *Meliaceae*), Africa; India; S. America. See Ramachar & Rao (*Mycol.* **73**: 778, 1981).

Phragmidiites Babajan & Tasl. (1970), Fossil Fungi. 1 (Tertiary), former USSR.

Phragmidiopsis (G. Winter) Mussat (1901) = Phragmidium fide Berndt (*in litt.*).

Phragmidium Link (1816), Phragmidiaceae. Anamorph *Physonema*. *c.* 110 (on *Rosa*, *Rubus*, *Potentilla* (*Rosaceae*) autoecious), widespread (esp. temperate). *P. violaceum* (blackberry (*Rubus*) rust), *P. rubi-idaei* (raspberry rust) and *P. mucronatum* (rose (*Rubus*) rust). See Dietel (*Hedwigia* **44**: 112, 1905), Dietel (*Hedwigia* **44**: 330, 1905), Cummins (*Mycol.* **23**: 433, 1931), Hiratsuka *et al.* (*Rep. Tottori Mycol. Inst.* **18**: 53, 1980), Wei (*Mycosystema* **1**: 179, 1988), Wahyuno *et al.* (*Mycoscience* **42**: 519, 2001; morph. urediniosp. & telios.), Helfer (*Nova Hedwigia* **81**: 325, 2005; Europ. spp.), Ritz *et al.* (*MR* **109**: 603, 2005; evolut.).

Phragmitensis K.M. Wong, Poon & K.D. Hyde (1998), Hyponectriaceae. 1 (on dead stems of *Phragmites*), Hong Kong. See Wong *et al.* (*Bot. Mar.* **41**: 379, 1998), Wong *et al.* (*Fungal Diversity* **2**: 175, 1999).

Phragmiticola Sherwood (1987), ? Helotiales. 1, Europe. See Magnes (*Biblthca Mycol.* **165**, 1997).

Phragmobasidiomycetes R.T. Moore (1980), see *Tremellomycetes*; now placed within the *Agaricomycotina.*

Phragmobasidiomycetidae Gäum. (1949), see *Tremellomycetes*; now placed within the *Agaricomycotina.*

phragmobasidium, see basidium.

Phragmocalosphaeria Petr. (1923), Calosphaeriaceae. 1, Czech Republic. See Wehmeyer (*Revision of Melanconis*, 1941).

Phragmocapnias Theiss. & Syd. (1918), Capnodiaceae. Anamorph *Conidiocarpus*. *c.* 2, widespread (tropical). See Reynolds (*Mycotaxon* **8**: 917, 1979), Reynolds (*Mycotaxon* **27**: 377, 1986), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; Australia), Reynolds & Gilbert (*Cryptog. Mycol.* **27**: 249, 2006; Panamá).

Phragmocarpella Theiss. & Syd. (1915) = Phyllachora Nitschke ex Fuckel (1870) fide Petrak (*Annls mycol.* **29**: 349, 1931).

Phragmocauma Theiss. & Syd. (1915) = Phyllachora Nitschke ex Fuckel (1870) fide Cannon (*SA* **7**: 111, 1988).

Phragmocephala E.W. Mason & S. Hughes (1951), anamorphic *Pezizomycotina*, Hso/Hsy.≡ eP.1. 9, widespread. See Hughes (*N.Z. Jl Bot.* **17**: 163, 1979), Holubová-Jechová (*Folia geobot. phytotax.* **21**: 173, 1986; Czechoslovakia).

Phragmodiaporthe Wehm. (1941), Melanconidaceae. 2 or 4, N. America. See Barr (*Mycol. Mem.* **7**, 1978).

Phragmodimerium Petr. & Cif. (1932) = Philonectria fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Phragmodiscus Hansf. (1947), Lasiosphaeriaceae. 1 or 2 (on bamboo), Africa (tropical). See Eriksson & Yue (*SA* **8**: 17, 1989), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004).

Phragmodochium Höhn. (1924), anamorphic *Pezizomycotina*, Hsp.≡ eH.?. 1, Java.

Phragmodothella Theiss. & Syd. (1915) = Discostroma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phragmodothidea Dearn. & Barthol. (1926) = Scirrhia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phragmodothis Theiss. & Syd. (1914) = Dothidea fide Barr (*Mycotaxon* **43**: 371, 1992).

Phragmogibbera Samuels & Rogerson (1990), Venturiaceae. Anamorph *Stigmina*. 1, Venezuela. See Samuels & Rogerson (*Mem. N. Y. bot. Gdn* **64**: 165, 1990).

Phragmogloeum Petr. (1954), anamorphic *Pezizomycotina*, Cpd.≡ eP.?. 1, Australia. See Petrak (*Sydowia* **8**: 158, 1954).

Phragmographium E.F. Morris (1966) ≡ Morrisographium.

Phragmographum Henn. (1905) = Opegrapha Ach. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phragmonaevia Rehm (1896) nom. dub., Helotiales. See Sherwood (*Mycotaxon* **5**: 1, 1977), Hawksworth & Santesson (*Biblthca Lichenol.* **38**: 121, 1990; lichenicolous taxa excluded).

Phragmopeltheca L. Xavier (1976) = Porina Müll. Arg. fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Phragmopelthecaceae L. Xavier (1976) = Porinaceae.

Phragmopeltis Henn. (1904), anamorphic *Pezizomycotina*, Cpt.1eP.?. 5, America (tropical).

Phragmoporthe Petr. (1934), Gnomoniaceae. 1, Europe; N. America. See Barr (*Mycol. Mem.* **7**, 1978), Monod (*Beih. Sydowia* **9**: 1, 1983).

Phragmopsora Magnus (1875) = Pucciniastrum fide Sydow & Sydow (*Monographia Uredinearum seu Specierum Omnium ad hunc usque Diem Descriptio et Adumbratio Systematica* **3**, 1915).

Phragmopyxine Clem. (1909) = Pyxine fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phragmopyxis Dietel (1897), Uropyxidaceae. 4 (on *Leguminosae*, esp. *Faboideae*), America (tropical); Africa.

Phragmoscutella Woron. & Abramov (1926), Dothideomycetes. 1, former USSR.

Phragmospathula Subram. & N.G. Nair (1966), anamorphic *Pezizomycotina*, Hsp.≡ eP.19. 2, India; Cuba. See Subramanian & Nair (*Antonie van Leeuwenhoek Ned. Tijdschr. Hyg.* **32**: 384, 1966), Mercado Sierra *et al.* (*Mycol.* **89**: 304, 1997; revision).

Phragmospathulella J. Mena & Mercado (1986), anamorphic *Pezizomycotina*, Hso.≡ eP.28. 1, Cuba. See Mena & Mercado (*Revta Jardín bot. Nac.* Univ. Habana **7**: 32, 1986).

Phragmosperma Theiss. & Syd. (1917), Dothideomycetes. See von Arx & Müller (*Stud. Mycol.* **9**, 1975), Aptroot (*Nova Hedwigia* **66**: 89, 1998).

phragmospore, differs from an amerospore (q.v.) and didymospore (q.v.) in having 2 to many transverse septa. See Anamorphic fungi.

Phragmosporonema Moesz (1924) ≡ Diplosporonema.

Phragmostachys Costantin (1888) = Sterigmatobotrys fide Bisby (*TBMS* **26**: 138, 1943).

Phragmostele Clem. (1909) ≡ Pucciniostele.

Phragmostilbe Subram. (1959) = Arthrosporium fide Wang (*Mycol.* **64**: 1175, 1972).

Phragmotaenium R. Bauer, Begerow, A. Nagler & Oberw. (2001), Tilletiariaceae. 1 (on *Poaceae*), India. See Bauer *et al.* (*MR* **105**: 423, 2001).

Phragmotelium Syd. (1921), Pucciniales. *c.* 10 (on *Rubus* (*Rosaceae*)), Asia; Australia. See Thirumalachar (*Proc. Indian natn Sci. Acad.* Part B. Biol. Sci. **15**: 186, 1942), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983; syn. of *Phragmidium*).

Phragmothele Clem. (1909) = Thelidium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phragmothyriella Höhn. (1912) ≡ Myriangiella.

Phragmothyriella Speg. (1919) nom. dub., Fungi. See Petrak (*Sydowia* **5**: 169, 1951).

Phragmothyrites W.N. Edwards (1922), Fossil Fungi. 13 (Tertiary), widespread. See Selkirk (*Proc. Linn. Soc. N. S. W.* **100**: 70, 1975).

Phragmothyrium Höhn. (1912) = Microthyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Phragmotrichum Kunze (1823), anamorphic *Pezizomycotina*, Cac/St.≡ -#eP.23. 4, Europe. See Sutton & Pirozynski (*TBMS* **48**: 349, 1965), Shabunin (*Mikol. Fitopatol.* **31**: 52, 1997; Russia).

Phragmoxenidiaceae Oberw. & R. Bauer (1990), Tremellales. 2 gen., 7 spp.

Lit.: Oberwinkler *et al.* (*Syst. Appl. Microbiol.* **13**: 186, 1990), Roberts (*Windahlia* **22**: 15, 1995).

Phragmoxenidium Oberw. (1990), Phragmoxenidiaceae. 1, Europe. See Oberwinkler (*Syst. Appl. Microbiol.* **13**: 187, 1990).

Phragmoxyphium Bat. & Cif. (1963) = Ciferrioxyphium fide Hughes (*Mycol.* **68**: 693, 1976).

Phrototecha, see *Prototheca*.

Phruensis Pinruan (2004), Diaporthales. 1, Thailand. See Pinruan *et al.* (*Mycol.* **96**: 1165, 2004).

Phthora d'Hérelle (1909), Pezizomycotina. 1 (on *Coffea*), Guatemala.

Phurmomyces Thaxt. (1931), Ceratomycetaceae. 1, Asia. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

phyco- (prefix), pertaining to algae.

Phycoascus Möller (1901) ? = Pyronema fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

phycobiont, the algal partner in a lichen (Scott, *Nature* **179**: 486, 1957), photobiont (q.v.); cf. mycobiont.

Phycodiscis Clem. (1909) = Knightiella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

phycolichenes (obsol.), lichens in which the vegetative thallus morphology is determined by the photobiont and which are of uncertain systematic position as the sporocarps are unknown (e.g. *Cystocoleus*, *Racodium*).

Phycomater Fr. (1825) nom. dub., ? Fungi.

Phycomelaina Kohlm. (1968), ? Phyllachorales. 1 (on *Laminaria*), Europe; N. America. Affinities are uncertain. See Schatz (*Mycol.* **75**: 762, 1983).

Phycomyces Kunze (1823), Phycomycetaceae. 3, widespread. See Benjamin & Hesseltine (*Mycol.* **51**: 751, 1959; key), Carlile (*J. gen. Microbiol.* **28**: 161, 1962; sporangiophore phototropism), Cerdá-Olmedo & Lipson (*Phycomyces*, 1987; review, lit.), Ootaki *et al.* (*Mycoscience* **37**: 427, 1996; mating response), Yamazaki & Ootaki (*Mycoscience* **37**: 269, 1996; zygospore formation), Yamazaki & Ootaki (*MR* **100**: 984, 1996; progametangia), James *et al.* (*Nature* **443**: 818, 2006; phylogeny), Wöstemeyer & Schimek *in* Heitman *et al.* (Eds.) (*Sex in Fungi*: 431, 2007; trisporic acid & mating), Dávila López *et al.* (*Nucleic Acids Research* **36**: 3001, 2008; spliceosomal RNA gene phylogeny).

Phycomycetaceae Arx (1982), Mucorales. 2 gen., 6 spp.

Lit.: Benjamin & Hesseltine (*Mycol.* **51**: 751, 1959), Yamazaki & Ootaki (*Mycoscience* **37**: 269, 1996).

Phycomycetes J. Schröt. (1892) (obsol.). Class formerly used for fungi now treated in *Chromista* (q.v.) and some *Fungi* (*Chytridiomycota* and *Zygomycota*);

best used only as a trivial term, 'phycomycetes'; an approx. syn. of 'lower fungi'.

Phycomycites D.E. Ellis (1915), Fossil Fungi. 3 (Jurassic), Germany; British Isles.

phycomycosis, a general term for a disease of humans or animals caused by a phycomycete. Cf. mucormycosis, zygomycosis.

Phycomycotera. Superdivision used by Moore (1971) for all fungi with non-septate hyphae (i.e. *Oomycota* and *Zygomycota* in the *Dictionary*, this edition); cf. *Septomycotera*.

phycophilous, growing with or on algae.

Phycopsis L. Mangin & Pat. (1912) [non *Phycopsis* (Fisch.-Oost.) Rothpletz 1896, *Algae*] = Seuratia fide Meeker (*CJB* **53**: 2462, 1975).

Phycorella Döbbeler (1980), Dothideomycetes. 1 (biotrophic parasite of *Scytonema*), Australia. See Döbbeler (*Sydowia* **33**: 33, 1980).

Phycosiphon A. Massal. (1859) ≡ Brachycarphium.

phycosymbiodeme, joined lichen thalli with a single mycobiont but different photobionts (Renner & Galloway, *Mycotaxon* **16**: 197, 1982); photomorph, phycotype.

phycosymbiont, phycobiont.

phycotrophic (of fungi), obtaining nutrients from algae (Dobbs, *Lichenologist* **4**: 323, 1970).

phycotype, see type.

Phylacia Lév. (1845), Xylariaceae. Anamorph *Geniculosporium*. 7, America (tropical). See Dennis (*Kew Bull.*: 320, 1957), Pérez-Silva (*Boln. Soc. mex. Micol.* **6**: 9, 1972), Silveira & Rogers (*Acta Amazon.* Supl. **15**: 7, 1985; key 4 spp. Brazil), Rodrigues & Samuels (*Mem. N. Y. bot. Gdn* **49**: 290, 1989), Hladki (*Lilloa* **41**: 9, 2004; Argentina), Medel *et al.* (*Mycotaxon* **97**: 279, 2006; Mexico), Stadler & Fournier (*Revta Iberoamer. Micol.* **23**: 160, 2006; chemistry), Bitzer *et al.* (*MR* **112**: 251, 2008; phylogeny, chemistry).

Phylaciaceae Speer (1980) = Xylariaceae.

Phylacteria (Pers.) Pat. (1887) ≡ Scyphopilus.

Phylacteriaceae Imazeki (1953) = Thelephoraceae.

Phyllachora Nitschke ex Fuckel (1867) nom. rej. = Scirrhia fide Holm (*Taxon* **24**: 475, 1973).

Phyllachora Nitschke ex Fuckel (1870) nom. cons., Phyllachoraceae. Anamorph *Linochora*. *c.* 944 (from living leaves), widespread. See Parbery & Langdon (*Aust. J. Bot.* **12**: 265, 1964; species concepts), Parbery (*Aust. J. Bot.* **15**: 271, 1967; key), Parbery (*Aust. J. Bot.* **19**: 207, 1971; spp. on *Gramineae*), Kamat *et al.* (*Univ. Agric. Sci. Phyllachorales M.E. Barr (1983). Sordariomycetes. 2 fam., 63 gen., 1226 spp. Stromata absent to well-developed, immersed in plant tissue, often clypeate, usually black. Ascomata perithecial, usually thin-walled, the ostioles periphysate. Peridium usually composed of thin-walled compressed hyaline or brown tissue, sometimes irregular in form. Interascal tissue of simple rather wide thin-walled paraphyses, sometimes deliquescing. Asci ± cylindrical, thin-walled, not fissitunicate, persistent, usually with an inconspicuous J- apical ring. Ascospores usually hyaline, aseptate, occ. ornamented. Anamorphs usually coelomycetous, spermatial or disseminative. Appressoria usually formed as adhesion/penetration structures. Mostly biotrophic, some necrotrophic and a few saprobic, on leaves, stems, and roots, widespr. esp. trop. Fams:

(1) **Phaeochoraceae**,

(2) **Phyllachoraceae**

Lit.: Cannon (*SA* **7**: 23, 1987; posn), Eriksson & Hawksworth (*SA* **11**: 181, 1993), Winka & Eriksson (*Mycoscience* **41**: 97, 2000; DNA).

Phyllachorella Syd. (1914), ? Dothideales. 1, India. See von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954; syn. with *Vestergrenia*), Kar & Maity (*Mycol.* **63**: 1024, 1971).

Phyllactinia Lév. (1851), Erysiphaceae. Anamorph *Ovulariopsis*. 40, widespread. *P. guttata* (mildew of hazel (*Corylus*), birch (*Betula*), and other trees). See Braun (*Beih. Nova Hedwigia* **89**, 1987; key), Hirata & Takamatsu (*Mycoscience* **37**: 283, 1996; phylogeny), Takamatsu *et al.* (*Mycoscience* **39**: 441, 1998; phylogeny), Saenz & Taylor (*CJB* **77**: 150, 1999; phylogeny), Mori *et al.* (*Mycol.* **92**: 74, 2000; phylogeny), Shin & Lee (*Mycotaxon* **83**: 301, 2002; morphology), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Takamatsu *et al.* (*MR* **112**: 299, 2008; phylogeny).

Phyllostictaceae Fr. (1849) = Botryosphaeriaceae.

Phyllostictella Tassi (1901) ? = Microsphaeropsis Höhn. fide Sutton (*Mycol. Pap.* **141**, 1977).

Phyllostictina Syd. & P. Syd. (1916) = Phyllosticta fide van der Aa (*Stud. Mycol.* **5**, 1973).

Phyllostictites Babajan & Tasl. (1970), Fossil Fungi. 1 (Tertiary), former USSR.

Phyllothelium Trevis. (1861) = Trypethelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Phyllotopsis E.-J. Gilbert & Donk ex Singer (1936), Agaricales. 5, widespread (temperate). Belongs to *Marasmiaceae* or *Tricholomataceae*. See Johannesen (*Blekksoppen* **26**: 23, 1998).

Phyllotremella Lloyd (1920) = Resupinatus fide Kuyper (*in litt.*).

Phyllotus P. Karst. (1879) = Resupinatus fide Kuyper (*in litt.*) Lectotypification has been contested; under another lectotypification it becomes the correct name for *Pleurocybella*.

Phylogenetic analysis. Systematics methods that aim to reconstruct the genealogical descent of organisms by means of objective and repeatable analysis, and from this pattern to propose a falsifiable hypothesis of natural classification or phylogeny. The theory is largely based on concepts introduced by the German entomologist Willi Hennig (1913-1976) which revolutionized systematic research through emphasis on evolutionary processes rather than shared characters. Hennig himself referred to his methodology as phylogenetic systematics, but for a time proponents of his methods preferred the term **cladistics**, derived from the Greek *κλάδος*, branch. Since around 2000 that term has fallen into disuse, and almost all researchers refer to their discipline as phylogenetics, or phylogenetic analysis.

Phylogenetic methodologies are based upon three fundamental assumptions: that taxa are united into natural groups on the basis of shared derived characters (**synapomorphies**); that all groups recognized must descend from a single ancestor (i.e. they are monophyletic) and that the most **parsimonious** pattern (that is the one requiring the least number of steps to resolve the relationships of the taxa) is the one most likely to be correct. Groups defined using shared primitive characters (**symplesiomorphies**) are likely to be paraphyletic and thus not include all the descendants of an ancestor. Groups delimited that do not share a common ancestor are polyphyletic and often result from convergent (non-homologous) characters. The product of phylogenetic analysis is a branching diagram (**phylogenetic tree** or **cladogram**, frequently referred to informally as a **tree**) which shows the pattern of relationships between the organisms based on the characters used.

Phylogenetic analysis methods were initially developed using morphology data sets and manual calculation, but now molecular data are used almost exclusively and powerful computers are required. Genes or gene fragments are amplified from extracted DNA using specific primers, and sequenced using equipment that is usually highly automated and optimized for high throughput. The resulting sequences must first be **aligned**, taking into account insertions and deletions and variations in overall sequence length. This is done using a computer package such as ClustalW (Chenna *et al.*, *Nucleic Acids Res.* **31**: 3497, 2003; Larkin *et al.*, *Bioinformatics* **23**: 2947, 2007; http://www.clustal.org), either down-loaded or via a web-based service. Many users prefer manually to adjust the alignment that is generated, to compensate for ambiguities in the sequence traces etc. The aligned sequences are then trimmed to a common length and output (typically in **NEXUS** format) so they can be read by phylogenetics packages. These use complex statistical algorithms to generate phylogenetic trees, often with numerous alternative settings to allow for differences in sequence characteristics, presumed evolutionary models, use of molecular clocks etc.

Currently, the three most widely used algorithms for phylogenetic analysis are:

Parsimony analysis (using the PAUP package; Swofford, *PAUP*: phylogenetic analyses using parsimony (*and other methods)*, 2002).

Maximum likelihood estimation (e.g. Stamatakis *et al.*, *Bioinformatics* **21**: 456, 2005).

Bayesian analysis (using the MrBayes package; Huelsenbeck & Ronquist, *Bioinformatics* **17**: 754, 2001; Ronquist *et al.*, http://www.mrbayes.csit.fsu.edu/).

In some cases the output is restricted to a text-based depiction of the resulting trees, which can be visualized using e.g. **Treeview** (http://taxonomy.zoology.gla.ac.uk/rod/treeview/). There are several freely available integrated software packages that make phylogenetic analysis somewhat more user-friendly, including **MESQUITE** (version 2.5: http://mesquiteproject.org/mesquite/mesquite/) and **MEGA** (Tamura *et al.*, *Mol. Biol. Evol.* **24**: 1596, 2007; version 4: http://www.megasoftware.net/).

Correct interpretation of phylogenetic trees is critically important: all the tree generation methods are

based on statistical assumptions that may not be justifiable in all cases, and they merely represent the most probable evolutionary pathway by which the organisms included have come into being. Trees must be **rooted** with the inclusion and specification of an **outgroup** – a taxon or group of taxa that are known to be outside of but related to the group in question. Phylogenetic analyses involve repeated analyses of the data, sometimes with many thousands of replicates, each of which produces a subtly different branching pattern or branch lengths. A **consensus** tree represents the most likely evolutionary pathway in statistical terms, and the degree of likelihood that this is the correct **topology** (or branching pattern) can also be measured statistically. This may be achieved using the **bootstrap** resampling technique (Felsenstein, *Evolution* **39**: 783, 1985; Nei & Kumar,

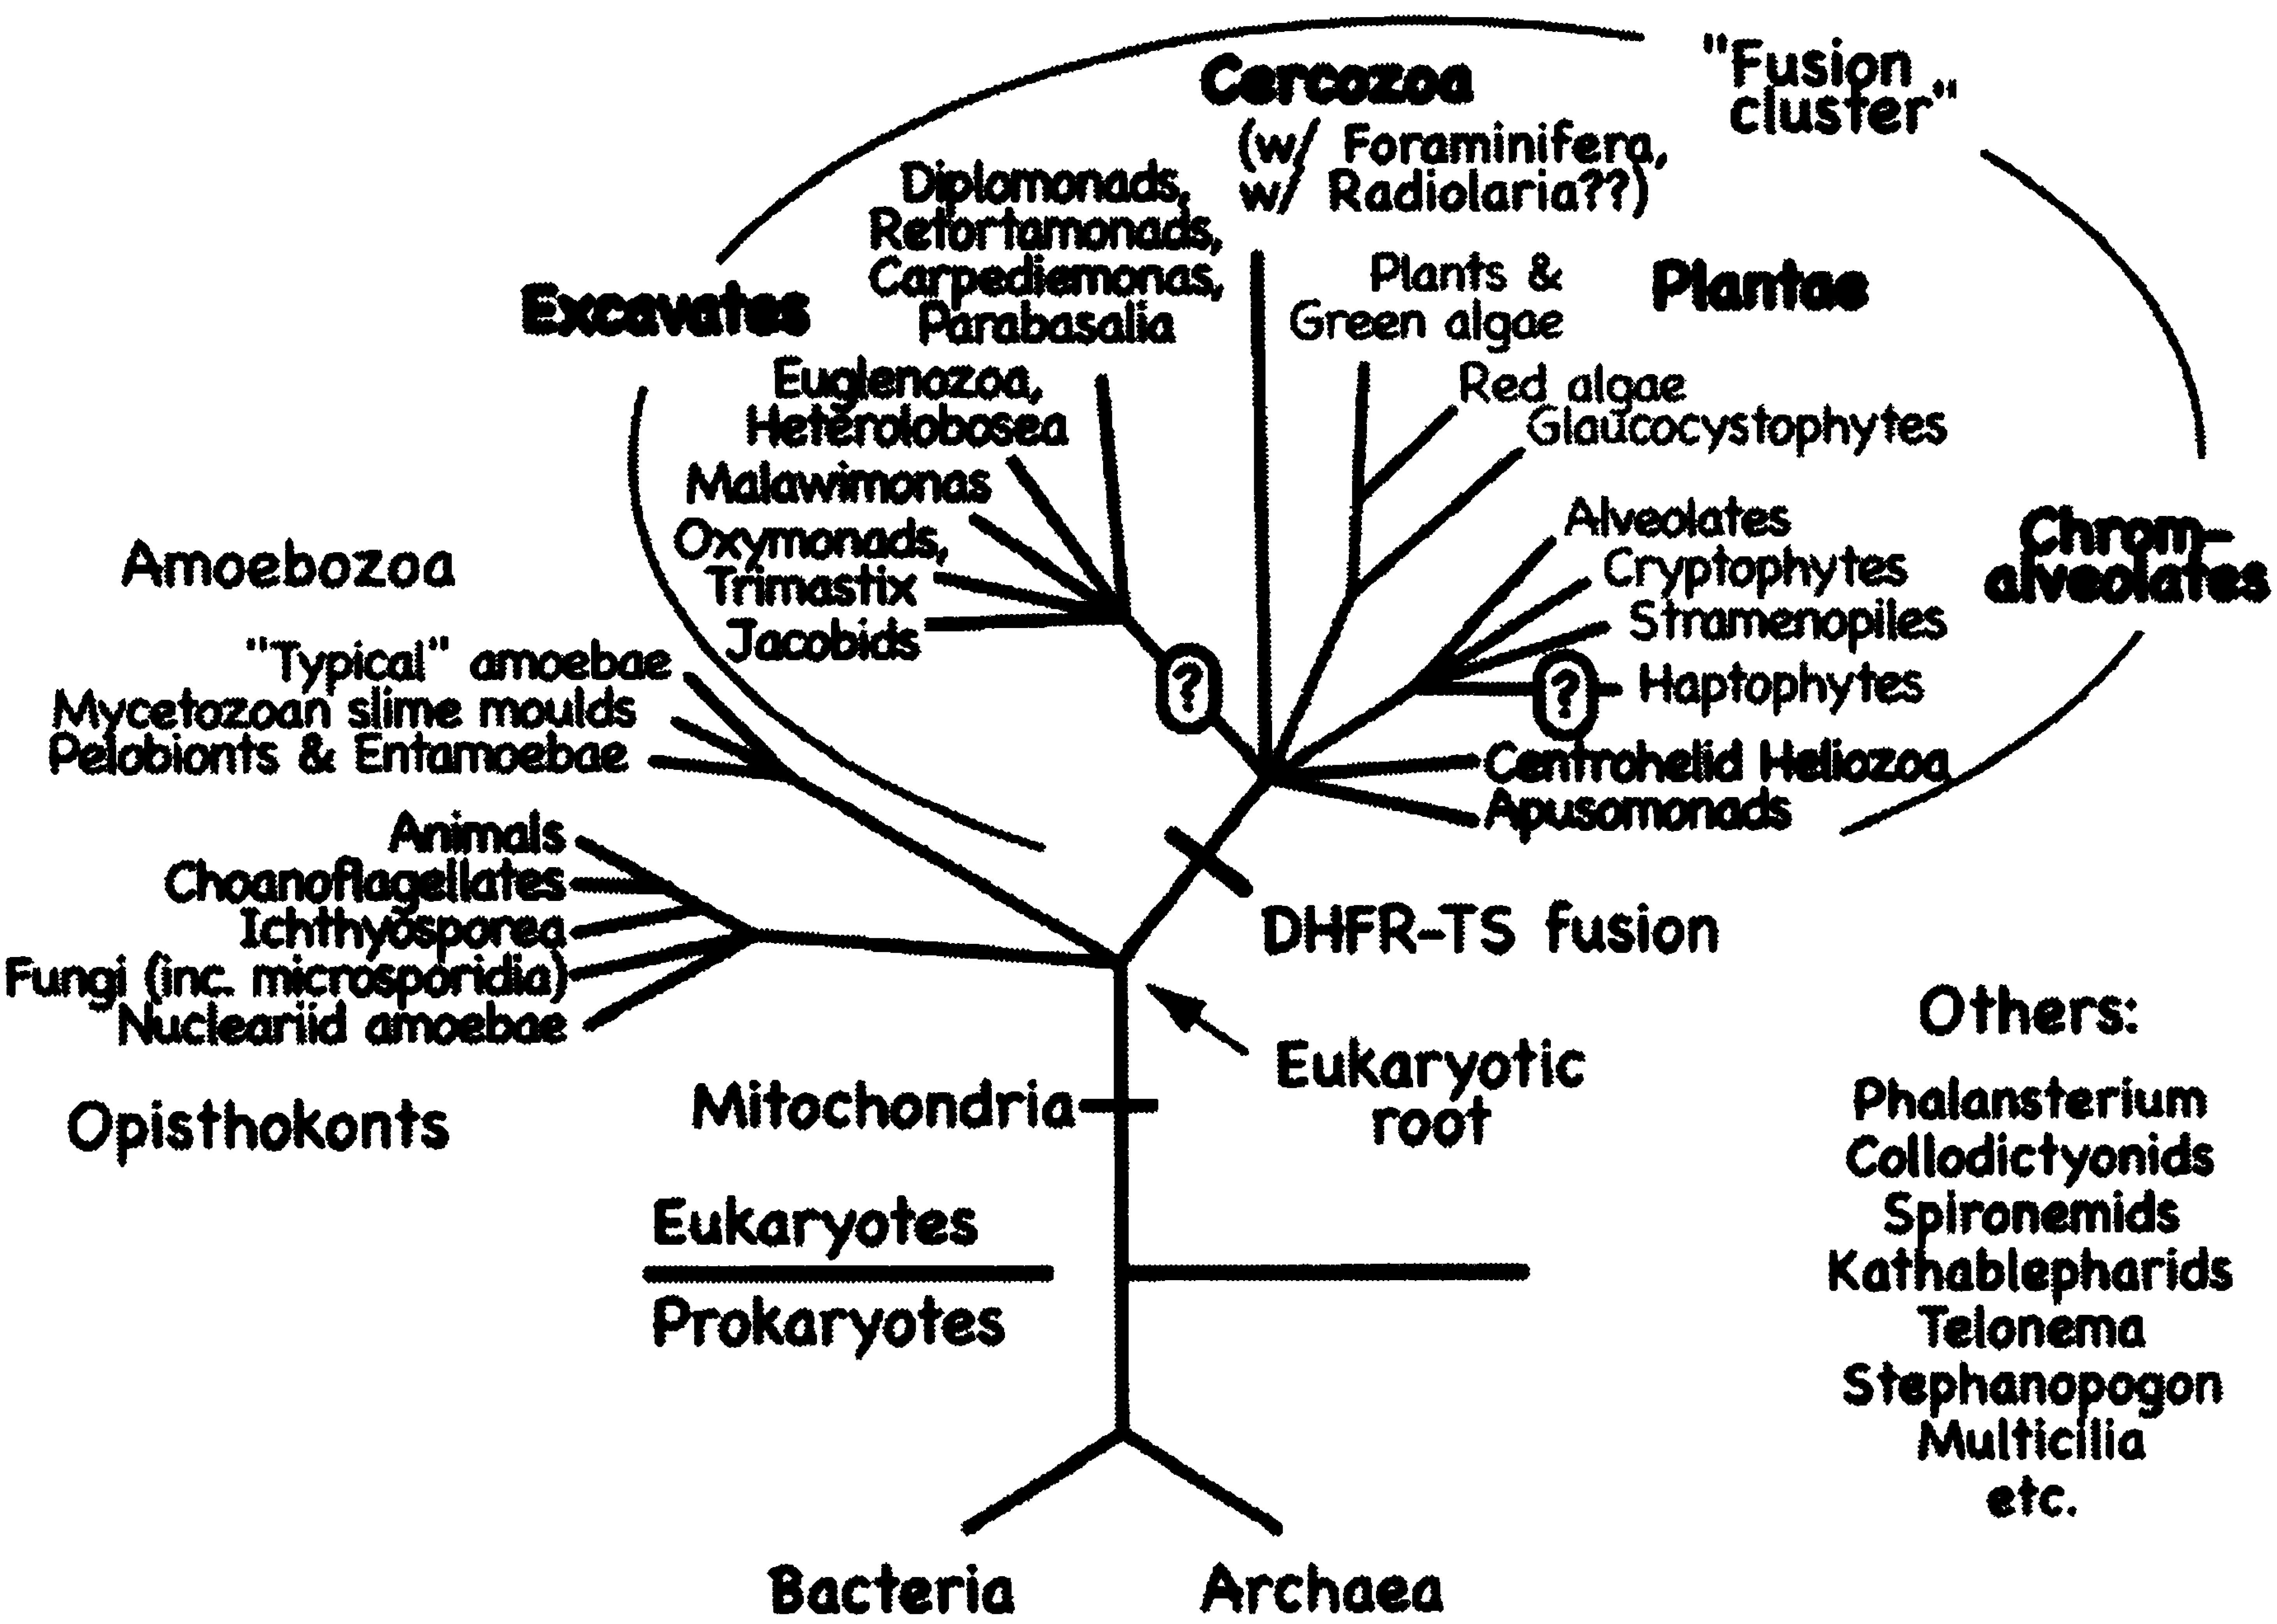

Fig. 31. Phylogenetic tree of eukaryotes based Simpson & Rogers, Eukaryotic evolution: getting to the root of the problem (*Current Biology* **12**: R691-R693, 2002).

Molecular evolution and phylogenetics, 2000) by comparing trees with those generated after random replacement of nucleotides within the sequences. The proportion of individual branching events with identical structure provides a measure of robustness of the analysis; a bootstrap value of less than about 70% is considered by most to be an unreliable indicator of relationships. Bootstrapping may be used in conjunction with several phylogenetic analysis methods, including parsimony and maximum likelihood analysis. Bayesian analysis is assessed using posterior probabilities (PP; the posterior distribution of trees, see Ronquist *et al.*, 2005); here strong support for a topology can be inferred from a PP figure of more than 0.95. Results from any of these techniques are only as reliable as the original data, and problems with alignment in particular can lead to serious anomalies.

Many different genes and gene fragments have been explored as potential indicators of evolutionary pathways for fungi. They show varying degrees of conservation, allowing their use for analysis of relationships at different levels of the taxonomic hierarchy. The most widely used remain ribosomal genes within nuclei or mitochondria; these are present in multiple copies which makes amplification easier (although there are instances of sequence heterogeneity within organisms). Of these, the 18S (SSU) fragment is relatively conserved and has been widely used to infer relationships at family level and above, and the 25S (LSU) fragment is more variable and is useful at genus or species level. The two ITS (internal transcribed spacer) regions of ribosomal DNA which are more variable again, are most widely used to investigate species relationships, although there are many cases where the level of variation is insufficient to distinguish reliably between taxa commonly accepted at species level. The search for the most effective gene for use in species-level diagnosis in fungi continues (**genetic barcoding**; see e.g. Seifert *et al.* (*Proc. Nat. Acad. Sci* **104**: 3901, 2007; barcoding of fungi), Kress & Erickson (*PNAS* **105**: 2761, 2008; introduction to barcoding), http://barcoding.si.edu/ and http://www.barcodinglife.org/). Other widely used genes in phylogenetic research include those

coding for α-tubulin, transcription elongation factor-1α (EF-1α), RNA polymerase B (RPB), glyceraldehyde 3-phosphate dehydrogenase (GAPDH) and mitochondrial ATP synthase F0 subunit 6 (ATP6). Primers for amplification of many of these genes may be found at the AFTOL website (http://aftol.org/).

See also Classification, Coevolution, Kingdoms of fungi, Phylogeny.

Phylogeny. Mycologists' views on phylogeny, the evolution of a group of organisms through time, have been based traditionally on comparative morphology, cytology, hyphal wall chemistry, ultrastructure, and to a lesser degree fossils (see Fossil fungi). The advent of cladistic and molecular approaches has led to major changes in understanding the relationships of fungal phyla.

The three kingdoms including fungi as traditionally circumscribed (see Kingdoms of fungi) are shown by molecular studies of 16S-like ribosomal RNA sequences to be phylogenetically remote (Fig. 31).

Current data mostly support the initial indications that *Animalia* and *Fungi* are sister groups and most probably arose from a choanozoan-like protozoan ancestor (see Adl *et al*, *J. Eukaryotic Microbiol.* **52**: 399, 2005; Baldauf *et al.*, *Science* **290**: 972, 2000; Cavalier-Smith, in Rayner, Brasier & Moore (Eds), *Evolutionary biology of the fungi*: 339, 1987, in McLaughlin *et al.* (Eds) *The Mycota* **7A**: 3, 2001); Cracraft & Donaghue (Eds), *Assembling the Tree of Life*, 2004; Steenkamp *et al.*, *Mol. Biol. Evol.* **23**: 93, 2006; van der Peer *et al.*, *J. Mol. Evol.* **51**: 565, 2000; Wainright *et al.*, *Science* **260**: 340, 1993). These two kingdoms have been informally grouped with the members of the DRIPs clade [DRIPs is an acronym of the original members of the clade: *Dermocystidium*, rosette agent, *Ichthyophonus*, and *Psorospermium*], microsporidians and the choanoflagellates in the Opisthokonta (q.v.) (see Baldauf *et al.*, *Science* **290**: 972, 2000; Philip *et al.*, *Mol. Biol. Evol.* **22**: 1175, 2005), though the most authors now regard the *Microsporidia* (q.v.) as members of the Kingdom *Fungi* (see e.g. Gill & Fast, *Gene* **375**: 103, 2006). No molecular data have been found to support the hypothesis for a red algal (*Rhodophyta*) ancestry of the *Ascomycota* and *Basidiomycota* which was strongly argued for by Demoulin (see *Bot. Rev.* **40**: 315, 1974, *BioSystems* **18**: 347, 1985).

'Fungi' in the other two kingdoms seem to have arisen polyphyletically. Within the Protozoa (q.v.) the fungus-like groups are all slime moulds but these various groups are not closely related and even such taxa as the acrasids are now thought to be quite different in origin. Molecular data are now showing where these groups belong. The Acrasids are now included among the amoeboid flagellate protozoa (*Heterolobosea*); the true slime moulds, protostelids and dictyostelids cluster together with another amoeboid protozoan group, *Rhizopoda*, which is informally known as the Ramicristates and the plasmodiophorids cluster together with the amoeboid, photosynthetic chlorarachnids and the cercomonads (a diverse group of soil flagellates). Other taxa such as *Fonticula* and the copromyxids are now thought to be independent lineages (Patterson, 1999).

Major new research elucidating relationships within the true fungi has been published in the last five years; see especially Hibbett *et al.* (*MR* **111**: 509, 2007), James *et al.* (*Nature* **443**: 818, 2006), Liu *et al.*, *BMC Evol. Biol.* **6**: 74, 2006), Lutzoni *et al.* (*Am. J. Bot.* **91**: 1446, 2004) and papers in the *Deep Hypha* issue of *Mycologia* (*Mycol.* **98** (6), 2006, publ. 2007). Within the Kingdom *Fungi*, analyses of molecular data strongly support the monophyly of the *Ascomycota* and *Basidiomycota* (recognized as Subkingdom *Dikarya*), and also led to acceptance of five further phyla – the *Blastocladiomycota*, *Chytridiomycota*, *Glomeromycota*, *Microsporidia* and *Neocallimastigomycota*. The *Zygomycota* as accepted in the previous edn of this *Dictionary* is no longer considered to be a viable taxonomic unit, with its components including the *Mucorales*, *Endogonales*, '*Trichomycetes*' and others shown to be only distantly related. The new system promises a robust framework within which to develop classifications of lower-order groups.

Insights into evolution of the phylum *Ascomycota* can be found in the apparently basal position of *Neolecta*, associated in a grouping with *Pneumocystis*, *Schizosaccharomyces* and *Taphrinales*, sometimes referred to as the archiascomycetes. These morphologically disparate taxa are here placed within subphylum *Taphrinomycotina*, alongside the ascomycetous yeast subphylum *Saccharomycotina* and the *Pezizomycotina* (syn. *Ascomycotina*) that contains the vast bulk of filamentous taxa. Major changes since the last edn of this *Dictionary* include remodelling of the major lichenized groups, with the most speciose taxon now named the *Lecanoromycetes*, which includes the subclasses *Lecanoromycetidae* and *Ostropomycetidae*. *Aspergillus*, *Penicillium* and similar fungi are confirmed as related to morphologically disparate groups including the black yeasts (*Chaetothyriales*) and some pyrenocarpous lichenized taxa (*Verrucariales*). Studies have underlined time and again that many of the morphological structures used in traditional classifications of the *Ascomycota* have evolved on multiple occasions, presumably in response to common evolutionary pressures.

Even more dramatic changes have resulted in the new classification of the *Basidiomycota*. Three familiar groups are recognized as subphyla, the *Pucciniomycotina* (rusts and relatives), *Ustilaginomycotina* (smuts etc.) and *Agaricomycotina* (agarics, polypores, 'gasteromycetes', jelly fungi etc.). Within the *Agaricomycotina* many of the traditional groups based on anatomical structure have been shown to be artificial. One of the most ancient lineages of the *Agaricomycetes* appears to be the *Cantharellales*, which includes *Rhizoctonia* and *Tulasnella* as well as the chanterelles and their relatives. The agarics and boletes cluster together within the *Agaricomycetidae*, earthstars, phalloid taxa and many basidiomycetous truffles form a distinct lineage (the *Phallomycetidae*) and the relatives of *Russula* include *Hericium* and

Stereum.

The *Chytridiomycota* constitute the main phylum of the *Fungi* that possesses motile zoospores. Their systematic arrangement has also undergone profound change as a result of molecular phylogenetic research, with the *Blastocladiomycota* now separated at phylum level (James *et al.*, *Mycol.* **98**: 860, 2006). The morphologically reduced genus *Rozella* appears to represent the most basal clade of all the true *Fungi*, though the position of the *Microsporidia* (strange protozoan-like fungi that lack mitochondria) remains to be stabilized. Major groups within the *Chytridiomycota* include the *Neocallimastigales* (rumen fungi) as well as the chytrids and *Spizellomycetales*. Many of the groups need further study, and further nomenclatural changes are likely.

In most, but not all analyses the *Glomerales* are basal to the ascomycete and basidiomycete lineage, and the group has now been elevated to phylum level as the *Glomeromycota*. This is particularly significant given their suggested role as mycorrhizal fungi associated with early land plants and the recent report of fossil glomeralean fungi from mid-Ordovician deposits (c. 460 Myr ago) (see Redecker *et al.*, *Science* **289**: 1920, 2000; Simon *et al.*, *Nature* **363**: 67, 1993).

The *Zygomycota* are no longer recognized as a phylogenetically coherent entity (see Sugiyama, *Mycoscience* **39**: 487, 1998; James *et al.*, *Can. J. Bot.* **78**: 336, 2000, White *et al.*, *Mycol.* **98**: 872, 2006). Further research is necessary, but there are strong indications that even the zygomycetes as traditionally recognized are paraphyletic with the *Glomeromycota*, *Ascomycota* and *Basidiomycota*. Two of the groups traditionally treated as trichomycetes are now understood to have protist affinities, and the *Entomophthorales* in their usual circumscription are now shown to be polyphyletic. Formerly included among the trichomycetes, *Amoebidium* and its relatives have been suggested to be a member of the DRIPs clade based on molecular evidence (see Ustinova *et al.*, *Protist* **151**: 253, 2000; White *et al.*, *Mycol.* **98**: 872, 2006), confirming the observations of Lichtwardt (*Trichomycetes*: 279, 1986), who thought that *Amoebidium* had arisen independently from a protozoan ancestor and was unrelated to any other *Trichomycetes*.

The predominantly autotrophic *Chromista* contain two separate heterotrophic lineages that include 'fungal' taxa. Both arose from an ancestral heterokont flagellate with chloroplasts. One lineage comprises the oomycetes and hyphochytrids with its sister taxon the marine flagellate, *Developayella*. The other lineage leads to the labyrinthulids and thraustochytrids (the slime nets), largely characterized by the presence of bothrosomes. Molecular data tend to support the morphological groups recognized in the oomycetes, now reflected in two subclasses: *Peronosporomycetidae* and *Saprolegniomycetidae*, although the position of *Rhipidium*, treated as a separate subclass by Dick (*Can. J. Bot.* **73**: S712, 1995) is uncertain since it appears basal in the oomycete phylogeny (see Peterson & Rosendahl, *MR* **104**: 1295, 2000).

The poor representation of fungi in the fossil record has stimulated much research in recent years using molecular methods to estimate the dates of major evolutionary radiations within the group. Statistical methods have been refined in recent years to take into account different rates of nucleotide substitution in different lineages (Peterson *et al.*, *Proc. Nat. Acad. Sci.* USA **101**: 6536, 2004). Berbee & Taylor (*CJB* **71**: 1114, 1993) calculated that the three main fungal phyla diverged from the *Chytridiomycota* approximately 550 Myr ago. The *Ascomycota/Basidiomycota* split most probably occurred at about 400 Myr ago after plants invaded the land and the dicot/monocot divergence occurred (Taylor & Berbee, *Mycol.* **98**: 838, 2006), but possibly as early as 1500 Myr ago if the fungal fossil *Paleopyrenomycetes devonicus* belongs to the *Sordariomycetes* (Taylor *et al.*, *Mycol.* **97**: 269, 2006; Padovan *et al.*, *J. Mol. Evol.* **60**: 726, 2005) and 1800Myr ago based on calibrations derived from assumed divergence of mammals and birds 300Myr ago. Many ascomycetous yeasts and moulds (e.g. *Eurotiales*) evolved after the origin of angiosperms, probably in the last 200 Myr. See also **Fossil fungi**.

Fungi are associated with some of the earliest remains of land plants, and may well have played a crucial role in enabling life out of water. Church (*J. Bot., Lond*, **59**: 7, 1921) considered that 'lichens' might be transmigrants, the earliest colonizers of land (see also Corner, *The life of plants*, 1964). Land plants may, however, have their origins in a green alga-oomycete symbiosis (Pirozynski & Malloch, *BioSystems* **6**: 153, 1975), and it has even been argued that plants are of biphyletic origin with some parts of the fungal genome (Jørgensen, *BioSystems* **31**: 193, 1993) or even 'inside-out' lichens as they contain organelles questionably of fungal origin (Atstatt, *Ecology* **69**: 17, 1988).

Revolutions in the development of automated gene sequencing have provided enormously more data with which to test evolutionary hypotheses compared with even five years ago. The first complete human genome to be sequenced, containing over 3 billion base pairs, was presented only in 2003, but by June 2008 genome sequencing projects were under way or completed for over 70 fungal species (see http://www.ncbi.nlm.nih.gov/Genomes/). The challenge is now to move from this *embarras de richesses* in terms of data to its effective analysis. It is now common practice to analyse phylogenies using multiple gene sequences (as with the studies presented in *Mycol.* **98** (6), 2006). One recent paper has mined data from 34 complete genome sequences to produce a phylogeny of the Fungi based on 29 universally conserved protein-encoding gene sequences (Cornell *et al.*, *Genome Res.* **17**: 1809, 2007).

Phylogenies may also focus on the other end of the taxonomic spectrum, at or below the species level. Molecular methods have revolutionized study of population biology, biogeography and microevolutionary processes. New methods of DNA extraction mean that unculturable taxa can be included in phylogenetic analyses, and dried material from fungal reference collections etc. can be used more extensively. Many morphospecies are now shown to be aggregates of taxa with distinct metabolic, ecological or pathological properties, though the level of the taxonomic hierarchy at which these should be recognized is debatable. A further major benefit of the molecular phylogenetic revolution is the ability to integrate anamorphic taxa effectively within the mainstream fungal classifications, and researchers are increasingly blurring the nomenclatural distinction between sexual and asexual morphs.

See Classification, Coevolution, Kingdoms of fungi, Phylogenetic analysis.

phylum, a taxonomic rank between kingdom and class; a division; see Classification.

Phymatium Chevall. (1826) = Elaphomyces fide Fries (*Syst. mycol.* **3**: 57, 1829).

Phymatodiscus Speg. (1919) = Myriangium fide von Arx (*Persoonia* **2**: 421, 1963).

Phymatomyces Kobayasi (1937) = Barssia fide Trappe (*Mycotaxon* **9**: 247, 1979).

Phymatopsis Tul. ex Trevis. (1857) = Abrothallus fide Keissler (*Rabenh. Krypt.-Fl.* **8**, 1930).

Phymatosphaeria Pass. (1875) = Myriangium fide von Arx (*Persoonia* **2**: 421, 1963).

Phymatosphaeriaceae Speg. (1888) = Myriangiaceae.

physiologic form (Stakman & Levine), see physiologic race.

physiologic race, one of a group of forms alike in morphology but unlike in certain cultural, physiological, biochemical, pathological, or other characters. The use of this term in place of biologic form, etc. was a recommendation of the International Botanical Congress, 1935. The term 'race' has been used in different senses by plant pathologists, the classical approach of using tests on differential hosts now being replaced by smaller flexible groups of host genotypes permitting characterization by virulence. See Caten (*in* Wolfe & Caten, *Populations of plant pathogens: their dynamics and genetics*: 21, 1987; review), Dennis (*Proc. Linn. Soc. Lond.* **163**: 47, 1952; taxonomic treatment), Johnson (*Biol. Rev.* **28**: 105, 1953; variation), Classification, special form, Species.

Physiology. Fungal physiology is the study of their mechanical, physical and biochemical functions, their adaptations to stresses and mechanisms for their development. Good introductory texts are: Berry (*Physiology of industrial fungi*, 1988) and Garraway & Evans (*Fungal nutrition and physiology*, 1984). Griffin (*Fungal physiology*, 2nd ed, 1996) summarizes fungal physiology from the viewpoint of the physical and chemical factors and processes behind the functioning of fungi, integrating discoveries in molecular genetics with conventional whole organism and biochemical approaches. At the more encyclopaedic level, Smith & Berry (Eds) (*The filamentous fungi*, 4 vols, 1975-83) and volumes of Esser & Lemke (Eds) (*The Mycota*, 1994-, e.g. Esser *et al.* (Eds), *The Mycota* **8**: 1, 2001) are recommended, though now some are now dated. Specialist treatments include: Ayers & Boddy (*Water, fungi and plants*, 1986), Bennett & Ciegler (*Secondary metabolism and differentiation in fungi*, 1983), Boddy *et al.* (*Nitrogen, phosphorus and sulphur utilisation by fungi*, 1989), Burnett & Trinci (*Fungal walls and hyphal growth*, 1989), Calvo *et al.*, *Microbiol. Mol. Biol. Rev.* **66**: 447, 2002; relations between secondary metabolism and fungal development), Cooke & Whipps (*Ecophysiology of fungi*, 1983), Cox (*In*: *In* Robson *et al.* (Eds) *Exploitation of Fungi*, 2007), Elliott (*Reproduction in fungi: genetical and physiological aspects*, 1994), Frankland *et al.* (*Decomposer basidiomycetes: their biology and ecology*, 1982), Jennings (*Stress tolerance of fungi*, 1993; *The physiology of fungal nutrition*, 1995), Jennings & Rayner (*The ecology and physiology of the fungal mycelium*, 1984), Kershaw (*Physiological ecology of lichens*, 1985), Lewis (*MR* **95**: 897, 1991; sugars), Moore *et al.* (*Developmental biology of higher fungi*, 1985), Smith (*Fungal differentiation*, 1983); Szaniszlo (*Fungal dimorphism*, 1985), Vicente *et al.* (*Surface physiology of lichens*, 1985), Weete (*Lipid biochemistry of fungi and other organisms*, 1981), Winkelmann & Winge (*Metal ions in fungi*, 1994), Yu & Keller (*Annual Review of Phytopathology* **43**: 437, 2005), Zhdanova & Vasilevskaya (*Melanin biosynthesizing fungi in extreme environments*, 1988). Special studies and reviews devoted to physiology of different ecological groups of fungi include: **anaerobic fungi**, study of physiology of fungal development in anaerobic conditions (Lübbehüsen *et al.*, *MR* **107**: 223, 2003); **marine fungi**, especially, their growth, enzyme production and secondary metabolites (Jensen & Fenical, *In*: Hyde, K.D. (Ed.) *Fungi in marine environments. Fungal diversity research series* **7**: 293, 2002; Kis-Papo *et al.*, *Microbial ecology* **45**: 83, 2003; Molitoris & Schaumann, *In*: *The biology of marine fungi*, 35, 1986); **mycorrhizal fungi**, the physiological interaction within the root (regulation of host defences, bidirectional transport of nutrients, modification of gene expression, carbon metabolism) and effects of the mycorrhiza upon the whole plant (Bago *et al.*, *Plant physiology* **124**: 949, 2000; Bago *et al.*, *Plant Physiology* **128**: 108, 2002; Kapulnik & Douds *Arbuscular mycorrhizas: physiology and function*, 2000; Le Quéré *et al.*, *Mol. plant microbe interactions MPMI* **18**: 659, 2005; Olsson *et al.*, *Appl. Envir. Microbiol.* **71**: 2592, 2005; Trepanier *et al.*, *Appl. Envir. Microbiol.* **71**: 5341, 2005), contribution of arbuscular mycorrhiza in maintaining antioxidant and carbon metabolism in plants under water stress (Goicoechea *et al.*, *J. Plant Physiol.* **162**: 27, 2005), biofertilizing, bioprotecting and bioregulating role of arbuscular mycorrhizal fungi in plant growth and health promotion in agricultural systems (Gianinazzi *et al.*, *Mycorrhizal technology in agriculture: from genes to bioproducts*, 2002); **soil fungi**, their nutritional requirments and place in ecosystems (Cullings *et al.*, *Appl. Environ. Microbiol.* **71**: 1996, 2005); **thermophilic and thermotolerant fungi**, especially their ezymes (Bhabhra *et al.*, *Infect. Immun.* **72**: 4731, 2004; Maheshwari *et al.*, *Microbiology and Molecular Biology Reviews* **64**: 461, 2000; Sandgren *et al.*, *Protein Sci.* **12**: 2782, 2003).

Bakers' yeast is by far the most studied fungus, physiologically and biochemically (see *Saccharomyces*). Because yeasts in general are easy to handle experimentally in comparison with other fungi, there is an extensive literature on their physiology and biochemistry, the best entries into which are Berry *et al.* (*Yeast biotechnology*, 1987), Rose & Harrison (*The yeasts* **3-4**, 1989-91) and van der Heijden (Ed.) (*Mycorrhizal Ecology*, 2002). Adaptation mechanisms of yeast cells to environmental stress, specific adaptations of their growth and metabolism to nutrient depletion, osmotic and heat shock, salt and oxidative stress are discussed by Hohmann & Mager (*Yeast stress responses*, 2003), Guerra *et al.* (*Microbiology* **151**: 805, 2005). For results of molecular biology

studies using *Saccharomyces cerevisiae*, and some other yeast species as model eukaryotes to study their growth mechanisms, division, elongation, pseudohyphal growth, mating and hormonal attraction see Madhani, *From a to α: yeast as a model for cellular differentiation*, 2007). Summarized data on the physiology, cell biology and genetics of the dimorphic fungus *Yarrowia lipolytica* are given by Barth & Gaillardin (*FEMS Microbiology Reviews* **19**: 219, 1997).

Advances in Microbial Physiology, *Ann. Rev. Phytopath.* and *Microbiol. Mol. Biol. Rev.* contain significant review articles. Because of the power of molecular biology, many of key physiological findings about fungi, albeit for a restricted number of genera (particularly *Aspergillus*, *Neurospora*, *Saccharomyces*), are in such journals as *J. biol. Chem.* and *Mol. cell. Biol.*

General reviews of lichen physiology are given by Ahmadjian (*The lichen symbiosis*, edn 2, 1993), Ahmadjian & Hale (Eds) (*The lichens*, 1974), Brown *et al.* (Eds) (*Lichenology: progress and problems*, 1976), Brown (Ed.) (*Lichen physiology and cell biology*, 1985), Hale (*The biology of lichens*, 1983), Kappen (Ed.) (New species and novel aspects in ecology and physiology of lichens. In honour of O.L. Lange. *In*: Bibliotheca Lichenologica **67**: 1, 1997), Nash (*Lichen Biology*, 1996), Quispel (*Encycl. pl. physiol.* **11**: 577, 1959), Seaward (Ed.) (*Lichen ecology*, 1977; ecophysiology), Smith (*Biol. Rev.* **37**: 537, 1962). All these publications have extensive bibliographies.

Physosporellaceae Höhn. ex M.E. Barr (1976) = Hyponectriaceae.

phytoalexin, a metabolite produced by a plant in response to infection by a fungus or other pathogen (or by an abiotic factor) inhibitory to the invading pathogen. Reviews: Cruickshank, *Ann. Rev. Phytopath.* **1**: 351, 1963; Kuć, *Ann. Rev. Phytopath.* **10**: 207, 1972; Ingram, *Bot. Rev.* **38**: 343, 1972. Cf. antibiotics.

Phytoalexins include: capsidiol, glyceollin, ipomearone, kievitone, phaseollin, pisatin, rishitin, wyerone (q.v.).

phytoalternarin (**A**, **B**, **C**), host-specific toxins produced by *Alternaria kikuchiana* (black spot of Japanese pears; *Pyrus serotina*) (Park *et al.*, *Physiol. Pl. Pathol.* **9**: 167, 1976).

Phytoconis Bory (1797) nom. rej. prop. = Lichenomphalia fide Kuyper (*in litt.*) The name has been used for the anamorph of *Lichenomphalia*. See, Gams (*Öst. bot. Z.* **109**: 376, 1962), Poelt & Jülich (*Herzogia* **1**: 331, 1969), Oberwinkler (*Ber. Deut. Bot. Ges.* **4**: 139, 1970), Redhead & Kuyper (*Arctic Alpine Mycology* **2**: 319, 1987), Redhead & Kuyper (*Mycotaxon* **31**: 221, 1988), Jørgensen & Ryman (*Taxon* **38**: 305, 1989).

Phytocordyceps C.H. Su & H.H. Wang (1986) = Cordyceps fide Su & Wang (*Mycotaxon* **26**: 337, 1986), Sung *et al.* (*Stud. Mycol.* **57**, 2007).

phytolysine, a plant tissue macerating enzyme from *Plowrightia ribesia* (Neaf-Roth *et al.*, *Phytopath. Z.* **40**: 283, 1961).

Phytomyxinae. An order for *Plasmodiophora*, *Phytomyxa*, *Sorosphaera* and *Tetramyxa*.

phytopathology, the branch of science for plant disease; see Plant pathogenic fungi.

Phytosociology. see Mycosociology.

Phytotoxic mycotoxins (toxins injurious to plants; see also phytotoxin (2) under Toxins). May be host specific (e.g. helminthosporoside, phytoalternarins, victorin, q.v.) or non-host specific (e.g. alternaric acid, baccatin, chaetoglobosin, culmomarasmin, diaporthin, fusaric acid, fusicoccin, helminthosporal, macrocyclic trichothecenes, ophiobolin (cochliobolin), skyrin, tentoxin, zearalenone, q.v.).

Fungi producing phytotoxic mycotoxins have potential as mycoherbicides for control of weeds. Phytotoxic mycotoxins biologically active against *Trifolium repens* and *Pueraria montana* have been found among metabolites of a *Sclerotinia* sp. (Yeon-Kyu Hong, *Plant Pathology Journal* **20**: 52, 2004). Macrocyclic trichothecenes produced by *Myrothecium verrucaria* exhibit phytotoxicity to both weeds and crops (beans, corn, tobacco, wheat) causing a range of damage (Cutler & Jarvis, *Environmental and Experimental Botany* **25**: 115, 1985; Abbas *et al.*, *Phytochemistry* **59**: 309, 2002). These mycotoxins including epiroridin, epiisororidin, roridins, trichoverrins and verrucarins are effective against *Lemna pausicostata* and *Pueraria montana* (Abbas *et al.*, *Phytochemistry* **58**: 269, 2001). *Fusarium* toxins such as enniatin and fumonisin, as well as fusaric and dehydrofusaric acids, reportedly have herbicidal properties (Hershenhorn *et al.*, *Plant Science* **86**: 155, 1992; Zonno & Vurro, *Phytoparasitica* **30**: 519, 2002). Seed germination of *Orobanche ramosa* is inhibited by fusaric acids, and *Striga hermonthica*, a serious pest of African crops, is totally suppressed by other fusaric metabolites (Idris *et al.*, *Phytopathologia Mediterranea* **42**: 65, 2003). Mycotoxins produced by *Alternaria alternata*, *Fusarium* species, *Myrothecium verrucaria* and *Phomopsis foeniculi* showed phytotoxic effects, i.e. chlorosis, necrosis and other symptoms, particularly on seedlings (Lamprecht *et al.*, *Phytopathology* **84**: 383, 1994; Corsaro *et al.*, *Carbohydr. Res.* **308**: 349, 1998; Abbas *et al.*, *Phytochemistry* **59**: 309, 2002). Phytotoxic mycotoxins may inhibit translation in eukaryotic ribosomes (Masuda *et al.*, *J. Experimental Botany* **58**: 1617, 2007). Trichoverrins, atranone and some *Fusarium* toxins are also weakly cytotoxic for mammals (Ueno & Ueno, *Toxicology, Biochemistry and Pathology of Mycotoxins*, 107, 1978; Abbas *et al.*, *Phytochemistry* **59**: 309, 2002).

Reviews: Pringle & Scheffer (*Ann. Rev. Phytopath.* **2**: 133, 1964), Wright (*Ann. Rev. Microbiol.* **22**: 269, 1968), Wood *et al.* (Eds) (*Phytotoxins in plant disease*, 1972), Strobel (*Ann. Rev. Pl. Physiol.* **25**: 541, 1974), Durbin (Ed.) (*Toxins in plant diseases*, 1981), Uraguche & Yamazaki [eds] (*Toxicology, Biochemistry and Pathology of Mycotoxins*, 1978).

Piemycus Raf. (1813) ≡ Piesmycus.

Piersonia Harkn. (1899) = Choiromyces fide Trappe

(*TBMS* **65**: 496, 1975).

Piesmycus Raf. (1808) ? = Bovista fide Stalpers (*in litt.*).

Pietria fungaia, see stone-fungus.

Piggotia Berk. & Broome (1851), anamorphic *Venturiaceae*, Cac.0eP.19. 3, widespread (temperate). See Sutton (*The Coelomycetes*, 1980), Braun (*Arnoldia* **15**: 44, 1998), Johnston (*N.Z. Jl Bot.* **37**: 703, 1999).

Pigments. The text of this entry is unrevised and remains the same as for the ninth edition. Characteristic pigments are produced by a wide variety of fungi. Species of *Drechslera* s.l. give hydroxyanthraquinones (e.g. helminthosporin ('maroon' in colour), catenarin (red), cynodontin ('bronze'), tritisporin (red brown)); the similar compound, erythroglaucin (red) is produced by forms of *Aspergillus glaucus* which gives in addition, auroglaucin (orange) and flavoglaucin (yellow). Among other pigments, investigations have been made on aurofusarin (orange yellow) and rubrofusarin from *Fusarium culmorum*; aurantin (yellow) and oosporin (purple-brown with ferric chloride ($FeCl_3$) from *Chrysonilia sitophila* (teleomorph *Neurospora sitophila*); boletol (blue) from *Boletus luridus* and other species; citromycetin, chrysogenin, citrinin, fulvic acid, and other yellow pigments from *Penicillium*. Many mycotoxins are pigmented, e.g. naphthoquinones from *Penicillium* and *Aspergillus*. 'Yellow rice' refers to the colour of rice infected by pigment and toxin producing species of *Penicillium*. Important fungal sex hormones such as trisporic acid from *Blakeslea trispora* are carotenoid pigments (Turner & Aldridge, *Fungal metabolites* II, 1983). Pigments from fungi are involved in biodeterioration of commodities, such as paint. The Chinese red rice (ang-kak, q.v.) is used for colouring food. See Wolf (*J. Elisha Mitch. Sci. Soc.* **89**: 184, 1973; synthesis, 261 refs).

Many pigments occur in lichens and may be red (e.g. rhodophyscin), yellow (e.g. usnic acid (q.v.), stictaurin), orange (e.g. parietin, q.v.), bright emerald green (e.g. vulpinic acid), or brown (e.g. *Parmelia*-brown). The chemical structures of pigments in thalli are mainly known whilst those of apothecial tissues (e.g. epithecium colours) are less understood. Lichen pigments are mainly pulvic acid derivatives, usnic acids, and anthraquinones.

See see Carotene, Dyeing, Metabolic products, Wood attacking fungi.

Pila Speg. (1923) [non *Pila* C.E. Bertrand & Renault 1892, fossil *Algae*] ≡ Gastropila.

Pilacre Fr. (1829) nom. dub., Agaricomycetes. See Donk (*Persoonia* **4**: 325, 1966).

Pilacrella J. Schröt. (1887) = Atractiella fide Oberwinkler & Bauer (*Sydowia* **41**: 224, 1989).

Pilaira Tiegh. (1875), Mucoraceae. 4 (esp. coprophilous), widespread (north temperate). See Zycha *et al.* (*Mucorales*, 1969; key), Mil'ko (*Mikol. Fitopatol.* **4**: 262, 1970), Fletcher (*J. Biol. Educ.* **5**: 229, 1971), Fletcher (*TBMS* **61**: 553, 1973; phototropism), Wood & Cooke (*TBMS* **86**: 672, 1986; parasitism), Wood & Cooke (*TBMS* **88**: 247, 1987; nutrition), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Pilát (Albert; 1903-1974; Czech). Student of Velenovský (q.v.), Charles University (1926); Scientific Assistant and Research Officer (1930-1948) then Head, Botanical Department (1948-1965) then Head, Mycological Department (1965-1974), National Museum, Prague. An authority on basidiomycetes, particularly wood-inhabiting and mycorrhizal species, particularly of Europe and temperate Asia; rediscovered the lost collections of Corda (q.v.). *Publs. Atlas des Champignons de l'Europe* (1934-1948) [including *Pleurotus* (1935); Polyporaceae (1936-1942); *Agaricus* (1951)]; *Houby Československa ve Svém Životním Prostředí* (1969). *Biogs, obits etc.* Kotlaba & Pouzar (*TBMS* **65**: 163, 1975) [portrait]; Singer (*Mycol.* **67**: 445, 1975) [portrait]; Stafleu & Cowan (*TL-2* **4**: 265, 1983).

Pilatia Velen. (1934) = Urceolella fide Raschle (*Sydowia* **29**: 170, 1977).

Pilatoporus Kotl. & Pouzar (1990) = Fomitopsis fide Ryvarden (*Syn. Fung.* **5**: 201, 1991).

pileate, having a pileus.

pileipellis, see pellis.

pileocystidium, see cystidium.

Pileodon P. Roberts & Hjortstam (1998), Gloeophyllales. 2, Brunei; Philippines. See Hjortstam *et al.* (*Kew Bull.* **53**: 817, 1998), Nakasone (*Sydowia* **56**: 258, 2004).

Pileolaria Castagne (1842), Pileolariaceae. *c.* 15 (on *Anacardiaceae*), widespread. See Hüseyın & Selçuk (*Pakist. J. Bot.* **36**: 203, 2004; Turkey).

Pileolariaceae Cummins & Y. Hirats. (1983), Pucciniales. 4 gen. (+ 3 syn.), 34 spp.

Lit.: Gardner & Hodges (*Mycol.* **77**: 575, 1985), Hiratsuka (*Mycotaxon* **31**: 517, 1988), Dianese *et al.* (*Fitopatol. Brasil* **18**: 342, 1993), Chen *et al.* (*Mycoscience* **37**: 91, 1996), Walker (*Australasian Mycologist* **20**: 3, 2001), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003), Wingfield *et al.* (*Australas. Pl. Path.* **33**: 327, 2004), Aime (*Mycoscience* **47**: 112, 2006).

pileolus, a small pileus.

pileus, the hymenium-supporting part of the basidioma of non-resupinate *Agaricomycetes*; cap (Fig. 4A).

Pilgeriella Henn. (1900), Parodiopsidaceae. Anamorph *Septoidium*. 2, S. America.

Pilidiella Petr. & Syd. (1927), anamorphic *Schizoparme*. 12, widespread. See Sutton (*The Coelomycetes*, 1980), Castlebury *et al.* (*Mycol.* **94**: 1017, 2002; phylogeny), Van Niekerk *et al.* (*MR* **108**: 283, 2004; phylogeny), Rossman *et al.* (*Mycoscience* **48**: 135, 2007; review).

Pilidium Kunze (1823), anamorphic *Discohainesia*, St.0eH.15. 2, widespread. See Sutton (*The Coelomycetes*, 1980), Palm (*Mycol.* **83**: 787, 1992; synanamorph *Hainesia*), Rossman *et al.* (*Mycol. Progr.* **3**: 275, 2004; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Piligena Schumach. (1821) = Onygena fide Saccardo (*Syll. fung.* **20**: 230, 1911).

Pilimelia W.D. Kane (1966), Actinobacteria. q.v.

Piline Theiss. (1917) = Perisporiopsis Henn. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Pillulasclerotes Stach & Pickh. (1957), Fossil Fungi. 1 (Carboniferous), Germany.

Pilobolaceae Corda (1842), Mucorales. 2 gen. (+ 4 syn.), 6 spp.

Lit.: Kirk & Benny (*TBMS* **75**: 123, 1980), Hu *et al.* (*Mycosystema* **2**: 111, 1989), Cacialli *et al.* (*Funghi e Ambiente* **78–79**: 13, 1998), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001).

Pilobolus Tode (1784), Pilobolaceae. 5 (coprophilous), widespread. See Grove *in* Buller (*Researches on Fungi* **6**: 190, 1934), Zycha *et al.* (*Mucorales*, 1969),

Nand & Mehrotra (*Sydowia* **30**: 283, 1978; spp.), Bourret & Keierleber (*Arch. Mikrobiol.* **126**: 43, 1980; spore germination), Foos & Royer (*CJB* **65**: 1063, 1987; growth temp), Hu *et al.* (*Mycosystema* **2**: 111, 1989; revision), Eysker (*Res. Vet. Sci.* **50**: 29, 1991; dispersal of cattle lungworm), Horie *et al.* (*Mycoscience* **39**: 463, 1998; gravitropic response), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

Pilocarpaceae Zahlbr. (1905), Lecanorales (L). 11 gen. (+ 11 syn.), 259 spp.

Lit.: Awasthi & Mathur (*Proc. Indian Acad. Sci.* Pl. Sci. **97**: 481, 1987), Kalb & Vězda (*Nova Hedwigia* **51**: 435, 1990), Lücking (*Nova Hedwigia* **52**: 267, 1991), Lücking *et al.* (*Bot. Acta* **107**: 393, 1994), Cáceres (*Mycotaxon* **71**: 383, 1999), Thor *et al.* (*Symb. bot. upsal.* **32**: 72 pp., 2000), Andersen & Ekman (*Lichenologist* **36**: 27, 2004), Andersen & Ekman (*MR* **109**: 21, 2005).

Pilocarpon Vain. (1890) = Byssoloma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pilocintractia Vánky (2004), ? Anthracoideaceae. 2 (in seeds of *Fimbristylis* (*Cyperaceae*)), S. Asia; Australia; C. & S. America. See Vánky (*Mycol. Balcanica* **1**: 169, 2004), Vánky (*Mycotaxon* **95**: 1, 2006; key).

Pilocratera Henn. (1891) ≡ Cookeina.

Piloderma Jülich (1969), Atheliaceae. 6, widespread. See Jülich (*Willdenowia* Beih. **7**, 1972).

Pilodermataceae Jülich (1982) = Atheliaceae.

Pilonema Nyl. (1860) = Polychidium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pilopeza Fr. (1849) ≡ Psilopezia.

Pilophora Wallr. (1833) [non *Pilophora* Jacq. 1802, *Palmae*] = Rhizopus fide Hesseltine (*Mycol.* **47**: 344, 1955) See *Crinofera.*

Pilophoraceae Stizenb. (1862) = Cladoniaceae.

Pilophoron (Tuck.) Tuck. (1858) = Pilophorus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pilophorum Nyl. (1857) ≡ Pilophorus.

Pilophorus Th. Fr. (1857), Cladoniaceae (L). 11, widespread (esp. temperate). See Jahns (*Lichenologist* **4**: 199, 1970; Eur.), Hawksworth *et al.* (*Taxon* **21**: 327, 1972; nomencl.), Jahns (*Mycotaxon* **13**: 289, 1981; monogr., key), Hertel & Rambold (*Pl. Syst. Evol.* **158**: 289, 1989; gen. concept), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; phylogeny), Wedin & Döring (*MR* **103**: 1131, 1999; DNA), Wedin *et al.* (*Lichenologist* **32**: 171, 2000; phylogeny), Stenroos *et al.* (*Mycol. Progr.* **1**: 267, 2002; phylogeny), Harada & Yoshimura (*Lichenology* **3**: 11, 2004; nomencl.), Myllys *et al.* (*Taxon* **54**: 605, 2005; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Piloporia Niemelä (1982), Polyporaceae. 2, widespread. See Niemelä (*Karstenia* **22**: 13, 1982).

Pilosace (Fr.) Quél. (1873) nom. dub., Agaricales. See Singer (*Agaric. mod. Tax.*, 1951).

pilose, covered with hairs.

Pilosporella E.I. Hazard & Oldacre (1975), Microsporidia. 2.

Pilula Harker, Sarjeant & Caldwell (1990), Fossil Fungi. 1.

Pilula Massee (1910) = Dimerina fide Clements & Shear (*Gen. Fung.*, 1931).

Pilulina Arnaud (1954), anamorphic *Pezizomycotina*, Hso.0eP.?. 1, France.

Pimina Grove (1888) = Zygosporium fide Mason (*Mycol. Pap.* **5**, 1941).

Piminella Arnaud (1954) = Gonytrichum fide Gams & Holubová-Jechová (*Stud. Mycol.* **13**, 1976).

Pinacisca A. Massal. (1854) = Hymenelia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pinatubo J.B. Manandhar & Mew (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Philippines. See Manandhar & Mew (*Mycotaxon* **60**: 203, 1996).

Pindara Velen. (1934) = Helvella. Clusters within *Helvella*, but that genus is polyphyletic. fide Svrček (*Česká Mykol.* **1**: 45, 1947), Kristiansen (*Agarica* **5**: 105, 1984), Landvik *et al.* (*Mycol.* **91**: 278, 1999).

pine moss, species of *Alectoria* and *Bryoria*.

pine mushroom, see matsu-take.

Pinnaticoemansia Kurihara & Degawa (2006), Kickxellaceae. 1, Japan. See Kurihawa & Degawa (*Mycoscience* **47**: 205, 2006).

Pinoyella Castell. & Chalm. (1919) = Trichophyton fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pinuzza Gray (1821) = Suillus Gray fide Singer (*Farlowia* **2**: 223, 1945).

Pionnotes Fr. (1849) = Fusarium fide Wollenweber & Reinking (*Die Fusarien*: 6, 1935).

pionnotes (of *Fusarium*), a spore mass having a fat-like or grease-like appearance; **pseudo-**, see sporodochium.

Pionospora Th. Fr. (1859) = Pertusaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Boqueras & Llimona (*Mycotaxon* **88**: 471, 2003).

Piperivora Siboe, P.M. Kirk & P.F. Cannon (1999), anamorphic *Pezizomycotina*, Hso.?.?. 1, Kenya. See Siboe *et al.* (*Mycotaxon* **73**: 298, 1999).

Piptarthron Mont. ex Höhn. (1918), anamorphic *Planistroma*, Cpd.0eH/≡ eH.1. 7 (on *Agavaceae*), widespread. See Sutton (*The Coelomycetes*, 1980), Sutton (*TBMS* **81**: 407, 1983), Ramaley (*Mycotaxon* **42**: 63, 1991; teleomorph), Ramaley (*Mycotaxon* **55**: 255, 1995; key 6 spp.), Ramaley (*Mycotaxon* **66**: 509, 1998).

Piptocephalidaceae J. Schröt. (1886), Zoopagales. 3 gen. (+ 9 syn.), 70 spp.

Lit.: Benjamin (*Aliso* **4**: 321, 1959), Benjamin (*Aliso* **5**: 273, 1963), Benjamin (*Mycol.* **48**: 1, 1966), Patil & Patil (*Indian Phytopath.* **47**: 217, 1994), Tanabe *et al.* (*Mol. Phylogen. Evol.* **30**: 438, 2004).

Piptocephalis de Bary (1865), Piptocephalidaceae. 24 (mycoparasites esp. of *Mucorales*), widespread. See Dobbs & English (*TBMS* **37**: 375, 1954; *P. xenophila* on non-mucoralean hosts), Leadbetter & Mercer (*TBMS* **39**: 17, 1956), Leadbetter & Mercer (*TBMS* **40**: 109, 1957; zygospores), Benjamin (*Aliso* **4**: 321, 1959), Berry (*Mycol.* **51**: 824, 1961; parasitism), Zycha *et al.* (*Mucorales*, 1969; key), Kuzuha (*J. Jap. Bot.* **51**: 123, 1976), Kirk (*TBMS* **70**: 335, 1978), Jeffries (*Mycol.* **71**: 209, 1979), Manocha (*CJB* **63**: 772, 1985; mycoparasitism), Manocha & McCullough (*CJB* **63**: 967, 1985; mycoparasitism), Gräfenhan (*A Taxonomic Revision of the Genus Piptocephalis (Fungi)*, 1998), Ho (*Taiwania* **49**: 188, 2004; Taiwan), Tanabe *et al.* (*J. gen. appl. Microbiol.* Tokyo **51**: 267, 2005; phylogeny), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

Piptoporaceae Jülich (1982) = Fomitopsidaceae.

Piptoporus P. Karst. (1881), Fomitopsidaceae. 4, widespread. *P. betulinus*, razor strop fungus, on birch. See Corner (*Beih. Nova Hedwigia* **78**: 140, 1984).

Piptostoma Berk. & Broome (1875) nom. dub., Fungi. See Petch (*Ann. R. bot. Gdns Peradeniya* **6**: 341, 1917) ? lapsus for *Piptostomum*.

Piptostomum Lév. (1845) nom. dub., anamorphic *Pezizomycotina*. See Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **119**: 617, 1910).

Piptostroma Fr. (1849) ≡ Piptostomum.

Pirella Bainier (1882), Mucoraceae. 2, widespread. See Benny (*A taxonomic revision of the Thamnidiaceae (Mucorales)*, 1973), Benny & Schipper (*Mycol.* **84**: 52, 1992), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Liu (*Mycosystema* **23**: 301, 2004; China).

Pirex Hjortstam & Ryvarden (1985), Meruliaceae. 1, N. America. See Hjortstam & Ryvarden (*Mycotaxon* **24**: 287, 1985).

Piricauda Bubák (1914), anamorphic *Pezizomycotina*, Hso.#eP.24. 4, neotropics. See Hughes (*CJB* **38**: 921, 1960), Mercado Sierra *et al.* (*Mycotaxon* **63**: 155, 1997; Mexico), Mercado Sierra *et al.* (*MR* **109**: 723, 2005; monogr.).

Piricaudilium Hol.-Jech. (1988), anamorphic *Pezizomycotina*, Hso.#eP.24. 1, Cuba. See Holubová-Jechová (*Česká Mykol.* **42**: 200, 1988), Heredia Abarca *et al.* (*Mycotaxon* **64**: 203, 1997).

Piricaudiopsis J. Mena & Mercado (1987), anamorphic *Pezizomycotina*, Hso.#eP.24. 1, Cuba. See Mena & Mercado (*Acta Bot. Cubana* **51**: 1, 1987).

Piricularia, see *Pyricularia*.

piricularin, a phytotoxin from *Pyricularia oryzae* (Togashi *et al.*, *Ann. phytopath. Soc. Japan* **25**: 142, 1960).

piriform, see pyriform.

Piriformospora Sav. Verma, Aj. Varma, Rexer, G. Kost & P. Franken (1998), Sebacinales. 1, India. See Verma *et al.* (*Mycol.* **90**: 897, 1998), Begerow *et al.* (*MR* **108**: 1257, 2004; posn.).

Piringa Speg. (1910) [non *Piringa* Juss. 1820, *Rubiaceae*] = Camarosporium fide Petrak & Sydow (*Annls mycol.* **33**: 157, 1935).

Pirispora Faurel & Schotter (1966), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Algeria. See Faurel & Schotter (*Revue Mycol.* Paris **30**: 341, 1965).

Piriurella Cookson & Eisenack (1979), Fossil Fungi. 2 (Cretaceous – Tertiary), Australia; Canada. ? = Alternaria (Hyphom.) fide Smith & Chaloner (*N. Jb. Geol. Paläont. Mh.* **11**: 701, 1979).

Pirobasidium Höhn. (1902) = Coryne fide Groves & Wilson (*Taxon* **16**: 35, 1967).

Pirogaster Henn. (1901) = Scleroderma fide Demoulin (*in litt.*).

Piromonas E. Liebet. (1910), Chytridiomycetes. 3, Europe. See Orpin (*J. gen. Microbiol.* **99**: 107, 1977; life history).

Piromyces J.J. Gold, I.B. Heath & Bauchop (1988), Neocallimastigaceae. 8 (anaerobic rumen fungi), widespread. See Gaillard-Martinie *et al.* (*Curr. Microbiol.* **24**: 159, 1992), Ho *et al.* (*Fungal Diversity* **4**: 37, 2000), Wubah (*Biodiversity of Fungi* Inventory and Monitoring Methods: 501, 2004).

Pirostoma (Fr.) Fuckel (1870) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Pirostoma (Fr.) Sacc. (1896) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Pirostomella Sacc. (1914), anamorphic *Pezizomycotina*, Hsy.0eP.?. 2, Philippines.

Pirottaea Sacc. (1878), Helotiales. 26, widespread (esp. north temperate). See Nannfeldt (*Symb. bot. upsal.* **25** no. 1: 1, 1985; key 23 spp.), Gamundí (*Fl. criptog. Tierra del Fuego* **10**, 1987), Johnston (*N.Z. Jl Bot.* **36**: 645, 1998; NZ spp.), Nauta & Spooner (*Mycologist* **14**: 65, 2000; key British spp.).

Pirozynskia Subram. (1972), anamorphic *Maurodothina*, Hso.1eP.24. 2, Canada; USA. See Subramanian (*Curr. Sci.* **41**: 711, 1972).

Pirozynskiella S.J. Hughes (2007), Pezizomycotina. 1 (on sooty moulds), pantropical. See Hughes (*Mycol.* **99**: 628, 2007).

pisatin, a phytoalexin (q.v.) from pea (*Pisum sativum*).

Pisocarpiaceae Corda (1838) = Pisolithaceae.

Pisocarpium Link (1808) ≡ Pisolithus.

Pisolithaceae Ulbr. (1928) = Sclerodermataceae.

Pisolithus Alb. & Schwein. (1805), Sclerodermataceae. 5 (ectomycorrhizal), widespread. See Marx (*Can. J. Microbiol.* **23**: 217, 1977; ecology), Martin *et al.* (*New Phytol.* **139**: 341, 1998; taxonomy), Chambers & Cairney (*Pisolithus – Ectomycorrhizal fungi, key genera in profile*, 1999; ecology), Martin *et al.* (*New Phytol.* **153**: 345, 2002; phylogeography), Kanchanaprayudh *et al.* (*Mycoscience* **44**: 287, 2003; phylogeny), Thomas *et al.* (*Mycotaxon* **87**: 405, 2003; hypogeous species from Australia).

Pisomyxa Corda (1837), ? Eurotiales. 2, S. America; Madeira.

Pistillaria Fr. (1821), Typhulaceae. *c.* 50, widespread (north temperate). See Berthier (*Bull. mens. Soc. linn. Lyon* Num. Spéc. **46**, 1976), Siepe (*Z. Mykol.* **65**: 187, 1999) = Typhula (Typhul.) fide.

Pistillina Quél. (1880), Typhulaceae. 4, widespread (north temperate). See Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**, 1950).

Pithoascaceae Benny & Kimbr. (1980) = Microascaceae.

Pithoascina Valmaseda, A.T. Martínez & Barrasa (1987) = Eremomyces fide Malloch & Sigler (*CJB* **66**: 1929, 1988).

Pithoascus Arx (1973), Microascaceae. Anamorphs *Arthrographis*-like, *Scopulariopsis*. 6, widespread. See von Arx (*Persoonia* **7**: 367, 1973; key), Malloch (*SA* **6**: 147, 1987; status), Valmaseda *et al.* (*CJB* **65**: 1802, 1987; concept), von Arx *et al.* (*Beih. Nova Hedwigia* **94**, 1988), Abbott *et al.* (*Mycol.* **94**: 362, 2002; synonymy with *Microascus*), Issakainen *et al.* (*Medical Mycology* **41**: 31, 2003; phylogeny).

Pithomyces Berk. & Broome (1875), anamorphic *Leptosphaerulina*, Hso.≡ -#P.1. 20, widespread. See facial eczema. See Ellis (*Mycol. Pap.* **76**, 1960; key), Rao & de Hoog (*Stud. Mycol.* **28**: 1, 1986; key), Roux (*TBMS* **86**: 319, 1986; teleomorph), Morgan-Jones (*Mycotaxon* **30**: 29, 1987; synonymy), Brewer *et al.* (*Proc. N.S. Inst. Sci.* **38**: 73, 1989; production of sporidesmin and sporidesmolides), Zhang & Zhang (*Mycotaxon* **85**: 241, 2003; China).

Pithosira Petr. (1949), anamorphic *Pezizomycotina*, Hsp.0eP.?. 1, S. America. See von Arx (*Persoonia* **11**, 1981; redescr.).

Pithospermum Mont. ex Berk. & Broome (1856) = Sporoschisma fide Mussat (*Syll. fung.* **15**: 294, 1901).

Pithya Fuckel (1870), Sarcoscyphaceae. Anamorph *Molliardiomyces*. 5, widespread (north temperate). See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949), Denison (*Mycol.* **64**: 616, 1972), Meléndez-Howell *et al.* (*Anales Inst. Biol. Univ. Nac. México* **60**: 9, 1990), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny).

Pithyella Boud. (1885), Hyaloscyphaceae. 8, wide-

spread. See Korf & Zhuang (*Mycotaxon* **29**: 1, 1987), Galán *et al.* (*MR* **98**: 1137, 1994), Döbbeler (*Feddes Repert.* **115**: 5, 2004; on bryophytes).

Pittierodothis Chardón (1939) = Protoscypha fide Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Pittostroma Kowalski & T.N. Sieber (1992), anamorphic *Pezizomycotina*. 1, Poland. See Kowalski & Sieber (*MR* **96**: 685, 1992).

Pitya, see *Pithya*.

pityriasis versicolor ('tinea versicolor'), a superficial skin disease of humans (*Malassezia furfur*).

Pityrosporum Sabour. (1904) = Malassezia fide Keddie (*XIII Int. Congr. Derm. (Munich)*: 867, 1968) See pityriasis versicolor.

Placella Syd. (1938), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Australia.

Placentaria Auersw. ex Rabenh. (1851) ? = Periola fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Placidiopsis Beltr. (1858), Verrucariaceae (L). 20, widespread. See Thomson (*Bryologist* **90**: 27, 1987; key 2 N. Am. spp.), Breuss (*Nova Hedwigia* **58**: 229, 1994; key 2 N. Afr. spp.), Breuss (*Öst. Z. Pilzk.* **5**: 65, 1996; revision), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

Placidium A. Massal. (1855), Verrucariaceae (L). 30, widespread. See Brusse (*Annln naturh. Mus. Wien* Ser. B, Bot. Zool. **98**: 35, 1996; key), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

Placoasterella Sacc. ex Theiss. & Syd. (1915), Asterinaceae. 3, Africa; Australia. See Tyson & Griffiths (*TBMS* **66**: 249, 1976; morphology, ultrastr.).

Placoasterina Toro (1930), ? Asterinaceae. 1, S. America.

Placocarpus Trevis. (1860), Verrucariaceae (L). 1, Europe. See Breuss (*Pl. Syst. Evol.* **148**: 313, 1985), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

Placocrea Syd. (1939), ? Mycosphaerellaceae. 1, Ecuador. See Petrak (*Sydowia* **6**: 336, 1952).

Placoderma (Ricken) Ulbr. (1928) ≡ Piptoporus fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Placodes Quél. (1886) ≡ Fomes.

Placodiella (Zahlbr.) Szatala (1941) = Solenopsora fide Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1984).

placodioid (of a crustose lichen thallus), disc-shaped with plicate lobes at the circumference (Fig. 21C).

placodiomorph, a 2-celled spore with a thickened septum which may or may not have a pore. Cf. polarilocular.

Placodiomyces E.A. Thomas ex Cif. & Tomas. (1953) = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Placodion Adans. (1763) nom. rej. = Peltigera fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Placodiplodia Bubák (1916), anamorphic *Pezizomycotina*, St.1eP.15. 2, Philippines. See Buchanan (*Mycol. Pap.* **156**, 1987).

Placodium (Ach.) DC. (1805) = Caloplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

placodium, see stroma, thyriothecium.

Placodium Weber ex F.H. Wigg. (1780) = Xanthoria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Placodium Hill (1773) nom. dub., Fungi (L). See Laundon (*in litt.*).

Placodothis Syd. (1928), ? Pezizomycotina. 1, West Indies.

Placographa Th. Fr. (1860) = Lithographa fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Placoheppia (Zahlbr.) Oxner (1956) nom. inval. = Heppia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

placoid, see placodioid.

Placolecania (J. Steiner) Zahlbr. (1906) = Solenopsora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Placolecanora Räsänen (1940) ≡ Protoparmeliopsis.

Placolecidaceae Hafellner (1984) = Catillariaceae.

Placolecis Trevis. (1857), Catillariaceae (L). 1, Europe. See Schneider (*Biblthca Lichenol.* **13**, 1980), Makryi (*Botanicheskiĭ Zhurnal* **88**: 123, 2003; Russia).

Placomaronea Räsänen (1944), Candelariaceae (L). 2 or 3, S. America. See Osorio (*Bryologist* **77**: 463, 1974), Poelt (*Phyton* Horn **16**: 189, 1974; key), Westberg *et al.* (*MR* **111**: 1277, 2007; phylogeny).

Placomelan Cif. (1962), anamorphic *Dothidasteroma*, Cpt.0eH.?. 1, Dominican Republic. See Ciferri (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **19**: 124, 1962).

placomycetoid, pileus with diam : stipe ratio ‹1. Cf. campestroid.

Placonema (Sacc.) Petr. (1921), anamorphic *Pezizomycotina*, St.0-1eH.19. 3, S. America. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Placonemina Petr. (1921), anamorphic *Pezizomycotina*, St.1eH.15. 1, former Czechoslovakia.

Placoparmelia Henssen (1992), Parmeliaceae (L). 1, Argentina. See Henssen (*Lichenologist* **24**: 134, 1992), Calvelo (*Lichenology in Latin America. History, Current Knowledge and Applications* [Proceedings of GLAL-3, Terceiro Encontro do Grupo Latino-Americano de Liquenólogos, São Paulo, Brazil, 24-28 September, 1997]: 117, 1998; key).

Placopezizia Höhn. (1916) = Leptotrochila fide Schüepp (*Phytopath. Z.* **36**: 236, 1959).

Placophomopsis Grove (1921) = Phomopsis (Sacc.) Bubák. fide Sutton (*Mycol. Pap.* **141**, 1977).

Placopsis (Nyl.) Linds. (1867), Trapeliaceae (L). 56, widespread. See Lamb (*Lilloa* **13**: 151, 1947), Brodo (*Biblthca Lichenol.* **57**: 59, 1995; key 3 N. Planobispora Thiemann & Beretta (1968), Actinobac-

teria. q.v.

planoconvex, a flat zygote.

planocyte (planont), a motile cell.

planogamete, a motile gamete; zoogamete.

Planomonospora Thiemann, Pagani & Beretta (1967), Actinobacteria. q.v.

planont, see planocyte.

Planoroccellaceae Elenkin (1929) = Roccellaceae.

planospore, a zoospore.

planozygote (1) a motile zygote; (2) a flat zygote (of a pileus or spore), convex but somewhat flat.

Plant pathogenic fungi. A large proportion of fungal species live in association with plants, as saprobes on plant surfaces or dead plant tissue, as mutualists in mycorrhizal associations or as endophytes or parasites of living plants. Some, e.g. *Pucciniales*, *Erysiphaceae*, are obligate parasites of plants. Many parasitic fungi are highly phytopathogenic and induce severe and frequently economically important diseases. They are the most important agents of plant disease; more than 60 per cent of the literature on plant diseases is devoted to fungal infections. Plant pathogens are represented in all the major groups of fungi and some groups, e.g. *Ustilaginales* (smuts), *Pucciniales* (rusts), *Peronosporaceae* (downy mildews), *Erysiphaceae* (powdery mildews), are known by the common names of the diseases for which they are responsible. Other groups important as plant pathogens are basidiomycetes (frequently wood-attacking), and a wide range of ascomycetes, represented particularly on living tissues by their anamorphs. (The teleomorph of a pathogen frequently develops only on dead plant tissue in the terminal phase of the disease.)

The symptoms of fungus diseases in plants are diverse. They may be roughly classified as **necrosis** - death of tissues (cf. anthracnose, blight, canker, damping-off, scab, shot hole); **wilting** - loss of turgor due to the mechanical plugging of the vessels by hyphae or to the action of a toxin secreted by the pathogen; **hyperplasia** - overgrowth (cf. galls, witches' brooms); and **hypoplasia** - dwarfing (and chlorosis).

Transmission of plant pathogenic fungi may be by air (either dry or moist, as in droplet transmission), water, soil, seeds and other propagating material, plant debris, and insects and other animal agents. Humans have spread many important diseases within one country, from one country to another, and from one part of the world to another by transporting infected material in the course of trade.

Control of parasitic disease is (fide Whetzel) based on exclusion, eradication, protection, and immunization. Quarantine procedures, inspection at ports, and legislation governing the movement of plants and plant products, the growth of susceptible plants under conditions unfavourable for the development of the pathogen, and the use of disease-free seed or planting material are based on exclusion. Eliminating ('roguing') diseased plants, the cutting-out of diseased parts, heat treatment of seed material, and the use of eradicant fungicides on infected plants (i.e. against the pathogen) are examples of methods based on eradication. Among protective measures are the dusting or spraying of healthy plants with fungicides. The use of immune or resistant varieties is an example of 'immunization', but active immunization, which is so important in the control of many diseases of animals and man, is of little value against plant diseases. The three main strategies for plant disease control are: phytosanitation (quarantine, removal of inoculum sources, crop rotation, clean seed etc.); protection (use of fungicides, avoidance of predisposing cultural conditions) and resistance (use of disease resistance cultivars). The new sciences of genetic engineering and genomics are making a huge impact on development of resistant cultivars, e.g. Kamoun & Smart (*Plant disease* **89**: 692, 2005; review of genomics and late blight of potato and tomato), Punja (2004).

Lit.: The literature on plant disease is large, but well covered by review journals and databases (see below). See also the CABI *Crop protection compendium* CD. The standard general phytopathological texts all deal with fungal diseases, as do most monographs on diseases of particular crop plants. Here a selection has been made of general works and review journals. For additional references see Moreau (*Rev. mycol., Paris* **27**: 41, 1962), *RAM* **46**: 1 and 113, 1967 (select bibliogr.), Waller & Lenné (*Plant pathologist's pocketbook*, 2001). See also Fungicides, gene-for-gene, Genetics, Geographical distribution, Mycotoxicoses, physiologic race, Seed-borne fungi, Special forms.

PEST-CD; see Literature].

plaque, a clear area in a bacterial colony caused by localized viral lysis; also applied to similar areas in fungal cultures (e.g. Riegman & Wessels, *TBMS* **75**: 325, 1980).

Plasia Sherwood (1981), anamorphic *Xylogramma*, St.≡ eH.15/16. 1, Europe. See Sherwood (*TBMS* **77**: 197, 1981).

plasma membrane, see plasmalemma.

plasmalemma, outer membrane composed of phospholipids and proteins which surrounds a cell and regulates exchange of materials between the cell and its environment; the limiting (boundary) membrane of the cytoplasm; cell, cytoplasmic, or plasma membrane.

plasmalemmasome, an intracytoplasmic vesicle (formed by invagination of the plasmalemma) filled with tubular diverticula. Cf. lomasome.

plasmamembranic vesicle, sporangial vesicle, the membrane of which is the same membrane bounding the protoplasm within the sporangium, c.f. homohylic vesicle, precipitative vesicle.

plasmatoogosis (of *Pythiaceae*), a bud-like outgrowth (like a prosporangium in form) in the host tissue (Sideris, *Mycol.* **23**: 255, 1931).

plasmodesma (pl. **-ta**), an isthmus-like strand of protoplasm connecting adjacent cells.

plasmodia, see plasmodium.

plasmodic granules, very small, dark-coloured particles on the surface of the peridium, and frequently of the spores, in the *Cribrariaceae*; dictydine granules.

plasmodiocarp (of *Mycetozoa*), a sessile and vein-like sporangium, like part of the larger veins of a plasmodium.

plasmodium (pl. **plasmodia**) (of *Myxogastria*), a multinucleate, motile mass of protoplasm bounded by a plasma membrane but lacking a wall, generally reticulate, characteristic of the growth phase; Alexopoulos (*Mycol.* **52**: 17, 1961) distinguishes: **protoplasmodium**, an undifferentiated microscopic plasmodium which gives rise to a single sporangium, as in *Echinosteliales*; **aphanoplasmodium**, a plasmodium composed of a network of undifferentiated strands of non-granular protoplasm, as in *Stemonitis*; **phaneroplasmodium**, a plasmodium composed of a well-differentiated advancing fan and thick strands of granular protoplasm exhibiting ecto- and endoplasmic regions, as in *Physarales*; **aggregate plasmodium, pseudoplasmodium** (of *Acrasiales*), a structure formed by the massing of separate myxamoebae or cells before reproduction (a grex); **filoplasmodium**, the net-like pseudoplasmodium of the *Labyrinthulales*.

plasmogamospore, aeciospore (Laundon, *TBMS* **58**: 345, 1972).

plasmogamy, fusion of two cells or plasmodial cytoplasms without karyogamy (nuclear fusion) or a precursor to karyogamy.

Plasmophagus De Wild. (1895), Chytridiales. 3 (in algae), Europe. See Dick (*Straminipilous Fungi*: 670 pp., 2001).

Platisma Hoffm. (1790) = Cetraria fide Santesson & Culberson (*Bryologist* **69**: 100, 1966).

Platisma P. Browne ex Adans. (1763) = Ramalina fide Santesson & Culberson (*Bryologist* **69**: 100, 1966).

Platismatia W.L. Culb. & C.F. Culb. (1968), Parmeliaceae (L). 10, widespread. See Culberson & Culberson (*Contr. US natn Herb.* **34**: 449, 1968; monogr.),

Thell *et al.* (*Cryptog. Bryol.-Lichénol.* **19**: 307, 1998; phylogeny), Wedin *et al.* (*MR* **103**: 1152, 1999; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Platisphaera Dumort. (1822) nom. rej. ≡ Lophiostoma fide Holm (*Taxon* **24**: 475, 1975).

Platistoma, see *Platystoma*.

Platistomum, see *Platystomum*.

Platycarpa Couch (1949), Eocronartiaceae. 2 (on *Pteridophyta*), America. See Couch (*Mycol.* **41**: 427, 1949), Oberwinkler & Bandoni (*TBMS* **83**: 369, 1984).

Platycarpium P. Karst. (1905) = Fusamen fide von Arx (*Verh. K. ned. Akad. Wet. Amst.* C **51**: 1, 1957).

Platychora Petr. (1925), Venturiaceae. Anamorph *Piggotia*. 2, widespread (north temperate). See Sivanesan (*Bitunicate Ascomycetes and their Anamorphs*, 1984), Winton *et al.* (*Mycol.* **99**: 240, 2007; phylogeny).

Platygloea J. Schröt. (1887), Platygloeaceae. *c.* 2, widespread. See Bandoni (*Mycol.* **48**: 821, 1956; key), Dueñas (*Nova Hedwigia* **72**: 441, 2001; Iberian).

Platygloeaceae Racib. (1909), Platygloeales. 4 gen. (+ 5 syn.), 6 spp.

Lit.: Berres *et al.* (*Mycol.* **87**: 821, 1995), Bandoni (*Mycoscience* **39**: 31, 1998), Oberwinkler *et al.* (*Kew Bull.* **54**: 763, 1999), Chen & Oberwinkler (*Mycotaxon* **76**: 279, 2000), Dueñas (*Nova Hedwigia* **72**: 441, 2001), Bauer *et al.* (*Mycol.* **96**: 960, 2004), Lutz *et al.* (*Mycol.* **96**: 614, 2004), Lutz *et al.* (*Mycol.* **96**: 1316, 2004), Lutz *et al.* (*MR* **108**: 227, 2004), Nakamura *et al.* (*MR* **108**: 641, 2004), Wingfield *et al.* (*Australas. Pl. Path.* **33**: 327, 2004).

Platygloeales R.T. Moore (1990). Pucciniomycetes. 2 fam., 11 gen., 19 spp. Fams:
(1) **Eocronartiaceae**
(2) **Platygloeaceae**
For *Lit.* see under fam.

platygonidia, photobionts occurring in stellately or orbicular spreading colonies (e.g. *Cephaleuros*) (obsol.).

Platygramma G. Mey. (1825) nom. rej. prop. = Phaeographis fide Lücking *et al.* (*Taxon* **56**: 1296, 2007; nomencl.).

Platygramma Leight. (1854) = Enterographa fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Platygramme Fée (1874), Graphidaceae (L). 9, pantropical. See Staiger (*Biblthca Lichenol.* **85**, 2002), Nakanishi *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **29**: 83, 2003; Japan), Archer (*Telopea* **11**: 59, 2005; Australia), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is).

Platygrapha Berk. & Broome (1870) [non *Platygrapha* Nyl. 1855] ? = Ocellularia fide Sherwood (*Mycotaxon* **3**: 233, 1976).

Platygrapha Nyl. (1855) = Schismatomma fide Tehler (*Op. Bot.* **118**: 1, 1993).

Platygraphis Hook. f. (1867) ≡ Platygrapha Nyl.

Platygraphomyces Cif. & Tomas. (1953) ≡ Platygrapha Nyl.

Platygraphopsis Müll. Arg. (1887), Ostropales (L). 1, America (tropical); Papua New Guinea. See Awasthi (*Biblthca Lichenol.* **40**, 1991; Indian subcontinent).

Platypeltella Petr. (1929), Microthyriaceae. 2, C. America. See Farr (*Mycotaxon* **15**: 448, 1982).

platyphyllous, broadly lobed.

Platyphyllum Vent. (1799) nom. rej. ≡ Cetraria.

Platysma Hill (1773) = Ramalina fide Santesson & Culberson (*Bryologist* **69**: 100, 1966).

platysmoid (1) (of lichen thalli), loosely attached foliose thalli with ascending lobes, as in *Platismatia* (obsol.); (2) (of tissues), a scleroplectenchyma in which the hyphae are brown (Yoshimura & Shimada, *Bull. Kochi Gakuen Jun. Coll.* **11**: 13, 1980).

Platysphaera Trevis. (1877) ≡ Platisphaera.

Platysphaeria, see *Platisphaera*.

Platyspora Wehm. (1961) = Comoclathris fide Shoemaker & Babcock (*CJB* **70**: 1617, 1992), Barr (*SA* **12**: 27, 1993).

Platysporoides (Wehm.) Shoemaker & C.E. Babc. (1992), Pleosporaceae. 12, widespread. See Shoemaker & Babcock (*CJB* **70**: 1617, 1992), Barr (*SA* **11**: 27, 1993).

Platysticta Cooke (1889) = Stictis fide Sherwood (*Mycotaxon* **6**: 215, 1977).

Platystoma (Fr.) Bonord. (1851) = Lophiostoma fide Mussat (*Syll. fung.* **15**: 295, 1901).

Platystomaceae J. Schröt. (1894) = Lophiostomataceae.

Platystomum Trevis. (1877) = Lophiostoma fide Chesters & Bell (*Mycol. Pap.* **120**, 1970), Eriksson (*SA* **10**: 144, 1991), Abdel-Wahab & Jones (*Mycoscience* **41**: 379, 2000).

Platythecium Staiger (2002), Graphidaceae. 17, widespread. See Staiger (*Biblthca Lichenol.* **85**: 385, 2002), Nakanishi *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **29**: 83, 2003; Japan), Adawadkar & Makhija (*Mycotaxon* **92**: 387, 2005; India), Archer (*Biblthca Lichenol.* **94**, 2006; Australia), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is).

Pleamphisphaeria Höhn. (1919) ≡ Titanella fide Harris (*Mem. N. Y. bot. Gdn* **49**, 1989).

Plearthonis Clem. (1909) = Arthonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Plecopteromyces Lichtw., Ferrington & López-Lastra (1999), Legeriomycetaceae. 3 (in *Plecoptera*), Australia; S. America. See Lichtwardt *et al.* (*Mycol.* **91**: 1060, 1999), Ferrington *et al.* (*Mycol.* **97**: 254, 2005; Tasmania), White (*MR* **110**: 1011, 2006; phylogeny).

Plecostoma Desv. (1809) ≡ Geastrum.

Plecotrichum Corda (1831) nom. dub., anamorphic *Pezizomycotina*. See Hughes (*CJB* **36**: 798, 1958).

Plectania Fuckel (1870), Sarcosomataceae. Anamorph *Conoplea*. 15, widespread (north temperate). See Korf (*Mycol.* **49**: 107, 1957), Paden (*Fl. Neotrop.* **37**: 1, 1983; 4 sect.), Li & Kimbrough (*CJB* **73**: 1761, 1995; ultrastr.), Zhuang & Wang (*Mycotaxon* **67**: 355, 1998; spp. China), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Medel & Chacón (*Acta Bot. Mexicana* **50**: 11, 2000; Mexico), Calonge & Mata (*Mycotaxon* **81**: 237, 2002; Costa Rica), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Plectascales. *Ascomycota* with ascoma in which the asci were irregularly distributed; sometimes extended and including *Erysiphales*, *Eurotiales* (q.v.) and *Myriangiaceae*. See also *Plectomycetes*.

plectenchyma, a thick tissue formed by hyphae becoming twisted and fixed together; synchyma (Vuillemin); it is **prosenchyma (proso-)** when the hyphal elements are seen to be hyphae; **pseudoparenchyma (para-)**, when they are not; Vuillemin (1912) distinguished as **merenchyma** tissue derived by cell division in several planes, and Degelius (1954) used **euthyplectenchyma** for hyphal tissue with no cellu-

lar structure. Yoshimura & Shimada (*Bull. Kochi Gakuen Jun. Coll.* **11**: 13, 1980) key nine categories of plectenchyma, **chalaroplectenchyma** (hyphal walls not united, lumina wide), **pallisadoplectenchyma** (hyphae parallel, not coherent, with intercellular spaces), **platysmoid** (a scleroplectenchyma with brown hyphal walls), **scleroplectenchyma** (cell-walls thickened, lumina narrow), **scleroprosoplectenchyma** (hyphae parallel, cohering, walls thick, lumina narrow), and **serioplectenchyma** (hyphae parallel, cohering, walls not thick, lumina wide).

Plectobasidiales Gäum. (1926). See *Melanogastrales*, *Sclerodermatales* and *Tulostomatales*.

Plectocarpon Fée (1825), Roccellaceae. 10 (on lichens, esp. *Peltigerales*), widespread. See Hawksworth & Galloway (*Lichenologist* **16**: 85, 1984), Diederich & Etayo (*Nordic Jl Bot.* **14**: 589, 1994; key 7 spp.), Ertz *et al.* (*Bryologist* **106**: 465, 2003), Ertz *et al.* (*Biblthca Lichenol.* **91**: 155 pp., 2005; revision).

Plectodiscella Woron. (1914) = Elsinoë fide Jenkins (*J. agric. Res.* **44**: 689, 1932).

Plectodiscellaceae Woron. (1914) = Elsinoaceae.

Plectolitus Kohlm. (1960) = Amylocarpus fide Kohlmeyer & Kohlmeyer (*Syn. Pl. Marine Fungi*, 1971), Crumlish & Curran (*Mycologist* **8**: 83, 1994).

Plectomyces Thaxt. (1931), Ceratomycetaceae. 1, Philippines. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Plectomycetes. Class of *Ascomycota* with ± globose non-ostiolate ascomata; formerly frequently used for *Elaphomycetales*, *Erysiphales*, *Eurotiales*, *Meliolales*, *Microascales* and *Onygenales* but now recognized as heterogeneous, the non-ostiolate habit having repeatedly evolved. Reintroduced by Berbee & Taylor (1992) in a restricted sense (see *Ascomycota*).

Lit.: Benny & Kimbrough (*Mycotaxon* **12**: 1, 1980; keys 90 gen., 6 orders, 12 fams, excluded gen. names), Malloch (*in* Kendrick (Ed.), *The whole fungus* **1**: 153, 1979; *in* Reynolds (Ed.), 1981: 73, placement of *all* fams in orders also characterized by ostiolate or apothecioid taxa), Stchigel & Guarro (*MR* **111**: 1100, 2007; review of cleistothecial taxa).

Plectomyriangium C. Moreau & M. Moreau (1950) = Lecideopsella fide Eriksson & Hawksworth (*SA* **9**: 15, 1991).

Plectonaemella Höhn. (1915), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Europe.

plectonematogenous, of conidiogenous cells arising from rope-like strands of interwoven hyphae (not from single hyphae), the strands intertwined and not synnematous; funiculose. See Gams (*Cephalosporium-artige Schimmelpilze*, 1971).

Plectopeltis Syd. (1927), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, C. America; Australia. See Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 282, 2005).

Plectophoma Höhn. (1907) = Asteromella fide Sutton (*Mycol. Pap.* **141**, 1977).

Plectophomella Moesz (1922), anamorphic *Pezizomycotina*, St.0eH.15. 3, Europe. See Guarro *et al.* (*J. Clin. Microbiol.* **44**: 4279, 2006; from human).

Plectophomopsis Petr. (1922), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Plectopsora A. Massal. (1860) = Lempholemma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Plectopycnis Bat. & A.F. Vital (1959), anamorphic *Dothideomycetes*. 1, neotropics. See von Arx (*in litt.*), Farr (*Mycol.* **78**: 269, 1986).

Plectosclerotes Stach & Pickh. (1957), Fossil Fungi. 2 (Carboniferous), Germany.

Plectosira Petr. (1929), anamorphic *Pezizomycotina*, Cpd/St.0eH.?. 1, Europe.

Plectosphaera Theiss. (1917) = Phyllachora Nitschke ex Fuckel (1870) fide Cannon (*Mycol. Pap.* **163**, 1991), Summerell *et al.* (*Fungal Diversity* **23**: 323, 2006; culture of *P. eucalypti*, link to *Amphisphaeriaceae*).

Plectosphaeraceae Theiss. (1916) = Phyllachoraceae.

Plectosphaerella Kirschst. (1938) ≡ Plectosphaerina.

Plectosphaerella Kleb. (1929), Plectosphaerellaceae. Anamorph *Plectosporium*. 2, widespread. See Gams & Gerlagh (*Persoonia* **5**: 177, 1968), Uecker (*Mycol.* **85**: 470, 1993; ontogeny), Palm *et al.* (*Mycol.* **87**: 397, 1995), Pitt & Gams (*Nova Hedwigia* **81**: 311, 2005), Sung *et al.* (*Stud. Mycol.* **57**, 2007), Zare *et al.* (*Nova Hedwigia* **85**: 463, 2007).

Plectosphaerellaceae W. Gams, Summerb. & Zare (2007), Hypocreomycetidae (inc. sed.). 5 gen. (+ 1 syn.), 56 spp.

Lit.: Zare *et al.* (*Nova Hedwigia* **85**: 463, 2007).

Plectosphaerina Kirschst. (1938) = Omphalospora fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Plectosporium M.E. Palm, W. Gams & Nirenberg (1995), anamorphic *Plectosphaerella*, Hso.1eH.15/16/19. 1, widespread. See Palm *et al.* (*Mycol.* **87**: 398, 1995), Gams *et al.* (*Taxon* **53**: 193, 2004; nomencl.), Pitt & Gams (*Nova Hedwigia* **81**: 311, 2005; on *Alisma*), Sung *et al.* (*Stud. Mycol.* **57**, 2007), Zare *et al.* (*Nova Hedwigia* **85**: 463, 2007).

Plectronidiopsis Nag Raj (1979), anamorphic *Pezizomycotina*, Cac.1eH.19. 1, Chile. See Nag Raj (*CJB* **57**: 1397, 1979).

Plectronidium Nag Raj (1977), anamorphic *Pezizomycotina*, Cac.0eH.19. 4, widespread. See Sutton & Pascoe (*TBMS* **87**: 249, 1986), Alcorn & Sutton (*Aust. Syst. Bot.* **12**: 169, 1999; Australia).

Plectrothrix Shear (1902), anamorphic *Pezizomycotina*, Hso.0eH.?. 1, N. America.

Pleiobolus, see *Plejobolus*.

Pleiochaeta (Sacc.) S. Hughes (1951), anamorphic *Pezizomycotina*, Hso.≡ eH-P.10. 4, widespread. *P. setosa* (lupin leaf spot). See Castañeda Ruíz *et al.* (*Mycotaxon* **57**: 457, 1996), Yang & Sweetingham (*Australas. Pl. Path.* **31**: 273, 2002; on legumes).

Pleiopatella Rehm (1908), Helotiales. 1, N. America.

Pleiopyrenis, see *Pleopyrenis*.

pleiosporous, having many spores.

Pleiostictis Rehm (1882) = Mellitiosporium fide Sherwood (*Mycotaxon* **5**: 1, 1977).

Pleiostomella Syd. & P. Syd. (1917) = Mendogia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pleiostomellina Bat., J.L. Bezerra & H. Maia (1964), Dothideomycetes. 1, Brazil. See Batista *et al.* (*Portugaliae Acta Biologica* Série B **7**: 373, 1964).

pleioxeny, the condition of plurivorous parasitism.

Pleistophora Gurley (1893), Microsporidia. 34.

Pleistosporidium Codreanu-Balcescu & Codreanu (1982), Microsporidia. 1.

Plejobolus (E. Bommer, M. Rousseau & Sacc.) O.E. Erikss. (1967) = Robergea fide Sherwood-Pike (*in litt.*).

Plenocatenulis Bat. & Cif. (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 2, USA. See Batista & Ciferri (*Mycopath. Mycol. appl.* **11**: 63, 1959).

Plenodomus Preuss (1851), anamorphic *Leptosphaeriaceae*. 1, widespread. See Boerema & Kesteren (*Per-

soonia **3**: 17, 1963), Boerema *et al.* (*TBMS* **77**: 61, 1981), Câmara *et al.* (*Mycol.* **94**: 630, 2002; phylogeny), Boerema *et al.* (*Phoma Identification Manual* Differentiation of Specific and Infra-Specific Taxa in Culture: 470 pp., 2004; monograph), Torres *et al.* (*Mycotaxon* **93**: 333, 2005; phylogeny, separation from *Phoma*).

Plenophysa Syd. & P. Syd. (1920), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1 or 2, Philippines; Sri Lanka.

Plenotrichaius Bat. & Valle (1961), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Batista & Valle (*Publções Inst. Micol. Recife* **337**: 9, 1961), Farr (*Mycol.* **78**: 269, 1986).

Plenotrichella Bat. & A.F. Vital (1959) = Myxothyriopsis fide von Arx (*in litt.*), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; as '*Plenotrichiella*').

Plenotrichopsis Bat. (1961), anamorphic *Pezizomycotina*, Cpt.0eH.38. 1, Brazil. See Batista (*Publções Inst. Micol. Recife* **338**: 33, 1961).

Plenotrichum Syd. (1927), anamorphic *Pezizomycotina*, Cpt.0eH.39. 2, C. America; China.

Plenozythia Syd. & P. Syd. (1916), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1 or 2, Asia.

pleoanamorphy, having more than one anamorph. See Hennebert (*in* Sugiyama (Ed.), *Pleomorphic fungi: the diversity and its taxonomic implications*, 1987), States of fungi.

Pleochaeta Sacc. & Speg. (1881), Erysiphaceae. Anamorph *Streptopodium*. 6, widespread. See Kimbrough (*Mycol.* **55**: 608, 1963; development), Kimbrough & Korf (*Mycol.* **55**: 619, 1963), Braun (*Beih. Nova Hedwigia* **89**, 1987; key), Mori *et al.* (*Mycol.* **92**: 74, 2000; phylogeny), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny), Kiss *et al.* (*MR* **110**: 1301, 2006; on *Celtis*), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Takamatsu *et al.* (*MR* **112**: 299, 2008; phylogeny).

Pleochroma Clem. (1909) ≡ Candelariella.

Pleococcum Desm. & Mont. (1849) nom. dub., anamorphic *Pezizomycotina*. See Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **119**: 617, 1910).

Pleoconis Clem. (1909) = Peccania fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pleocouturea G. Arnaud (1911), anamorphic *Pezizomycotina*. 1, France. See Sutton (*Mycol. Pap.* **141**, 1977).

Pleocryptospora J. Reid & C. Booth (1969), Diaporthales. 1, Brazil. See Reid & Booth (*CJB* **47**: 1055, 1969).

Pleocyta Petr. & Syd. (1927) = Phaeocytostroma fide Sutton (*Mycol. Pap.* **97**, 1964).

Pleodothis Clem. (1909) = Sydowia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pleogibberella Sacc. ex Berl. & Voglino (1886), Nectriaceae. 2 (on *Palmae* fruits), India; Brazil. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Pleoglonis Clem. (1909) ≡ Hariotia.

Pleolecis Clem. (1909) ≡ Steinia.

Pleolpidium A. Fisch. (1892) = Rozella fide Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960).

Pleomassaria Speg. (1880), Pleomassariaceae. Anamorph *Prosthemium*. 4, widespread (temperate). See Barr (*Mycotaxon* **49**: 129, 1993; synonymy with *Splanchnonema*), Hantula *et al.* (*MR* **102**: 1509, 1998; anamorph), Paavolainen *et al.* (*Mycol.* **92**: 253, 2000; biological species), Lumbsch & Lindemuth (*MR* **105**: 901, 2001; phylogeny), Tanaka *et al.* (*Mycoscience* **46**: 248, 2005; Japan), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny).

Pleomassariaceae M.E. Barr (1979), Pleosporales. 12 gen. (+ 2 syn.), 86 spp.

Lit.: Barr (*Mycotaxon* **15**: 349, 1982; keys 24 spp.), Barr (*Mycotaxon* **49**: 129, 1993; cladistic analysis, key gen.), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000), Lumbsch & Lindemuth (*MR* **105**: 901, 2001), Shoemaker *et al.* (*Can. J. Pl. Path.* **25**: 384, 2003).

Pleomeliola (Sacc.) Sacc. (1899), ? Meliolaceae. 1 or 2, Europe; N. America.

Pleomelogramma Speg. (1909), ? Herpotrichiellaceae. 1, S. America. See Petrak & Sydow (*Annls mycol.* **32**: 21, 1934).

Pleomeris Syd. (1921) = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Pleomerium Speg. (1918), Meliolaceae. 1 (from leaves), Brazil.

pleomorphic (1) of fungi having more than one independent form or spore-stage in the life cycle, especially of holomorphs comprising a teleomorph and one or more anamorphs; polymorphic; see Savile (*Mycol.* **61**: 1161, 1970), Sugiyama (Ed.) (*Pleomorphic fungi: their diversity and its taxonomic implications*, 1987), States of fungi; (2) (of dermatophytes), changes due to 'degeneration' in culture.

pleomorphism, the condition of being pleomorphic.

Pleonectria Sacc. (1876) = Nectria fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

pleont, any one of the two or more states of a pleomorphic fungus (Delphino, 1887).

Pleophalis Clem. (1909) = Spheconisca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pleophragmia Fuckel (1870), Sporormiaceae. 1, Europe. See von Arx & Müller (*Stud. Mycol.* **9**, 1975), Réblová & Svrcek (*Czech Mycol.* **49**: 193, 1997; Czech Republic).

Pleopsidium Körb. (1855), Acarosporaceae (L). 3, widespread. Pleosporales Luttr. ex M.E. Barr (1987). Pleosporomycetidae. 23 fam., 332 gen., 4764 spp. Thallus or stroma absent or rarely poorly developed. Ascomata perithecial or rarely cleistothecial, sometimes clypeate, variable in form but usually ± globose, thick-walled, immersed or erumpent, black, normally opening by a well-developed lysigenous ostiole, sometimes hairy or setose; peridium usually thick, composed of pseudoparenchymatous cells. Interascal tissue of cellular or trabeculate pseudoparaphyses, often immersed in J- gel. Asci usually ± cylindrical, fissitunicate, with a well-developed ocular chamber, rarely also with a poorly defined ring, not blueing in iodine. Ascospores hyaline to brown, septate, thin or thick-walled, sometimes muriform, often with a gelatinous sheath. Anamorphs hyphomycetous or coelomycetous, varied and often prominent. Fams.:

Pleurothelium Müll. Arg. (1877) = Pyrenula Ach. (1814) fide Aptroot (*in litt.*).

Pleurothelium Müll. Arg. (1885) = Pyrenula Ach. (1809) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pleurothyriella Petr. & Syd. (1925), anamorphic *Pezizomycotina*, Cac.0eH.?. 1, Europe.

Pleurothyrium Bubák (1916), anamorphic *Pezizomycotina*, St.0fH.10. 1, Europe.

Pleurotopsis (Henn.) Earle (1909) = Resupinatus. Belongs to *Mycenaceae* or *Marasmiaceae*. See Hughes *et al.* (*Mycol.* **90**: 595, 1998; biogeography).

Pleurotrema Müll. Arg. (1885) = Lithothelium fide Aptroot (*Biblthca Lichenol.* **44**, 1991), Barr (*Mycotaxon* **51**: 191, 1994).

Pleurotremataceae Walt. Watson (1929) = Pyrenulaceae.

Lit.: Barr (*Mycotaxon* **51**: 191, 1994; circumscribed with 5 genera with non-fissitunicate asci (*Daruvedia*, *Melomastia*, *Phomatospora*, *Pleurotrema* and *Saccardoella*)).

Pleurotrematomyces Cif. & Tomas. (1957) ≡ Pleurotrema.

Pleurotus (Fr.) P. Kumm. (1871) nom. cons., Pleurotaceae. Anamorph *Antromycopsis*. 20 (esp. on wood), widespread. *P. ostreatus*, the Oyster Cap, and several other species are edible and commercially cultivated. See Hilber (*Biblthca Mycol.* **87**: 1, 1982; monogr.), Barron & Thorn (*CJB* **64**: 774, 1987; ecology), Thorn *et al.* (*TMSJ* **34**: 449, 1993; ecology), Vilgays & Sun (*Proc. natn Acad. Sci. U.S.A.* **91**: 4599, 1994; speciation), Zervakis & Balis (*MR* **100**: 717, 1996; key Europ. spp.), Zervakis (*Mycol.* **90**: 1063, 1998; taxonomy), Albertó *et al.* (*Persoonia* **18**: 55, 2002), Li & Yao (*Mycosystema* **23**: 345, 2004; phylogeny), Zervakis *et al.* (*Microbiology* Reading **150**: 715, 2004; phylogeny, biogeography and speciation), Stajic *et al.* (*Mycotaxon* **93**: 247, 2005; genetics).

Pleurovularia R. Kirschner & U. Braun (2002), anamorphic *Pezizomycotina*, H?.?.?. 1, E. Asia. See Kirschner *et al.* (*Mycoscience* **43**: 16, 2002).

Pliariona A. Massal. (1860) = Thecaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Plicaria Fuckel (1870), Pezizaceae. Anamorph *Chromelosporium*. *c.* 10, widespread (temperate). Clusters within *Peziza*, but that genus is itself polyphyletic. See Hirsch (*Agarica* **6**: 241, 1985; key 4 Eur. spp.), Egger (*Mycotaxon* **29**: 183, 1986), Norman & Egger (*Mycol.* **88**: 986, 1996), Norman & Egger (*Mycol.* **91**: 820, 1999; phylogeny), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Spooner (*Czech Mycol.* **52**: 259, 2001), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny).

Plicariaceae Velen. (1934) = Pezizaceae.

Plicariella (Sacc.) Rehm (1894) = Plicaria fide Spooner (*Czech Mycol.* **52**: 259, 2001).

plicate, folded into pleats; **plica**, a pleat.

Plicatura Peck (1872), Agaricales. 1, widespread (north temperate). Belongs to *Amylocorticiaceae* or *Tricholomataceae*.

Plicaturaceae Jülich (1982) = Atheliaceae.

Plicaturella Murrill (1910) = Boletinellus fide Kuyper (*in litt.*).

Plicaturopsis D.A. Reid (1964), Agaricales. 2, Europe; New Zealand. Belongs to *Amylocorticiaceae* or *Tricholomataceae*.

Plistophora, see *Pleistophora*.

Plocaria Nees (1820) nom. rej. prop., Algae.

Plochmopeltidella J.M. Mend. (1925) = Chaetothyrina fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Plochmopeltinites Cookson (1947), Fossil Fungi. 2 (Oligocene, Miocene), India.

Plochmopeltis Theiss. (1914), Schizothyriaceae. 5, pantropical. See Gómez Acosta & Clavel Calzado (*Rev. Jardín Bot. Nac. Univ. la Habana* **17-18**: 137, 1998; Cuba), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; Australia).

Plochmothea Syd. (1939) = Xenostomella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ploettnera Henn. (1899), Helotiales. 5, Europe. See Hein (*Willdenowia* Beih. **9**, 1976; key), Nauta & Spooner (*Mycologist* **13**: 65, 1999; Brit. spp.).

Ploettnerula Kirschst. (1924) = Pirottaea fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Ploioderma Darker (1967), Rhytismataceae. Anamorph *Cryocaligula*. 5, India; N. America. See Hou & Liu (*Acta Mycol. Sin.* **12**: 99, 1993), Lin & Hou (*Acta Mycol. Sin.* **14**: 175, 1995), Hansen & Lewis (*Compendium of Conifer Diseases*, 1997), Jewell (*Forest Pathology* **31**: 33, 2001; histopathology).

Plokamidomyces Bat., C.A.A. Costa & Cif. (1957), anamorphic *Trichopeltheca*, Hso.0eH.15. 1, New Zealand. See Batista *et al.* (*Publções Inst. Micol. Recife* **90**: 15, 1957).

Plowrightia Sacc. (1883), Dothioraceae. *c.* 7, widespread. *P. ribesia* (black pustule of gooseberry and currants (*Ribes*)). See Wakefield (*TBMS* **24**: 286, 1940), Barr (*Harvard Pap. Bot.* **6**: 25, 2001), Winton *et al.* (*Mycol.* **99**: 240, 2007; phylogeny).

Plowrightiella (Sacc.) Trotter (1926) = Sydowia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pluesia Nieuwl. (1916) ≡ Maurya.

plug (in an ascus), see ascus.

Plunkettomyces G.F. Orr (1977) = Arachniotus fide von Arx (*Persoonia* **9**: 393, 1977).

Pluricellaesporites Hammen (1954), Fossil Fungi. 30 (Cretaceous, Tertiary), widespread.

Pluricellulites Hammen (1954), Fossil Fungi ? Fungi. 1.

plurilocular (1) (of ascospores), many-celled; (2) (of stromata), having several locules.

Pluriporus F. Stevens & R.W. Ryan (1925) = Dothidella fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Plurisperma Sivan. (1970), ? Verrucariales. 1, Pakistan. See Matzer (*Nova Hedwigia* **56**: 203, 1993).

plurivorous, attacking a number of hosts or substrates; not specialized.

Pluteaceae Kotl. & Pouzar (1972), Agaricales. 4 gen. (+ 8 syn.), 364 spp.

Lit.: Miller & Horak (*Mycol.* **84**: 64, 1992), Banerjee & Sundberg (*Mycotaxon* **53**: 189, 1995), Weiss *et al.* (*CJB* **76**: 1170, 1998), Drehmel *et al.* (*Mycol.* **91**: 610, 1999), Hibbett *et al.* (*Nature* **407**: 506, 2000; as syn. of *Amanitaceae*), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000), Grgurinovic (*Aust. Syst. Bot.* **14**: 395, 2001), Bougher & Lebel (*Aust. Syst. Bot.* **15**: 514, 2002), Moncalvo *et al.* (*Mol. Phylogen. Evol.* **23**: 357, 2002), Seok *et al.* (*Mycobiology* **30**: 183, 2002), Simmons *et al.* (*Persoonia* **17**: 563, 2002), Bhatt & Miller (*Mem. N. Y. bot. Gdn* **89**: 33, 2004), Oda *et al.* (*MR* **108**: 885, 2004), Zhang *et al.* (*Fungal Diversity* **17**: 219, 2004).

Pluteolus (Fr.) Gillet (1876) = Bolbitius fide Singer (*Agaric. mod. Tax.*, 1951).

Pluteopsis Fayod (1889) = Psathyrella fide Singer (*Agaric. mod. Tax.*, 1951).

Pluteus Fr. (1836), Pluteaceae. *c.* 300 (esp. on wood), widespread. See Singer (*TBMS* **39**: 222, 1956; key), Smith & Stuntz (*Lloydia* **21**: 115, 1959; key S. Am. spp.), Singer (*Sydowia* **15**: 114, 1962; suppl. S. Am. spp.), Homola (*Mycol.* **64**: 1211, 1972; sect. *Celluloderma* N. Am., keys), Horak (*Fl. Illustr. Champ. Afr. Centr.* **6**: 107, 1976; key 10 C. Afr. spp.), Pegler (*Kew Bull.* Addit. Ser. **6**, 1977; key 6 E. Afr. spp.), Vellinga & Schreurs (*Persoonia* **12**: 337, 1985; key W. Eur. spp.), Orton (*British fungus flora* **4**: 4, 1986; key Brit. spp.), Contu (*Mycol. helv.* **11**: 137, 2001; Sardinia), Pradeep *et al.* (*Mycotaxon* **83**: 59, 2002; India), Wartchow *et al.* (*Mycotaxon* **96**: 241, 2006; Brazil).

Pneumatospora B. Sutton, Kuthub. & Muid (1984) = Minimedusa fide Diederich & Lawrey (*Mycol. Progr.* **6**: 61, 2007).

Pneumocystidaceae O.E. Erikss. (1994), Pneumocystidales. 1 gen., 5 spp.

Lit.: Edman *et al.* (*Nature* Lond. **334**: 519, 1988), Eriksson (*SA* **13**: 165, 1994), Lu *et al.* (*J. Clin. Microbiol.* **32**: 2904, 1994), Eriksson (*SA* **13**: 165, 1995), Sugiyama *et al. in* Colwell *et al.* (Eds) (*Microbial Diversity in Time and Space*: 41, 1996), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997; phylogeny), Dei-Cas *et al.* (*J. Mycol. Médic.* **8**: 1, 1998), Mazars & Dei-Cas (*FEMS Immunol. Med. Microbiol.* **22**: 75, 1998), Stringer (*FEMS Immunol. Med. Microbiol.* **22**: 15, 1998), Wakefield *et al.* (*Medical Mycology* **36**: 183, 1998), Chin *et al.* (*J. Eukary. Microbiol.* **46**: 95S, 1999), Frenkel (*J. Eukary. Microbiol.* **46**: 89S, 1999), Palmer *et al.* (*Appl. Environm. Microbiol.* **66**: 4954, 2000), Demanche *et al.* (*J. Clin. Microbiol.* **39**: 2126, 2001), Norris *et al.* (*Clin. Diagn. Lab. Immunol.* **10**: 1037, 2003), Cushion *et al.* (*Mycol.* **96**: 429, 2004), Guillot *et al.* (*Mol. Phylogen. Evol.* **31**: 988, 2004), Keely *et al.* (*Microbiology (Reading)* **150**: 1153, 2004), Robberts *et al.* (*J. Clin. Microbiol.* **42**: 1505, 2004), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny).

Pneumocystidales O.E. Erikss. (1994). Pneumocystidomycetidae. 1 fam., 1 gen., 5 spp. Fam.:
Pneumocystidaceae
For *Lit.* see under fam.

Pneumocystidomycetes O.E. Erikss. & Winka (1997). Taphrinomycotina. 1 ord., 1 fam., 1 gen., 5 spp. Clusters within the *Taphrinomycotina* and contains a single genus of obligate mammalian parasites. Ord.:
Pneumocystidales
For *Lit.* see under fam.

Pneumocystidomycetidae, see *Pneumocystidomycetes*.

Pneumocystis P. Delanoë & Delanoë (1912), Pneumocystidaceae. 5, widespread. *P. carinii* causes pneumonia (PCP) in immunocompromized (esp. AIDS) patients. See Hong *et al.* (*J. Clin. Microbiol.* **28**: 1785, 1990; karyotypes), Kovacs *et al.* (*Exp. Parasitol.* **71**: 60, 1990; characterization of dihydrofolate reductase), Mackenzie (*Rev. Iberoam. Micol.* **7**: 3, 1990; aetiology), Tamburrini *et al.* (*J. Clin. Microbiol.* **31**: 2788, 1993; rapid diagnosis by PCR), Wakefield *et al.* (*Mol. Microbiol.* **8**: 426, 1993; basidiomycete affinity), Eriksson (*SA* **13**: 165, 1995), Stringer (*Clin. Microbiol. Rev.* **9**: 489, 1996; review), Dei-Cas *et al.* (*J. Mycol. Médic.* **8**: 1, 1998; host specificity), Dei-Cas *et al.* (*FEMS Immunol. Med. Microbiol.* **22**: 185, 1998; ultrastr.), Lee *et al.* (*J. Clin. Microbiol.* **36**: 734, 1998; ITS), Stringer (*FEMS Immunol. Med. Microbiol.* **22**: 15, 1998; genome), Wakefield (*FEMS Immunol. Med. Microbiol.* **22**: 5, 1998; genetic diversity), Wakefield *et al.* (*Medical Mycology* **36** Suppl. 1: 183, 1998; host specificity), Rabodonirina *et al.* (*J. Clin. Microbiol.* **37**: 127, 1999; nested PCR detection), Baldauf *et al.* (*Science* N.Y. **290** no. 5493: 972, 2000; phylogeny), Denis *et al.* (*Medical Mycology* **38**: 289, 2000; genetic diversity), Durand-Joly *et al.* (*Medical Mycology* **38**, 2000; from monkey), Palmer *et al.* (*Appl. Environm. Microbiol.* **66**: 4954, 2000; population structure in rats), Demanche *et al.* (*J. Clin. Microbiol.* **39**: 2126, 2001; phylogeny, coevolution), Kaiser *et al.* (*J. Microbiol. Meth.* **45**: 113, 2001; PCR analysis), Pal-

ladino *et al.* (*Diagn. Microbiol. Infect. Dis.* **39**: 233, 2001; molecular detection), Smulian (*Fungal Genetics Biol.* **34**: 145, 2001; genetic diversity), Guillot *et al.* (*J. Eukary. Microbiol.* Suppl.: 113S, 2001; phylogeny), Stringer *et al.* (*J. Eukary. Microbiol.* Suppl.: 184S, 2001; nomencl., species concepts), Hugot *et al.* (*Syst. Biol.* **52**: 735, 2003; phylogeny), Keely *et al.* (*J. Eukary. Microbiol.* **50** Suppl.: 624, 2003; evolution), Cushion (*J. Eukary. Microbiol.* **51**: 30, 2004; comparative genomics), Cushion *et al.* (*Mycol.* **96**: 429, 2004; from rat), Guillot *et al.* (*Mol. Phylogen. Evol.* **31**: 988, 2004; from monkey), Keely *et al.* (*Microbiology* Reading **150**: 1153, 2004; from mouse), James (*Nature* Lond. **443** no. 7113: 818, 2006; phylogeny), Slaven *et al.* (*J. Eukary. Microbiol.* **53** Suppl. 1: S89, 2006; whole genome), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny).

pneumomycosis, see mycosis.

Pochonia Bat. & O.M. Fonseca (1965), Clavicipitaceae. See Barron & Onions (*CJB* **44**, 1966; synonym of *Diherterospora*), Gams & Zare (*Nova Hedwigia* **72**: 334, 2001), Zare *et al.* (*Nova Hedwigia* **73**: 51, 2001; revision), Morton *et al.* (*MR* **107**: 198, 2003; genetic diversity), Stadler *et al.* (*Mycol. Progr.* **2**: 95, 2003; chemistry), Sung *et al.* (*Stud. Mycol.* **57**, 2007).

Pocillaria P. Browne (1756) ≡ Lentinus.

Pocillopycnis Dyko & B. Sutton (1979), anamorphic *Pezizomycotina*, St.0fH.10. 1, Sweden. See DiCosmo (*Mycotaxon* **10**: 288, 1980).

Pocillum De Not. (1863), Helotiaceae. 2 or 3, Europe; America. See Petrak (*Sydowia* **5**: 345, 1951).

pocket plums, plums swollen then 'mummified' by *Taphrina pruni*.

pocket rot, localized rotting of trunks of trees or roots by wood-destroying fungi.

Pocosphaeria (Sacc.) Berl. (1892) = Nodulosphaeria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pocsia Vězda (1975), ? Verrucariales (L). 3, widespread (tropical). See Hafellner & Kalb (*Biblthca Lichenol.* **57**: 161, 1995; posn), McCarthy (*Lichenologist* **31**: 141, 1999; Australia), Herrera-Campos & Lücking (*Lichenologist* **34**: 211, 2002; Mexico).

Poculinia Spooner (1987), Sclerotiniaceae. 1 (on *Nothofagus*), Tasmania. See Spooner (*Biblthca Mycol.* **116**, 1987).

Poculopsis Kirschst. (1935), Helotiaceae. 1, Europe.

Poculum Velen. (1934), Rutstroemiaceae. *c.* 20, widespread. See Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny).

Podabrella Singer (1945) = Termitomyces fide Kuyper (*in litt.*).

Podaleuris Clem. (1909) = Peziza Fr. fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Podaxaceae Corda (1842) = Agaricaceae.

Podaxales = Agaricales.

Podaxis Desv. (1809), Agaricaceae. 10, widespread (subtropical dry areas). See Morse (*Mycol.* **25**: 1, 1933), Martinez (*Boln Soc. argent. Bot.* **14**: 73, 1971; Argentina), McKnight & Stransky (*Mycol.* **72**: 195, 1980), McKnight (*Mycol.* **77**: 24, 1985; key small-spored spp.), Hopple & Vilgalys (*Mol. Phylogen. Evol.* **13**: 1, 1999; phylogeny), Dios *et al.* (*Mycotaxon* **80**: 453, 2001; Argentina), Keirle *et al.* (*Fungal Diversity* **15**: 33, 2004; Hawaiian Islands), Vellinga (*MR* **108**: 354, 2004; phylogeny).

Podaxon, see *Podaxis*.

podetium, lichenized stem-like portion (stipe, or discopodium) bearing the hymenial discs and sometimes conidiomata in a fruticose apothecium (Ahti, *Lichenologist* **14**: 105, 1982), esp. as in *Cladonia*. Cf. pseudopodetium.

Podisoma Link (1809) = Gymnosporangium fide Saccardo (*Syll. fung.* **7**: 737, 1888).

Podobactridium Penz. & Sacc. ex Petch (1916) = Bactridium fide Hughes (*N.Z. Jl Bot.* **4**: 522, 1966).

Podobelonium (Sacc.) Sacc. & D. Sacc. (1906) = Crocicreas fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Podocapsa Tiegh. (1887), Saccharomycotina. 1, Europe. Position uncertain.

Podocapsium Clem. (1909) ≡ Podocapsa.

Podochytrium Pfitzer (1870), Chytridiaceae. 7 (on diatoms or saprobes), widespread (north temperate). See Canter (*J. Linn. Soc.* Bot. **63**: 47, 1970).

Podoconis Boedijn (1933) = Sporidesmium fide Ellis (*Mycol. Pap.* **70**, 1958).

Podocratera Norman (1861) nom. rej. ≡ Tholurna.

Podocrea (Sacc.) Lindau (1897) = Podostroma fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Chamberlain *et al.* (*Karstenia* **44**: 1, 2004).

Podocrella Seaver (1928), Clavicipitaceae. Anamorph *Harposporium*. 4 (on rotten wood), widespread (esp. tropical). See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Chaverri *et al.* (*Mycol.* **97**: 433, 2005), Chaverri *et al.* (*Mycol.* **97**: 1225, 2005).

Podocystis Fr. (1849) nom. rej. prop. = Melampsora fide Saccardo (*Syll. Fung.* **18**: 812, 1906).

Pododimeria E. Müll. (1959), ? Pseudoperisporiaceae. 4, Europe; N. America. See Luttrell & Barr (*Am. J. Bot.* **65**: 251, 1978; key).

Podofomes Pouzar (1966), Polyporaceae. 3. See David *et al.* (*BSMF* **99**: 361, 1983).

Podohydnangium G.W. Beaton, Pegler & T.W.K. Young (1984) = Laccaria fide Kropp & Mueller (*Laccaria – Ectomycorrhizal fungi, key genera in profile*, 1999; phylogeny, congeneric with *Laccaria*).

Podonectria Petch (1921), Tubeufiaceae. Anamorphs *Peziotrichum*, *Tetracrium*. 11 (on scale insects), widespread (esp. tropical). See Pirozynski (*Kew Bull.* **31**: 595, 1977), Rossman (*Mycotaxon* **7**: 163, 1978; key), Rossman (*Mycol. Pap.* **157**, 1987), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006; review).

Podonectrioides Kobayasi & Shimizu (1983) nom. inval. = Podonectria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Podophacidium Niessl (1868), Helotiales. 2, Europe; N. America. See Seaver (*Mycol.* **31**: 350, 1939), Raitviir & Järv (*Proc. Est. Acad. Sci. Biol. Ecol.* **46**: 94, 1997), Pärtel & Raitviir (*Mycol. Progr.* **4**: 149, 2005; asci).

Podoplaconema Petr. (1921), anamorphic *Omphalospora*, St.0eH.15. 1, Europe.

Podoporia P. Karst. (1892) = Oligoporus fide Ryvarden (*Syn. Fung.* **5**, 1991).

Podoscypha Pat. (1900), Meruliaceae. *c.* 35, widespread (esp. tropical). See Reid (*Beih. Nova Hedwigia* **18**: 150, 1965; key), Douanla-Meli & Langer (*Mycotaxon* **90**: 323, 2004).

Podoscyphaceae D.A. Reid (1965), Polyporales.

Podoserpula D.A. Reid (1963), Amylocorticiaceae. 1, widespread. See Reid (*Kew Bull.* **16**: 437, 1963).

Podosordaria Ellis & Holw. (1897), Xylariaceae. Anamorph *Geniculosporium*-like. 23 (esp. coprophilous), widespread. See Krug & Cain (*CJB* **52**: 589, 1974; key), Rogers *et al.* (*Mycol.* **84**: 166, 1992),

Krug & Jeng (*CJB* **73**: 65, 1995; key 17 spp.), Rogers *et al.* (*Mycotaxon* **67**: 61, 1998).

Podosphaera Kunze (1823), Erysiphaceae. Anamorph *Oidium* subgen. *Fibroidium*. 73, widespread. *P. leucotricha* (mildew of apple and other pome fruits), *P. clandestina* (hawthorn (*Crataegus*) mildew), *P. macularis* (hop mildew), *P. mors-uvae* (American mildew of currant and gooseberry (*Ribes*)), *P. pannosa* (rose mildew). See Braun (*Beih. Nova Hedwigia* **89**, 1987; key), Hirata *et al.* (*CJB* **78**: 1521, 2000; ITS, coevolution), Takamatsu (*MR* **104**: 1303, 2000), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny), Cunnington *et al.* (*MR* **109**: 357, 2005; on *Prunus*), Leus *et al.* (*J. Phytopath.* **154**: 23, 2006; on *Rosaceae*), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Voytyuk *et al.* (*Nova Hedwigia* **85**: 277, 2007; Israel).

Podospora Ces. (1856) nom. cons., Lasiosphaeriaceae. 94 (coprophilous), widespread. See Mirza & Cain (*CJB* **47**: 1999, 1969; key), Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972), Krug & Khan (*CJB* **67**: 1174, 1989; culture, records), Schmidt (*Biblthca Mycol.* **127**, 1989; *P. anserina*), Guarro *et al.* (*SA* **10**: 79, 1991), Bell & Mahoney (*Mycol.* **87**: 375, 1995), Bell & Mahoney (*Mycol.* **88**: 163, 1996; development), Bell & Mahoney (*Mycol.* **89**: 908, 1997), Wang (*Mycotaxon* **76**: 373, 2000; Taiwan), Lorenzo & Havrylenko (*Mycol.* **93**: 1221, 2001; Argentina), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005; anatomy, phylogeny), Fitzpatrick *et al.* (*BMC Evolutionary Biology* **6**: 99, 2006; whole genome phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Podosporiella Ellis & Everh. (1894), anamorphic *Pezizomycotina*, Hsy.≡ eP.?. 1, N. America; Australia.

Podosporium Bonord. (1851) = Aplosporella fide Sutton (*Mycol. Pap.* **141**, 1977).

Podosporium Lév. (1847) = Melampsora fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Podosporium Sacc. & Schulzer (1884) = Aplosporella fide Saccardo (*Syll. fung.* **3**: 1, 1884).

Podosporium Schwein. (1832), anamorphic *Pezizomycotina*, Hsy.≡ eP.24. 15, widespread (esp. tropical). See Ellis (*Dematiaceous Hyphomycetes*: 291, 1971), Ellis (*More Dematiaceous Hyphomycetes*: 303, 1976), Rong (*Phytophylactica* **24**: 103, 1992), Chen & Tzean (*MR* **97**: 637, 1993; Taiwan).

Podostictina Clem. (1909) = Pseudocyphellaria fide Galloway (*Bull. Br. Mus. nat. hist.* Bot. **17**, 1988).

Podostroma P. Karst. (1892), Hypocreaceae. Anamorph *Trichoderma*. 11 (from decaying wood), widespread. See Boedijn (*Annls mycol.* **36**: 314, 1938), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Wang & Liu (*Mycosystema* **21**: 156, 2002; China), Chamberlain *et al.* (*Karstenia* **44**: 1, 2004).

Podostrombium Kunze ex Rchb. (1828) nom. inval., Clavariaceae. See Donk (*Taxon* **6**: 110, 1957).

Podotara Malcolm & Vězda (1996), Lecanoromycetes (L). 1, New Zealand. See Malcolm & Vězda (*Folia geobot. phytotax.* **31**: 263, 1996).

Podoxyphiomyces Bat., Valle & Peres (1961) nom. dub., anamorphic *Pezizomycotina*, St.0eH.? (L). 1, Brazil. See Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Podoxyphium Speg. (1918) = Conidiocarpus fide Hughes (*Mycol.* **68**: 693, 1976).

Poecilosporium, see *Poikilosporium*.

Poecylomyces, see *Paecilomyces*.

Poelt (Josef; 1924-1995; Germany). Bavarian; doctorate (1950) then member of academic staff (1950-1965), University of Munich; Professor of Systematic Botany, Free University of Berlin (1965-1972); Professor and Director of the Botanical Garden, University of Graz (1972-1991), where he remained active after retirement. His wide-ranging interests included lichen-forming fungi, rusts and smuts, and oomycetes, as evident in over 320 publications, including pioneering keys to European lichens; he travelled extensively, making important contributions to Himalayan lichens (1966-1977) and Mediterranean (especially Greek) mycotas; renowned for a determination to tackle 'difficult' groups, for insights into lichen biology, phylogeny and structure, and for work on lichenicolous and bryophilous lichens; an inspiring teacher, his PhD students included P. Döbbeler, J. Hafellner, B. Hein, H. Hertel, W. Jülich, H. Mayrhofer and F. Oberwinkler; editor/co-editor of journals including *Herzogia* and *Nova Hedwigia*; also worked with bryophytes. *Publs. Bestimmungschlussel Europäischer Flechten* (1969); (A. Vězda) *Erganzungsheft I-II* (1977, 1981); (with Mayrhofer) Die saxicolen Arten der Flechtengattung *Rinodina* in Europa. *Bibliotheca Lichen* (1979); (with Hinteregger) Beiträge zur kenntnis der flechtenflora des Himalaya. VII die gattungen *Caloplaca*, *Fulgensia* und *Ioplaca* (mit englischem bestimmungsschlüssel). *Bibliotheca Lichenologica* (1993). *Biogs, obits etc.* De Priest (*Inoculum* **46**(3): 3, 1995); Grummann (1974: 36); Hertel (*International Lichenological Newsletter* **26**: 25, 1993); Hertel & Oberwinkler (*Bericht der Bayerischen Botanischen Gesellschaft* **66-67**: 327, 1996) [bibliography, obituary].

Poeltia Petr. (1972) [non *Poeltia* Grolle 1966, *Hepaticae*] ≡ Poeltiella.

Poeltiaria Hertel (1984), Porpidiaceae (L). 3, S. America; Australasia. See Hertel (*Nova Hedwigia* Beih. **79**: 430, 1984).

Poeltidea Hertel & Hafellner (1984), Porpidiaceae (L). 1, Kerguelen; Australasia. See Hertel & Hafellner (*Nova Hedwigia* Beih. **79**: 462, 1984).

Poeltiella Petr. (1974) = Hyalocrea fide Rossman (*Mycol. Pap.* **157**, 1987).

Poeltinula Hafellner (1984), Rhizocarpaceae (L). 2, Europe. See Hawksworth (*SA* **10**: 36, 1991; nomencl.).

Poetschia Körb. (1861), Patellariaceae. 4, Europe; S. America. See Hafellner (*Beih. Nova Hedwigia* **62**, 1979), Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Pogonomyces Murrill (1904) = Hexagonia Fr. fide Pegler (*The polypores [Bull. BMS Suppl.]*, 1973).

Pogonospora Petr. (1957) ? = Endoxylina fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Poikiloderma Füisting (1868) = Amphisphaeria fide Eriksson & Hawskworth (*SA* **7**: 80, 1988).

Poikilosperma Bat. & J.L. Bezerra (1961), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Batista & Bezerra (*Publções Inst. Micol. Recife* **340**: 22, 1961).

Poikilosporium Dietel (1897) = Thecaphora fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Poisonous fungi. Diverse fungi produce toxins (q.v.) which affect humans, animals and plants. For larger fungi poisonous for humans, see **Mycetisms**; microfungi which produce toxins affecting humans and higher animals, see Mycotoxicoses, plants, Phytotoxic mycotoxins. See also Bresinsky & Besl (*A col-*

our atlas of poisonous fungi: a handbook for pharmacists, doctors and biologists, 1989). See also Antibiotics, Hallucinogenic fungi.

Poisonous lichens, see Edible fungi.

Poitrasia P.M. Kirk (1984), Choanephoraceae. 1, widespread (tropical). See Kirk (*TBMS* **68**: 429, 1977; zygospore ultrastr.), Kirk (*Mycol. Pap.* **152**: 61 pp., 1984; monogr.), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

polar (of bacteria, spores, etc.), at the ends or poles.

Polar and alpine mycology. Mycotas characteristic for cooler regions have been recognized at least since the description by Greville in 1821 of the mountain top species *Amanita nivalis*. Fungi from all major taxonomic groups are represented in these specialist mycotas: distribution of *Lachnellula pini* seems to be governed by the mean winter temperature (Kurkela & Norokorpi, *Eur. J. Forest Pathol.* **9**: 65, 1979); *Phacidium infestans* and various other ascomycetes exploit snow-cover to develop on their hosts. Cold adaptations in arctic and antarctic fungi are discussed by Robinson (*New Phytologist* **151**: 341, 2001). Specialist polar marine fungi exist (Pang *et al.*, *Mycol.* **100**: 291, 2008). Fungal spores have been recorded during flights over the north pole (Polunin & Kelly, *Nature* **170**: 314, 1952). Cryptoendolithic fungi have been extensively investigated in antarctic dry deserts by Friedmann (q.v.) and others, partly as a paradigm for extra-terrestrial life. Hypogeous fungi play a significant role in plant colonization of alpine areas formerly covered by retreating glaciers (Cazares & Trappe, *Mycol.* **86**: 507, 1994). Some myxomycetes (known as nivicolous myxomycetes) are specialist colonizers of areas uncovered by snow-melt (see Singer *et al.*, *Cryptogamie Mycologie* **22**: 79, 2001). Many of these organisms are likely to be highly susceptible to climate change. See also Laursen *et al.* (Eds) (*Arctic and alpine mycology* **1**, 1985; **2**, 1987), Gulden *et al.* (*Arctic and alpine fungi* **1**, 1985; **2**, 1988; **3**, 1990; **4**, 1992), Longton (*Biology of polar bryophytes and lichens*, 1988), Trappe (*Mycol.* **80**: 1, 1988; alpine fungi). See also Climate change, Lichenometry, Space exploration and fungi.

polar-diblastic, see polarilocular.

polaribilocular, polarilocular (q.v.) with two cells.

polarilocular (of ascospores), bicellular and the two cells separated by a central perforated septum; orculiform, polaribilocular, polar-diblastic. See Sheard (*Lichenologist* **3**: 328, 1967). (Fig. 22B).

Polaroscyphus Huhtinen (1987), Hyaloscyphaceae. 1, Svalbard. See Huhtinen *in* Laursen *et al.* (Eds) (*Arctic and Alpine Mycology* **2**: 123, 1987), Raitviir (*Scripta Mycologica* Tartu **20**, 2004).

poleophilous, town loving; sometimes used of lichens which thrive in urban areas (e.g. *Lecanora conizaeoides* in Eur.).

Polhysterium Speg. (1912) ? = Hysterographium fide Clements & Shear (*Gen. Fung.*, 1931).

Polioma Arthur (1907), Pucciniaceae. 4 (on *Geraniaceae*, *Lamiaceae*), N. & S. America. See Baxter & Cummins (*Bull. Torrey bot. Club* **78**: 51, 1951).

Poliomella Syd. (1922) = Puccinia fide Laundon (*Mycol. Pap.* **102**, 1965).

Poliomopsis A.W. Ramaley (1987), ? Uropyxidaceae. 1 (on *Thermopsis* (*Leguminosae*)), USA. See Ramaley (*Mycotaxon* **28**: 361, 1987), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; excluded from *Pucciniales*).

Poliotelium Syd. (1922) = Uromyces fide Berndt (*in litt.*) See, Mains (*Bull. Torrey bot. Club* **66**: 173, 1939).

Polistophthora Lebert (1858) = Cordyceps fide Tulasne & Tulasne (*Select. fung. carpol.* **3**: 4, 1865).

Polistroma Clemente (1807), Gyalectaceae (L). 1, America (tropical). See Frisch (*Biblthca Lichenol.* **92**: 1, 2006).

Pollaccia E. Bald. & Cif. (1937) = Fusicladium fide Funk (*Can. J. Pl. Path.* **11**: 353, 1989; *P. borealis*), Wu & Sutton (*MR* **99**: 983, 1995; relationships of *P. mandshurica*, key), Schubert *et al.* (*Schlechtendalia* **9**, 2003), Beck *et al.* (*Mycol. Progr.* **4**: 111, 2005; phylogeny).

Poloniodiscus Svrček & Kubička (1967) = Ameghiniella fide Zhuang (*Mycotaxon* **31**: 261, 1988), Gamundí (*MR* **95**: 1131, 1991).

poly- (prefix), a great number; many.

Polyactidaceae Corda (1838) = Sclerotiniaceae.

Polyactis Link (1809) = Botrytis fide Hennebert (*Persoonia* **7**: 183, 1973).

Polyadosporites Hammen (1954), Fossil Fungi. 6 (Cretaceous, Paleocene), Colombia.

Polyancora Voglmayr & Yule (2006), Xylariales. 1 (aquatic), Malaysia. See Voglmayr & Yule (*MR* **110**: 1247, 2006).

Polyandromyces Thaxt. (1920), Laboulbeniaceae. 1, widespread. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

polyandrous (of oospores), formed when more than one functioning antheridium is present; cf. monandrous.

Polyangium Link (1809) nom. dub., Predibacteria.

Polyascomyces Thaxt. (1900), Laboulbeniaceae. 1, British Isles. See Tavares (*Mycol.* **65**: 929, 1973), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

polyascous, having many asci; esp. having the asci in one hymenium, not separated by sterile bands.

Polyblastia A. Massal. (1852) nom. cons., Verrucariaceae (L). *c.* 85, widespread. See Servít (*Československé lišejníky čeledi Verrucariaceae*, 1954), Swinscow (*Lichenologist* **5**: 92, 1971; Brit. spp.), McCarthy (*Muelleria* **8**: 269, 1995; Australia), Ceynowa-Gieldon (*Acta Mycologica* Warszawa **33**: 299, 1998; Poland), Roux *et al.* (*Mycotaxon* **84**: 1, 2002), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

polyblastic (of conidiogenous cell), producing blastic conidia at several conidiogenous loci, either synchronously or irregularly.

Polyblastidea (Zschacke) Tomas. & Cif. (1952) = Polyblastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Polyblastiomyces Cif. & Tomas. (1953) = Polyblastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Polyblastiomyces E.A. Thomas (1939) nom. inval. = Staurothele fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Polyblastiopsis Zahlbr. (1903) = Julella fide Mayrhofer (*Biblthca Lichenol.* **26**, 1987), Aptroot & Boom (*Mycotaxon* **56**: 1, 1995).

Polybulbophiale Goh & K.D. Hyde (1998), anamorphic *Pezizomycotina*, Hso.?.?. 1 (on palms), Brunei. See Goh & Hyde (*Mycotaxon* **69**: 145, 1998).

Polycarpella Theiss. & Syd. (1918) = Muellerella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

polycarpic (of *Exobasidium* infections), systemic (or circumscribed) and perennial (Nannfeldt, 1981: 15); cf. monocarpic.

Polycarpum Stempel [not traced] nom. dub., Fungi. Protozoa or fungi.

Polycauliona Hue (1908) = Caloplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Kärnefelt (*Cryptog. Bryol.-Lichénol.* **19**: 93, 1998), Arup & Mayrhofer (*Lichenologist* **32**: 359, 2000).

Polycellaesporonites A. Chandra, R.K. Saxena & Setty (1984), Fossil Fungi. 1, Arabian Sea.

Polycellaria H.D. Pflug (1965), Fossil Fungi. 1 (Tertiary), USA.

polycentric, having a number of centres of growth and development and more than one reproductive organ, as in the *Cladochytriaceae* (Karling, *Mycol.* **36**: 528, 1934); see monocentric; cf. reproductocentric.

Polycephalomyces Kobayasi (1941), anamorphic *Berkelella*, Hsy.0eH.15. 6, widespread. See Seifert (*Stud. Mycol.* **27**: 168, 1985; key), Bischoff *et al.* (*Mycotaxon* **86**: 433, 2003; phylogeny), Stensrud *et al.* (*MR* **109**: 41, 2005; phylogeny).

polycephalous, many-headed.

Polycephalum Kalchbr. & Cooke (1880) nom. dub., Predibacteria. See Seifert (*TBMS* **85**: 123, 1985).

Polychaetella Speg. (1918), anamorphic *Capnodium*, Hso.?.?. 3, Europe; N. America. See Sutton (*Mycol. Pap.* **141**, 1977).

Polychaeton (Pers.) Lév. (1846) nom. dub., ? Capnodiaceae. 8. See Hughes (*Mycol.* **68**: 693, 1976), Sutton (*Mycol. Pap.* **141**, 1977; nomencl.), Sharma & Singh (*Acta Bot. Indica* **24**: 117, 1997; citrus sooty mould), Manoharachary *et al.* (*Journal of Mycology and Plant Pathology* **33**: 212, 2003; India).

Polychidium (Ach.) Gray (1821), Massalongiaceae (L). 6, widespread. See Henssen (*Symb. bot. upsal.* **18** no. 1, 1963), Burgaz & Martínez (*Nova Hedwigia* **73**: 381, 2001; Iberian peninsula), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Xiao *et al.* (*Lichenology* **5**: 53, 2006; China), Wedin *et al.* (*Lichenologist* **39**: 61, 2007; n. fam.).

polychotomous, having an apex dividing simultaneously into more than two branches (Corner, 1950).

Polychytrium Ajello (1942), Cladochytriaceae. 1, USA; Brazil.

Polycladium Ingold (1959), anamorphic *Pezizomycotina*, Hso.1bH.1. 1 (aquatic), British Isles. See Ingold (*TBMS* **42**: 114, 1959).

Polyclypeolina Bat. & I.H. Lima (1959), Aulographaceae. 1, Uganda. See Batista & Lima (*Publções Inst. Micol. Recife* **56**: 457, 1959).

Polyclypeolum Theiss. (1914) = Schizothyrium fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Polycoccum Saut. ex Körb. (1865), Dacampiaceae. Anamorph *Cyclothyrium*. *c.* 49 (on lichens), widespread. See Hawksworth & Diederich (*TBMS* **90**: 293, 1988; key 23 spp.), van der Aa (*Stud. Mycol.* **31**: 15, 1989; anamorph), Kocourková & Berger (*Czech Mycol.* **51**: 171, 1999), Atienza *et al.* (*Lichenologist* **35**: 125, 2003; Spain, key).

Polycornum Malcolm & Vězda (1995), Porinaceae (L). 1, New Zealand. See McCarthy & Malcolm (*Lichenologist* **29**: 1, 1997), McCarthy (*Biblthca Lichenol.* **87**, 2003; nomenclator).

Polycyclina Theiss. & Syd. (1915), Parmulariaceae. 1, S. America.

Polycyclinopsis Bat., A.F. Vital & I.H. Lima (1958), Microthyriaceae. 1, Brazil. See Batista *et al.* (*Revta Biol.* Lisb. **1**: 284, 1958).

Polycyclus Höhn. (1909), Parmulariaceae. 2, S. America. See Petrak (*Sydowia* **4**: 533, 1950).

Polycystis Lév. (1846) nom. rej. = Urocystis fide Vánky (*in litt.*).

Polycytella C.K. Campb. (1987) = Scedosporium fide Campbell (*J. Med. Vet. Mycol.* **25**: 302, 1987), Borman *et al.* (*Medical Mycology* **44**: 33, 2006).

polydactyloid venation, see veins.

Polydesmia Boud. (1885), Hyaloscyphaceae. Anamorph *Brefeldochium*. 7, widespread. See Korf (*Mycotaxon* **7**: 457, 1978), Raitviir & Galán (*Mycotaxon* **53**: 447, 1995; key), Huhtinen & Santesson (*Lichenologist* **29**: 205, 1997), Zhuang (*Mycotaxon* **72**: 325, 1999), Zhuang (*Mycol.* **92**: 593, 1999), Verkley (*Nova Hedwigia* **80**: 503, 2005; anamorph).

Polydesmus Mont. (1845), anamorphic *Pezizomycotina*. 7. See Hernández-Gutiérrez & Sutton (*MR* **101**: 201, 1997), Shoemaker & Hambleton (*CJB*: in press, 2001), Shoemaker & Hambleton (*CJB* **79**: 592, 2001).

Polydiscidium Wakef. (1934), Helotiaceae. 1, Guyana; Africa. See Dennis (*Bull. Jard. bot. Brux.* **31**: 154, 1961).

Polydiscina Syd. (1930), ? Helotiales. 1, Bolivia.

Polydispyrenia E.U. Canning & E.I. Hazard (1982), Microsporidia. 1.

polyenergid, coenocytic.

Polyetron Bat. & Peres (1963), anamorphic *Pezizomycotina*, Cpt.0-1eH-P.?. 1, Brazil. See Batista & Peres (*Publções Inst. Micol. Recife* **394**: 6, 1963).

Polygaster Fr. (1823) nom. dub., ? Agaricales. ? 'gasteromycetes'.

Polyhyphaethyrites R. Srivast. & R.K. Kar (2004), Fossil Fungi, Ascomycota. 1, India. See Srivastava & Kar (*Curr. Sci.* **87**: 867, 2004).

Polylagenochromatia Sousa da Câmara (1929) ? = Polystigmina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Polylobatispora Matsush. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 2, Malaysia. See Matsushima (*Matsush. Mycol. Mem.* **9**: 21, 1996).

Polymarasmius Murrill (1915) = Marasmius fide Singer (*Agaric. mod. Tax.*, 1951).

Polymeridium (Müll. Arg.) R.C. Harris (1980), Trypetheliaceae (L). 19, widespread (esp. tropical). See Harris (*Bolm Mus. paraense 'Emílio Goeldi'* sér. bot. **7**: 619, 1993; key), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

polymorphic, having different forms; pleomorphic.

polymorphic species, species with a series of intergrading morphological features; e.g. resulting from inbreeding or automictic sexual reproduction.

Polymorphomyces Coupin (1914) = Geotrichum fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Polymorphum Chevall. (1822), anamorphic *Ascodichaena*, St.0eH/1eP.1. 1, widespread (temperate). See Hawksworth & Punithalingam (*TBMS* **60**: 501, 1973), Hawksworth (*Taxon* **32**: 212, 1983; nomencl.).

Polymyces Battarra ex Earle (1909) ≡ Armillaria.

Polynema Lév. (1846), anamorphic *Clavicipitaceae*, Ccu.1eH/1eP.15. 8, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Vujanovic *et al.* (*Mycol.* **91**: 136, 1999; n.sp. from Canada).

Polyopeus A.S. Horne (1920) = Phoma Sacc. fide Boerema & Dorenbosch (*Persoonia* **6**: 49, 1970), Gruyter *et al.* (*Persoonia* **18**: 1, 2002).

Polyorus, see *Polyozus*.

polyoxin antibiotics, inhibit chitin synthesis, e.g. polyoxin D inhibits synthetase formation (Endo *et al.*, *J. Bact.* **104**: 189, 1970).

Polyozellus Murrill (1910), Thelephoraceae. 1, USA; Japan. See Imazeki (*Mycol.* **45**: 555, 1953), Bigelow (*Mycol.* **70**: 707, 1978), Yang (*Zhongguo Shiyongjun* **11**: 1 [unnumbered page], 1992; edibility).

Polyozosia A. Massal. (1855) = Lecania fide Hafellner (*Beih. Nova Hedwigia* **79**: 214, 1984).

Polyozus P. Karst. (1881) = Tremellodendropsis fide Donk (*Persoonia* **4**: 184, 1966).

Polypaecilum G. Sm. (1961), anamorphic *Thermoascus*, Hso.0eH.19. 3, widespread. See Piontelli *et al.* (*Bol. Micol.* **4**: 155, 1989; hyalohyphomycosis caused by *P. insolitum*).

Polypedia Bat. & Peres (1959), Micropeltidaceae. 1, Brazil. See Batista & Peres (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **16**: 118, 1959).

Polypera Pers. (1818) ≡ Pisolithus.

polyphagous, see polyphagy.

Polyphagus Nowak. (1877), Chytridiaceae. *c.* 9, widespread. See Bartch (*Mycol.* **37**: 553, 1945).

polyphagy (adj. **polyphagous**), see monophagy.

polyphialidic (of a conidiogenous cell), having more than one conidiogenous locus at which conidia are produced. Cf. monophialidic.

Polyphlyctis Karling (1968), Chytridiaceae. 1 or 2, widespread. See Karling (*Sydowia* **20**: 86, 1966).

polyphyllous (of foliose lichen thalli), having many connected leaf-like lobes.

Polypilus P. Karst. (1881) ≡ Grifola.

polyplanetism, sequence of two or more motile flagellate phases with interspersed mobile aplanosporic phases in the zoosporic part of the life history; the aplanosporic phase may be naked or as a walled cyst; motile phases may be monomorphic or dimorphic.

Polyplocium Berk. (1843) = Gyrophragmium fide Zeller (*Mycol.* **35**: 409, 1943).

polyploidy (in fungi), see Chromosome numbers.

Polyporaceae Fr. ex Corda (1839), Polyporales. 92 gen. (+ 79 syn.), 636 spp.

Lit.: Pilát (*Atlas Champ. Eur.* III *Polyporaceae* **1**, 1936; Europe), Pilát (*Atlas Champ. Eur.* III *Polyporaceae* **2**, 1942; Europe), Donk (*Reinwardtia* **1**, 1951; gen. lists), Bondartsev (*[Polyporaceae of European Russia and the Caucasus]*, 1953; former USSR), Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera, addenda] **17**: 152, 1953; construction of polypores), Overholts (*Polyporaceae of the United States, Alaska, & Canada*, 1953; N. America), Nobles (*CJB* **40**: 987, 1958; cultural characters), Cooke (*Lloydia* **22**: 163, 1959), Lowe & Gilbertson (*J. Elisha Mitchell scient. Soc.* **77**: 43, 1961; keys gen., 293 spp. S.E. USA), Teixeira (*Biol. Rev.* **37**: 51, 1962; taxon. rev.), Jahn (*Westfäl. Pilzbr.* **4**, 1963; C. Eur.), Lowe (*Mycol.* **55**: 1, 1963; rev.), Cunningham (*Polyporaceae of New Zealand* [*N.Z. Dep. sci. industr. Res. Bull.* **164**], 1965; Trinidad & Tobago), Fidalgo & Fidalgo (*Mycol.* **58**: 862, 1967; former USSR), Boquiren (*Mycol.* **63**: 937, 1971; as *Epitheliaceae*), Domanski (*Fungi, Polyporaceae* 2 vols, 1972-73; [Engl. transl.]), Ryvarden (*Norw. Polyporus Pers. (1821) ≡ Laetiporus.

Polypyrenula D. Hawksw. (1985), Requienellaceae. 1, West Indies. See Aptroot (*Biblthca Lichenol.* **44**, 1991; posn in *Pyrenulaceae*).

Polyrhina Sorokīn (1876) ≡ Harposporium fide Karling (*Mycol.* **30**: 512, 1938).

Polyrhizium Giard (1889) ? = Cladosporium fide Petch (*TBMS* **19**: 190, 1935).

Polyrhizon Theiss. & Syd. (1914), ? Venturiaceae. 2, India; S. Africa.

Polysaccopsis Henn. (1898) = Urocystis fide Vánky (*Illustrated genera of smut fungi*, 1987).

Polysaccum F. Desp. & DC. (1807) = Pisolithus fide Stalpers (*in litt.*).

Polyschema H.P. Upadhyay (1966), anamorphic *Pezizomycotina*, Hso.≡ eP.24/27. 17, widespread. See Ellis (*More Dematiaceous Hyphomycetes*, 1976), Castañeda Ruíz *et al.* (*Mycotaxon* **57**: 451, 1996), Castañeda Ruíz *et al.* (*Cryptog. Mycol.* **21**: 215, 2000; Cuba).

Polyschistes J. Steiner (1898) = Diploschistes fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Polyscytalina Arnaud (1954), anamorphic *Pezizomycotina*, Hso.1eP.3. 1, France. *P. pustulans* (syn. *Oospora pustulans*), skin spot of potato tubers. See Ciferri & Caretta (*Mycopathologia* **16**: 304, 1962), Holubová-Jechová (*Fol. Geobot. Phyt. Praha* **13**: 433, 1976; synonym of *Hormiactella*).

Polyscytalum Riess (1853), anamorphic *Pezizomycotina*, Hso.0-1eH.3. 12, widespread. See Sutton & Hodges (*Nova Hedwigia* **28**: 487, 1976), Crous *et al.* (*MR* **110**: 264, 2006; key), Crous *et al.* (*Stud. Mycol.* **58**: 185, 2007; phylogeny).

polysidia, specialized dual vegetative propagules in certain *Pyxine* spp. formed in depressions at the tips of coral-like structures (**polysidiangia**) which recall isidia but are not themselves propagules (Kalb, *Bibl. Lich.* **24**, 1987).

Polyspora Laff. (1921) [non *Polyspora* Sweet ex Don 1831, *Theaceae*] = Aureobasidium fide Hermanides-Nijhof (*Stud. Mycol.* **15**: 141, 1977).

Polysporella Woron. (1916), Fungi. See Voronikhin (*Izvestiya Kavkazskago Muzeya* **10**: 7, 1916).

Polysporidiella Petr. (1960), Dothideomycetes. 1, Iran. See Petrak (*Sydowia* **14**: 355, 1960).

Polysporidium Syd. & P. Syd. (1908) = Guignardia fide Eriksson (*SA* **5**: 197, 1986).

Polysporina Vězda (1978) nom. cons., Acarosporaceae (L). 9, widespread. See Kantvilas (*Lichenologist* **30**: 551, 1998), Lutzoni *et al.* (*Am. J. Bot.* **91**: 1446, 2004; phylogeny), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny), Knudsen (*Opuscula Philolichenum* **2**: 17, 2005; USA), Crewe *et al.* (*MR* **110**: 521, 2006; phylogeny), Kantvilas & Seppelt (*Lichenologist* **38**: 109, 2006; Antarctica), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Polysporinopsis Vězda (2002) = Acarospora fide Vězda (*Lichenes Rariores Exsiccati* **48**: 2, 2002), Crewe *et al.* (*MR* **110**: 521, 2006).

polysporous, many-spored.

Polystema Raf. (1815) nom. dub., Fungi. No spp. included.

Polystictaceae Rea (1922) = Hymenochaetaceae.

Polystictoides Lázaro Ibiza (1916) ≡ Inonotus.

Polystictus Fr. (1851) ≡ Coltricia.

Polystigma DC. (1815), Phyllachoraceae. Anamorph *Rhodosticta*. 24 (living leaves of *Rosaceae*), widespread (temperate). See Hyde & Cannon (*Aust. Syst. Bot.* **5**: 415, 1992), Cannon (*MR* **100**: 1409, 1996; monogr.), Cannon & Evans (*MR* **103**: 577, 1999).

Polystigmataceae Höhn. ex Nannf. (1932) = Phyllachoraceae.

Polystigmatales = Phyllachorales.

Polystigmella Jacz. & Natalina (1931) = Polystigma fide Cannon (*in litt.*), Cannon (*MR* **100**: 1409, 1996; monogr.).

Polystigmina Sacc. (1884), anamorphic *Polystigma*, St.0fH.10. 2 (on *Rosaceae*), Europe. See Cannon (*MR* **100**: 1409, 1996; monogr. teleom.).

Polystigmites A. Massal. (1857), Fossil Fungi. 1 (Miocene), Italy.

Polystoma Gray (1821) ≡ Myriostoma.

Polystomella Speg. (1888) = Dothidella fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Polystomellaceae Theiss. & P. Syd. (1915), ? Dothideomycetes (inc. sed.). 3 gen. (+ 5 syn.), 9 spp.
Lit.: Swart (*TBMS* **89**: 483, 1987).

Polystomellina Bat. & A.F. Vital (1958), ? Microthyriaceae. 1, Brazil. See Batista & Vital (*Revta Biol. Lisb.* **1**: 280, 1958).

Polystomellomyces Bat. (1959), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Greece. See Batista (*An. Soc. Biol. Pernambuco* **16**: 148, 1959).

Polystomellopsis F. Stevens (1923), Dothideomycetes. 1, S. America. See Ciferri & Batista (*Ann. Soc. Biol. Pernambuco* **14**: 79, 1956).

Polystratorictus Matsush. (1993), anamorphic *Pezizomycotina*, Hso.≡ eP.15. 2, Peru. See Matsushima (*Matsush. Mycol. Mem.* **7**: 62, 1993).

Polystroma Fée (1824) ≡ Polistroma.

Polysynnema Constant. & Seifert (1988), anamorphic *Pezizomycotina*, Hsy.0eH.10. 1, Hawaii; Grenada. See Constantinescu & Seifert (*TBMS* **90**: 332, 1988).

Polythecium Bonord. (1861) = Fusicoccum fide Saccardo (*Syll. fung.* **3**: 1, 1884).

Polythelis Arthur (1906) = Tranzschelia fide Arthur (*Manual Rusts US & Canada*, 1934).

Polythelis Clem. (1909) ≡ Polypyrenula.

Polythrinciella Bat. & H. Maia (1960), anamorphic *Pezizomycotina*, Hsp.1eP.?. 1, Brazil. See Batista & Maia (*Publções Inst. Micol. Recife* **283**: 20, 1960).

Polythrinciopsis J. Walker (1966), anamorphic *Pezizomycotina*, Hso.1eH.10. 1, Australia.

Polythrincium Kunze (1817), anamorphic *Mycosphaerella*, Hso.1eP.10. 1 (on *Trifolium*), widespread (temperate).

Polythyrium Syd. (1929) = Neostomella fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Polytolypa J.A. Scott & Malloch (1993), ? Ajellomycetaceae. 1 (coprophilous), Canada. See Scott *et al.* (*Mycol.* **85**: 503, 1993), Untereiner *et al.* (*Stud. Mycol.* **47**: 25, 2002; phylogeny), Untereiner *et al.* (*Mycol.* **96**: 812, 2004).

polytomous, dividing into many branches, usually at one node or point.

polytretic, see tretic.

Polytretophora Mercado (1983), anamorphic *Pezizomycotina*, Hso.1eP.27. 2, Cuba; S.E. Asia. See Kuthubutheen & Nawawi (*MR* **95**: 623, 1991), Whitton *et al.* (*Mycoscience* **42**: 555, 2001).

Polytrichia Sacc. (1882) = Pyrenophora fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Sivanesan (*Mycol. Pap.* **158**: 261 pp., 1987).

Polytrichiella M.E. Barr (1972) = Capronia fide Müller *et al.* (*TBMS* **88**: 63, 1987).

polyxeny, see pleioxeny.

Pomatomyces Oerst. (1864) = Thekopsora fide Sydow & Sydow (*Monogr. Ured.*, 1915) Anamorph name for (I).

Pompholyx Corda (1834) = Scleroderma fide Guzmán (*Darwiniana* **16**: 270, 1970).

Pontecorvo (Guido; 1907-1999; Italy). Undergraduate (1924-1928) then postgraduate student, Pisa University; Agricultural Advisory Service, Tuscany (-1938); left Italy in 1938 anticipating anti-Semitism; PhD, Edinburgh University (*c.* 1938-1940); Academic staff (1941-1952), then Reader (1952-1955), then Professor of Genetics (1955-1968), Glasgow University; Honorary Director, UK Medical Research Council Unit of Cell Genetics (1966-1968); Royal Society (1955). Noted for his work on genetics, at first with the insect *Drosophila* then, as a pioneer in mycology, with *Emericella nidulans* (anamorph *Aspergillus nidulans*), and finally with human genetics. His review of *Aspergillus* genetics became a handbook for the science, and he proposed the term 'parasexual cycle'. *Publs.* (with Roper, Hemmons, Macdonald & Bufton) The genetics of *Aspergillus nidulans*. *Advances in Genetics* **5**: 141, 1953). *Biogs, obits etc.* Roper (*MR* **104** (10): 1276, 2000).

Pontogeneia Kohlm. (1975), Pezizomycotina. 7 (marine), widespread. See Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979), Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991).

Pontomyxa Topsent (1892), Hydromyxales. q.v.

Pontoporeia Kohlm. (1963) = Zopfia fide Malloch & Cain (*CJB* **50**: 61, 1972).

Population biology. The study of patterns of distribution and variation in space and time within fungal species and the interpretation of these patterns in terms of genetic, developmental and environmental influences on phenotype and modes of proliferation. Some means of distinguishing between individual population components is necessary, and this can cause difficulties in view of the indeterminacy (indefinite growth potential) and capacity of anastomosis of fungal mycelia. However, it is usually possible to determine whether fungal samples have the same or different genetic origins (i.e. arise from the same or different 'genets') on the basis of somatic and/or sexual incompatibility, phenotypic differences (including isoenzyme polymorphism) or DNA polymorphisms. The latter are sometimes regarded as most definitive in that they do not depend on gene expression. However, they can be relatively expensive to detect, and identify differences and similarities at varied levels of resolution which may or may not be correlated with 'biological' entities or groups.

Often a variety of approaches is needed before deciding on which, or which combination, of the above approaches resolves population components at the level most appropriate to the biological question being addressed. Once population components have been located, their distribution can be quantified by mapping their extent and varied content within regional boundaries. The resulting information can help provide meaningful answers to fundamentally important questions concerning where the organisms (and their offspring) are and what they do there, how they arrived, whether they will persist and how they are likely to change in character and/or distribution. It is also vital for assessment of the levels at which population variation should be recognized for taxonomic purposes.

Distributional patterns in fungal populations can be interpreted in terms of resource relationships, modes of development and modes of reproduction. Resource relationships, the ways in which fungi interact with those non-living or living materials (substrata, hosts) which provide them with a source of organic nutrients, are determined both by selective influences and by the mode of fungal arrival (propagules or migratory mycelium) at colonization sites. Genets capable of arriving only as propagules have 'resource-unit-restricted' regional boundaries; those with migratory mycelium are 'non-unit-restricted' and can become very large. At the individual level, the heterogeneity of microenvironmental conditions encountered by a fungal genet may be reflected in the range of developmental modes or alternative phenotypes that it produces, allowing it to vary functional role with circumstances. At the population level, whether reproduction is clonal (non-recombinatorial) or diversifying (recombinatorial) may partly reflect habitat heterogeneity. The abilities of fungi to vary both their developmental pattern and degree of commitment to clonal and recombinatorial modes of reproduction has important implications for understanding gene flow and genetic and epigenetic diversity within and betwen populations. These abilities are also a crucial consideration when attempting to predict or interpret the evolutionary responses of fungi to environmental change.

In the fungi, work on mathematical modelling of populations has concentrated on attempts to predict

outbreaks of plant diseases. See Bearchell *et al.* (*Proc. nat. acad. sci.* **102**: 5438, 2005), Gilligan & Kleczkowski (*Philosophical trans.: biol. sci.* **352**: 591, 1997).

Porinella R. Sant. (2004) = Caprettia fide Vězda (*Acta Musei Richnoviensis* Sect. Natur. **11**: 62, 2004), Galloway (*Flora of New Zealand. Lichens* edn 2 **1**, 2007).

Porinopsis Malme (1928) = Aspidothelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Porinula (Nyl. ex Hue) Flagey (1896) = Porina Müll. Arg. fide Galloway (*Flora of New Zealand. Lichens* edn 2 **1**, 2007).

Porinula Vězda (1975) nom. illeg. = Caprettia fide Harris *in* Hafellner & Kalb (*Biblthca Lichenol.* **57**: 161, 1995), Sérusiaux & Lücking (*Biblthca Lichenol.* **86**: 161, 2003), Galloway (*Flora of New Zealand. Lichens* edn 2 **1**, 2007).

Poriodontia Parmasto (1982), Schizoporaceae. 1, former USSR. See Parmasto (*Mycotaxon* **14**: 103, 1982).

Poroauricula McGinty (1917) = Favolaschia fide Donk (*Persoonia* **1**: 173, 1960).

Porobeltraniella Gusmão (2004), anamorphic *Pezizomycotina*. 2. See Gusmão (*Mycol.* **96**: 151, 2004).

Porocladium Descals (1976), anamorphic *Pezizomycotina*, Hso.1bH.24. 1 (aquatic), British Isles. See Descals (*TBMS* **67**: 211, 1976).

poroconidium, see tretic.

Poroconiochaeta Udagawa & Furuya (1979) = Coniochaeta fide Udagawa & Furuya (*TMSJ* **20**: 5, 1979), Læssøe (*SA* **13**: 43, 1994; posn), García *et al.* (*Mycol.* **95**: 525, 2003; Russia), García *et al.* (*MR* **110**: 1271, 2006; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Porocyphaceae Körb. (1855) = Lichinaceae.

Porocyphus Körb. (1855), Lichinaceae (L). 8, widespread. See Henssen (*Symb. bot. upsal.* **18** no. 1, 1963), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Porodaedalea Murrill (1905), Hymenochaetaceae. 10, widespread. See Fiasson & Niemalä (*Karstenia* **24**: 14, 1984).

Porodiscella Viégas (1944) ? = Xylaria Hill ex Schrank fide Læssøe (*SA* **13**: 43, 1994).

Porodisculaceae Jülich (1982) = Polyporaceae.

Porodisculus Murrill (1907), Fistulinaceae. 1, USA. See Ginns (*CJB* **75**: 220, 1997; systematics, cultural characters *Porodisculus pendulus*), Bodensteiner *et al.* (*Mol. Phylogen. Evol.* **33**: 501, 2004).

Porodiscus Lloyd (1919), Pezizomycotina. 1, Brazil.

Porodiscus Murrill (1903) [non *Porodiscus* Grev. 1863, *Algae*] ≡ Porodisculus.

Porodothion Fr. (1825) ≡ Porothelium.

Porogramme (Pat.) Pat. (1900), Polyporaceae. 3, widespread (tropical). See Lowe (*Pap. Mich. Acad. Sci.* **49**: 33, 1964; key), Ryvarden (*TBMS* **73**: 9, 1979), Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 34, 1980; key).

poroid, of a form resembling *Polyporus*; specifically, with a pore-like hymenium.

Poroidea Göttinger ex G. Winter (1884) = Craterocolla fide Donk (*Persoonia* **4**: 165, 1966).

Poroisariopsis M. Morelet (1971), anamorphic *Pezizomycotina*, Hso.≡ eP.24. 2, N. America. See Morelet (*Bulletin de la Société des Sciences naturelles et*

d'Archéologie de Toulon et du Var **195**: 7, 1971).

Porolaschia Pat. (1900) = Favolaschia fide Singer (*Farlowia* **2**: 223, 1945).

Porolepricuria M.C. González, Hanlin, Ulloa & E. Aguirre (2004), Xylariaceae. 1, Mexico. See González *et al.* (*Mycol.* **96**: 676, 2004).

Poromarasmius Binder et al. (2006) nom. nud., Marasmiaceae. 1. See Binder *et al.* (*Amer. J. Bot.* **93**: 547, 2006).

Poromycena Overeem (1926) = Mycena fide Singer (*Agaric. mod. Tax.*, 1951).

Poronea Raf. (1815) nom. dub., Fungi. No spp. included.

Poronia Willd. (1787), Xylariaceae. Anamorph *Lindquistia*. 4 (mostly coprophilous), widespread. See Jong & Rogers (*Mycol.* **61**: 853, 1969), Paden (*CJB* **56**: 1774, 1976; culture, anamorph), Lohmeyer & Benkert (*Z. Mykol.* **54**: 93, 1988), Rogers & Læssøe (*Mycotaxon* **44**: 435, 1992; as *Podosordaria*), San Martín & Rogers (*Mycotaxon* **48**: 179, 1993; Mexico), Rogers *et al.* (*Mycotaxon* **67**: 61, 1998; delimitation), Winka & Eriksson (*Mycoscience* **41**: 97, 2000; DNA), Ju & Rogers (*MR* **105**: 1134, 2001).

Poronidulus Murrill (1904), Polyporaceae. 1, N. America. See Gilbertson & Ryvarden (*N. Amer. Polyp.* **2**: 773, 1987; relationship with *Trametes*).

Poroniopsis Speg. (1922) = Hypocreodendron fide Lindquist & Wright (*Darwiniana* **11**: 598, 1959).

Poropeltis Henn. (1904), anamorphic *Pezizomycotina*, Cpt.0eP.?. 1, S. America.

Porophilomyces U. Braun (2000), anamorphic *Pezizomycotina*. 1. See Braun (*Schlechtendalia* **5**: 42, 2000).

Porophora G. Mey. (1825) ≡ Ascidium Fée fide Hafellner & Kalb (*Biblthca Lichenol.* **57**: 161, 1995).

Porophora Zenker ex Göbelez (1827) = Trypethelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Porophoromyces Thaxt. (1926), Laboulbeniaceae. 1, Africa. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Poroptyche Beck (1888) ? = Perenniporia fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Porosphaera Dumort. (1822) nom. dub., Pezizomycotina.

Porosphaerella E. Müll. & Samuels (1982), ? Coniochaetales. Anamorphs *Cordana*, *Pseudobotrytis*. 1 (on rotten wood), widespread. See Müller & Samuels (*Sydowia* **35**: 150, 1982), Réblová *et al.* (*Sydowia* **51**: 49, 1999), Réblová & Winka (*Mycol.* **92**: 939, 2000; phylogeny), Fernández & Huhndorf (*Fungal Diversity* **17**: 11, 2004), Réblová & Seifert (*MR* **111**: 287, 2007; phylogeny).

Porosphaerellopsis Samuels & E. Müll. (1982), Hypocreomycetidae. Anamorph *Sporoschismopsis*. 1, Brazil. See Müller & Samuels (*Sydowia* **35**: 150, 1982), Réblová *et al.* (*Sydowia* **51**: 49, 1999), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny).

Porosphaeria Samuels & E. Müll. (1979) ≡ Porosphaerellopsis.

porospore, see tretic.

Porostereum Pilát (1936), Phanerochaetaceae. 15, widespread. See Hjortstam & Ryvarden (*Syn. Fung.* **4**: 25, 1990; key), Ryvarden (*Syn. Fung.* **18**: 76, 2004).

Porostigme Syd. & P. Syd. (1917) = Phaeostigme fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Porosubramaniania Hol.-Jech. (1985), anamorphic *Pezizomycotina*, Hso.1eP.27. 2, former Czechoslovakia; India. See Holubová-Jechová (*Proc. Indian Acad. Sci.* Pl. Sci. **94**: 253, 1985).

Porotenus Viégas (1960), Uropyxidaceae. 4 (on *Memora* (*Bignoniaceae*)), C. America; Brazil. See Viégas (*Bragantia* **19**: xcviii, 1960).

Porotheleaceae Murrill (1916) = Meripilaceae.

Porotheleum Fr. (1818) = Hydnopolyporus fide Kirk (*in litt.*).

Porothelium Eschw. (1824), ? Pyrenulales (L). 4, widespread (tropical).

Porphyrellus E.-J. Gilbert (1931) = Tylopilus fide Singer (*Agaric. mod. Tax.* edn 2, 1962) but see Smith & Thiers (*The Boletes of Michigan*, 1971), Wolfe & Petersen (*Mycotaxon* **7**: 152, 1978; nomencl. suprasp. taxa).

Porphyriospora A. Massal. (1852) = Polyblastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Porphyrosoma Pat. (1927), ? Hypocreales. 1 (on *Amphisphaeria*), Madagascar. See Rossman (*Stud. Mycol.* **42**, 1999; type material lost).

Porpidia Körb. (1855), Porpidiaceae (L). 27, widespread (temperate). See Hertel (*Beih. Nova Hedwigia* **79**: 399, 1984; Antarct.), Hertel & Knoph (*Mitt. bot. StSamml., München* **20**: 467, 1984), Gowan (*Bryologist* **92**: 25, 1989; key 21 spp. N. Am.), Gowan & Ahti (*Ann. bot. fenn.* **30**: 53, 1993; key 15 spp. Scand.), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004; phylogeny), Fryday (*Lichenologist* **37**: 1, 2005; Europe), Buschbom & Mueller (*Mol. Biol. Evol.* **23**: 574, 2006; evolution), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Porpidiaceae Hertel & Hafellner (1984), Lecideales (L). 16 gen. (+ 6 syn.), 58 spp.

Potebniamyces Smerlis (1962), Bulgariaceae. Anamorph *Phacidiopycnis*. 1, Europe; N. America. *P. discolor* (apple bark canker). See Hahn (*Mycol.* **49**: 226, 1957), Xiao *et al.* (*Mycol.* **97**: 464, 2005; USA), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny, reln with *Phacidium*).

Potoromyces Müll. bis ex Hollós (1902) = Mesophellia fide Stalpers (*in litt.*).

Potridiscus Döbbeler & Triebel (2000), Leotiaceae. 1, Australia. See Döbbeler & Triebel (*Hoppea* **61**: 72, 2000).

Potriphila Döbbeler (1996), Odontotremataceae. 3, Austria. See Döbbeler (*Haussknechtia* Beih. **9**: 79, 1999).

Pouzarella Mazzer (1976) ≡ Pouzaromyces.

Pouzaromyces Pilát (1953) = Entoloma fide Kuyper (*in litt.*).

Pouzaroporia Vampola (1992), Meruliaceae. 1, N. America. See Vampola (*Česká Mykol.* **46**: 59, 1992).

Powellia Bat. & Peres (1964), anamorphic *Pezizomycotina*. 1, Jamaica. See Batista & Peres (*Publções Inst. Micol. Recife* **398**: 4, 1964).

Powellomyces Longcore, D.J.S. Barr & Désauln. (1995), Spizellomycetaceae. 2, Canada. See Longcore *et al.* (*CJB* **73**: 1389, 1995).

ppb, parts per billion; a measure of concentration.

ppm, parts per million; a measure of concentration.

Prachtflorella Matr. (1903) ≡ Gonatobotrys.

praemorse (of the stipe base), as if broken off; truncate.

Pragmoparopsis Höhn. (1917) = Colpoma fide Holm & Holm (*Symb. bot. upsal.* **21** no. 3, 1977).

Pragmopora A. Massal. (1855), Helotiaceae. Anamorphs *Pragmopycnis*, *Hormonema*-like. 6, Europe; N. America. See Groves (*CJB* **45**: 169, 1967; key), de Hoog & McGinnis (*Stud. Mycol.* **30**: 187, 1987; anamorph).

Pragmopycnis B. Sutton & A. Funk (1975), anamorphic *Pragmopora*, St.0eH.16. 1, Canada. See Sutton & Funk (*CJB* **53**: 522, 1975).

Prasiola Menegh. (1838), Algae. Algae.

Prataprajella Hosag. (1992), Meliolaceae. 2 (from leaves), India; Taiwan. See Hosagoudar (*Nova Hedwigia* **55**: 223, 1992), Song *et al.* (*Jour. Shandong Agric. Univ.* **30**: 49, 1999).

Pratella (Pers.) Gray (1821) ≡ Agaricus L.

Prathigada Subram. (1956), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 7, Asia. See Subramanian (*Journal of Madras Univ.* B **26**: 366, 1956), Furlanetto & Dianese (*MR* **103**: 1203, 1999; Brazil), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Prathoda Subram. (1956) = Alternaria fide Cejp & Deighton (*Mycol. Pap.* **117**, 1969).

precipitative vesicle, sporangial vesicle, the membrane of which is formed after extrusion of naked sporangial protoplasm, whether partially cleaved into planonts or not, possibly as a precipitation reaction between periprotoplasmic colloids and the environment; amorphous or fibrillar, c.f. homohylic vesicle, plasmamembranic vesicle.

precipitin, see antigen.

Predacious fungi. The ability to trap and then parasitize or kill amoebae, nematodes, rotifers and other small terrestrial or aquatic animals has evolved several times in various unrelated groups of fungi, with >200 + spp. involved. The most important are *Zoopagales* (q.v.); others are hyphomycetes (*Arthrobotrys*, *Harposporium*, *Monacrosporium*, *Rotiferophthora*, *Verticillium*), anamorphic basidiomycetes (*Nematoctonus*) or members of the *Saprolegniales* (*Sommerstorffia*). Study of these fungi is particularly associated with the mycologist Drechsler who produced a long series of beautifully illustrated accounts of them, mostly in *Mycologia*. Various types of trap are produced, including adhesive hyphal nets or pegs to which the prey become stuck, and special hyphal rings in which individual cells suddenly expand in response to touch, thereby constricting their prey. Comandon & de Fonbrune (see Lloyd & Madison, *Discovery* **7**: 303, 1946) studied the trapping mechanism of *Arthrobotrys*, etc. by cinemicrography.

Lit.: Barron (*The nematode-destroying fungi*, 1977), Barron (*CJB* **63**: 211, 1985, *CJB* **69**: 494, 1991; rotifer endoparasites), Carris & Glawe (*Fungi colonizing cysts of Heterodera glycines*, 1990), Castner (*CJB* **46**: 764, 1966; key to 14 nematode-destroying spp. with constricting rings), Cooke & Godfrey (*TBMS* **47**: 61, 1964; key to nematode-destroying fungi), Dayal (*Predaceous fungi*, 2000), Dix & Webster (*Fungal ecology*, 1995), Dolfus (*Parasites. des helminthes*, 1946), Duddington (*Bot. Proactinomyces (K. Lehm. & Haag) H.L. Jensen (1934) = Nocardia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

probasidium, see basidium.

Probilimbia Vain. (1899) ≡ Mycobilimbia.

Proboscispora Punith. (1984), anamorphic *Pezizomycotina*, Cpd.1eH.10. 1, Malaysia. See Punithalingam (*Nova Hedwigia* **39**: 63, 1984).

Proboscispora S.W. Wong & K.D. Hyde (1999) nom. illegit. ≡ Pseudoproboscispora.

Procandida E.K. Novák & Zsolt (1961) = Syringospora fide von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977).

Proceropycnis M. Villarreal, Arenal, V. Rubio, Begerow, R. Bauer, R. Kirschner & Oberw. (2006), Phleogenaceae. 1, Spain; E. Asia. See Villarreal *et al.* (*Mycol.* **98**: 641, 2006), Hausner *et al.* (*Mycotaxon* **103**: 279, 2008).

pro-diploidization hypha, a hypha which may be diploidized, cf. flexuous hypha.

progametangium (of *Mucorales*), a hyphal branch forming a gametangium and suspensor cell (Fig. 27C).

progamones, a group of sex hormones of zygomycetes (Reschke & Plempel, *Z. Pflanzenphysiol.* **67**: 343, 1972).

prohybrid, a mycelium having additional nuclei from hyphal fusions (after Dodge, *Mycol.* **28**: 407, 1936).

Prokaryota. See *Eukaryota*.

prokaryote (adj. **-otic**), an organism lacking membrane-limited nuclei and not exhibiting mitosis, e.g. bacteria; cf. eukaryote.

prolate (of a spore, sporocarp, etc.), elongated in the direction of the poles; **- spheroidal**, only slightly so. See subglobose.

proliferation, successive development of new parts, esp. of new sporangia within the old wall in *Oomycota*, or of new wall material in conidiogenous cells.

proliferin, an anti-tubercle bacillus antibiotic from *Aspergillus proliferans* (Gupta & Viswanathan, *Antibiot. & Chemotherapy* **5**: 496, 1955).

Proliferobasidium J.L. Cunn. (1976), Brachybasidi-

aceae. 1 (on *Heliconia*), West Indies. See Begerow *et al.* (*Mycol. Progr.* **1**: 187, 2002).

Proliferodiscus J.H. Haines & Dumont (1983), Hyaloscyphaceae. 7, widespread. See Spooner (*Biblthca Mycol.* **116**, 1987; 4 spp. Australasia), Cantrell & Hanlin (*Mycol.* **89**: 745, 1997; DNA).

Prolisea Clem. (1931) = Cercidospora fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Prolixandromyces R.K. Benj. (1970), Laboulbeniaceae. 6, C. America; Europe. See Benjamin (*Aliso* **7**: 174, 1970), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Santamaria (*Mycotaxon* **32**: 433, 1988).

Promicromonospora Krassiln., Kalakout. & Kirillova (1961), Actinobacteria. q.v.

promitosis, the special type of nuclear division during the growth stage in *Plasmodiophoraceae*; cruciform division.

promycelium, Tulasne's term for the germ tube of the teliospore (*Pucciniales*) or ustilospore (*Ustilaginales*) from which **promycelial spores** (Plowright) (sporidia) are produced. The teliospore has been interpreted as a probasidium, the - as a metabasidium (after septation a phragmobasidium) and the ballistisporous promycelial spores basidiospores, as have the non-ballistosporic smut sporidia (see Donk, *K. ned. Akad. Wet.* C **76**: 109, 1973).

Promycetes. See *Pucciniales* and *Ustilaginales* (Clements & Shear, 1931).

Pronectria Clem. (1931), Bionectriaceae. Anamorph *Acremonium*-like. 19 (lichenicolous and algicolous), widespread. See Lowen (*Mycotaxon* **39**: 461, 1990), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

proper exciple (margin), see excipulum (proprium).

prophialide, see metula; primary sterigma.

Prophytroma Sorokīn (1877), anamorphic *Pezizomycotina*, Hsy.0eP.?. 1, former USSR.

Propolidium Sacc. (1884), ? Rhytismatales. 2, Africa; N. America. See Sherwood (*Mycotaxon* **5**: 1, 1977).

Propolina Sacc. (1884), ? Dothideales. 1, Europe.

Propoliopsis Rehm (1914), ? Stictidaceae. 1, Asia; N. America. See Sherwood (*Mycotaxon* **5**: 1, 1977).

Propolis Fr. (1849), ? Rhytismataceae. *c.* 14, widespread. See Sherwood (*Mycotaxon* **5**: 320, 1977; key), Johnston (*N.Z. Jl Bot.* **24**: 84, 1986; key 4 NZ spp.), Spooner (*Kew Bull.* **45**: 451, 1990), Minter (*Mycotaxon* **87**: 43, 2003).

Propolomyces Sherwood (1977) ≡ Propolis.

Proprioscypha Spooner (1987), Hyaloscyphaceae. 1 (on *Eucalyptus*), Australia. See Spooner (*Biblthca Mycol.* **116**, 1987).

Propythium M.K. Elias ex Janson. & Hills (1979), Fossil Fungi, Oomycota. 1 (Carboniferous), USA.

Prosaccharomyces E.K. Novák & Zsolt (1961) = Saccharomycopsis Schiønning fide von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977).

prosenchyma, see plectenchyma.

Prosopidicola Crous & C.L. Lennox (2004), anamorphic *Cryphonectriaceae*. 1, Mexico; USA. See Lennox *et al.* (*Stud. Mycol.* **50**: '187' [191], 2004).

prosoplectenchyma, see plectenchyma.

prosorus (of *Chytridiales*), a cell giving a group of sporangia (the sorus).

Prospodium Arthur (1907), Uropyxidaceae. *c.* 85 (on *Bignoniaceae*, some on *Verbenaceae*), America (tropical & subtropical); India. See Cummins (*Annls mycol.* **35**: 15, 1937; morphology), Cummins (*Lloydia* **3**: 1, 1940; key), Hernández & Hennen (*Mycol.* **95**: 728, 2003).

prosporangium (in *Oomycota*), a sporangium-like body which puts out a vesicle (sporangium) in which zoospores may undergo development and from which they are freed; presporangium.

Prosporobolomyces E.K. Novák & Zsolt (1961) = Sporobolomyces fide Lodder (*Yeasts, a taxonomic study* 2nd edn, 1970).

Prosthecium Fresen. (1852), Diaporthales. Anamorph *Stilbospora*. 12 (from bark), Europe; N. America. See Merezhko (*Ukr. Bot. Zh.* **45**: 57, 1988), Jaklitsch & Voglmayr (*Stud. Mycol.* **50**: 229, 2004; phylogeny).

Prosthemiella Sacc. (1881), anamorphic *Pezizomycotina*, Cac.1bH.?. 3, widespread.

Prosthemium Kunze (1817), anamorphic *Pleomassaria, Splanchnonema*, Cac.0bP.1. 6, widespread (temperate). See Hantula *et al.* (*MR* **102**: 1509, 1998; teleomorph), Paavolainen *et al.* (*Mycol.* **92**: 253, 2000; cryptic spp.), Tanaka *et al.* (*Mycoscience* **46**: 248, 2005; Japan).

Prostratus Sivan., W.H. Hsieh & Chi Y. Chen (1993), Diaporthales. 1 (from leaves), Taiwan. See Sivanesan *et al.* (*MR* **97**: 1179, 1993).

Protascus Wolk (1913) ≡ Wolkia.

Protasia Racib. (1900) nom. nud., ? Fungi.

Protendomycopsis Windisch (1965) = Trichosporon fide Carmo-Sousa *in* Lodder (Ed.) (*Yeasts, a taxonomic study* 2nd edn, 1970).

proteoglycan, an antitumour metabolite from *Coriolus pubescens* active against sarcoma-180.

Proteomyces Moses & Vianna (1913) = Trichosporon fide Diddens & Lodder (*Die anaskosporogenen Hefen* **2**, 1942).

Proteophiala Cif. (1958), anamorphic *Melanospora*, Hso.0eH.15. 3, widespread. See Ciferri (*Sydowia* **11**: 289, 1957).

proteophilous fungi, fungi associated with ammonia-rich (e.g. urea affected) soils (Sagara, *Trans. mycol. Soc. Japan* **14**: 41, 1973).

proterospore, a spore formed at the start of the sporulation period in *Ganoderma* and able to germinate easily without passing through the gut of a fly larva (Nuss, *Pl. Syst. Evol.* **141**: 53, 1982).

prothallus, see hypothallus.

prothecium, a primitive or rudimentary perithecium, as in the *Gymnoascaceae*.

Protista. See *Protoctista*.

proto- (prefix), primitive; primordial.

Protoabsidia Naumov (1935) = Absidia fide Hesseltine (*Mycol.* **47**: 344, 1955).

protoaecium, a haploid structure which, after diploidization, becomes a fruiting structure.

Protoascon L.R. Batra, Segal & R.W. Baxter (1964), Fossil Fungi ? Mucorales. 1 (Carboniferous), USA. See Baxter (*Paleont. Contrib. Univ. Kansas* **77**, 1975), Pirozynski (*Ann. Rev. Phytopath.* **14**: 237, 1976).

Protobagliettoa Servít (1955) = Verrucaria Schrad. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

protobasidium, see basidium.

Protoblastenia (Zahlbr.) J. Steiner (1911), Psoraceae (L). 14, widespread. See Pant (*J. Bombay nat. Hist. Soc.* **85**: 658, 1988; India), Kainz & Rambold (*Biblthca Lichenol.* **88**: 267, 2004; phylogeny, Europe), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

protoblem, a loose flocculent mycelial layer covering the universal veil, as in *Amanita*; primordial veil.

Protocalicium Woron. (1927) = Chaenothecopsis fide Titov (*Folia cryptog. Estonica* **32**: 127, 1998).

Protocolletotrichum R.K. Kar, Neeta Sharma & U.K. Verma (2004), Fossil Fungi. 1.

protoconidium, see hemispore.

Protocoronis Clem. & Shear (1931) = Aureobasidium fide Sutton (*in litt.*).

Protocoronospora G.F. Atk. & Edgerton (1907) = Aureobasidium fide Hermanides-Nijhof (*Stud. Mycol.* **15**: 141, 1977).

Protocrea Petch (1937), Hypocreaceae. Anamorphs *Acremonium*-like, *Verticillium*. 4 (on decaying wood and old basidiomycetes), widespread (temperate). See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Põldmaa (*Stud. Mycol.* **45**: 83, 2000).

Protocreopsis Yoshim. Doi (1977), Bionectriaceae. Anamorph *Acremonium*-like. 9 (from decaying plant material), widespread (tropical). See Doi (*Bull. natn. Sci. Mus.* Tokyo, B **4**: 113, 1978), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Protoctista (Protista), kingdom of eukaryotic microorganisms exclusive of the Kingdoms *Animalia*, *Fungi*, and *Plantae*, but including *Myxomycota* and *Oomycota* and related groups (Margulis *et al.* (Eds), *Handbook of Protoctista*, 1991). Molecular data has shown the 'kingdom' to be exceptionally heterogenous and recent authors accept *Chromista* and *Protozoa* instead. See *Chromista*, Kingdoms of fungi, *Protozoa*.

Protocucurbitaria Naumov (1951), Pleosporales. 1, former USSR. See Naumov (*Bot. Mater. Otd. Sporov. Rast. Bot. Inst. Komarova Akad. Nauk S.S.S.R.* **7**: 110, 1951).

Protodaedalea Imazeki (1955) = Elmerina.

Protodontia Höhn. (1907) = Stypella fide Roberts (*Mycotaxon* **69**: 209, 1998).

Protoerysiphe N. Sharma, R.K. Kar, A. Agarwal & R. Kar (2005), Fossil Fungi, Erysiphales. See Sharma *et al.* (*Micropaleontology* **51**: 73, 2005).

Protogaster Thaxt. (1934), Protogastraceae. 1 (on roots of *Viola*), USA.

Protogastraceae Zeller (1934), ? Boletales. 1 gen., 1 spp.

Lit.: Zeller (*Ann. Mo. bot. Gdn* **21**: 231, 1934), Zeller & Walker (*Mycol.* **27**: 573, 1935), Reijnders (*MR* **104**: 900, 2000).

Protogautieria A.H. Sm. (1965), Gomphaceae. 2, N. America. See Smith (*Mycopath. Mycol. appl.* **26**: 393, 1965).

Protogenea Kobayasi (1964) = Hydnocystis fide Trappe (*TBMS* **65**: 496, 1975), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Protoglossum Massee (1891), Cortinariaceae. 8, widespread. See May (*Muelleria* **8**: 287, 1995), Vidal (*Revista Catalana de Micologia* **24**: 287, 2002).

protogonidium, the first of a series of gonidia (obsol.).

Protograndinia Rick (1933) = Patouillardina Bres. fide Rogers (*Mycol.* **31**: 513, 1939).

Protohydnum Möller (1895), Auriculariales. 3, widespread. See Martin (*Lloydia* **4**: 262, 1941), Roberts & Spooner (*Kew Bull.* **53**: 631, 1998; Brunei Darussalam).

protohymenial, having a primitive hymenium (Maire).

protologue, everything associated with a name on its first publication, i.e. diagnosis, description, references, synonymy, geographical data, citation of specimens, discussion, comments, illustrations (see Stearn, *in* Linnaeus, *Species plantarum* [Reprint] **1**: 126, 1957). See also Nomenclature.

Protomarasmius Overeem (1927) ? = Marasmius fide Kuyper (*in litt.*).

Protomerulius Möller (1895), Auriculariales. *c.* 4, widespread. See Ryvarden (*Synopsis Fungorum* **5**, 1991).

Protomicarea Hafellner (2001), Psoraceae (L). 1, Europe. See Hafellner & Türk (*Stapfia* **76**: 156, 2001).

Protomycena Hibbett, D. Grimaldi & Donoghue (1997) nom. inval., Fossil Fungi. 1, Dominican Republic. See Hibbett *et al.* (*Am. J. Bot.* **84**: 984, 1997).

Protomyces Unger (1832), Protomycetaceae. *c.* 10 (biotrophic on plants), widespread. See Reddy & Kramer (*Mycotaxon* **3**: 1, 1975; key), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997; phylogeny), Nishida *et al.* (*J. Mol. Evol.* **46**: 442, 1998; introns), Sugiyama (*Mycoscience* **39**: 487, 1998; phylogeny), Schweigkofler *et al.* (*Organ. Divers. Evol.* **2**: 1, 2002; phylogeny), Lopandic *et al.* (*Mycol. Progr.* **4**: 205, 2005; phylogeny), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny).

Protomycetaceae Gray (1821), Taphrinales. 6 gen., 22 spp.

Lit.: Reddy & Kramer (*Mycotaxon* **3**: 1, 1975), Blanz & Unseld (*Stud. Mycol.* **30**: 247, 1987), Nishida & Sugiyama (*Mol. Biol. Evol.* **10**: 431, 1993), Döbbeler (*Nova Hedwigia* **60**: 171, 1995), Sugiyama *et al.* (*Microbial Diversity in Time and Space* Proceedings of the International Symposium, October 24-26, 1994, Tokyo, Japan: 41, 1996), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997; phylogeny), Ahearn *et al.* *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 600, 1998), Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 353, 1998), Kurtzman & Blanz *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 69, 1998), Sugiyama (*Mycoscience* **39**: 487, 1998; phylogeny).

Protomycetales Luttr. ex D. Hawksw. & O.E. Erikss. (1986) = Taphrinales.

Protomycites Mesch. (1892), Fossil Fungi. 1 (Carboniferous), British Isles.

Protomycocladus Schipper & Samson (1994), Syncephalastraceae. 1, Pakistan. See Schipper & Samson (*Mycotaxon* **50**: 487, 1994), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Protomycopsis Magnus (1905), Protomycetaceae. 5 (from living plants), widespread. See Reddy & Kramer (*Mycotaxon* **3**: 1, 1975; key), Haware & Pavgi (*Caryologia* **30**: 313, 1977; development), Piepenbring & Bauer (*Mycol.* **89**: 924, 1997; excl. spp.).

protonym (in nomenclature), a name effectively but not validly published after the starting point for the group (Donk, *Persoonia* **1**: 175, 1960).

Protopannaria (Gyeln.) P.M. Jørg. & S. Ekman (2000), Pannariaceae (L). 5, widespread. See Jørgensen (*Bryologist* **103**: 699, 2000), Jørgensen (*Cryptog. Mycol.* **22**: 67, 2001; Antarctic), Ekman & Jørgensen (*CJB* **80**: 625, 2002; phylogeny), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Wedin & Wiklund (*Symb. bot. upsal.* **34** no. 1: 469, 2004; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Protoparmelia M. Choisy (1929), Parmeliaceae (L). 20, widespread. See Sancho & Crespo (*Actas Simp. Nac. bot. Crypt.* **6**: 441, 1987; 3 spp. Spain), Miyawaki (*Hikobia* **11**: 29, 1991), Poelt & Leuckert

(*Nova Hedwigia* **52**: 39, 1991; key 6 spp., mostly on lichens), Hafellner *et al. in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 379, 1994; posn), Crespo *et al.* (*Taxon* **50**: 807, 2001; phylogeny), Grube *et al.* (*MR* **108**: 506, 2004), Brodo & Aptroot (*CJB* **83**: 1075, 2005; corticolous spp., N America), Barbero *et al.* (*Mycotaxon* **97**: 299, 2006; Spain), Arup *et al.* (*Mycol.* **99**: 42, 2007; sister group relations with *Parmeliaceae*).

Protoparmeliopsis M. Choisy (1929) = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Grube *et al.* (*MR* **108**: 506, 2004).

Protopeltis Syd. (1927) = Myriangiella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

protoperithecium, a young but walled perithecium before ascus formation (Ellis, *Mycol.* **51**: 416, 1960).

Protophallaceae Zeller (1939) = Phallaceae.

Protophallus Murrill (1910) = Protubera fide Furtado & Dring (*TBMS* **50**: 500, 1967).

protophyte, see antithetic.

Protopistillaria Rick (1933) = Eocronartium fide Martin (*Lloydia* **5**: 158, 1942).

Protoplacodium Motyka (1995) nom. inval. = Lobothallia fide Aptroot (*in litt.*).

protoplasmodium, see plasmodium.

protoplast, traditionally the totality of the living cell constituents, whether walled or not, but now frequently used for the cell protoplasm after experimental removal of the cell wall, a usage to which Brenner *et al.* (*Nature* **181**: 1713, 1958) proposed to restrict the term. Fungal protoplasts are proving to have value in the study of cell organelles, biochemistry, genetics; they also have potential applications in biotechnology, esp. since protoplasts from different strains or even species can be fused (first achieved in 1975) into an aggregate protoplast and produce a heterokaryon with changed properties. See Villanueva (*in* Ainsworth & Sussman (Eds), *The Fungi* **2**: 3, 1966), Perberdy (*Sci. Progr.* **60**: 73, 1972; review methods), Villanueva *et al.* (Eds) (*Yeast, mould and protoplasts*, 1973), Perberdy *et al.* (Eds) (*Microbial and plant protoplasts*, 1976), Peberdy & Ferenczy (Eds) (*Fungal protoplasts. Applications in biochemistry and genetics*, 1985), Peberdy (*Microbiol. Sci.* **4**: 108, 1987; review). **sphaeroplast** a - enclosed by a modified or fragmentary cell wall. [**gymnoplast** was used by Küster (1935) for plant cells without a cell wall and Frey-Wyssling (*Nature* **216**: 516, 1967) prefered **semi-gymnoplast** to sphaeroplast.].

Protoradulum Rick (1933), ? Auriculariales. 1, Brazil. See Rick (*Egatea* **18**: 348, 1933).

Protoroccella L.M. Sánchez-Pinto & M. Schulz (2001) = Protoroccella Follmann fide Grube (*Bryologist* **101**: 377, 1998).

Protoroccella Follmann (2001), Roccellaceae (L). 2, Chile. See Follmann (*J. Hattori bot. Lab.* **90**: 261, 2001).

Protoschistes M. Choisy (1928) = Diploschistes fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Protoscypha Syd. (1925), Protoscyphaceae. 1, widespread (tropical). See Petrak (*Annls mycol.* **32**: 317, 1934), Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Protoscyphaceae Kutorga & D. Hawksw. (1997), ? Dothideomycetes (inc. sed.). 1 gen. (+ 1 syn.), 1 spp.

Lit.: Kutorga & Hawksworth (*SA* **15**: 1, 1997), Magnes (*Biblthca Mycol.* **165**: 177 pp., 1997).

protosexual (of yeasts or other organisms), having diploid or dikaryotic cells which produce haploid or unisexual cells in the absence of fructifications or sexual spores; in contrast to parasexual (q.v.), which is redefined to cover organisms having both protosexual and sexual cycles, and **neo-sexual**, for organisms having a sexual but not a protosexual cycle (Wickerham, *Mycol.* **56**: 254, 1964, cf. **57**: 134, 1965, **58**: 943, 1967).

protospore (1) the multinucleated mass of cytoplasm cut out by primary cleavage planes, to be followed by further cleavage to form the uninucleate spores of *Phycomyces* and other *Mucorales* (Harper), and the sporangiospores of *Coccidioides*; (2) (of *Synchytriaceae*), a 1-nucleate portion of protoplasm which becomes the sporangium.

Protostegia Cooke (1880), anamorphic *Pezizomycotina*, Cpd.0fH.1. 1, S. Africa. See Dyko *et al.* (*Mycol.* **71**: 918, 1979).

Protostegiomyces Bat. & A.F. Vital (1955), anamorphic *Pezizomycotina*, Ccu.0fH.?. 1 (on *Lembosia*), Brazil. See Batista & Vital (*An. Soc. Biol. Pernambuco* **13**: 94, 1955).

protosterigma, see basidium.

Protostroma Bat. (1957), anamorphic *Pezizomycotina*, St.0eH.?. 1, USA. See Batista (*Revta Biol.* Lisb. **1**: 109, 1957).

Prototaxaceae Hueber (2001), Fungi (inc. sed.). See Fossil fungi.

Prototaxites Dawson (1859), Fossil Fungi. 2 (Silurian-Devonian). See Boyce *et al.* (*Geology* **35**: 399, 2007; carbon isotopic range), Kibby (*Field Mycology* **9**: 48, 2008).

Prototheca W. Krüger (1894) nom. dub., Algae. ? Achloric algae. See Arnold & Ahearn (*Mycol.* **64**: 265, 1972; key), Smith (*Mycopath.* **71**: 95, 1980), Capriotti (*Arch. Microbiol.* **42**: 409, 1962; in fish). Associated with disease in humans (**protothecosis**), bovine mastitis, etc.; see Sudman (*Am. J. clin. Path.* **61**: 10, 1974). *P. richardsii* has been transferred to a new genus, *Aneurofeca*, in the *Icthyosporea* (DRIPs clade), see Baker *et al.* [*Microbiology* **145**: 1777, 1999].

protothecium, an incompletely differentiated ascoma containing neither asci nor ascospores (Shoemaker, *CJB* **34**: 641, 1955).

Protothelenella Räsänen (1943), Protothelenellaceae (±L). 10 (on lichens and *Musci*), Europe; N. America. See Mayrhofer (*Herzogia* **7**: 313, 1987; key), Fryday (*Bryologist* **107**: 231, 2004; USA), Schmitt *et al.* (*Mycol.* **97**: 362, 2005; phylogeny).

Protothelenellaceae Vězda, H. Mayrhofer & Poelt (1985), Ostropomycetidae (inc. sed.) (±L). 2 gen. (+ 2 syn.), 11 spp.

Lit.: Sherwood-Pike & Boise (*Brittonia* **38**: 35, 1986), David (*SA* **6**: 217, 1987), Mayrhofer (*Herzogia* **7**: 313, 1987), Schmitt *et al.* (*Mycol.* **97**: 362, 2005), Lumbsch *et al.* (*MR* **111**: 257, 2007; phylogeny).

Protothyrium G. Arnaud (1917), Parmulariaceae. 4, widespread (tropical).

Prototrema M. Choisy (1928) ? = Thelotrema fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Prototremella Pat. (1888) = Tulasnella fide Rogers (*Annls mycol.* **31**: 183, 1933).

prototroph, see wild type.

prototunicate (of asci), basically unitunicate, but with

the wall lysing at or before maturity and lacking differentiated apical structures (e.g. *Saccharomycetales*); such asci may develop in an hymenium or be distributed randomly in the interior of the ascoma. See ascus.

Prototylium M. Choisy (1929) ? = Pseudopyrenula fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Protounguicularia Raitv. & R. Galán (1986), Hyaloscyphaceae. 5, Europe. See Huhtinen (*Mycotaxon* **30**: 9, 1987), Baral (*SA* **13**: 113, 1994; ? synonymy with *Olla*).

protouredinium, see protoaecium.

Protousnea (Motyka) Krog (1976), Parmeliaceae (L). 7, S. America. See Kärnefelt *et al.* (*Nova Hedwigia* **67**: 71, 1998), Calvelo *et al.* (*Mycotaxon* **85**: 277, 2003; Argentina), Calvelo *et al.* (*Bryologist* **108**: 1, 2005; revision), Czeczuga *et al.* (*Feddes Repert.* **116**: 195, 2005; carotenoids).

Protoventuria Berl. & Sacc. (1887), Venturiaceae. Anamorph *Fusicladium*-like. 1, widespread. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Barr (*Prodr. Cl. Loculoasc.*, 1987), Richiteanu & Bontea (*Rev. Roum. Biol.* biol. vég. **32**: 15, 1987; nomencl., on *Ericaceae*), Barr (*Sydowia* **41**: 25, 1989; key 23 N. Am. spp.), Pascoe & Sutton (*Aust. Syst. Bot.* **3**: 281, 1990; Australia), Carris & Poole (*Mycol.* **85**: 93, 1993; USA), Winton *et al.* (*Mycol.* **99**: 240, 2007; phylogeny).

Protubera Möller (1895), Phallogastraceae. 13, widespread (tropical; subtropical). See Furtado & Dring (*TBMS* **50**: 500, 1967), Castellano & Beever (*N.Z. Jl Bot.* **32**: 305, 1994; NZ spp.).

protuberate (of conidia), having short projections.

Protuberella S. Imai & A. Kawam. (1958), Phallaceae. 1, Japan. See Malloch (*Mycotaxon* **34**: 133, 1989).

pruinose, having a frost-like or flour-like surface covering of **pruina**. Often caused by calcium oxalate hydrates on lichen thalli; see Wadsten & Moberg (*Lichenologist* **17**: 239, 1985).

Prunulus Gray (1821) = Mycena fide Donk (*Beih. Nova Hedwigia* **5**, 1962).

PSA, see Media.

Psalidosperma Syd. & P. Syd. (1914) = Ypsilonia fide Clements & Shear (*Gen. Fung.*, 1931).

Psaliota, see *Psalliota*.

Psalliota (Fr.) P. Kumm. (1871) ≡ Agaricus L.

Psalliotina Velen. (1939) = Psathyrella fide Pilát (*Agaricalium Europaeorum Clavis Dichotomica*, 1951).

Psammina Sacc. & M. Rousseau ex E. Bommer & M. Rousseau (1891), anamorphic *Pezizomycotina*, Cac.0bP.1 (±L). 8 (mostly lichenicolous or algicolous), Europe. See Earland-Bennett & Hawksworth (*Lichenologist* **31**: 579, 1999), Earland-Bennett & Hawksworth (*Lichenologist* **37**: 191, 2005; key).

Psammocoparius Delile ex De Seynes (1863) nom. inval. = Psathyrella fide Kuyper (*in litt.*).

Psammomyces Lebedeva (1932) = Galeropsis fide Zeller (*Mycol.* **35**: 409, 1943).

Psammospora Fayod (1893) nom. rej. ≡ Melaleuca.

Psathyra (Fr.) P. Kumm. (1871) [non *Psathyra* Spreng. 1818, *Rubiaceae*] = Psathyrella fide Singer (*Agaric. mod. Tax.*, 1951).

Psathyrella (Fr.) Quél. (1872), Psathyrellaceae. *c.* 400, widespread. See Smith (*Mem. N. Y. bot. Gdn* **24**, 1972; 414 N. Am. spp.), Pegler (*Kew Bull.* Addit. Ser. **6**, 1977; E. Afr.), Kits van Waveren (*Persoonia* Suppl. **2**: 1, 1985; monogr. Dutch, French, Br. spp.), Enderle & Hübner (*Beitr. Kenntn. Pilze Mitteleur.* **14**: 53, 2005), Vašutová (*Czech Mycol.* **58**: 1, 2006; Czech Republic, Slovakia), Padamsee *et al.* (*Mol. Phylog. Evol.* **46**: 415, 2008; phylogeny), Vašutová *et al.* (*MR* **112**: in press, 2008; phylogeny).

Psathyrellaceae Vilgalys, Moncalvo & Redhead (2001), Agaricales. 12 gen. (+ 14 syn.), 746 spp. Generic delimitation in the *Psathyrellaceae* is in need of revision considering the extenstive polyphyly in *Psathyrella* and the redisposition of coprinoid species to it.

Lit.: Smith (*Mem. N. Y. bot. Gdn* **24**: 633 pp., 1972), Bogart (*Mycotaxon* **10**: 155, 1979), Kits van Waveren (*Persoonia* Suppl. **2**: 300 pp., 1985), Enderle & Bender (*Z. Mykol.* **56**: 19, 1990), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000), Redhead *et al.* (*Taxon* **50**: 203, 2001; redisposition of coprinoid species), Adamsee *et al.* (*Mol. Phyl. Evol.* **46**: 415, 2008; phylogeny), Vašutová *et al.* (*MR* **112**: in press, 2008).

Psathyrodon Maas Geest. (1977) = Beenakia fide Parmasto & Ryvarden (*Windahlia* **18**: 39, 1990).

Psathyromyces Bat. & Peres (1964) = Tricharia Fée fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Psathyrophlyctis Brusse (1987), Phlyctidaceae (L). 1, S. Africa. See Brusse (*Bothalia* **17**: 182, 1987).

Psecadia Fr. (1849) ≡ Cytospora fide Sutton (*Mycol. Pap.* **141**, 1977).

Pselaphidomyces Speg. (1917), Laboulbeniaceae. 1, N. America. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Pselliophora P. Karst. (1879) nom. rej. = Coprinus fide Redhead *et al.* (*Mycotaxon* **50**: 203, 2001).

Pseudacoliomyces Cif. & Tomas. (1953) ≡ Pseudacolium.

Pseudacolium Stizenb. ex Clem. (1909) = Cyphelium Ach. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Tibell (*MR* **107**: 1403, 2003).

Pseudaegerita J.L. Crane & Schokn. (1981), anamorphic *Hyaloscypha*, Hsp.0eP.3. 10, widespread. See Crane & Schoknecht (*Mycol.* **73**: 78, 1981), Abdullah *et al.* (*MR* **109**: 590, 2005).

Pseudaleuria Lusk (1987), Pyronemataceae. 1, USA. See Lusk (*Mycotaxon* **30**: 417, 1987), Moravec (*Acta Musei Moraviae* Scientiae Biologicae **88**: 37, 2003), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Pseudallescheria Negr. & I. Fisch. (1944), Microascaceae. Anamorphs *Graphium*, *Scedosporium*. 8, widespread. *P. boydii*complex on humans (white grain mycetoma). See Campbell & Smith (*Mycopathologia* **78**: 145, 1982; conidiogenesis), McGinnis *et al.* (*Mycotaxon* **14**: 94, 1982), von Arx *et al.* (*Beih. Nova Hedwigia* **94**, 1988), Issakainen *et al.* (*J. Med. Vet. Mycol.* **35**: 389, 1997; DNA), Wedde *et al.* (*Medical Mycology* **36**: 61, 1998; PCR-based identification), Issakainen *et al.* (*MR* **103**: 1179, 1999; DNA), Okada *et al.* (*CJB* **76**: 1495, 1999; DNA), Paul & Masih (*FEMS Microbiol. Lett.* **189**: 61, 2000; molecular variation), Issakainen *et al.* (*Medical Mycology* **41**: 31, 2003; phylogeny), Riddell *et al.* (*Mycoses* **47**: 442, 2004; disseminated infection), Gilgado *et al.* (*J. Clin. Microbiol.* **43**: 4930, 2005; phylogeny), Guarro *et al.* (*Medical Mycology* **44**: 295, 2006; review), Rainer & Hoog (*MR* **110**: 151, 2006; phylogeny), Zeng *et al.* (*Medical Mycology* **45**: 547, 2007; infraspecific variation), Rainer *et al.* (*Antonie van Leeuwenhoek* **93**: 315, 2008; selective isolation).

Pseudapiospora Petr. (1928) = Pseudomassaria fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2,

1962).

Pseudarctomia Gyeln. (1939), ? Lichinaceae (L). 1, France. See Moreno & Egea (*Acta Bot. Barcinon.* **41**: 1, 1992).

Pseudarthopyrenia Keissl. (1935) = Pyrenocollema fide Harris (*Lichenogr. Thomsoniana*: 133, 1998).

Pseudascozonus Brumm. (1985), Thelebolaceae. 1 (coprophilous), France. See Brummelen (*Proc. Indian Acad. Sci.* Pl. Sci. **94**: 363, 1985), Brummelin (*Persoonia* **16**: 425, 1998; ultrastr.), Hoog *et al.* (*Stud. Mycol.* **51**: 33, 2005).

Pseudasterodon Rick (1959) nom. dub., Agaricomycetes. See Donk (*Persoonia* **3**: 199, 1964).

Pseudephebe M. Choisy (1930), Parmeliaceae (L). 2, widespread (montane-arctic; bipolar). See Brodo & Hawksworth (*Op. bot. Soc. bot. Lund* **42**, 1977), Kantvilas (*Flora of Australia* **55**: 162, 1994), Crespo *et al.* (*Taxon* **50**: 807, 2001; phylogeny), Thell *et al.* (*Mycol. Progr.* **1**: 335, 2002; phylogeny), Thell *et al.* (*Mycol. Progr.* **3**: 297, 2004; phylogeny).

Pseuderiospora Keissl. (1924) = Eriosporella fide Sutton (*Mycol. Pap.* **141**, 1977).

Pseuderiospora Petr. (1959) ≡ Suttoniella.

Pseudeurotiaceae Malloch & Cain (1970), Leotiomycetes (inc. sed.). 6 gen. (+ 1 syn.), 26 spp.

Lit.: Booth (*Mycol. Pap.* **83**, 1961), Malloch & Cain (*CJB* **48**: 1815, 1970; genera), Lodha *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 241, 1978), von Arx *et al.* (*Beih. Nova Hedwigia* **94**: 104 pp., 1988), Suh & Blackwell (*Mycol.* **91**: 836, 1999; phylogeny), Sogonov *et al.* (*Mycol.* **97**: 695, 2005), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Stchigel & Guarro (*MR* **111**: 1100, 2007).

Pseudeurotium J.F.H. Beyma (1937), Pseudeurotiaceae. Anamorph *Teberdinia*. 5 (on rotten wood etc.), widespread. See Booth (*Mycol. Pap.* **83**, 1961; key), Suh & Blackwell (*Mycol.* **91**: 836, 1999; phylogeny), Sogonov *et al.* (*Mycol.* **97**: 695, 2005; anamorph), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Pseudevernia Zopf (1903), Parmeliaceae (L). 5 or 6, widespread. See Hale (*Bryologist* **71**: 1, 1968), Legaz *et al.* (*Cryptog. Bryol.-Lichénol.* **6**: 343, 1985; anatomy), López Redondo & Manrique Reol (*An. Jard. bot. Madr.* **46**: 295, 1989; chemical races, Spain), Strobl *et al.* (*Biblthca Lichenol.* **53**: 251, 1993; protein composition), Czeczuga & Christensen (*Feddes Repert.* **105**: 473, 1994; carotenoids), Kärnefelt *et al.* (*Nova Hedwigia* **67**: 71, 1998; anatomy), Crespo *et al.* (*Lichenologist* **31**: 451, 1999; anatomy, chemistry, phylogeny), Crespo *et al.* (*Taxon* **50**: 807, 2001; phylogeny), Wei & Abbas (*Mycosystema* **22**: 26, 2003; China), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Honegger & Zippler (*MR* **111**: 424, 2007; mating systems).

Pseudhaplosporella Speg. (1920) = Botryodiplodia fide Petrak & Sydow (*Feddes Repert.* **42**: 1, 1927).

Pseudhydnotrya E. Fisch. (1897) = Geopora fide Fischer (*Nat. Pflanzenfam.* **5b**: viii, 1938).

pseudo- (prefix), false; spurious.

Pseudoabsidia Bainier (1903) = Absidia fide Hesseltine (*Mycol.* **47**: 344, 1955).

Pseudoacrodictys W.A. Baker & Morgan-Jones (2003), anamorphic *Pezizomycotina*. 8, widespread. See Baker & Morgan-Jones (*Mycotaxon* **85**: 373, 2003), Somrithipol & Jones (*Sydowia* **55**: 365, 2003; Thailand).

pseudoaethium (of *Mycetozoa*), a group of separate sporangia looking like an aethalium.

Pseudoamauroascus Cano, M. Solé & Guarro (2002), Onygenaceae. 1, Australia. See Cano *et al.* (*Stud. Mycol.* **47**: 175, 2002).

pseudoamyloid, see dextrinoid.

pseudoangiocarpous (of a basidioma), hymenial surface at first exposed but later covered by an incurving pileus margin and/or excrescences from the stipe (Singer, 1975: 26).

Pseudoanguillospora S.H. Iqbal (1974), anamorphic *Pezizomycotina*, Hso.0fH.1/10. 2, Europe. See Iqbal (*Biologia* Lahore **20**: 11, 1974), Marvanová (*Czech Mycol.* **49**: 7, 1996).

Pseudoarachniotus Kuehn (1957) = Gymnascella fide von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981), Currah (*Mycotaxon* **24**: 1, 1985).

Pseudoaristastoma Suj. Singh (1979), anamorphic *Pezizomycotina*, Cpd.≡ eH.?. 1, India. See Singh (*Sydowia* **31**: 238, 1978).

Pseudoarmillariella (Singer) Singer (1956), Agaricales. 2, N. America; C. America. Belongs to *Hygrophoraceae* or *Tricholomataceae*. See Singer (*Mycol.* **48**: 725, 1956), Redhead *et al.* (*Mycotaxon* **83**: 19, 2002).

Pseudoarthonia Marchand (1896) = Arthonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudoasperisporium U. Braun (2000), anamorphic *Pezizomycotina*. 2. See Braun (*Schlechtendalia* **5**: 72, 2000), Schubert & Braun (*Fungal Diversity* **20**: 187, 2005).

Pseudoauricularia Kobayasi (1982), Agaricaceae. 1, Papua New Guinea. See Kobayasi (*TMSJ* **22**: 421, 1981).

Pseudobaeomyces M. Satô (1940), Icmadophilaceae (L). 1, Asia. See Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Stenroos *et al.* (*Mycol. Progr.* **1**: 267, 2002).

Pseudobaeospora Singer (1942), Tricholomataceae. *c.* 20, widespread. See Singer (*Mycol.* **60**: 13, 1963), Horak (*Revue Mycol.* Paris **29**: 72, 1964; key), Bas (*Persoonia* **18**: 115, 2002; Europe), Bas (*Persoonia* **18**: 163, 2003).

Pseudobalsamia E. Fisch. (1907) = Balsamia fide Trappe (*TBMS* **65**: 496, 1975), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Pseudobasidiospora Dyko & B. Sutton (1978), anamorphic *Pezizomycotina*, Cpd.0eH.1. 1 (aquatic), Australia; USA. See Dyko & Sutton (*Nova Hedwigia* **29**: 168, 1977).

Pseudobasidium Tengwall (1924) = Arthrinium fide Ellis (*Mycol. Pap.* **103**, 1965).

Pseudobeltrania Henn. (1902), anamorphic *Pezizomycotina*, Hso.0eP.10. 7, widespread (esp. tropical). See Sutton (*TBMS* **55**: 506, 1970), Zucconi (*MR* **95**: 1017, 1991).

Pseudoboletus Šutara (1991), Boletaceae. 2 (in parasitic association with *Scleroderma* and *Pisolithus*), north temperate. See Šutara (*Česká Mykol.* **45**: 1, 1991), Šutara (*Czech Mycol.* **57**: 1, 2005; anatomical characters).

Pseudobotrytis Krzemien. & Badura (1954), anamorphic *Porosphaerella*, Hso.1eP.10. 1, widespread. See Mel'nik (*Mikol. Fitopatol.* **32**: 32, 1998), Fernández & Huhndorf (*Fungal Diversity* **17**: 11, 2004; teleomorph), Yamaguchi *et al.* (*Mycoscience* **45**: 9, 2004; chemistry).

Pseudobuellia B. de Lesd. (1907) = Rinodina fide

Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudocalicium Marchand (1896) = Chaenothecopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudocalopadia Lücking (1999), Ectolechiaceae (L). 1, Costa Rica. See Lücking (*Phyton* Horn **39**: 142, 1999).

Pseudocamptoum Gonz. Frag. & Cif. (1925) = Melanographium fide Ellis (*Mycol. Pap.* **93**, 1963).

Pseudocanalisporium R.F. Castañeda & W.B. Kendr. (1991), anamorphic *Pezizomycotina*, Hsp.#eP.1. 1, Cuba. See Castañeda Ruiz & Kendrick (*Univ. Waterloo Biol. Ser.* **35**: 89, 1991).

pseudocapillitium (of *Mycetozoa*), a sterile structure in the fruit-body which has had no connexion with the sporogenous protoplasm.

Pseudocenangium A. Knapp (1924) = Ascocoryne fide Dennis (*Mycol. Pap.* **62**, 1956).

Pseudocenangium P. Karst. (1886), anamorphic *Pezizomycotina*, Ccu.0fH.19. 2, Europe; N. America. See Dyko & Sutton (*CJB* **57**: 370, 1979), Mel'nik *et al.* (*Mikol. Fitopatol.* **40**: 510, 2006).

Pseudocercophora Subram. & Sekar (1986), Lasiosphaeriaceae. Anamorph *Mammaria*. 1, India. See Subramanian & Sekar (*Journal of the Singapore National Academy of Science* **15**: 58, 1986).

Pseudocercospora Speg. (1910) nom. cons. prop., anamorphic *Mycosphaerella*, Hso.0fP.10. *c.* 1124, widespread (esp. tropical). See Deighton (*Mycol. Pap.* **140**, 1976), Deighton (*TBMS* **88**: 365, 1987), Guo & Liu (*Mycosystema* **2**: 225, 1989; China), Anon. (*Progr. Rep. Asian Veg. Res. Develop. Centr e, 1990*: 150, 1991; in vitro data on *P. fuligena*), Guo & Hsieh (*The genus Pseudocercospora in China*, 1995), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 397, 1998; relat. to *Cercostigmina* and *Uwebraunia*, key to sections), Stewart *et al.* (*MR* **103**: 1491, 1999; phylogeny), Crous *et al.* (*Stud. Mycol.* **45**: 107, 2000; review), Gonzalez & Pons (*MR* **104**: 1507, 2000; ontogeny), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Crous *et al.* (*MR* **105**: 425, 2001; on *Myrtaceae*), Beilharz *et al.* (*Mycotaxon* **82**: 397, 2002; on *Kennedia*), Braun & Dick (*N.Z. Jl For. Sci.* **32**: 221, 2002; on *Eucalyptus*), Crous & Mourichon (*Sydowia* **54**: 35, 2002; on *Musa*), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003; nomenclator), Taylor *et al.* (*MR* **107**: 653, 2003; on *Proteaceae*), Crous *et al.* (*Stud. Mycol.* **50**: 457, 2004; on *Acacia*), Ávila *et al.* (*MR* **109**: 881, 2005; on *Olea*), Braun & Crous (*Taxon* **55**: 803, 2006; nomencl.), Hunter *et al.* (*Stud. Mycol.* **55**: 147, 2006; on *Eucalyptus*).

Pseudocercosporella Deighton (1973), anamorphic *Mycosphaerella*, Hso.0fH.10. 119, widespread. See Inman *et al.* (*MR* **95**: 1334, 1991; *Mycosphaerella* teleomorph of *P. capsellae*), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 129, 1995; monogr., keys), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 405, 1998), Braun (*Schlechtendalia* **1**: 41, 1998), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**, 1998), Braun *et al.* (*Mycol. Progr.* **2**: 197, 2003), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003; nomenclator), Hunter *et al.* (*Stud. Mycol.* **55**: 147, 2006; on *Eucalyptus*).

Pseudocercosporidium Deighton (1973), anamorphic *Mycosphaerellaceae*, Hso.0fP.10. 1, Venezuela. See Deighton (*Mycol. Pap.* **133**: 55, 1973), Crous *et al.* (*Mycol.* **93**: 1081, 2001), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Pseudochaete T. Wagner & M. Fisch. (2002), Hymenochaetaceae. 1, widespread. See Wagner & Fischer (*Mycol. Progr.* **1**: 100, 2002).

Pseudochaetosphaeronema Punith. (1979), anamorphic *Pleosporales*, Cpd.0eH.15. 1 (from humans), Venezuela. See Punithalingam (*Nova Hedwigia* **31**: 126, 1979), Hoog *et al.* (*Mycoses* **47**: 121, 2004; phylogeny).

Pseudochuppia Kamal, A.N. Rai & Morgan-Jones (1984), anamorphic *Pezizomycotina*, Hso.#eP.1/10. 1, India. See Kamal *et al.* (*Mycol.* **76**: 163, 1984).

Pseudociboria Kanouse (1944), Sclerotiniaceae. 1, widespread. See Dumont (*Mycol.* **66**: 706, 1974), Schumacher (*Mycotaxon* **38**: 233, 1990).

Pseudocladosporium U. Braun (1998) = Fusicladium fide Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 392, 1998), Braun *et al.* (*Mycol. Progr.* **2**: 3, 2003; phylogeny), Schubert *et al.* (*Schlechtendalia* **9**, 2003), Beck *et al.* (*Mycol. Progr.* **4**: 111, 2005; phylogeny), Crous *et al.* (*Stud. Mycol.* **58**: 185, 2007; phylogeny).

Pseudoclathrosphaerina Voglmayr (1997), anamorphic *Pezizomycotina*, Hso.?.?. 1, USA. See Voglmayr & Krisai-Greilhuber (*Mycol.* **89**: 943, 1997).

Pseudoclathrus B. Liu & Y.S. Bau (1980), Phallaceae. 1, China. See Liu & Bau (*Mycotaxon* **10**: 293, 1980).

pseudocleistothecium, see discrete body.

Pseudoclitocybe (Singer) Singer (1956), Tricholomataceae. 10, widespread (north temperate; S. America). See Singer (*Mycol.* **48**: 725, 1956), Watling & Turnbull (*British Fungus Flora*, 1998; UK).

Pseudococcidioides O.M. Fonseca (1928) = Coccidioides fide Dodge (*Medical Mycology*, 1935).

Pseudocochliobolus Tsuda, Ueyama & Nishih. (1978) = Cochliobolus fide Alcorn (*Mycotaxon* **16**: 353, 1983), Sivanesan (*Mycol. Pap.* **158**: 261 pp., 1987).

Pseudocoelomomyces E.A. Nam & Dubitskiĭ (1977) ≡ Tabanomyces.

Pseudocollema Kanouse & A.H. Sm. (1940) = Byssonectria fide Sivertsen (*SA* **9**: 23, 1990), Pfister (*Mycol.* **85**: 952, 1993).

pseudocolumella (of *Physaraceae*), lime-knots massed like a columella at the centre of the sporangium.

Pseudocolus Lloyd (1907), Phallaceae. 2, widespread (tropical; subtropical introduced). See Dring (*Kew Bull.* **35**: 1, 1980).

Pseudoconiocybe Marchand (1896) = Coniocybe fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudoconium Petr. (1969), anamorphic *Pezizomycotina*, Cpd.0eP.?. 1, Europe. See Petrak (*Sydowia* **22**: 385, 1968).

Pseudoconocybe Hongo (1967) = Conocybe fide Watling (*Kew Bull.* **31**: 593, 1977).

Pseudocoprinus Kühner (1928) = Coprinellus fide Redhead *et al.* (*Mycotaxon* **50**: 203, 2001).

Pseudocordyceps Hauman (1936), anamorphic *Penicilliopsis*, Hsy.0eH.?. 1, Taiwan; Zaire. See Hsieh & Ju (*Mycol.* **94**: 539, 2002; teleomorph).

Pseudocornicularia Gyeln. (1933) = Coelocaulon fide Kärnefelt (*Op. Bot.* **86**, 1986).

pseudocortex (of lichen thalli), a false cortex, used for the outer layer of the pseudopodetia in *Pycnothelia papillaria*.

Pseudocraterellus Corner (1958) = Craterellus fide Peterson (*Česká Mykol.* **29**: 199, 1975).

Pseudocryptosporella J. Reid & C. Booth (1969), Diaporthales. 1, Venezuela. See Reid & Booth (*CJB* **47**: 1058, 1969).

pseudocyphella (pl. **-e**), an opening in the cortex of lichens where the medulla is exposed to the open air but lacking specialized cells surrounding the cavity; they provide valuable taxonomic characters in e.g. *Alectoria, Bryoria, Pseudocyphellaria.*

Pseudocyphellaria Vain. (1890) nom. cons., Lobariaceae (L). *c.* 170, widespread (esp. south temperate). See Coppins & James (*Lichenologist* **11**: 139, 1979; key Eur. spp.), Galloway & James (*Lichenologist* **12**: 291, 1980; NZ), Galloway *et al.* (*Lichenologist* **15**: 135, 1983; NZ), Kondratyuk & Galloway (*Biblthca Lichenol.* **57**: 327, 1985; lichenicolous spp.), Galloway (*Lichenologist* **18**: 105, 1986; S. Am. non-glabrous spp.), Galloway & James (*Nova Hedwigia* **42**: 423, 1986; Delise's spp.), Galloway (*Bull. Br. Mus. nat. hist.* Bot. **17**: 1, 1988; key 48 spp.), Galloway & Laundon (*Taxon* **37**: 48, 1988; gen. nomencl.), Galloway & James (*Biblthca Lichenol.* **46**, 1992; 53 S. Am. spp.), Czeczuga *et al.* (*J. Hattori bot. Lab.* **87**: 277, 1999; carotenoids), Kantvilas & Elix (*Muelleria* **12**: 217, 1999; Tasmania), Thomas *et al.* (*Biblthca Lichenol.* **82**: 123, 2001; phylogeny, New Zealand), Summerfield *et al.* (*New Phytol.* **155**: 121, 2002; photobionts), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny), Wedin & Wiklund (*Symb. bot. upsal.* **34** no. 1: 469, 2004; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Summerfield & Eaton-Rye (*New Phytol.* **170**: 597, 2006; N and S hemisphere spp. synonymous).

pseudocystidium (1) (in agarics), see cystidium; (2) (of *Entomophthora*), the organ penetrating the insect cuticle allowing conidiophores to emerge.

Pseudocytoplacosphaeria Punith. & Spooner (2002), anamorphic *Pezizomycotina.* 1, British Isles. See Punithalingam & Spooner (*Kew Bull.* **57**: 534, 2002).

Pseudocytospora Petr. (1923), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Pseudodasyscypha Velen. (1939) = Merismodes fide Kuyper (*in litt.*).

Pseudodeconica Overeem (1927) nom. nud. = Agrocybe fide Singer (*Agaric. mod. Tax.*, 1951).

Pseudodelitschia J.N. Kapoor, Bahl & S.P. Lal (1976) = Neotestudina fide Hawksworth (*CJB* **57**: 91, 1979).

Pseudodermatosorus Vánky (1999), Doassansiaceae. 2 (on *Alismataceae*), Venezuela. See Vánky (*Mycotaxon* **71**: 213, 1999).

Pseudodescolea Raithelh. (1980) = Descolea fide Bougher (*MR* **94**: 287, 1990).

Pseudodiaporthe Speg. (1909) = Massarina fide Bose (*Phytopath. Z.* **41**, 1961), Aptroot (*Nova Hedwigia* **66**: 89, 1998).

pseudodiblastic (of ascospores), having oil-drops at the poles so that they superficially resemble polarilocular spores (q.v.).

Pseudodichomera Höhn. (1918), anamorphic *Pezizomycotina*, St.#eP.?. 3, Europe. See Arnold & Russell (*Mycol.* **52**: 509, 1960).

Pseudodictya Tehon & G.L. Stout (1929) nom. dub., anamorphic *Pezizomycotina.* See Sutton (*Mycol. Pap.* **141**, 1977).

Pseudodictyosporium Matsush. (1971), anamorphic *Massarinaceae*, Hso.#eP.24. 2, Papua New Guinea. See Matsushima (*Bull. natn. Sci. Mus.* Tokyo, B **14**: 473, 1971), Tsui *et al.* (*Fungal Diversity* **21**: 157, 2006; phylogeny), Cai *et al.* (*Persoonia* **20**: 53, 2008; phylogeny).

Pseudodidymaria U. Braun (1993), anamorphic *Pezizomycotina*, Hsp.1eP.10/12. 2, USA; Japan. See Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**, 1998), Ono & Kobayashi (*Mycoscience* **46**: 352, 2005).

Pseudodidymella C.Z. Wei, Y. Harada & Katum. (1997), Pleosporales. Anamorph *Pycnopleiospora.* 1 (on *Fagus*), Japan. See Wei *et al.* (*Mycol.* **89**: 494, 1997).

Pseudodidymium R. Michel, Walochnik & Aspöck (2003), Didymiaceae. 1. See Michel *et al.* (*Acta Protozool.* **42**: 331, 2003).

Pseudodimerium Petr. (1924) = Phaeostigme fide Hansford (*Mycol. Pap.* **15**, 1946).

Pseudodiplodia (P. Karst.) Sacc. (1884), anamorphic *Pezizomycotina*, Cpd.1eP.15. *c.* 45, widespread. See Buchanan (*Mycol. Pap.* **156**, 1987), Dianese & Furlanetto (*Fitopatol. Brasil* **18** (Supl.): 344, 1993; Brazil).

Pseudodiplodia Speg. (1920) [non *Pseudodiplodia* (P. Karst) Sacc. 1884] = Botryodiplodia fide Petrak & Sydow (*Feddes Repert.* **42**: 1, 1927).

Pseudodiplodiella Bender (1932) = Botryodiplodia fide Sutton (*Mycol. Pap.* **141**, 1977).

Pseudodiscinella Dennis (1956) ≡ Ciliatula.

Pseudodiscosia Hösterm. & Laubert (1921) = Heteropatella fide Sutton (*Mycol. Pap.* **141**, 1977), Leuchtmann (*Mycotaxon* **28**: 261, 1987).

Pseudodiscula Laubert (1911), anamorphic *Pezizomycotina*, St.0eH.?. 2, Europe. See Sutton (*Mycol. Pap.* **141**, 1977).

Pseudodiscus Arx & E. Müll. (1959), Saccardiaceae. 1, Europe. See von Arx & Müller (*Sydowia* **13**: 64, 1959).

Pseudodoassansia (Setch.) Vánky (1981), Doassansiaceae. 2 (on *Hydrocleys, Sagittaria*), N. & S. America. See Vánky (*Mycotaxon* **78**: 265, 2001).

Pseudoecteinomyces W. Rossi (1977), Euceratomycetaceae. 1, Africa; Asia. See Rossi (*Mycol.* **69**: 1075, 1977), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

Pseudoendococcus Marchand (1896) = Endococcus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudoepicoccum M.B. Ellis (1971), anamorphic *Pezizomycotina*, Hsp.0eP.10. 1, widespread (tropical). See Ellis (*Dematiaceous Hyphomycetes*: 270, 1971).

pseudoepithecium, an amorphous or granular layer overlying paraphyses in an apothecium and in which their tips are immersed, but not forming a separate tissue.

Pseudofarinaceus Battarra ex Kuntze (1891) ≡ Amanitopsis.

Pseudofarinaceus Earle (1909) = Volvariella fide Kuyper (*in litt.*).

Pseudofavolus Pat. (1900), Polyporaceae. 4, widespread (pantropical). See Núñez & Ryvarden (*Syn. Fung.* **10**: 68, 1995).

pseudofissitunicate (of asci), see ascus.

Pseudofistulina O. Fidalgo & M. Fidalgo (1963), Fistulinaceae. 1, Brazil. See Gilbertson & Ryvarden (*N. Amer. Polyp.*: 261, 1987; syn. of *Fistulina*).

Pseudofomes Lázaro Ibiza (1916) = Phellinus fide

Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Pseudofumago Briosi & Farneti (1906) nom. dub., anamorphic *Pezizomycotina*. See de Hoog & Hermanides-Nijhof (*Stud. Mycol.* **15**: 186, 1977).

Pseudofungi. A subdivision in the *Chromista*; including the fungi treated as belonging to the oomycetes in a broad sense, and as *Oomycota*, *Hyphochytriomycota*, *Labyrinthulales* and *Thraustochytriales* in this edition of the *Dictionary*; see Cavalier-Smith (*Progr. Phycol. Res.* **4**: 309, 1986), Pseudomycotina.

Pseudofusarium Matsush. (1971) = Fusarium fide Booth & Sutton (*in litt.*).

Pseudofuscophialis Sivan. & H.S. Chang (1995), anamorphic *Pezizomycotina*, Hso.≡ eP.15. 1, Taiwan. See Sivanesan & Chang (*MR* **99**: 711, 1995).

Pseudofusicoccum Mohali, Slippers & M.J. Wingf. (2006), anamorphic *Botryosphaeriaceae*. 1, Venezuela. See Mohali *et al.* (*Stud. Mycol.* **55**: 249, 2006).

Pseudofusidium Deighton (1969) = Acremonium fide Gams (*Cephalosporium-artige Schimmelpilze*, 1971).

Pseudogaster Höhn. (1907), anamorphic *Pezizomycotina*, Hsy.0eP.?. 1 (on bark), Brazil. See Seifert (*TBMS* **85**: 123, 1985).

Pseudogenea Buchholz (1901) = Genabea fide Trappe (*TBMS* **65**: 496, 1975), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Pseudogibellula Samson & H.C. Evans (1973), anamorphic *Cordycipitaceae*, Hsy.0eH.32/33. 1, Ghana. See Samson & Evans (*Acta Bot. Neerl.* **22**: 524, 1973), Evans (*Trichomycetes and Other Fungal Groups* Robert W. Lichwardt Commemoration Volume: 119, 2001; review).

Pseudogliomastix W. Gams (1985), anamorphic *Wallrothiella*, Hso.0eP.15. 1, Italy. See Gams (*Proc. Indian Acad. Sci.* Pl. Sci. **94**: 279, 1985), Gams (*Stud. Mycol.* **45**: 187, 2000), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006; key).

Pseudogliophragma Phadke & V.G. Rao (1980), anamorphic *Pezizomycotina*, Hsy.0eH.10. 1, India. See Phadke & Rao (*Norw. Jl Bot.* **27**: 127, 1980).

Pseudogloeosporium Jacz. (1917) = Kabatia fide Sutton (*Mycol. Pap.* **141**, 1977).

Pseudogomphus R. Heim (1970), Gomphaceae. 1, Gabon. See Heim (*Revue Mycol.* Paris **34**: 344, 1969).

Pseudographiella E.F. Morris (1966), anamorphic *Pezizomycotina*, Hsy.1eH.?. 3, widespread. See Morris (*Mycopath. Mycol. appl.* **28**: 97, 1966), Illman *et al.* (*Mycol.* **77**: 662, 1985).

Pseudographis Nyl. (1855) nom. cons., Triblidiaceae. 3, widespread (temperate). See Magnes (*Biblthca Mycol.* **165**, 1997).

Pseudographium Höhn. (1915), anamorphic *Pezizomycotina*, Hsy.?.?. 1, USA. See Sutton (*Mycol. Pap.* **141**, 1977).

Pseudographium Jacz. (1898) ≡ Sphaerographium fide Sutton (*Mycol. Pap.* **141**, 1977).

Pseudoguignardia Gutner (1927) = Physalospora fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Pseudogyalecta Vězda (1975) nom. rej. = Badimia fide Lücking & Vězda (*Taxon* **44**: 227, 1995).

Pseudogymnoascus Raillo (1929), Pseudeurotiaceae. Anamorph *Geomyces*. 7, widespread. See Samson (*Acta Bot. Neerl.* **21**: 517, 1972), Orr (*Mycotaxon* **8**: 165, 1979), Ito & Yokoyama (*IFO Res. Comm.* **13**: 83, 1987), Sogonov *et al.* (*Mycol.* **97**: 695, 2005; phylogeny), Jiang & Yao (*Mycotaxon* **94**: 55, 2005; phylogeny, ontogeny), Rice & Currah (*Mycol.* **98**: 307, 2006; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Pseudogymnopilus Raithelh. (1974), ? Strophariaceae. 1, S. America. See Raithelhuber (*Hong. Argentin.* **1**: 148, 1974).

Pseudogyrodon Heinem. & Rammeloo (1983) = Gyrodon fide Kuyper (*in litt.*).

Pseudohalonectria Minoura & T. Muroi (1978), Magnaporthaceae. 9 (on wood, freshwater), widespread. See Shearer (*CJB* **67**: 194, 1989; key, posn), Chen *et al.* (*Mycol.* **91**: 84, 1999; phylogeny), Promputtha *et al.* (*Cryptog. Mycol.* **25**: 43, 2004; Thailand), Shenoy *et al.* (*Cryptog. Mycol.* **26**: 123, 2005).

Pseudohansenula E.K. Novák & Zsolt (1961) nom. dub., Fungi. See Lodder (*Yeasts, a taxonomic study* 2nd edn: 236, 1970).

Pseudohansenula Mogi (1939) nom. dub., Fungi.

Pseudohansfordia G.R.W. Arnold (1970), anamorphic *Pezizomycotina*, Hso.1-≡ eH.10. 15 (on fungi), widespread. See de Hoog (*Persoonia* **10**: 57, 1978), Eicker *et al.* (*Bot. Bull. Acad. Sin.* **31**: 205, 1990; disease of *Auricularia mesenterica*).

Pseudohansfordia S.M. Reddy & Bilgrami (1975), anamorphic *Pezizomycotina*, Hso.0eH.?. 2, India. See de Hoog (*Persoonia* **10**: 58, 1978).

Pseudohaplis Clem. & Shear (1931) = Botryodiplodia fide Sutton (*Mycol. Pap.* **141**, 1977).

Pseudohaplosporella, see *Pseudhaplosporella*.

Pseudoharpella Ferrington, M.M. White & Lichtw. (2003), Harpellales. 1, USA. See Ferrington *et al.* (*Aquatic Insects* **25**: 86, 2003), White (*MR* **110**: 1011, 2006; phylogeny).

Pseudohelicomyces Garnica & E. Valenz. (2000), anamorphic *Pezizomycotina*. 2, Chile. See Valenzuela & Garnica (*MR* **104**: 739, 2000).

Pseudohelotium Fuckel (1870), Helotiaceae. *c.* 50, Europe. See Arendholz (*Mycotaxon* **36**: 283, 1989; nomencl.).

Pseudohendersonia Crous & M.E. Palm (1999), anamorphic *Pezizomycotina*, Cpd.?.?. 1, S. Africa. See Crous & Palm (*MR* **103**: 1302, 1999), Crous *et al.* (*CBS Diversity Ser.* **2**, 2004).

Pseudohepatica P.M. Jørg. (1993), Pezizomycotina (L). 1 (ascomata unknown), Venezuela. See Jørgensen (*Bryologist* **96**: 435, 1993), Marcano *et al.* (*Trop. Bryol.* **18**: 203, 2000).

Pseudoheppia Zahlbr. (1903), ? Lichinaceae (L). 1, Europe.

pseudoheterothallism, see heterothallism.

Pseudohiatula (Singer) Singer (1938), Tricholomataceae. *c.* 5, widespread (tropical). See Singer (*Persoonia* **2**: 407, 1962).

Pseudohiatulaceae Grgur. (2000) = Tricholomataceae.

Pseudohydnotrya E. Fisch. (1897) = Geopora fide Fischer (*Nat. Pflanzenfam.* **5b**: viii, 1938), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Pseudohydnum P. Karst. (1868), Auriculariales. 1, widespread. See Donk (*Persoonia* **3**: 199, 1964), Hjortstam *et al.* (*Kew Bull.* **45**: 319, 1990), Roberts & Spooner (*Kew Bull.* **53**: 631, 1998; Brunei Darussalam).

Pseudohydnum Rick (1904) = Hydnodon fide Donk (*Taxon* **5**: 69, 1956).

Pseudohygrocybe (Bon) Kovalenko (1988) = Hygrocybe fide Kuyper (*in litt.*).

Pseudohygrophorus Velen. (1939) nom. dub.,

Tricholomataceae. 1, Europe.

Pseudohypocrea Yoshim. Doi (1972), Hypocreaceae. Anamorph *Acremonium*-like. 1 (on decaying wood and bark), N. America. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

pseudoidia, separated hyphal cells able to be germinated (Bensaude).

Pseudoidium Y.S. Paul & J.N. Kapoor (1986) = Oidium Link (1824) fide Sutton (*in litt.*), Takamatsu (*Mycoscience* **45**: 147, 2004).

Pseudoinonotus T. Wagner & M. Fisch. (2001), Hymenochaetaceae. 4, widespread. See Wagner & Fischer (*MR* **105**: 773, 2001).

pseudoisidium (pl. **-ia**), (1) an outgrowth from the surface of a lichen thallus resembling an isidium (e.g. *Gyalideopsis*; see Vězda, *Folia geobot. phytotax.* **14**: 48, 1979); (2) isidium without photosynthetic cells in *Pseudocyphellaria* (see Galloway, *Bull. Br. Mus. nat. Hist., Bot.* **17**: 1, 1988).

Pseudokarschia Velen. (1934) = Dactylospora fide Hafellner (*Beih. Nova Hedwigia* **62**, 1979).

Pseudolachnea Ranoj. (1910), anamorphic *Pezizomycotina*, Cac/Ccu.1-≡ eH.15. 5, widespread. See Sutton (*The Coelomycetes*, 1980).

Pseudolachnea Velen. (1934) [non *Pseudolachnea* Ranoj. 1910] ? = Hyalopeziza fide Eckblad (*Nytt Mag. Bot.* **15**: 174, 1978), Huhtinen (*Öst. Z. Pilzk.* **10**: 1, 2001; redispositions).

Pseudolachnella Teng (1936) = Pseudolachnea Ranoj. fide Sutton (*Mycol. Pap.* **141**, 1977).

Pseudolachnum Velen. (1934), ? Helotiales. 1, former Czechoslovakia.

Pseudolagarobasidium J.C. Jang & T. Chen (1985), Phanerochaetaceae. 2, widespread. See Stalpers (*Folia Cryptog. Estonica* **33**: 133, 1998).

Pseudolasiobolus Agerer (1983), Tricholomataceae. 1, tropical. See Agerer (*Mitt. bot. StSamml.* Münch. **19**: 279, 1983).

Pseudolecanactis Zahlbr. (1907), ? Roccellaceae (L). 1, Samoa.

Pseudolecidea Clauzade & Cl. Roux (1984) ≡ Claurouxia.

Pseudolecidea Marchand (1896) = Abrothallus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudolembosia Theiss. (1913), Parmulariaceae. 2, Australia; C. America. See Petrak (*Sydowia* **8**: 297, 1954), Inácio & Cannon (*MR* **107**: 82, 2003), Inácio *et al.* (*Mycol. Progr.* **4**: 133, 2005).

Pseudoleptogium Jatta (1900) = Polychidium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudoleptogium Müll. Arg. (1885) = Leptogium fide Degelius (*Svensk bot. Tidskr.* **37**: 65, 1943).

Pseudolignincola Chatmala & E.B.G. Jones (2006), Halosphaeriaceae. Anamorph *Humicola*-like. 1 (marine), Thailand. See Chatmala & Jones (*Nova Hedwigia* **83**: 225, 2006).

Pseudolizonia Pirotta (1889) = Lizonia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pseudoloma J.L. Matthews, A.M.V. Brown, K. Larison, J.K. Bishop-Stewart, P. Rogers & M.L. Kent (2001), Microsporidia. 1. See Matthews *et al.* (*J. Eukary. Microbiol.* **48**: 227, 2001).

Pseudolycoperdon Velen. (1947) = Bovista fide Kreisel (*Beih. Nova Hedwigia* **25**: 63, 1967).

Pseudolyophyllum (Singer) Raithelh. (1979) = Clitocybe fide Kuyper (*in litt.*).

Pseudomassaria Jacz. (1894), Hyponectriaceae. Anamorph *Beltraniella*. 20 (from dead plant tissues), widespread. See Barr (*Mycol.* **56**: 841, 1964; keys), Barr (*Mycol.* **68**: 611, 1976; nomencl.), Hyde *et al.* (*Sydowia* **50**: 21, 1998), Wang & Hyde (*Fungal Diversity* **3**: 159, 1999).

Pseudomassariella Petr. (1955) = Leiosphaerella fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Pseudombrophila Boud. (1885), Pyronemataceae. 28 (esp. coprophilous), widespread. See van Brummelen (*Libri Botanici* **14**, 1995; monogr., key), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Hansen *et al.* (*Mycol.* **97**: 1023, 2005; phylogeny), Yao & Spooner (*Fungal Diversity* **22**: 267, 2006), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Pseudomelasmia Henn. (1902) = Phyllachora Nitschke ex Fuckel (1870) fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **119**: 54, 1910).

Pseudomeliola Speg. (1889), ? Parodiellaceae. 4, America (tropical). Poorly known and heterogenous. See von Arx (*Acta Bot. Neerl.* **7**: 503, 1958), Cannon (*Mycol. Pap.* **163**: 302 pp., 1991).

Pseudomeria G.L. Barron (1980), anamorphic *Clavicipitaceae*, Hso.0eH.10. 1 (on nematodes), Canada. See Barron (*CJB* **58**: 443, 1980).

Pseudomerulius Jülich (1979), Tapinellaceae. 3, widespread. See Jülich (*Persoonia* **10**: 350, 1979).

Pseudomicrocera Petch (1921) = Fusarium fide Wollenweber & Reinking (*Die Fusarien*: 7, 1935).

Pseudomicrodochium B. Sutton (1975), anamorphic *Hypocreales*, Hso.1-≡ eH.15. 9, widespread. See Sutton *et al.* (*Mycopathologia* **114**: 159, 1991; from humans), Castañeda Ruíz *et al.* (*Mycotaxon* **68**: 23, 1998), Decock *et al.* (*Antonie van Leeuwenhoek* **84**: 209, 2003; phylogeny).

Pseudomitrula Gamundí (1980), Helotiaceae. 1, S. America. See Gamundí (*Fl. criptog. Tierra del Fuego* **10**, 1987).

pseudomixis (**-gamy**), the type of fertilization in which the copulating elements are not special sexual cells.

Pseudomonilia A. Geiger (1910) nom. rej. = Candida fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pseudomorfea Punith. (1981), Dothideomycetes. Anamorph *Chaetasbolisia*. 1, India; Argentina. See Venedikian (*Boln Soc. argent. Bot.* **25**: 495, 1988).

pseudomorph, a stroma made up of plant parts kept together by plectenchyma.

pseudomycelium (of *Candida*, etc.), loosely united, catenulate groups of cells (see Zobl, *RAM* **23**: 177, 1944).

Pseudomycena Cejp (1929) = Mycena fide Smith (*North American Species of Mycena*, 1947).

Pseudomycoderma H. Will (1916), anamorphic *Saccharomycetales*, Hso.0eH.?. 1, Europe.

Pseudomycoporon Marchand (1896) ? = Mycoporum Flot. ex Nyl. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

pseudomycorrhiza, see mycorrhiza.

Pseudomycotina, see mycorrhiza.

Pseudonaevia Dennis & Spooner (1993), Helotiales. 1, British Isles. See Dennis & Spooner (*Persoonia* **15**: 177, 1993).

Pseudonectria Seaver (1909), Nectriaceae. Anamorph *Volutella*. 5 (on leaves and twigs), Europe; America. See Rossman *et al.* (*Mycol.* **85**: 685, 1993; key), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999),

Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Pseudonectriella Petr. (1959) = Catabotrys fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Pseudoneottiospora Faurel & Schotter (1965), anamorphic *Pezizomycotina*, Cpd.1bH.19. 2 (coprophilous), Algeria; Italy. See Faurel & Schotter (*Revue Mycol.* Paris **29**: 278, 1964).

Pseudoneurospora Dania García, Stchigel & Guarro (2004), Sordariaceae. 1, Thailand. See García *et al.* (*MR* **108**: 1139, 2004).

Pseudoniptera Velen. (1947) = Hymenoscyphus fide Gminder (*Czech Mycol.* **58**: 125, 2006).

Pseudonitschkia Coppins & S.Y. Kondr. (1995), ? Dacampiaceae. 1 (on *Parmotrema*), widespread. See Coppins & Kondratyuk (*Edinb. J. Bot.* **52**: 229, 1995).

Pseudonocardia Henssen (1957), Actinobacteria. q.v.

Pseudonosema E.U. Canninga, D. Refardtb, C.R. Vossbrinckc, B. Okamurad & A. Curry (2002), Microsporidia. 1. See Canninga *et al.* (*Eur. J. Protist.* **38**: 247, 2002).

Pseudoolla Velen. (1934) = Olla fide Baral (*SA* **13**: 113, 1994).

Pseudoomphalina (Singer) Singer (1956), Tricholomataceae. *c.* 5, widespread (north temperate). See Singer (*Mycol.* **48**: 725, 1956), Watling & Turnbull (*British Fungus Flora*, 1998; UK), Contu (*Micologia e Vegetazione Mediterranea* **18**: 61, 2003; Sardinia).

pseudooperculate (of asci), ones which are essentially unitunicate in structure and with a thickened apical cap which splits completely away at discharge (e.g. *Odontotrema*); see ascus.

Pseudopannaria (B. de Lesd.) Zahlbr. (1924), ? Lecideaceae (L). 1, France.

Pseudopapulaspora N.D. Sharma (1977), anamorphic *Pezizomycotina*, Hso.#eP.1. 1, India. See Sharma (*J. Indian bot. Soc.* **56**: 100, 1977).

pseudoparaphyses (of ascomycetes), see hamathecium; (of basidiomycetes), see hyphidium.

pseudoparenchyma, see plectenchyma.

Pseudoparmelia Lynge (1914), Parmeliaceae (L). 27, pantropical. See Hale (*Smithson. Contr. bot.* **31**, 1976), Hale (*Mycotaxon* **25**: 603, 1986), Elix & Nash (*Bryologist* **100**: 482, 1998).

Pseudoparodia Theiss. & Syd. (1917), Venturiaceae. 1 (on *Vaccinium*), S. America. See Petrak (*Sydowia* **1**: 169, 1947).

Pseudoparodiella F. Stevens (1927), Venturiaceae. Anamorph *Spilodochium*. 1, Costa Rica. See Sivanesan (*TBMS* **86**: 187, 1986).

Pseudopatella Sacc. (1884) = Cystotricha fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **119**: 617, 1910).

Pseudopatella Speg. (1891) = Botryodiplodia fide Petrak & Sydow (*Feddes Repert.* **42**: 1, 1927).

Pseudopatellina Höhn. (1908), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Pseudopaulia M. Schultz (2002), Lichinaceae. 1, Socotra. See Schultz (*Mycotaxon* **82**: 446, 2002), Schultz & Büdel (*Lichenologist* **35**: 151, 2003; phylogeny).

Pseudopeltis L. Holm & K. Holm (1978), ? Helotiales. 1 (on *Dryopteris*), Sweden. See Holm & Holm (*Bot. Notiser* **131**: 97, 1978).

Pseudopeltistroma Katum. (1975), anamorphic *Pezizomycotina*, Cpt.0eP.?. 1, Japan. See Katumoto (*Bulletin of the Faculty of Agriculture, Yamaguchi University* **26**: 99, 1975).

Pseudopeltula Henssen (1995), Gloeoheppiaceae (L). 3, Mexico; Caribbean. See Henssen (*Lichenologist* **27**: 261, 1995), Schultz (*Bryologist* **110**: 286, 2007; USA).

pseudoperidium, a false peridium; covering membrane of the aecium in the *Pucciniales*.

Pseudoperis Clem. & Shear (1931) ≡ Pseudoperisporium.

Pseudoperisporiaceae Toro (1926), ? Dothideomycetes (inc. sed.). 25 gen. (+ 39 syn.), 228 spp.

Lit.: Farr (*Mycol.* **55**: 226, 1963; on *Pinaceae*), Farr (*Mycol.* **58**: 221, 1966; on *Gramineae*), Farr (*Mycol.* **71**: 243, 1979; on *Asteraceae*), Farr (*Mycol.* **76**: 793, 1984; on *Rubiaceae*), Farr (*Sydowia* **38**: 65, 1985), Döbbeler (*Arctic and Alpine Mycology* II: 87, 1987), Sivanesan (*SA* **6**: 201, 1987), Barr (*Mycotaxon* **64**: 149, 1997), Döbbeler (*Biodiv. Cons.* **6**: 721, 1997), Valinsky *et al.* (*Appl. Environm. Microbiol.* **68**: 5999, 2002), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **34**: 512, 2005).

Pseudoperisporium Toro (1926) = Lasiostemma fide Farr (*Mycol.* **71**: 250, 1979).

Pseudoperitheca Elenkin (1922), Pezizomycotina (L). 1, former USSR.

pseudoperithecium (of *Laboulbeniales*), a perithecium-like structure in which the asci and spores become free.

Pseudopestalotia Elenkin & Ohl (1912) = Truncatella fide Steyaert (*Bull. Jard. Bot. État* **19**: 285, 1949), Sutton (*Mycol. Pap.* **141**, 1977).

Pseudopetrakia M.B. Ellis (1971), anamorphic *Pezizomycotina*, Hsy.#eP.10. 1, India. See Ellis (*Mycol. Pap.* **125**: 3, 1971), Sutton & Alcorn (*Proc. R. Soc. Qd.* **95**: 41, 1984).

Pseudopezicula Korf (1986), Helotiaceae. Anamorph *Phialophora*-like. 2, Europe; N. America. See Korf *et al.* (*Mycotaxon* **26**: 457, 1986), Pearson *et al.* (*Pl. Dis.* **72**: 796, 1988; disease), Reiss & Zinkernagel (*Z. PflKrankh. PflPath. PflSchutz* **101**: 212, 1994; heterothallism), Verkley (*Stud. Mycol.* **44**: 180 pp., 1999).

Pseudopeziza Fuckel (1870), ? Dermateaceae. Anamorph *Gloeosporidiella*. 3, widespread. *P. trifolii* (clover leaf spot). See Schüepp (*Phytopath. Z.* **36**: 224, 1959; key), Thite & Nagaraja (*Geophytology* **20**: 17, 1990; ontogeny), Reiss & Zinkernagel (*Z. PflKrankh. PflPath. PflSchutz* **101**: 212, 1994; heterothallism), Nauta & Spooner (*Mycologist* **14**: 65, 2000; key British spp.).

Pseudopezizites Fiore (1932), Fossil Fungi. 1 (Eocene), Italy.

Pseudophacidiaceae Rehm (1887) ? = Ascodichaenaceae.

Pseudophacidium P. Karst. (1885), ? Ascodichaenaceae. 5, widespread. See Minter *in* Capretti *et al.* (Eds) (*Shoot and Foliage Diseases in Forest Trees*: 65, 1995), Yuan *et al.* (*Australas. Pl. Path.* **29**: 215, 2000).

Pseudophaeolus Ryvarden (1975) = Laetiporus fide Westhuizen (*Bothalia* **11**: 143, 1973), Ofosu-Asiedu (*TBMS* **65**: 285, 1975), Ryvarden (*Gen. Polyp.*: 135, 1991) See.

Pseudophaeoramularia U. Braun (1997) = Pseudocercospora fide Braun & Melnik (*Trudy Botanicheskogo Instituta im. V.L. Komarova* **20**: 18, 1997), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Pseudophaeotrichum Aue, E. Müll. & C. Stoll (1969) = Neotestudina fide Hawksworth (*CJB* **57**: 91, 1979).

pseudophialide, a cell bearing a sporangiolum in the

Kickxellaceae.

Pseudophloeosporella U. Braun (1993), anamorphic *Pezizomycotina*, Cac.≡ eH.10. 1, Japan. See Braun (*Cryptog. bot.* **4**: 110, 1993).

Pseudophoma Höhn. (1916) = Chaetosphaeronema fide Petrak (*Annls mycol.* **42**: 58, 1944).

Pseudophomopsis Höhn. (1926) = Phomopsis (Sacc.) Bubák. fide Clements & Shear (*Gen. Fung.*, 1931).

Pseudophragmotrichum W.P. Wu, B. Sutton & Gange (1998), anamorphic *Pezizomycotina*, Cpd.?.?. 1, Cuba. See Wu *et al.* (*MR* **102**: 179, 1998).

Pseudophyllachora Speg. (1919) nom. dub., Fungi. See Petrak (*Sydowia* **5**: 350, 1951).

Pseudophysalospora Höhn. (1918) = Physalospora fide Barr (*Mycol.* **68**, 1976).

Pseudophyscia Müll. Arg. (1894) ≡ Heterodermia.

Pseudophysciaceae Tomas. (1949) = Physciaceae.

pseudophyse, see cystidium.

pseudophysis, see hyphidium.

Pseudopileum Canter (1963), Chytridiaceae. 1 (on *Mallomonas*), British Isles. See Canter (*TBMS* **46**: 309, 1963).

pseudopionnotes, see sporodochium.

Pseudopiptoporus Ryvarden (1980), Polyporaceae. 2, E. Africa; India. See Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 523, 1980), Decock & Ryvarden (*Nova Hedwigia* **77**: 199, 2003).

Pseudopithyella Seaver (1928), Sarcoscyphaceae. 2, widespread. See Dissing & Raitviir (*Eesti NSV Tead. Akad. Toim.* Biol. seer **23**: 104, 1974), Donadini *et al.* (*Cryptog. Mycol.* **10**: 283, 1989; asci), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).

Pseudoplacodium Motyka (1996) nom. inval. = Protoparmelia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

pseudoplasmodium, see plasmodium.

Pseudoplea Höhn. (1918) = Leptosphaerulina fide Barr (*Contr. Univ. Mich. Herb.* **9**, 1972).

Pseudoplectania Fuckel (1870), Sarcosomataceae. 3 or 4, Europe; N. America. See Donadini (*Mycol. Helv.* **2**: 217, 1987; 4 spp.), Li & Kimbrough (*CJB* **73**: 1761, 1995; ultrastr.), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Pseudopleistophora Sprague (1977), Microsporidia. 1.

Pseudopleospora Petr. (1920), Dothideomycetes. 3, Europe. See Crivelli (*Über die heterogene Ascomycetengattung Pleospora Rbh.*, 1983; key).

pseudopodetium, a lichenized podetium-like structure of vegetative origin, ascogonia arising on this not on the pre-formed granular or squamulose thallus initials (e.g. *Cladia*, *Stereocaulon*).

pseudopodium (of *Mycetozoa*), a protoplasmic process from a myxamoeba or plasmodium.

Pseudopolyporus Hollick (1910), Fossil Fungi ? Basidiomycota. 1 (Carboniferous), USA.

Pseudopolystigmina Murashk. (1928), anamorphic *Pezizomycotina*, St.0eH.?. 1, Russia.

Pseudoproboscispora Punith. (1999), Annulatascaceae. 1 (on submerged wood), widespread. See Wong & Hyde (*MR* **103**: 81, 1999), Campbell *et al.* (*Mycol.* **95**: 41, 2003; phylogeny).

Pseudoprotomyces Gibelli (1874) = Phloeoconis fide Saccardo (*Syll. fung.* **14**: 1197, 1899).

Pseudopuccinia Höhn. (1925) = Stigmina fide Laundon (*Mycol. Pap.* **99**: 14, 1965).

pseudopycnidium (obsol.), a pycnidium-like structure of hyphal tissue, as in certain anamorphic fungi.

Pseudopyrenula Müll. Arg. (1883), Trypetheliaceae (±L). 10, widespread (tropical). See Riedl (*Sydowia* **16**: 215, 1963), Aptroot (*Nova Hedwigia* **66**: 89, 1998), Aptroot (*Trop. Bryol.* **14**: 25, 1998), Harris (*Lichenogr. Thomsoniana*: 133, 1998), Prado *et al.* (*MR* **110**: 511, 2006; phylogeny), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Pseudopythium Sideris (1930) nom. nud., Fungi. See Merlich (*Mycol.* **24**: 453, 1932).

Pseudoramonia Kantvilas & Vězda (2000), Thelotremataceae. 2, Australia; Venezuela. See Kantvilas & Vězda (*Lichenologist* **32**: 343, 2000).

Pseudoramularia Matsush. (1983), anamorphic *Pezizomycotina*, Hso.≡ eH.3. 2, Uganda; Pacific islands. See Matsushima (*Matsush. Mycol. Mem.* **3**: 13, 1983).

Pseudorbilia Ying Zhang, Z.F. Yu, Baral & K.Q. Zhang (2007), Orbiliaceae. 1, China. See Zhang *et al.* (*Fungal Diversity* **26**: 305, 2007).

pseudorhiza, a rooting base, as in *Collybia radicata* (Buller, 4).

Pseudorhizina Jacz. (1913), Discinaceae. 2, N. America. See Harmaja (*Karstenia* **13**: 48, 1973), Abbott & Currah (*Mycotaxon* **62**: 1, 1997; N. Am.), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Holec & Beran (*Czech Mycol.* **59**: 51, 2007; Europe).

Pseudorhizinaceae Harmaja (1974) = Discinaceae.

Pseudorhizopogon Kobayasi (1983), anamorphic *Pezizomycotina*, Cpd.0eH.?23. 1, Japan. See Kobayasi (*J. Jap. Bot.* **58**: 175, 1983).

Pseudorhynchia Höhn. (1909) = Trichosphaeria fide Samuels & Barr (*CJB* **75**: 2165, 1998), Dulymamode *et al.* (*MR* **105**: 247, 2001).

Pseudorhytisma Juel (1895), Rhytismataceae. 1, widespread. See Schüepp (*Phytopath. Z.* **36**: 262, 1959).

Pseudorobillarda M. Morelet (1968), anamorphic *Pezizomycotina*, Cpd.≡ eH.15. 11, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Bianchinotti (*MR* **101**: 1233, 1997), Vujanovic & St-Arnaud (*Mycol.* **95**: 955, 2003; key), Plaingam *et al.* (*Nova Hedwigia* **80**: 335, 2005; Thailand).

Pseudorobillarda Nag Raj, Morgan-Jones & W.B. Kendr. (1972) = Pseudorobillarda M. Morelet fide Nag Raj *et al.* (*CJB* **51**: 688, 1973).

Pseudosaccharomyces Briosi & Farneti (1906), anamorphic *Pezizomycotina*, HSo.0eH.?. *c.* 20, Italy.

Pseudosaccharomyces Klöcker (1912) [non *Pseudosaccharomyces* Briosi & Farneti 1906] ≡ Kloeckera fide Cadez *et al.* (*FEMS Yeast Res.* **1**: 279, 2002).

Pseudosagedia (Müll. Arg.) M. Choisy (1949), Porinaceae (L). 1, widespread. See Hafellner & Kalb (*Biblthca Lichenol.* **57**: 161, 1995; status), McCarthy & Malcolm (*Lichenologist* **29**: 1, 1997), Harris (*Opuscula Philolichenum* **2**: 15, 2005; N America).

Pseudosarcophoma Urries (1952) ? = Selenophoma fide Sutton (*Mycol. Pap.* **141**, 1977).

Pseudoschizothyra Punith. (1980), anamorphic *Pezizomycotina*, Cpt.1eH.15. 1, Myanmar. See Punithalingam (*Nova Hedwigia* **31**: 890, 1979).

Pseudosclerophoma Petr. (1923) = Phoma Sacc. fide Sutton (*Mycol. Pap.* **141**, 1977).

pseudosclerotium, a compacted mass of intermixed substratum (soil, stones, etc.) held together by mycelium, as in *Polyporus tuberaster* (see stone-fungus;

also zone lines).

Pseudoscypha J. Reid & Piroz. (1966), ? Hysteriaceae. 1 (on *Abies*), Canada. See Reid & Pirozynski (*CJB* **44**: 351, 1966).

Pseudoseptoria Speg. (1910), anamorphic *Pezizomycotina*, Cpd.0eH.19. 7 (on *Poaceae*), widespread (temperate). See Sutton (*The Coelomycetes*, 1980).

pseudoseptum (1) (obsol.) a protoplasmic or vacuolar membrane looking like a septum (= distoseptum, distoseptate) as in *Corynespora*; (2) (of *Blastocladiales*), a septum having pores.

pseudosetae (false setae), the upturned free-ends of context hyphae in the hymenium of *Duportella*.

Pseudosigmoidea K. Ando & N. Nakam. (2000), anamorphic *Pezizomycotina*. 1, USA. See Ando & Nakamura (*J. gen. appl. Microbiol.* Tokyo **46**: 55, 2000).

Pseudosolidum Lloyd (1923), Ascoporiaceae. Anamorph *Plectophomella*-like. 1, S. America. See Samuels & Romero (*Bol. Mus. Paraense Emilio Goeldi* ser. bot. **7**: 263, 1991; as *Ascoporia*), Kutorga & Hawksworth (*SA* **15**: 1, 1997; as *Ascoporia*), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Pseudosphaerella Höhn. (1911) = Microcyclus fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pseudosphaeria Höhn. (1907) = Wettsteinina fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Shoemaker & Babcock (*CJB* **65**: 373, 1987).

Pseudosphaeriales = Pleosporales.

Pseudosphaerialites Venkatach. & R.K. Kar (1969), Fossil Fungi ? Ascomycota. 1 (Tertiary), India.

Pseudosphaerophorus M. Satô (1968) = Bunodophoron fide Wedin (*Pl. Syst. Evol.* **187**: 213, 1993).

Pseudospiropes M.B. Ellis (1971), anamorphic *Strossmayeria*, Hso.≡ eP.10. 26, widespread. See Ellis (*Dematiaceous Hyphomycetes*, 1971), Ellis (*More Dematiaceous Hyphomycetes*, 1976), Hyde & Goh (*MR* **102**: 739, 1998).

Pseudospora Schiffn. (1931), Algae.

pseudospore (1) (of *Acrasiales*), an encysted myxamoeba; (2) (of *Ustilaginales*), a basidiospore (obsol.); (3) a chlamydospore, as in *Rhizoctonia rubi*.

Pseudostegia Bubák (1906), anamorphic *Pezizomycotina*, Cac.0eH.15. 1, N. America.

pseudostem (of gasteromycete basidiomata), spongy tissue in which hyphae are not orientated parallel to the stipe axis (Dring, 1973).

Pseudostemphylium (Wiltshire) Subram. (1961) = Ulocladium fide Simmons (*Mycol.* **59**: 80, 1967).

Pseudostictis Lambotte (1887) = Cryptodiscus fide Sherwood (*Mycotaxon* **6**: 215, 1977).

Pseudostilbella Munt.-Cvetk. & Gómez-Bolea (1995), anamorphic *Pezizomycotina*. 1, Morocco. See Muntañola-Cvetkovic & Gómez-Bolea (*CJB* **73**: 591, 1995).

Pseudostracoderma A.E. Martinez & Godeas (1997), anamorphic *Pezizomycotina*, Hso.?.?. 1. See Martinez & Godeas (*Mycotaxon* **65**: 455, 1997).

pseudostroma, a stroma formed of thalline tissue and remnants of host tissue (see Eriksson, *Opera bot.* **60**: 14, 1981), an aggregation of perithecial ascomata into a pustule some partly of bark cells altered by the fungus (see Johnson, *Ann. Mo bot. Gdn* **27**: 31, 1940), a coelomycetous conidioma of fungal and host tissue (see Sutton, *The Coelomycetes*, 1980), Fig. 10S). cf. substroma.

Pseudostypella McNabb (1969), Auriculariaceae. 1, New Zealand. See McNabb (*N.Z. Jl Bot.* **7**: 259, 1969).

Pseudotaeniolina J.L. Crane & Schokn. (1986), anamorphic *Capnodiales*, Hso.0-1eP.3. 1, Iran. See Crane & Schoknecht (*Mycol.* **78**: 88, 1986), De Leo *et al.* (*Antonie van Leeuwenhoek* **83**: 351, 2003), Kurzai *et al.* (*Mycoses* **46**: 141, 2003), Selbmann *et al.* (*Stud. Mycol.* **51**: 1, 2005; phylogeny).

Pseudotapesia Velen. (1939), ? Helotiales. 1, former Czechoslovakia.

pseudothecium (1) an ascostromatic ascoma having asci in numerous unwalled locules, as in loculoascomycetes; cf. euthecium; (2) a protoperithecium.

Pseudothelephora Lloyd (1919) = Thelephora fide Donk (*Taxon* **6**: 17, 1957).

Pseudothiella Petr. (1928), Phyllachoraceae. Anamorph *Pseudothiopsella*. 1 (from living leaves), Brazil. See Hyde (*TMSJ* **32**: 265, 1991).

Pseudothiopsella Petr. (1928), anamorphic *Pseudothiella*, St.0eH.?. 1, Brazil.

Pseudothis Theiss. & Syd. (1914), Diaporthales. 1, America (tropical). See Cannon (*Fungal Diversity* **7**: 17, 2001).

Pseudothyridaria Petr. (1925) = Valsaria fide Clements & Shear (*Gen. Fung.*, 1931), Ju *et al.* (*Mycotaxon* **58**: 419, 1996).

Pseudothyrium Höhn. (1927), anamorphic *Pezizomycotina*, St.0eH.15. 1, Europe.

Pseudotis (Boud.) Boud. (1907) = Otidea fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Pseudotomentella Svrček (1958), Thelephoraceae. 12, widespread. See Larsen (*Mycol.* **66**: 167, 1974; key), Stalpers (*Stud. Mycol.* **35**: 49, 1993; key), Kõljalg (*Syn. Fung.* **9**: 41, 1996; key eurasian spp.), Martini & Hentic (*BSMF* **119**: 19, 2003; France).

Pseudotorula Subram. (1958), anamorphic *Pezizomycotina*, Hso.≡ fP.3. 1, India. See Subramanian (*J. Indian bot. Soc.* **37**: 58, 1958).

Pseudotracya Vánky (1999), Doassansiaceae. 1 (on *Ottelia* (*Hydrocharatiaceae*)), Australia. See Vánky (*Mycotaxon* **71**: 216, 1999).

Pseudotracylla B. Sutton & Hodges (1976), anamorphic *Pezizomycotina*, Cpt.0eH.15. 2, Brazil; USA. See Carris (*Mycol.* **84**: 534, 1992), Carris (*Mycotaxon* **50**: 93, 1994).

Pseudotrametes Bondartsev & Singer (1944) = Trametes fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Pseudotremellodendron D.A. Reid (1957) = Tremellodendropsis fide Corner (*TBMS* **49**: 205, 1966).

Pseudotrichia Kirschst. (1939), Pleosporales. 6, widespread (north temperate). See Barr (*Mycotaxon* **20**: 1, 1984), Huhndorf (*Mycol.* **86**: 134, 1994; key 4 spp. neotropics), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; phylogeny), Câmara *et al.* (*MR* **107**: 516, 2003; phylogeny).

Psiloboletinus Singer (1945), Suillaceae. 1, Asia (temperate). See Smith (*Mycol.* **58**: 332, 1966).

Psilobotrys Sacc. (1879) = Chloridium fide Hughes (*CJB* **36**: 727, 1958).

psilocin, a hallucinatory indole derivative from *Psilocybe mexicana* (Hoffman *et al.*, *Experientia* **14**: 11, 397, 1958). See also psilocybin, hallucinogenic fungi.

Psilocistella Svrček (1977), Hyaloscyphaceae. 10, Europe. See Huhtinen (*Karstenia* **29**: 45, 1990), Raitviir (*Scripta Mycol.* **20**, 2004).

Psilocybe (Fr.) P. Kumm. (1871), Strophariaceae. *c.* 300, widespread. Several species of subgen. *Psilocybe* hallucinogenic, producing psilocybin, psilocin and baeocystin (Stamets, *Psilocybin mushrooms of the world*, 1996; Guzmán, *International Journal of Medicinal Mushrooms* **7**: 410, 2005); the edible *P. rugoso-annulata* ('strophaire') cultivated in Eur. In the present edition the genus is very widely circumscribed (Smith, *Taxon* **28**: 19, 1979; Kühner, *Les Hyménomycètes agaricoïdes*: 249, 1980; Noordeloos, *Persoonia* **16**: 127, 1995), whereas Singer (*Agaricales mod. Taxon.*, 4th ed., 1986) recognized a number of smaller segregate genera (*Hypholoma*, *Melanotus*, *Psilocybe*, *Stropharia*). Recognition of these segregate genera is unsatisfactory, a number of species having been transferred from one genus to another and moved back again, depending on the significance attached on various characters. Recognition of one broadly defined genus is not entirely satisfactory, and the older genera are still maintained at subgeneric or sectional level. Moncalvo *et al.* (*Mol. Phylog. Evol.* **23**: 357, 2002) distributed the taxon over at least 8 clades, and 6 of these were also recognised by Bridge *et al.* (*Mycotaxon* **103**: 109, 2008). The taxon in a broad sense also includes the gasteroid genera *Leratiomyces* and *Weraroa*. See Guzmán (*Beih. Nova Hedwigia* **74**, 1983, monograph Psilocybe, *Bibl. Mycol.* **159**: 91, 1995; suppl. to monogr., *International Journal of Medicinal Mushrooms* **7**: 305, 2005), Noordeloos (*Öst. Z. Plzk.* **10**: 115, 2001; sect. *Psilocybe*), Boekhout *et al.* (*MR* **106**: 1251, 2002; taxonomy sect. *Psilocybe*). See also Hallucinogenic Fungi.

Psilocybe Fayod (1889) = Panaeolina fide Singer & Smith (*Mycol.* **38**: 287, 1946).

psilocybin, a hallucinatory indole derivative from *Psilocybe mexicana*. See Bazanté (*Rev. Mycol.* **36**: 25, 1971; action). See also psilocin, hallucinogenic fungi.

Psilodiporites C.P. Varma & Rawat (1963), Fossil Fungi. 7, Cameroon; India.

Psiloglonium Höhn. (1918) = Glonium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Psilolechia A. Massal. (1860), Lecanorales (L). 4, widespread. See Coppins & Purvis (*Lichenologist* **19**: 29, 1987; key), Yoshimura & Harada (*Lichenology* **3**: 41, 2004; Japan), Andersen & Ekman (*MR* **109**: 21, 2005; phylogeny).

Pterygium Nyl. (1854) = Placynthium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pterygosporopsis P.M. Kirk (1983), anamorphic *Pezizomycotina*, Hso.0eP.4. 1, British Isles. See Kirk (*Mycotaxon* **18**: 285, 1983).

Ptychella Roze & Boud. (1879), Bolbitiaceae. 1, Europe. See Singer (*Agaric. mod. Tax.* 4th ed: 851, 1986; possible teratological variant of *Agrocybe*).

Ptychogaster Corda (1838), anamorphic *Oligoporus*. 6, widespread. See Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974), Sigler & Carmichael (*Mycotaxon* **4**: 394, 1976), Stalpers (*Karstenia* **40**: 167, 2000).

Ptychographa Nyl. (1874), Agyriaceae (L). 2, Europe. See Redinger (*Rabenh. Krypt.-Fl.* **9** 2.1: 217, 1938), McCune (*Bryologist* **100**: 239, 1997; N America), Schmitt *et al.* (*Mycol.* **95**: 827, 2003; phylogeny), Baloch & Grube (*MR* **110**: 125, 2006; phylogeny), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Ptychographomyces Cif. & Tomas. (1953) ≡ Ptychographa.

Ptychopeltis Syd. (1927) = Calothyriopsis fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ptychoverpa Boud. (1907) = Verpa fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

ptyophagous (of endotrophic mycorrhiza), the young hyphae rupturing and extruding plasmal masses (**ptyosomes**) which are digested by the host cells (Burgeff, 1924); **tolypophagous**, the penetrating hyphae killed and digested by the host (Burgeff, 1924); **thamnisophagous**, forming haustorial arbuscles which are finally digested by the host (Burgeff, 1938). Cf. halmophagous.

pubescent, having soft hairs.

Pubigera Baral, Gminder & Svrček (1995) nom. inval., Hyaloscyphaceae. 1, Europe. See Baral *et al.* (*Docums Mycol.* **25** nos 98-100: 47, 1995).

Puccinella Fuckel (1860) [non *Puccinella* Parl. 1848) nom. cons., *Gramineae*] = Uromyces fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Puccinia Pers. (1794), Pucciniaceae. *c.* 4000 (on angiosperms, 1 on ferns), widespread. Heteroecious or autoecious, macro- or micro-cyclic; teliospores 2-celled, though in some species (e.g. *P. heterospora* on *Malvaceae*) most of the spores are 1-celled (mesospores), or spores several-celled by transverse septa ('*Rostrupia*'). There are important pathogens of cereals (*P. hordei*) (barley, brown or leaf rust; I on *Ornithogalum*), *P. coronata* (oat, crown rust; I on *Rhamnus*), *P. striiformis* (syn. *P. glumarum*) (yellow or stripe rust), *P. graminis* (black or stem rust; I on *Berberis*), *P. recondita* (syn. *P. dispersa*) (rye, brown, or leaf rust; I on *Anchusa*) and *P. perplexans* f.sp. *triticina* (syn. *P. triticina*) (wheat, brown, or leaf rust; I on *Isopyrum*); *P. polysora* (maize rust), *P. kuehnii*, *P. melanocephata* (sugarcane), groundnut (*P. arachidis*), sunflower (*P. helianthi*), and a great number of other crop plants. See Lehmann *et al.* (*Der Schwarzrost*, 1937; *P. graminis*), Chester (*Cereal rusts* □, 1946; *P. recondita*), Cammack (*TBMS* **41**: 89, 1958; *P. polysora*), Cummins (*Rust fungi of cereals, grasses and bamboos*, 1971), Johnson *et al.* (*TBMS* **58**: 475, 1972; *P. striiformis*, physiologic races), Urban (*Česká Mykol.* **28**: 80, 1974; *P. recondita*), Cummins (*Rust fungi on legumes and composites in North America*, 1978), Bushnell & Roelfs (Eds) (*The cereal rusts* **1** Origin, specificity, structure and physiology, 1984), Bushnell & Roelfs (Eds) (*The cereal rusts* **2** Diseases, distribution, epidemiology, control, 1985), Mordue (*TBMS* **84**: 758, 1985; *P. kuehnii, P. melanocephala*, grasses), Urban & Marková (*Acta Univ. Carol. Pucciniales Clem. & Shear (1931). Pucciniomycetes. 14 fam., 166 gen., 7798 spp. The rust fungi or rusts. Mycelium (without clamp connexions) generally intercellular (frequently with haustoria), limited to parts of leaves or other aerial organs of the host ('local' infection), sometimes perennial, if systemic overwintering in roots or other parts; cosmop. on seed plants and ferns, frequently causing major disease; obligate parasites but axenic culture reported for *Gymnosporangium juniperi-virginianae* (Cutter, *Mycol.* **51**: 248, 1959), *Puccinia graminis* f.sp. *tritici* (Williams *et al.*, *Phytopath.* **56**: 1418, 1966; **57**: 326, 1967; *TBMS* **57**: 129, 137, 1971), *Melampsora lini* (Turel, *CJB* **47**: 821, 1969), *Uromyces dianthi* (Jones, *TBMS* **58**: 29, 1972) and others, are now known to be possible from all states of the life cycle (Narisawa *et al.*, *Trans. Mycol. Soc. Japan* **33**: 35, 1992).

Rusts have up to five spore states (frequently numbered **0-IV**; these roman numerals can be ambiguous unless restricted to a morphological system. See Holm, *Notes R. Bot. Gard. Edin.* **44**: 433, 1987) (Fig. 25A). Traditionally the spore terminology was based on morphology. Arthur coined contractions for the original terms (e.g. telium for teleutosorus) and later linked them to the nuclear events in the life cycle, as did Cummins (1959). Other authors have used either the long or short spellings with interchanged definitions and much confusion resulted. In attempts to unite the merits of both schemes Laundon (*TBMS* **50**: 189, 1964; **58**: 344, 1972) proposed a basically morphological terminology which incorporated nuclear events by adding qualifiers where desirable and Holm (1987) devised a compromise in which 'short' terms were linked to nuclear events and 'long' terms to morphology. Essentially, Hiratsuka (*Mycol.* **65**: 432, 1973, *Rep. Tottori mycol. Inst.* **12**: 99, 1975), who, following Cummins, relates the spore states to the nuclear cycle, is followed here. Hennen & Hennen (*Biologico* São Paulo **62**: 113, 2000) provide a review of the terminology applied to the sori and life cycles of rust fungi from 1729 to 2000.

0. Spermatia (sing. -ium; pycniospores), monokaryotic gametes produced in **Spermogonia** (sing. -ium; pycnia; morphological types of spermogonia, see Hiratsuka & Hiratsuka, *Rept. Tottori Mycol. Inst.* **18**: 257, 1980) which are variable in form and position, contain a palisade of sporogenous cells which produce spores in nectar exuded through the ostiole and may have periphyses and flexuous hyphae (q.v.). Savile (*Mycotaxon* **33**: 387, 1988) emphasized that spermogonia are 'hermaphroditic' structures.

I. Aeciospores (aecidiospores, plasmogamospores), produced in **aecia** (sing. -ium; aecidiosori; morphological types of aecia see Sato & Sato, *TBMS* **85**: 223, 1985), are unicellular, non-repeating vegetative spores, usually resulting from dikaryotization (and thus usually associated with pycnia), which germinate to give dikaryotic mycelium. Aeciospores (aecial aeciospore (I^{I}), Laundon) are typically catenulate, thin-walled, and verrucose but sometimes they resemble typical urediniospores when they are designated **uredinioid aeciospores** by Cummins (= aecial urediniospores (II^{I}), Laundon; primary uredospores, Winter).

II. Urediniospores (uredospores, urediospores (for orthography see Savile, *Mycol.* **60**: 459, 1968), summer spores, red rust spores), repeating vegetative spores (which give urediniospores again or teliospores), usually on dikaryotic mycelium, in **uredinia** (uredosori, uredia; morphological types of uredinia, see Sathe, *Kavaka* **5**: 59, 1977; Hiratsuka & Sato, *in* Scott & Chakravorty (Eds), 1982). Typical urediniospores are unicellular, pedicellate, deciduous, with the pigmented echinulate wall showing two or more germ pores. Rarely they resemble typical aeciospores when they are designated **aecidioid urediniospores** by Cummins (= uredinial aeciospores (I^{II}), Laundon). **Amphispores** (II^{II};X) or resting urediniospores are produced by some rusts. These spores generally have thicker and darker walls than normal urediniospores.

III. Teliospores (teleutospores, teleutosporodesma, winter spores, black rust spores), produced in **telia** (sing. -ium; teleutosori; ontogeny and morphology, see Hiratsuka, *Mycotaxon* **31**: 517, 1988), are basidia-producing spores. Telia and teliospores, which characterize the teleomorph of rust fungi, show wide morphological variation but typically teliospores are resting spores, 2- or more celled, sessile or pedicellate but not deciduous, and the thick wall is variously ornamented. Rarely they resemble typical aeciospores when they are designated **aecidioid teliospores** by Cummins (= telial aeciospores (I^{III}), Laundon). Teliospores that germinate immediately, especially in species of genera that usually show dormancy, may be termed leptospores.

IV. Basidiospores (sporidia) are haploid, unicellular, thin-walled, short-lived spores produced on 2-4-celled **basidia** (sing. -ium; promycelium, metabasidium) after meiosis and liberated from sterigmata by abjection (Buller, 3).

Hughes (*CJB* **48**: 2147, 1970) studied the development (ontogeny) of rust spores and concluded that in his hyphomycete spore terminology O spores are phialospores; I, meristem arthrospores; II, sympodioconidia (or, less common, meristem arthrospores); III, terminal chlamydospore-like cells, sympodioconidia, or meristem arthrospores. Savile (*in* Kendrick (Ed.), *The whole fungus* **2**: 547, 1979) has considered the evolution of anamorphs in rusts.

Rust life cycles (Petersen, *Bot. Rev.* **40**: 453, 1974) vary according to which stages are present or absent. Special terms designate the different life cycles as

TABLE 5. Nomenclature of rust life-cycles.

Example	Schröter (1894-7)	Arthur (1925)	Laundon (1974)	Durrieu (1979)	Cummins & Hiratsuka (2003)
Puccinia graminis	0 I II III IV eu-form	0 I II III IV macrocyclic	0 I II III IV macrocyclic	macrocyclic	0 I-II III IV heteromacrocyclic
P. helianthi					0 I II III IV automacrocyclic
P punctiformis	0 II III IV brachy-form	0 I II III IV macrocyclic	0 $\mathrm{II^{I}}$ $\mathrm{II^{II}}$ III IV brachycyclic	brachycyclic	
Gymnosporangium sp. (most spp.)	0 I III IV opsis-form	0 I III IV macrocyclic	0 I III IV demicyclic	opsicyclic	0 I-III IV heterodemicyclic
Gymnoconia peckiana					0 I III IV autodemicyclic
Coleosporium sp.[a]	0 I II III IV eu-form	0 I II III IV macrocyclic	0 $\mathrm{I^{I}}$ $\mathrm{II^{II}}$ III IV demicyclic	opsicyclic (pseudopsicyclic)	
P. lagenophorae[b]	(0) I III IV opsis-form	(0 I) II III IV macrocyclic	(0 $\mathrm{I^{I}}$) $\mathrm{II^{II}}$ III IV demicyclic	opsicyclic (pseudopsicyclic)	
P heterospora[c]	(0) III IV micro-form	(0) III IV macrocyclic	(0) III IV demicyclic	microcyclic	0 III IV microcyclic
Endophyllum sp.	0 I IV endo-form(s)	0 III IV microcyclic	0 $\mathrm{I^{III}}$ IV microcyclic	endocyclic	0 III IV endocyclic
P. chryanthemi	II III IV hemi-form				

[a] The uredinial aecia of *Coleosporium* spp. have been traditionally known as uredosori because of their association with telia in a heteroecious life-cycle.
[b] The uredinial aecia of such rusts as this have not generally been recognized on account of their being morphologically indistinguishable from ordinary aecia. The pycnia and true aecia are rarely found.
[c] Rusts like *P. malvacearum* with spores which germinate immediately were referred to as leptoforms by Schröter.)

shown in Table 8 but have been applied in slightly different ways (see Durrieu, *BSMF* **95**: 379, 1979). Hiratsuka *et al.* (*Rust flora of Japan*, 1992) revert to terminology similar to Schröter.

A rust fungus may be **autoecious** (Fig. 25B) with its life cycle on one host (or group of closely related collateral hosts) or **heteroecious** (Fig. 25A) with O and I on one sort of host and II and III (or $\mathrm{I^{II}}$, III or III only) on another sort (i.e. it has alternate hosts generally living in the same plant association).

The life-cycle of a rust is generally constant, though there may be no development of O, II, or sometimes I, because of weather or other conditions. A species with I, II, III, but not O, is sometimes given the name **cata-species.** If there is no knowledge of III, the form-genus (e.g. *Aecidium, Uredo*) is, however, still included in the Uredinales.

Physiologic specialization of *Uredinales* has had much attention. *Puccinia graminis* s.l. has 7 races (formae speciales) (*tritici, avenae*, etc.), and there are about 250 physiologic races of *P. graminis* f.sp. *tritici*, and so on. Races are determined by the use of differential hosts.

Nuclear cycle: A rust may be heterothallic or homothallic. In a heterothallic macrocyclic species a basidium has two + and two – basidiospores (see Sex). A + (or –) spore, after infection of the right host, gives a haploid mycelium, pycnia with + (–) spermatia, and protoaecia. If taken (frequently by an insect) to a flexuous hypha of a – (+) pycnium, a + (–) spermatium may put out a 'peg' to make a connexion, its nucleus goes into (spermatizes) the hypha, and by division gives nuclei for the diploidization of cells down to the protoaecia. The cells of a protoaecium undergo conjugate division and an aecium with aeciospores is produced. An aeciospore and its mycelium, and urediniospores and their mycelia, are dikaryotic. There is nuclear fusion in the teliospore, meiosis in the basidium.

In homothallic species, where pycnia are not necessary and are frequently not present, the dikaryophase has its start from two cell nuclei at some point or points in the life-cycle. Nuclear fusion and reduction are as in heterothallic species. Following Dietel (1928) two families, *Melampsoraceae* and *Pucciniaceae*, have frequently been recognized. Concepts have been refined by subsequent workers (see Hennen & Buriticá, *Rept. Tottori Mycol. Inst.* **18**: 43, 1980). In this edition of the *Dictionary* fourteen familes are recognized as they are in current use by Cummins & Hiratsuka (1983) and in the major compilation Hiratsuka *et al.* (*Rust Flora of Japan*, 1992). Fams:

(1) **Chaconiaceae**
(2) **Coleosporiaceae**
(3) **Cronartiaceae**

(4) **Melampsoraceae**
(5) **Mikronegeriaceae**
(6) **Phakopsoraceae**
(7) **Phragmidiaceae**
(8) **Pileolariaceae**
(9) **Pucciniaceae**
(10) **Pucciniastraceae**
(11) **Pucciniosiraceae**
(12) **Raveneliaceae**
(13) **Uncolaceae**
(14) **Uropyxidaceae**

Placement of some genera is controversial and still others cannot be accommodated in any of the accepted families due to absence of key structures (especially pycnia, regarded as conservative and therefore valuable at the higher levels of classification) or otherwise incomplete information on their characters. It is acknowledged that family circumscription requires further investigation.

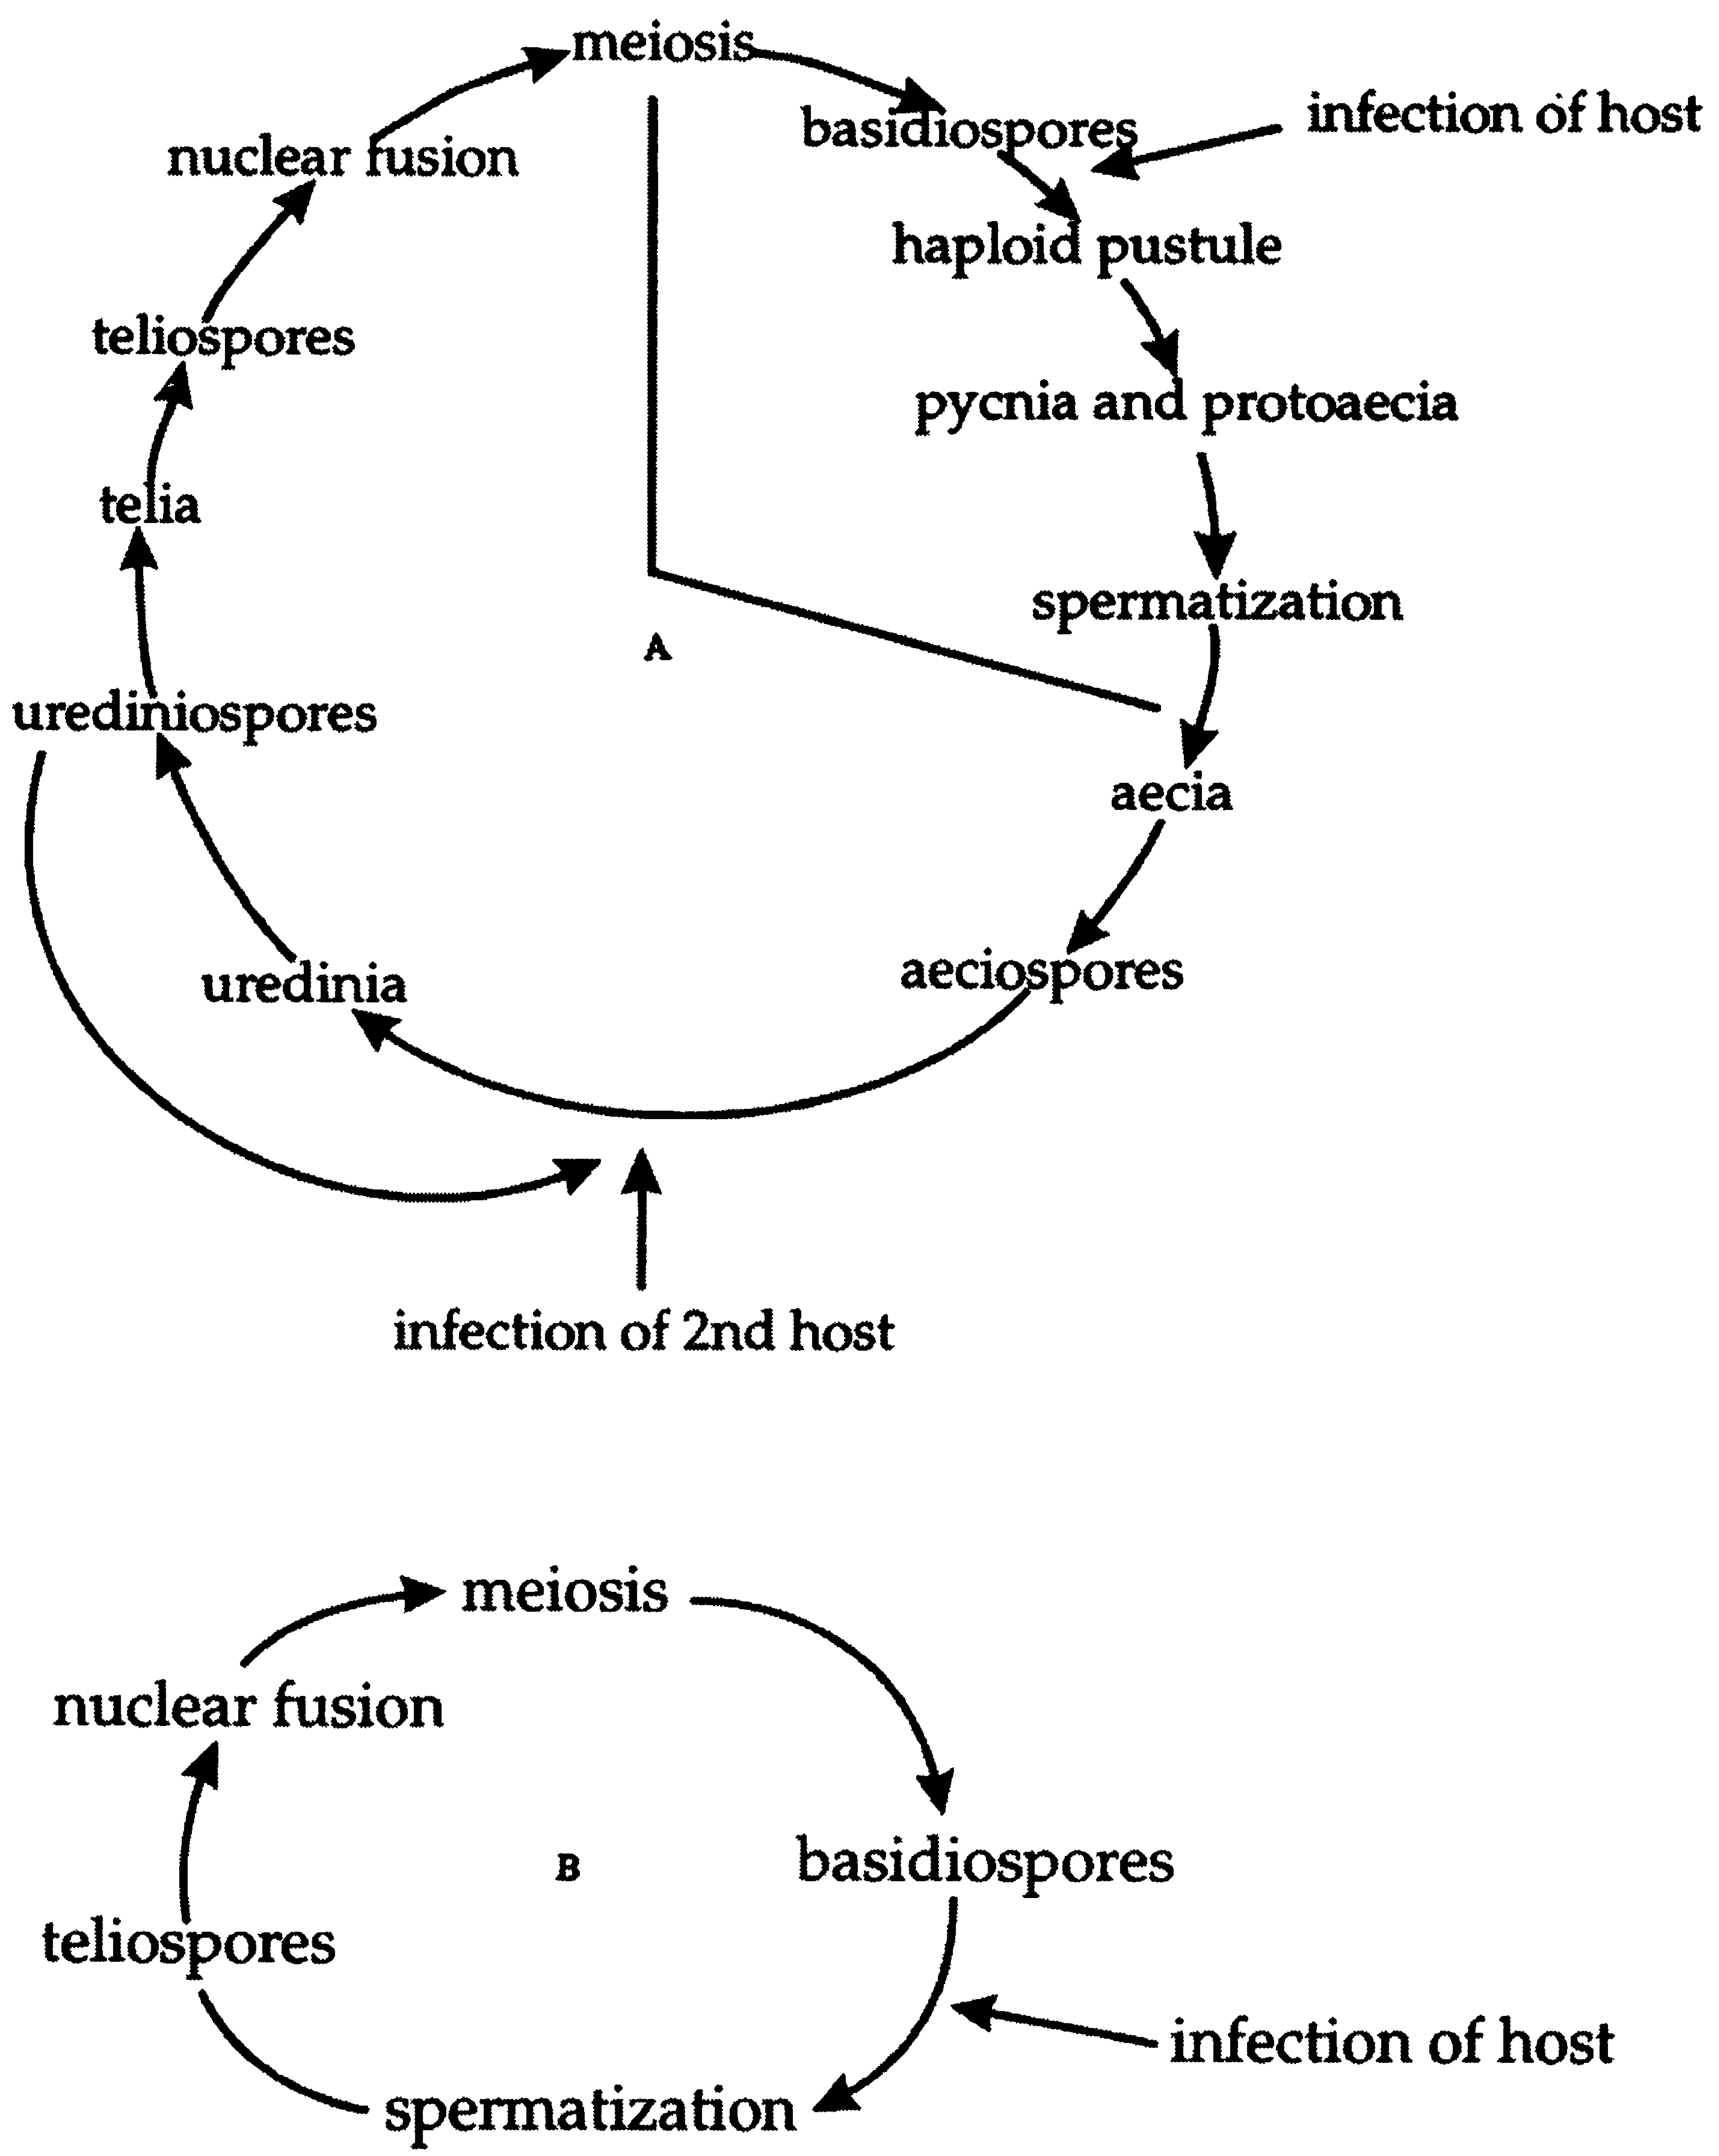

Fig. 25. Life cycles of A, a macrocyclic heteroecious rust; B, a microcyclic autoecious rust

Control: Sulphur is used against a number of rusts. Destruction of an alternate host (e.g. *Berberis* for *Puccinia graminis*) is sometimes of value. The development of resistant varieties of plants is ever in view.

Pucciniopsis Speg. (1888) nom. ambig., anamorphic *Pezizomycotina*. See Sutton (*TBMS* **60**: 525, 1973).

Pucciniosira Lagerh. (1892), Pucciniosiraceae. *c.* 15 (on angiosperms (0, III)), America; Africa; Asia. May include *Gambleola*. See Buriticá (*Rev. Acad. Colomb. Cienc.* **19**: 131, 1991), Gjærum *et al.* (*Lidia* **5**: 18, 2000; Uganda).

Pucciniosiraceae Cummins & Y. Hirats. (1983), Pucciniales. 10 gen. (+ 7 syn.), 57 spp.
Lit.: Gjærum *et al.* (*Lidia* **5**: 18, 2000), Hernández (*Mycotaxon* **76**: 329, 2000), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003), Wingfield *et al.* (*Australas. Pl. Path.* **33**: 327, 2004), Aime (*Mycoscience* **47**: 112, 2006).

Pucciniospora Speg. (1886), anamorphic *Pezizomycotina*, Cpd.1eH.?. 1, S. America.

Pucciniostele Tranzschel & Kom. (1899), Phakopsoraceae. *c.* 4 (on *Astilbe* (*Saxifragaceae*)), Asia. Cf. *Scalarispora*. See Cummins & Thirumalachar (*Mycol.* **45**: 572, 1953), Koursanov *et al.* (*Bull. Soc. Nat. Moscou. Cinenc.* **19** (no. 69): 131, 1991).

Puccinites Ettingsh. (1853), Fossil Fungi. 3 (Cretaceous, Tertiary), Europe; USA.

Puciola De Bert. (1976) = Dicyma fide von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981).

puff-ball, basidioma of the *Lycoperdales*.

puffing, a phenomenon in which thousands of asci in an apothecial ascoma discharge their ascospores simultaneously, producing a visible cloud.

Puiggariella Speg. (1881) = Strigula fide Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Puiggarina Speg. (1919) = Phyllachora Nitschke ex Fuckel (1870) fide Cannon (*Mycol. Pap.* **163**, 1991).

Pulcherricium Parmasto (1968) = Terana fide Parmasto (*Consp. System. Corticiac.*: 132, 1968).

Pulchromyces Hennebert (1973), anamorphic *Pezizomycotina*, Hso.0eH.7. 1 (coprophilous), Ghana. See Pfister *et al.* (*Mycotaxon* **1**: 137, 1974).

Pulicispora Vedmed, S.V. Krylova & I.V. Issi (1991), Microsporidia. 1.

Pulina Adans. (1763) nom. rej. ≡ Lepraria.

Pullospora Faurel & Schotter (1965), anamorphic *Pezizomycotina*, Cpd.0eH.15. 2 (coprophilous), Algeria; USA. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Pullularia Berkhout (1923) = Aureobasidium fide Cannon (*Mycopathologia* **111**: 75, 1990), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

pullulation, budding, as in yeasts.

Pulmonaria Hoffm. (1789) [non *Pulmonaria* L. 1753, *Boraginaceae*] = Lobaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pulmosphaeria Joanne E. Taylor, K.D. Hyde & E.B.G. Jones (1996), Xylariales. 1 (on *Palmae*), Australia. Perhaps related to *Linocarpon*. See Taylor *et al.* (*Sydowia* **48**: 255, 1996).

Pulparia P. Karst. (1866) nom. rej. = Pulvinula. See also *Marcelleina*. fide Dissing (*Mycotaxon* **32**: 365, 1988), Dissing *et al.* (*Taxon* **39**: 130, 1990; nomencl.), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

pulque, a Mexican alcoholic drink made by yeast fermentation of the juice of *Agave* spp.; *Lactobacillus* and *Leuconostoc* spp. add acidity and viscosity; when distilled yields the spirit **tequila**.

pulsed field gel-electrophoresis, see Electrophoresis.

pulveraceo-delitescent, covered with a layer of powdery granules.

Pulveraria Ach. (1803) nom. rej. prop. = Chrysothrix fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pulverariaceae Schltdl. (1824) = Chrysothricaceae.

Pulveria Malloch & Rogerson (1977) = Pyrenomyxa fide Læssøe (*SA* **13**: 43, 1994; nomencl.).

Pulveroboletus Murrill (1909), Boletaceae. 25, cosmopolitan. See Singer (*Am. midl. Nat.* **37**: 1, 1947), Gómez (*Revta Biol. trop.* **44** Suppl. 4: 59, 1996; Costa Rica), Zang *et al.* (*Mycotaxon* **80**: 481, 2001; China).

Pulverolepiota Bon (1993) = Cystolepiota fide Kuyper (*in litt.*).

pulverulent, powdered; as if powdered over.

Pulvinaria Bonord. (1851), Pezizomycotina. 1, Europe.

Pulvinaria Rodway (1918) ≡ Waydora.

Pulvinaria Velen. (1934) ? = Pachyella fide Pfister (*CJB* **51**: 2009, 1973).

pulvinate, cushion-like in form.

Pulvinella A.W. Ramaley (2001), anamorphic *Pezizomycotina*. 1, USA. See Ramaley (*Mycotaxon* **79**: 52, 2001).

Pulvinodecton Henssen & G. Thor (1998), Roccellaceae (L). 2, tropical. See Henssen & Thor (*Nordic Jl Bot.* **18**: 95, 1998; ontogeny), Thor (*J. Jap. Bot.* **77**: 47, 2002; Japan, Taiwan).

Pulvinotrichum Gamundí, Aramb. & Giaiotti (1981), anamorphic *Pezizomycotina*, Hso.0-1eH.15. 2, Argentina; Australia. See Summerbell *et al.* (*CJB* **67**: 577, 1989; synonymy with *Cylindrodendrum*), Sutton (*Sydowia* **41**: 330, 1989), Crous *et al.* (*Mycotaxon* **50**: 441, 1994), Wu *et al.* (*Mycoscience* **38**: 11, 1997).

Pulvinula Boud. (1885) nom. cons., Pezizales. 27, widespread. See Pfister (*Occ. Pap. Farlow Herb. Crypt. Bot.* **9**, 1976; key), O'Donnell & Hooper (*CJB* **56**: 101, 1978; ontogeny), Kaushal (*Kavaka* **9**: 21, 1981), Korf & Zhuang (*Mycotaxon* **20**: 607, 1984), Dissing (*Mycotaxon* **32**: 365, 1988; nomencl.), Korf & Zhuang (*Mycotaxon* **40**: 79, 1991), Liu (*Acta Mycol. Sin.* **10**: 185, 1991), Yao & Spooner (*MR* **100**: 193, 1996), Yao & Spooner (*MR* **100**: 883, 1996; Brit. spp.), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Liu & Zhuang (*Mycosystema* **25**: 546, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Pumilus Viala & Marsais (1934), Pezizomycotina. 1 (on *Vitis*), Europe.

punctate, marked with very small spots (Fig. 20.5); **puncta**, small spots.

Punctelia Krog (1982), Parmeliaceae (L). 42, widespread. See Galloway & Elix (*N.Z. Jl Bot.* **22**: 441, 1984; Australasia, key), Modenesi (*Nova Hedwigia* **45**: 423, 1987; histochemistry), Wilhelm & Ladd (*Mycotaxon* **44**: 495, 1992; key 13 N. Am. spp.), Longán *et al.* (*Mycotaxon* **74**: 367, 2000), van Herk & Aptroot (*Lichenologist* **32**: 233, 2000; Eur.), Aptroot (*Bryologist* **106**: 317, 2003; sorediate spp., N America), Crespo *et al.* (*Lichenologist* **36**: 299, 2004; Iberian peninsula), Thell *et al.* (*Folia cryptog. Estonica* **41**: 115, 2005; phylogeny), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

punctiform (of rust sori, bacterial colonies, etc.), very small, but seen without a lens.

Punctillina Toro (1934), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, S. America.

Punctillum Petr. & Syd. (1924), Dothideomycetes. 2 (on *Musci*), widespread. See Döbbeler (*Beih. Nova Hedwigia* **79**: 203, 1984).

Punctodiporites C.P. Varma & Rawat (1963), Fossil Fungi, anamorphic *Ascomycota*. 1. See Varma & Rawat (*Grana Palynologica* **4**: 136, 1963).

Punctonora Aptroot (1997), Lecanoraceae (L). 1, Papua New Guinea. See Aptroot *et al.* (*Biblthca Lichenol.* **64**: 151, 1997).

Punctularia Pat. (1895), Corticiaceae. 2, widespread. See Niemelä (*Sienilehti* **55**: 67, 2003; *P. strigosozonata* in Finland and Estonia).

Punctulariaceae Donk (1964) = Corticiaceae.

punk, see touchwood or amadou; **punky**, soft and tough.

Pureke P.R. Johnst. (1991), Rhytismataceae. 1, New Zealand. See Johnston (*N.Z. Jl Bot.* **29**: 395, 1991).

Pustularia Bonord. (1851) nom. dub., Pezizomycotina. Used for a wide range of taxa.

Pustularia Fuckel (1870) ≡ Pustulina.

pustule, a blister-like, frequently erumpent, spot or spore-mass.

Pustulina Eckblad (1968) = Tarzetta fide Rogers *et al.* (*Mycol.* **63**: 1084, 1971).

Pustulipora P.F. Cannon (1982), Ceratostomataceae. 1, British Isles. See Cannon (*Mycotaxon* **15**: 523, 1982), Ranghoo & Hyde (*MR* **103**: 938, 1999).

Putagraivam Subram. & Bhat (1978) = Didymostilbe Henn. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

putrescent (of basidiomata), decaying, rotting. Cf. marcescent.

Puttemansia Henn. (1902), Tubeufiaceae. Anamorphs *Guelichia*, *Tetracrium*. 7 (on fungi), widespread (tropical). See Rossman (*Mycol. Pap.* **157**, 1987; key), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006).

Puttemansiella Henn. (1908) nom. dub., Fungi.

pv., see pathovar.

Pycnidiales (obsol.), see *Sphaeropsidales* (Anam. fungi).

Pycnidiella Höhn. (1915), anamorphic *Sarea*, St.0eH.15. 1 (on resin), widespread. See Hawksworth & Sherwood (*CJB* **59**: 357, 1981).

Pycnidioarxiella Punith. & N.D. Sharma (1980), anamorphic *Pezizomycotina*, Cpd.1eP.2. 1, India. See Punithalingam & Sharma (*Nova Hedwigia* **31**: 893, 1979).

Pycnidiochaeta Sousa da Câmara (1950) = Dinemasporium fide Sutton (*Mycol. Pap.* **141**, 1977).

Pycnidiopeltis Bat. & C.A.A. Costa (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, USA; Brazil. See Batista & Costa (*Mycopath. Mycol. appl.* **11**: 83, 1959).

Pycnidiophora Clum (1956), Sporormiaceae. Anamorph *Phoma*-like. 2 (from soil etc.), widespread. See Cain (*CJB* **39**: 1633, 1961; as *Preussia*), Berbee (*Mol. Biol. Evol.* **13**: 462, 1996; DNA, as *Westerdykella*), Barr (*Mycotaxon* **76**: 105, 2000), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny).

pycnidiospore, a conidium in or from a pycnidium (obsol.).

Pycnidiostroma F. Stevens (1927) = Phomachora fide Petrak (*Annls mycol.* **27**: 324, 1929).

pycnidium (pl. **-ia**), a frequently ± flask-shaped conidioma of fungal tissue with a circular or longitudinal ostiole, the inner surface of which is lined entirely or partially by conidiogenous cells; pycnidial conidioma (Fig. 10A-F).

pycniospore (of *Pucciniales*), a spore from a pycnium; spermatium; sometimes used in error for pycnidiospore.

Pycnis Bref. (1881), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Europe.

pycnium (in *Pucciniales*), the pycnidium-like haploid fruit-body, or spermogonium. See Hiratsuka & Cummins (*Mycol.* **55**: 487, 1963), Savile (*Mycol.* **63**: 1089, 1971).

pycnoascocarp, an ascoma arising from a pycnidial conidioma.

Pycnocalyx Naumov (1916) = Bothrodiscus fide Sutton (*Mycol. Pap.* **141**, 1977).

Pycnocarpon Theiss. (1913), Dothideomycetes. 4, India; Philippines.

Pycnochytrium (de Bary) J. Schröt. (1892) = Synchytrium fide Fitzpatrick (*The lower fungi. Phycomycetes*, 1930).

Pycnociliospora Bat. (1962) = Strigula fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

pycnoconidium, see pycnidiospore (obsol.).

Pycnodactylus Bat., A.A. Silva & Cavalc. (1967), anamorphic *Pezizomycotina*, Cpd.#eP.?. 1, Brazil. See Batista *et al.* (*Atas Inst. Micol. Univ. Pernambuco* **5**: 140, 1967).

Pycnodallia Kohlm. & Volkm.-Kohlm. (2001), anamorphic *Pezizomycotina*. 1, USA. See Kohlmeyer & Volkmann-Kohlmeyer (*MR* **105**: 500, 2001).

Pycnoderma Syd. & P. Syd. (1914), Cookellaceae. 2, widespread (tropical). See Petrak (*Sydowia* **1**: 108, 1947).

Pycnodermella Petr. (1947) = Saccardinula fide von Arx (*Persoonia* **2**: 421, 1963).

Pycnodermellina Bat. & H. Maia (1957) ? = Echinoplaca fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pycnodermina Petr. (1954) ? = Pycnoderma fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pycnodon Underw. (1898) ≡ Neokneiffia.

Pycnodothis F. Stevens (1924) nom. dub., Fungi. See Petrak (*Sydowia* **5**: 169, 1951).

Pycnofusarium Punith. (1973) = Fusarium fide Sutton (*TBMS* **86**: 1, 1986).

pycnogonidium, see pycnidiospore (obsol.), pycniospore, or stylospore (obsol.).

Pycnographa Müll. Arg. (1890) = Parmularia Lév. fide Santesson (*Svensk bot. Tidskr.* **43**: 547, 1949).

Pycnoharknessia Matsush. (1996), anamorphic *Pezizomycotina*, Cpd.?.?. 1, Pakistan. See Matsushima

(*Matsush. Mycol. Mem.* **9**: 23, 1996).

Pycnomma Syd. (1924), anamorphic *Pezizomycotina*, St.0eH.?. 1, Canary Islands.

Pycnomoreletia Rulamort (1990), anamorphic *Pezizomycotina*, St.≡ eP.1. 2, Africa; Pakistan. See Rulamort (*Bull. Soc. bot. Centre-Ouest* Nouv. sér. **21**: 512, 1990).

Pycnopeltis Syd. & P. Syd. (1916) = Saccardinula fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Pycnopeziza W.L. White & Whetzel (1938), Sclerotiniaceae. Anamorph *Acarosporium*. 4, Europe; N. America. See Whetzel & White (*Mycol.* **32**: 616, 1940), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Holst-Jensen *et al.* (*Mycol.* **96**: 135, 2004).

Pycnopleiospora C.Z. Wei, Y. Harada & Katum. (1997), anamorphic *Pezizomycotina*, Hso.?.?. 1, Japan. See Wei *et al.* (*Mycol.* **89**: 496, 1997).

Pycnopodium Corda (1842) ≡ Pilobolus fide Hesseltine (*Mycol.* **47**: 344, 1955).

Pycnoporellus Murrill (1905), Fomitopsidaceae. 2, widespread. See Ryvarden (*Polyp. N. Eur.* **2**, 1978), Piątek (*Polish Botanical Journal* **48**: 131, 2003; Poland).

Pycnoporus P. Karst. (1881), Polyporaceae. 4, widespread. See Nobles & Frew (*CJB* **40**: 987, 1962), Roberts & Ryvarden (*Kew Bull.* **61**: 55, 2006; Cameroon).

Pycnopsammina Diederich & Etayo (1995) = Psammina fide Etayo & Diederich (*Flechten Follmann* Contributions to Lichenology in Honour of Gerhard Follmann: 215, 1995), Earland-Bennett & Hawksworth (*Lichenologist* **37**: 191, 2005).

Pycnora Hafellner (2001), Lecanoromycetes. 4, widespread. See Hafellner & Türk (*Stapfia* **76**: 157, 2001), Kubiak *et al.* (*Botanica Lithuanica* **9**: 371, 2003; Poland), Wedin *et al.* (*MR* **109**: 159, 2005; phylogeny), Crewe *et al.* (*MR* **110**: 521, 2006; phylogeny).

Pycnorostrum Golovin (1950) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

pycnosclerotium, a more or less hard-walled structure resembling a pycnidial conidioma but having no spores.

Pycnoseynesia Kuntze (1898), anamorphic *Pezizomycotina*, Cpt.0eH.?. 2, widespread (tropical).

pycnosis (of *Microthyriaceae*), the process by which a part of the stroma is arched up and becomes thick while an ascigerous hymenium is formed under it.

pycnospore, formerly occasionally used for pycniospore or pycnidiospore (obsol.).

Pycnosporium Siegel (1909) nom. dub., anamorphic *Pezizomycotina*.

Pycnostemma Syd. (1927) = Poropeltis fide Clements & Shear (*Gen. Fung.*, 1931).

Pycnostroma Clem. (1909) = Munkia fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **120**: 379, 1911).

pycnostroma, see stroma.

Pycnostysanus Lindau (1904) = Sorocybe. See also *Seifertia*. fide Kaneko *et al.* (*Ann. phytopath. Soc. Japan* **54**: 323, 1988), Partridge & Morgan-Jones (*Mycotaxon* **83**: 335, 2002).

pycnothecium (of *Microthyriaceae*), an ascoma formed by pycnosis.

Pycnothele Sommerf. (1826) ≡ Dufourea.

Pycnothelia (Ach.) Dufour (1821), Cladoniaceae (L). 2, widespread. See Laundon (*Lichenologist* **18**: 169, 1986; nomencl.), Ahti (*Regnum veg.* **128**: 58, 1993), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Hammer (*Am. J. Bot.* **87**: 33, 2000; ontogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Zhou *et al.* (*J. Hattori bot. Lab.* **100**: 871, 2006; phylogeny).

Pycnotheliomyces Cif. & Tomas. (1953) ≡ Pycnothelia.

Pycnothera N.D. Sharma & G.P. Agarwal (1974), anamorphic *Pezizomycotina*, Cpt.0eH.38. 2, India. See Punithalingam (*Nova Hedwigia* **31**: 95, 1979).

Pycnothyriella Bat. (1952), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Batista (*Bol. Secr. Agric. (Pernambuco)* **19**: 110, 1952).

Pycnothyrium Died. (1913), anamorphic *Pezizomycotina*, Cpt.0eH.?. 6, Europe; Philippines. See Holm & Holm (*Bot. Notiser* **130**: 115, 1977; sensu v. Arx (1964) = *Leptopeltis*), Sutton (*Mycol. Pap.* **141**, 1977).

pycnothyrium, a superficial flattened shield-shaped conidioma with radiate upper and sometimes lower walls; pycnothyrial conidioma. See Hughes (*Mycol. Pap.* **50**: 7, 1953). Characteristic of *Microthyriaceae* (q.v.) etc. (Fig. 10G-M).

Pycnovellomyces R.F. Castañeda (1987), anamorphic *Agaricomycetes*, Cpd.0eH.41. 1 (with clamp connexions), Cuba. See Nag Raj *et al.* (*CJB* **67**: 3386, 1989; redescription).

Pygmaea Stackh. (1809) nom. rej. = Lichina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pyonema Nieuwl. (1916) ≡ Myxonyphe.

Pyramidospora Sv. Nilsson (1962), anamorphic *Pezizomycotina*, Hso.1bH.1. 2 (aquatic), widespread. See Nilsson (*Svensk bot. Tidskr.* **56**: 358, 1962), Kendrick (*CJB* **81**: 75, 2003; morphogenesis).

Pyrenastromyces Cif. & Tomas. (1953) ? = Pyrenula Ach. (1809) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pyrenastrum Eschw. (1824) = Pyrenula Ach. (1814) fide Harris (*Mem. N. Y. bot. Gdn* **49**, 1989).

Pyrenidiaceae Zahlbr. (1898) = Dacampiaceae.

Pyrenidiomyces Cif. & Tomas. (1953) ≡ Pyrenidium.

Pyrenidium Nyl. (1865), Dacampiaceae. 3 (on lichens), widespread. See Hawksworth (*TBMS* **80**: 547, 1983).

Pyreniella Theiss. (1916) = Botryosphaeria fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Pyrenillium, see *Pyrenyllium*.

Pyreniococcus Wheldon & A. Wilson (1915) ? = Phaeospora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pyreniopsis Kuntze (1898) ≡ Trichoderma Pers. (1794).

Pyrenisperma, see *Pyrisperma*.

Pyrenium Tode (1790) = Trichoderma Pers. (1794) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

pyrenium, a pyrenomycete ascoma (obsol.).

Pyrenobotrys Theiss. & Syd. (1914), Venturiaceae. 3, America; Scandinavia. See Eriksson (*Svensk bot. Tidskr.* **68**: 223, 1974), Barr (*Sydowia* **41**: 25, 1989; key 3 N. Am. spp.).

pyrenocarp, a perithecium (s.l., q.v.); used colloquially as a term for any fungus with a perithecium-like ascoma.

Pyrenocarpon Trevis. (1855), Lichinaceae (L). 1,

Europe. See Jørgensen & Henssen (*Taxon* **39**: 343, 1990), Jørgensen (*SA* **10**: 51, 1991), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

pyrenocarpous, see pyrenocarp.

Pyrenochaeta De Not. (1849), anamorphic *Herpotrichia, Leptosphaeria*, Cpd.0eH.15. 16, widespread. See Last *et al.* (*Ann. appl. Biol.* **57**: 95, 1966), Last *et al.* (*Ann. appl. Biol.* **62**: 55, 1968), Last *et al.* (*Ann. appl. Biol.* **64**: 449, 1969; *P. lycopersici*, tomato brown rot), Schneider (*Mitt. biol. BundAnst. Ld- u. Forstw.* **189**, 1979), Schneider *in* Subramanian (Ed.) (*Taxonomy of fungi* **2**: 513, 1984; disposition of spp.), Datnoff *et al.* (*TBMS* **87**: 297, 1986; sclerotial state), Ferreira *et al.* (*J. Phytopath.* **133**: 289, 1991; variability in *P. terrestris* using isozyme polymorphism etc.), Sieber (*MR* **99**: 274, 1995; *P. lignipputridi* in *Abies* butt rot), Grondona *et al.* (*MR* **101**: 1405, 1997), Padhye & McGinnis *in* Murray *et al.* (Eds) (*Manual of Clinical Microbiology*: 1318, 1999), Infantino *et al.* (*MR* **107**: 707, 2003; Italy), Boerema *et al.* (*Phoma Identification Manual* Differentiation of Specific and Infra-Specific Taxa in Culture: 470 pp., 2004), Infantino & Pucci (*Eur. J. Pl. Path.* **112**: 337, 2005; molecular detection), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Pyrenochaetella P. Karst. ex Höhn. (1917) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Pyrenochaetina Syd. & P. Syd. (1916) = Parodiella fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Pyrenochium Link (1833), ? Dothideomycetes. 1, Europe.

Pyrenocollema Reinke (1895), Xanthopyreniaceae (L). 1, Europe; N. America. Most species are transferred to *Collemopsidium*. See Puymaly (*Botaniste* **36**: 331, 1952), Tucker & Harris (*Bryologist* **83**: 1, 1980), Harris (*More Florida Lichens*, 1995), Aptroot & van den Boom (*Cryptog. Bryol.-Lichénol.* **19**: 193, 1998), Harada (*Bryologist* **102**: 50, 1999), McCarthy & Kantvilas (*Herzogia* **14**: 39, 2000; Tasmania), Kohlmeyer *et al.* (*Mycol. Progr.* **3**: 51, 2004), Mohr *et al.* (*MR* **108**: 515, 2004).

Pyrenocyclus Petr. (1955), Dothideomycetes. 1, Hawaii. See Petrak (*Sydowia* **9**: 515, 1955).

Pyrenodermium Bonord. (1851) = Hypoxylon Bull. fide Læssøe (*SA* **13**: 43, 1994).

Pyrenodesmia A. Massal. (1853) nom. rej. = Caloplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pyrenodiscus Petr. (1927) = Diplonaevia fide Hein (*Nova Hedwigia* **38**: 669, 1983).

Pyrenodium Fée (1837) = Asterothelium fide Zahlbruckner (*Catalogus Lichenum Universalis* **1**, 1921).

Pyrenodochium Bonord. (1851) = Diatrype fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pyrenogaster Malençon & Riousset (1977) = Schenella fide Estrada-Torres *et al.* (*Mycol.* **97**: 139, 2005).

Pyrenographa Aptroot (1991), Requienellaceae. 1, Australia; S.E. Asia. Placed in the *Pyrenulaceae* by Eriksson (*in litt.*). See Alias *et al.* (*MR* **100**: 580, 1996).

pyrenomycete, one of the *Pyrenomycetes*.

Pyrenomycetes. Class of *Ascomycota*; used in various senses, but mostly for fungi with perithecioid ascomata which are also ascohymenial in ontogeny and have unitunicate asci, often with an apical annulus (e.g. *Diaporthales, Hypocreales, Sordariales, Xylariales*). The *Dothideales, Erysiphales, Meliolales* and *Laboulbeniales* also included by some authors.

The class is not generally accepted but was reintroduced by Berbee & Taylor (1992) in a restricted sense (see *Ascomycota*). However, the term 'pyrenomycetes' still has value as a colloquial term for all ascomycetes with flask-shaped ascomata. See Hanlin (*in* Parker, 1982, **1**: 225), Rogers (*in* Hawksworth, 1994: 321).

Pyrenomyxa Morgan (1895), Xylariaceae. 3, N. America; Asia. See Læssøe (*SA* **13**: 43, 1994; nomencl.), Stadler *et al.* (*Mycol.* **97**: 1129, 2005; key, chemistry), Bitzer *et al.* (*MR* **112**: 251, 2008; phylogeny, chemistry).

Pyrenopeziza Fuckel (1870), Helotiales. Anamorph *Cylindrosporium*. c. 59, widespread. See Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932; 32 spp.), Gremmen (*Fungus* Wageningen **28**: 37, 1958; key sects.), Hütter (*Phytopath. Z.* **33**: 1, 1958; key), Majer *et al.* (*Pl. Path.* **47**: 22, 1998; genetic variation), Foster *et al.* (*Physiol. Mol. Pl. Pathol.* **55**: 111, 1999; PCR), Paavolainen *et al.* (*MR* **104**: 611, 2000), Paavolainen *et al.* (*Mycol.* **93**: 258, 2001; population genetics), Foster *et al.* (*Eur. J. Pl. Path.* **108**: 379, 2002; molecular diagnosis), Vrålstad *et al.* (*New Phytol.* **155**: 131, 2002; phylogeny), Pärtel & Raitviir (*Mycol. Progr.* **4**: 149, 2005; ultrastr.).

Pyrenopezizopsis Höhn. (1917) = Cenangiopsis Rehm fide Dennis (*Persoonia* **2**: 171, 1962).

Pyrenophora Fr. (1849), Pleosporaceae. Anamorph *Drechslera*. 8, widespread. Plant pathogens include: *P. chaetomioides*, anamorph *Drechslera avenacea* (oat leaf spot and seedling blight); *P. graminea*, anamorph *D. graminea* (barley leaf stripe); *P. teres*, anamorph *D. teres* (net blotch of barley). See Ammon (*Phytopath. Z.* **47**: 269, 1963; keys), Shoemaker (*CJB* **39**: 901, 1963; status), Sutton (*Taxon* **21**: 319, 1972; nomencl.), Crivelli (*Über die heterogene Ascomycetengattung Pleospora Rbh.*, 1983; key), Sivanesan (*Mycol. Pap.* **158**: 261 pp., 1987; anamorph), Scott (*Mycopathologia* **116**: 29, 1991; on *Hordeum*), Medd (*Review of Plant Pathology* **71**: 891, 1992; *P. semeniperda*), Peever & Milgroom (*CJB* **72**: 915, 1994; population structure), Stevens *et al.* (*Diagnosis and Identification of Plant Pathogens. Proceedings of the 4th International Symposium of the European Foundation for Plant Pathology*: 461, 1997; phylogeny), Dong *et al.* (*MR* **102**: 151, 1998; phylogeny), Pecchia *et al.* (*FEMS Microbiol. Pyrenulales Fink ex D. Hawksw. & O.E. Erikss. (1986), (±L). Chaetothyriomycetidae. 6 fam., 42 gen., 538 spp. Thallus (where present) crustose, often immersed, often inconspicuous; ascomata perithecial, immersed or erumpent, ± globose or flattened, often clypeate, sometimes aggregated into stromata, the peridium usually thick-walled, usually composed of small-celled pseudoparenchymatous tissue, sometimes crystalline; interascal tissue initially of thin-walled anastomosing pseudoparaphyses, subsequently ± unbranched paraphyses often developing from the base of the ascoma, occasionally only of true paraphyses; asci cylindrical, persistent, usually multilayered and fissitunicate, sometimes with a conspicuous apical ring, not blueing in iodine; ascospores hyaline or brown, septate, sometimes muriform, often with strongly thickened septa and angular lumina, sometimes with a sheath. Anamorphs pycnidial where known. Saprobes on bark, or lichenized with green algae (esp. *Trentepohliaceae*), mainly trop.

Fams:

(1) **Celotheliaceae**
(2) **Massariaceae**
(3) **Monoblastiaceae** (syn. *Acrocordiaceae*)
(4) **Pyrenulaceae** (syn. *Pleurotremataceae*)
(5) **Requienellaceae**
(6) **Xanthopyreniaceae**

Lit.: Aptroot (*Biblthca Lichenol.* **44**, 1991), Del Prado *et al.* (*MR* **110**: 511, 2006; phylogeny), Lutzoni (*Am. J. Bot.* **91**: 114, 2004).

Pyrenulella Fink (1935) ≡ Pharcidiella.

Pyrenulomyces E.A. Thomas ex Cif. & Tomas. (1953) = Pyrenula Ach. (1814) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Pyrenyllium Clem. (1909), anamorphic *Pezizomycotina* (?L). 1. See Aguirre-Hudson (*Bull. Br. Mus. nat. hist.* Bot. **21**: 85, 1991).

Pyrgidiomyces Cif. & Tomas. (1953) ≡ Pyrgidium.

Pyrgidium Nyl. (1867), Sphinctrinaceae (?L). 1, widespread. See Tibell (*Lichenologist* **14**: 219, 1982), Tibell (*Symb. bot. upsal.* **27** no. 1, 1987), Tibell (*Symb. bot. upsal.* **32**: 291, 1997; anamorphs), Tibell & Wedin (*Mycol.* **92**: 577, 2000).

Pyrgillocarpon Nádv. (1942) = Pyrgillus fide Aptroot (*Biblthca Lichenol.* **44**, 1991).

Pyrgillomyces Cif. & Tomas. (1953) ≡ Pyrgillus.

Pyrgillus Nyl. (1858), Pyrenulaceae (L). 4, widespread. See Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Lumbsch *et al.* (*Symb. bot. upsal.* **34** no. 1: 9, 2004; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Pyrgostroma Petr. (1951), anamorphic *Pezizomycotina*, St.≡ eP.?. 1, USA. See Petrak (*Sydowia* **5**: 484, 1951).

Pyricularia Sacc. (1880), anamorphic *Magnaporthe*,

Hso.≡ eP.10. 14, widespread. *P. oryzae* (sometimes as *P. grisea*; conservation to be sought), rice blast. See Ou (Ed.) (*The rice blast disease*, 1965), Vales *et al.* (*L'Agron. Tropic.* **41**: 242, 1986; electrophoresis in *P. oryzae* identification), Leung & Williams (*CJB* **65**: 112, 1987; nuclear division and chromosomes), Rossman *et al.* (*Mycol.* **82**: 509, 1990; nomencl. rice blast pathogen), Zhu *et al.* (*Mycosystema* **5**: 89, 1992; DNA fingerprinting and pathotype identification), Zeigler *et al.* (*Rice blast disease*, 1994), George *et al.* (*Phytopathology* **88**: 223, 1998), Kusaba *et al.* (*Ann. phytopath. race, see physiologic race and Classification.

Racemella Ces. (1861) = Cordyceps fide Tulasne & Tulasne (*Select. fung. carpol.* **3**: 4, 1865).

Racemosporium Moreau & Moreau (1941) = Arthrinium fide Ellis (*Mycol. Pap.* **103**, 1965).

Rachicladosporium Crous, U. Braun & C.F. Hill (2007), anamorphic *Capnodiales*. 1, New Zealand. See Crous *et al.* (*Stud. Mycol.* **58**: 33, 2007).

Rachidicola K.D. Hyde & J. Fröhl. (1995), Dothideomycetes. 1, Hong Kong. See Hyde (*Sydowia* **47**: 217, 1995).

rachis, a geniculate or zig-zag holoblastic extension of a conidiogenous cell (as in *Tritirachium*) resulting from sympodial conidiogenous cell development; **rachiform** (of conidiogenous cells), having a rachis; cf. raduliform.

Rachisia Lindner (1913) = Fusarium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Raciborski (Marjan; 1863-1917; Poland). Student, München (1894); Indonesia (1896-1900); Professor of Botany, Agricultural Academy, Dublany (1900-1909) then Professor and Director, Plant Physiological Institute (1909-1912), L'viv; Professor of Botany, Cracow University (1912-1917). Pioneer mycologist in Indonesia; pioneer of nature conservation in Poland; also wrote papers on fungi of Poland and Switzerland. *Publs. Parasitische Algen und Pilze Java?s* (1900). *Biogs, obits etc.* Goebel (*Bericht der Deutschen Botanischen Gesellschaft* **35**: (97), 1918; bibliography); Grummann (1974: 437); Kornasia (*Marian Raciborski*, 1986); Stafleu & Cowan (*TL-2* **4**: 529, 1983).

Raciborskiella Höhn. (1909) = Strigula fide Harris (*in litt.*), Roux & Sérusiaux (*Bull. Soc. linn. Provence* **46**: 91, 1995; ascospores), Roux *et al.* (*Biblthca Lichenol.* **90**: 96 pp., 2004).

Raciborskiella Speg. (1919) ≡ Trichopeltella.

Raciborskiomyces Siemaszko (1925) = Epipolaeum fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

racket (racquette) cell (of dermatophytes), a hyphal cell having a swelling at one end; cf. hypha.

Racoblenna A. Massal. (1852) = Placynthium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Racoblennaceae Arnold (1858) = Placynthiaceae.

Racodium Fr. (1829) nom. cons., anamorphic *Capnodiales*, Hso.0eP.? (±L). 1, widespread. See Hawksworth & Riedl (*Taxon* **26**: 208, 1977; nomencl.), Kantvilas (*Muelleria* **16**: 65, 2002; Australia), Sakamoto & Miyamaoto (*Forest Pathology* **35**: 1, 2005; Japan), Tribe *et al.* (*Mycologist* **20**: 171, 2006), Muggia *et al.* (*MR* **112**: 50, 2008; phylogeny).

Racodium Pers. (1794) nom. rej. = Rhinocladiella Nannf. See cellar fungus. fide Hawksworth & Riedl (*Taxon* **26**: 208, 1977), Tribe *et al.* (*Mycologist* **20**: 171, 2006).

Racoplaca Fée (1825) = Strigula fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Racospermyces J. Walker (2001), ? Raveneliaceae. 6 (on *Acacia* (*Leguminosae*)), Australia; E. Asia; Hawaii. See Walker (*Australasian Mycologist* **20**: 3, 2001; monogr., key), Scholler & Aime (*Mycoscience* **47**: 159, 2006; syn. of *Endoraecium*).

Racovitziella Döbbeler & Poelt (1978), Dothideomycetes. 1 (on *Musci*), Austria. See Döbbeler & Poelt (*Mitt. bot. StSamml.* Münch. **14**: 206, 1978).

racquette cell, see racket cell.

Radaisiella Bainier (1910) = Botryosporium Corda fide Mason (*Mycol. Pap.* **2**: 27, 1928).

Raddetes P. Karst. (1887) nom. rej. = Conocybe fide Kuyper (*in litt.*).

radial (of lichen thalli), radially symmetrical in transverse section (e.g. *Alectoria*, *Bryoria*, *Coelocaulon*, *Usnea*).

radiate, spreading from a centre.

Radiation and fungi. Fungi like all living organisms are influenced by ionizing and non-ionizing radiation.

Ionizing radiation affects fungal DNA both directly and indirectly and causes a wide range of damage. Harmful effects, including chromosomal breaks and elevated mutation frequencies were identified during satellite and space studies with different fungi (Dublin & Volz, *Origins of Life and Evolution of Biospheres* **4**: 223, 1973; Volz *et al.*, *Mycopath. mycol. Appl.* **54**: 221, 1974). Spore germination and subsequent hyphal growth of soil microfungi in the presence of pure gamma or mixed beta and gamma radiation is influenced by the origin of the isolate. Fungi isolated from background radiation sources show inhibition or no response in germination when experi-

mentally irradiated, but isolates from sites with elevated mixed radiation showed stimulation in spore germination and enhanced hyphal growth. Prior long-term exposure to radiation influences fungal decomposition of radionuclide-bearing resources in the environment (Tugay *et al.*, *Mycologia* **98**: 521, 2006).

Ecosystems throughout the world have been contaminated with radionuclides as a result of above ground nuclear testing, nuclear reactor accidents and nuclear power generation. The reactor disaster at the Chernobyl Nuclear Power Station in April 1986, in particular, led to huge amounts of radioactive material being distributed over a large area of Europe, stimulating studies of radiation effects on fungi. Radioisotopes characteristic of nuclear fission, such as ^{137}Cs and ^{90}Sr, were released into the environment, becoming more concentrated as they move up the food chain and often becoming human health hazards. Following Chernobyl, lichens (mainly *Cladonia rangiferina*) of northern Scandinavia accumulated so much radioactivity that reindeer feeding on them were considered dangerous for human consumption. Basidiomycete fruit bodies are known to accumulate radioactive nuclides (Haselwandter, *Health Phys.* **4**: 713, 1978; Bakken & Olsen, *Can. J. Microbiol.* **36**: 704, 1990; Grodzinskaya *et al.*, *Sydowia* **10**: 88, 1995). Concentrations of radioactive ^{134}Cs, ^{137}Cs in mushrooms vary in different regions with, e.g. a maximum of 2860 Bq kg- (dry wt.) for France (Kirchner & Daillant, *Science of the Total Environment* **222**: 63, 1998). Radionuclides accumulate in mushroom fruit bodies under experimental conditions in the following order: ^{83}Rb ^{65}Zn ^{54}Mn ^{22}Na ^{75}Se and ^{85}Sr ^{60}Co ^{88}Y, ^{102}Rh, ^{139}Ce ^{143}Ce, ^{144}Pm ^{146}Pm, ^{153}Gd and ^{173}Lu ^{175}Hf (Tadaaki Ban-Nai *et al.*, *J. Radiation Res.* **38**: 213, 1997).

Reports of high concentrations of fallout radiocaesium in basidiomycete fruit bodies after Chernobyl and speculation that fungi could be long-term ^{137}Cs accumulators led to special studies which indicated that uptake of Cs by common fungi of upland grassland ranged from 44 to 235 nmol Cs g^{-1} d.w. h^{-1} with more than 40% of the Cs taken up from environment being bound within the hyphae. Immobilization of radiocaesium fallout by the soil fungal component is discussed by Dighton *et al.* (*MR* **95**: 1052, 1991). Study during 1996-1998 of ^{137}Cs concentration in mushrooms from one of the regions of Ukraine contaminated by radiation revealed higher accumulations in fruit bodies of *Paxillus involutus*, *Sarcodon imbricatus*, *Xerocomus subtomentosus* and *Cantharellus cibarius* than in mycelium from soil, with ratios ranging from 0.1 to 66 and a mean of 9.9. Fungal mycelium accumulated from 0.1 to 50% ^{137}Cs compared with sampled soil (Vinichuk & Johanson *J. environ. Radioactivity* **64**: 27, 2002). Another study revealed higher levels of ^{90}Sr transfer to fruit bodies of some mushrooms from soils of sampling sites than $^{239+240}$Pu and ^{241}Am transfer. The Available Transfer Factor (ATF) index, based on the the ratio between fruitbody content and the amount of radionuclide available for transfer in soil, has been proposed as a measure of the actual process of transfer. *Hebeloma cylindrosporum*and *Lycoperdon perlatum* were found to have $^{239+240}$Pu and ^{241}Am ATF values greater than or similar to those of ^{90}Sr, and such fungi have been suggested as suitable as bioindicators for radioactive nuclides in a forest ecosystems (Baeza *et al.*, *Radiochimica Acta* **94**: 75, 2006). *Ganoderma lucidum* has also been proposed as an indicator for ^{137}Cs environmental monitoring because of its high levels of accumulation (Tran Van & Le Duy, *J. radioanalytical nucl. chem.* **155**: 451, 1991).

Biosorption of radioactive elements is exhibited by different fungi. *Rhizopus arrhizus* takes up to 180 mg U^6/g of uranium from aqueous solutions. Uranium adsorption in cell-wall chitin occurs simultaneously and rapidly; precipitation of uranyl hydroxide within the chitin microcrystalline cell-wall occurs at a lower rate (Tsezos & Volesky, *Biotechnol. Bioeng. Symp.* **24**: 385, 1982). There is experimental evidence for fungal transformations of uranium solids and production of secondary mycogenic uranium minerals. Saprotrophic, ericoid and ectomycorrhizal fungi dissolve uranium oxides and accumulate uranium within the mycelium to over 80 mg (g dry weight)(-1) biomass (Fomina *et al.*, *Environ. Microbiol.* **9**: 1696, 2007). Absorption and adsorption of radionuclides from 'hot particles' originating from the Chernobyl accident and from atomic bomb testing sites has also been observed. Studied species and strains of soil fungi overgrew and dissolved the 'hot particles' after prolonged contact. Accumulation was generally more intensive for ^{152}Eu than for ^{137}Cs by a factor of about 2.6–134. The main factors influencing Cs and Eu accumulation in soil fungi seem to be fungal species, fungal strain, and size and composition of the 'hot particle' (Zhdanova *et al.*, *J. environ. radioactivity* **67**: 119, 2003).

Microfungi have been found to be highly resilient to exposure to ionizing radiation. Free-living and mycorrhizal fungi can colonize thermodynamically unstable depleted uranium surfaces and transform metallic depleted uranium into uranyl phosphate minerals (Fomina *et al.*, *Curr. Biol.* **18**: R375, 2008). Radioresistance of some fungal species has been linked to the presence of melanin, which has been shown to have emerging properties of acting as an energy transporter for metabolism (Dighton *et al.*, *FEMS Microbiology Letters* **281**: 109, 2008; review). Sustained exposure of microfungi to radiation appears to have resulted in formerly unknown adaptive features, such as directed growth of fungi toward sources of ionizing radiation. Soil microfungi isolated from around the Chernobyl Nuclear Power Station are able to grow into and decompose 'hot particles' in the carbon based radioactive graphite from the reactor. Long-term investigations of about 2000 strains of 200 species of 98 genera revealed that both beta and gamma radiation promote directional growth of hyphae towards the source of radiation (Zhdanova *et al.*, *MR* **108**: 1089, 2004). Recent research raises the possibility that some fungi use the pigment melanin to extract energy from ionizing radiation, such as gamma radiation, for 'radiotrophic' growth. There is speculation that these properties of energy capture may have potential use in genetic engineering for development of biofuels, bioremediation of sites with radioactive contamination, and similar applications (Dadachova *et al.*, *PLoS ONE* **2** (5): e457, 2007).

Non-ionizing radiation effects are electromagnetic and do not carry enough energy per quantum to ionize atoms and molecules of fungi. Among them are near ultraviolet (UV), infrared and visible light radiation, etc. Some lethal effects of UV radiation on fungus spores are known (Zahl *et al.*, *J. gen. physiol.* **22**:

689, 1939; Dimond & Duggar, *Proc. nat. acad. sci. USA* **27**: 459, 1941; Ghar *et al.*, *Biocontrol Sci. Technol.* **16**: 451, 2006). UV radiation trigger sporogenesis in many fungi, and action spectra constructed for fungal sporogenesis typically have peaks at 280-290 nm (Leach & Trione, *Photochem. Photobiol.* **5**: 621, 1966; Leach, *In*: Booth (Ed.) *Methods in microbiology* **4**: 609, 1971) or near 360, 440, and 480 nm (Curtis, *Plant Physiol.* **49**: 235, 1972). Shortwave UV-B radiation (280-315 nm) influences distribution of fungi on leaf surfaces and its increase directly affects abundance of specific phylloplane fungi. Yeasts and yeast-like fungi such as *Aureobasidium pullulans* and *Sporobolomyces roseus* are reduced by supplemental levels of UV radiation, but *Alternaria* spp. and *Microdochium nivale* are less affected, while the most tolerant are *Cladosporium* spp. and *Epicoccum nigrum* (Newsham *et al.*, *New phytologist* **136**: 287, 1997). Sometimes UV radiation influence is unpredictable (Duguay & Klironomos *Appl. soil ecol.* **14**: 157, 2000). Solar UV radiation has been observed to reduce fungal growth on Antarctic soil surfaces. Exposure to solar radiation of >287 nm reduced hyphal extension rates of *Geomyces pannorum*, *Phoma herbarum*, *Pythium* sp., *Verticillium* sp., and *Mortierella parvispora*, each isolated from Antarctic terrestrial habitats. Short-wave solar UV radiation of between 287 and 305 nm inhibited growth of hyphae on and below the surface of an agar medium in a day, but radiation of ≥345 nm only reduced growth of surface hyphae (Hughes *et al.*, *Appl. environ. microbiol.* **69**: 1488, 2003).

Radiatispora Matsush. (1995), anamorphic *Pezizomycotina*, Hso.1bH.1. 1, China. See Matsushima (*Matsush. Mycol. Mem.* **8**: 32, 1995).

radicating (of stipes), like a root; rooting (Fig. 4H).

Radiomycetaceae Hesselt. & J.J. Ellis (1974), Mucorales. 3 gen. (+ 1 syn.), 5 spp.

Lit.: Kitz *et al.* (*Sabouraudia* **18**: 115, 1980), Benny & Khan (*Scanning Microscopy* **2**: 1199, 1988; ultrastr., sporangiolar appendage chemistry), Benny & Samson (*Mem. N. Y. bot. Gdn* **49**: 11, 1989; ultrastr.), Tanphaichitr *et al.* (*Mycoses* **33**: 303, 1990), Benny & Benjamin (*Mycol.* **83**: 713, 1991; key), Benny & Benjamin (*Mycol.* **83**: 713, 1991), Meis *et al.* (*J. Clin. Microbiol.* **32**: 3078, 1994), Ribes *et al.* (*Clin. Microbiol. Rev.* **13**: 236, 2000), Chakrabarti *et al.* (*J. Clin. Microbiol.* **41**: 783, 2003).

Radiomycopsis Pidopl. & Milko (1971) = Radiomyces fide Benny & Benjamin (*Mycol.* **83**: 713, 1991).

Radotinea Velen. (1934), ? Helotiales. 1, former Czechoslovakia.

radula spore (**radulaspore**, **radulospore**), one of the slimy spores borne over the surface of ascospores as in *Nectria coryli* while still in the ascus; **dry - -** = sympodulospore (Mason, 1933, 1937).

Radulaceae Gäum. (1926) = Valsaceae.

Radulidium Arzanlou, W. Gams & Crous (2007), anamorphic *Pezizomycotina*. 1. See Arzanlou *et al.* (*Stud. Mycol.* **58**: 57, 2007).

raduliform (of conidiogenous cells), the elongating conidiogenous axis resulting from holoblastic sympodial development, clavate or somewhat inflated rather than zig-zag; cf. rachiform.

Raduliporus Spirin & Zmitr. (2006), Polyporaceae. 1.

Radulochaete Rick (1940) nom. dub., Cantharellales. 'basidiomycetes' fide Donk (*Persoonia* **3**: 199, 1964).

Radulodon Ryvarden (1972), Meruliaceae. 9, widespread. See Ryvarden (*Česká Mykol.* **30**: 38, 1976; key), Hjortstam *et al.* (*Kew Bull.* **45**: 303, 1990; key).

Radulomyces M.P. Christ. (1960), Pterulaceae. 10, widespread. See Christiansen (*Dansk bot. Ark.* **19**: 230, 1960), Gilbertson & Nakasone (*Mycol.* **95**: 467, 2003; key Hawaiian spp.).

Radulum Fr. (1825) = Xenotypa fide Donk (*Taxon* **5**: 109, 1956).

Raesaeneniolichen Tomas. & Cif. (1952) = Polyblastia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Raesaeneniomyces Cif. & Tomas. (1953) ≡ Raesaeneniolichen.

Raffaelea Arx & Hennebert (1965), anamorphic *Ophiostoma*, Hso.0eH.10. 12, widespread. See Scott & du Toit (*TBMS* **55**: 181, 1970), Kubono & Ito (*Mycoscience* **43**: 255, 2002; Japan), Gebhardt & Oberwinkler (*Antonie van Leeuwenhoek* **88**: 61, 2005; ontogeny).

ragi, a starter for arrack, etc. composed of small balls of rice flour containing *Mucor*, *Rhizopus*, yeasts and bacteria (Hesseltine, *Mycol.* **57**: 163, 1965).

Ragnhildiana Solheim (1931) = Passalora fide Deighton (*Mycol. Pap.* **137**, 1974), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Raizadenia S.L. Srivast. (1981), anamorphic *Pezizomycotina*, Hsy.≡ eP.1. 1, India. See Srivastava (*Indian Phytopath.* **34**: 335, 1981).

Rajapa Singer (1945) = Termitomyces fide Singer (*Agaric. mod. Tax.*, 1951).

Ramakrishnanella Kamat & Ullasa ex Ullasa (1970), anamorphic *Pezizomycotina*, Cpd.0eP.?. 1, India. See Kamat & Ullasa ex Ullasa (*Bull. Torrey bot. Club* **97**: 255, 1970).

Ramakrishnania Ramachar & Bhagyan. (1979), Pucciniaceae. 1 (on *Ixora* (*Rubiaceae*)), India. See Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; syn. of *Gymnoconia*) Probably a *Puccinia* with atypical sporogeneous cells.

Ramalea Nyl. (1866), Cladoniaceae (L). 4, widespread. See Stenroos *et al.* (*Mycol. Progr.* **1**: 267, 2002; phylogeny), Printzen & Kantvilas (*Biblthca Lichenol.* **88**: 541, 2004; phylogeny).

Ramaleaceae Elenkin (1929) = Cladoniaceae.

Ramalia Bat. (1957), anamorphic *Dothideomycetes*. See Sutton & Pascoe (*Aust. Syst. Bot.* **1**: 79, 1988; synonymy with *Fusicladium*), Braun & Mouchacca

(*MR* **104**: 1009, 2000).

Ramalina Ach. (1809) nom. cons., Ramalinaceae (L). *c.* 246, widespread. See Howe (*Bryologist* **16**: 65, 1913), Howe (*Bryologist* **17**: 1, 1914), Krog & Swinscow (*Norw. Jl Bot.* **23**: 153, 1976; E. Afr.), Krog & James (*Norw. Jl Bot.* **24**: 15, 1977; Fennoscandia, UK), Krog & Østhagen (*Norw. Jl Bot.* **27**: 255, 1980; Canary Is.), Stevens (*Bull. Br. Mus. nat. hist.* Bot. **16**: 107, 1987; key 20 spp. Australia), Kashiwadani & Kalb (*Lichenologist* **25**: 1, 1993; key 22 spp. Brazil), Blanchon *et al.* (*J. Hattori bot. Lab.* **79**: 43, 1996; NZ), Groner & LaGreca (*Lichenologist* **29**: 441, 1997; DNA), LaGreca (*Bryologist* **102**: 602, 1999; DNA), Rosato & Scutari (*Mycotaxon* **74**: 141, 2000; Argentina), Alvarez *et al.* (*Cryptog. Mycol.* **22**: 271, 2001; chemistry, Spain), Kashiwadani & Nash (*Mycotaxon* **83**: 385, 2002; Mexico), Kashiwadani *et al.* (*J. Jap. Bot.* **77**: 351, 2002; Hawaii), Cordeiro *et al.* (*Phytochem.* **63**: 967, 2003; chemistry), Bannister *et al.* (*N.Z. Jl Bot.* **42**: 121, 2004; New Zealand), Joneson *et al.* (*Bryologist* **107**: 98, 2004; Kuril Is), Sparrius (*Biblthca Lichenol.* **89**, 2004; monogr.), Stocker-Wörgötter *et al.* (*Bryologist* **107**: 152, 2004; chemistry), Kashiwadani *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **32**: 161, 2006; China), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Aptroot & Bungartz (*Lichenologist* **39**: 519, 2007; Galápagos Is), Honegger & Zippler (*MR* **111**: 424, 2007; mating systems), Kashiwadani & Moon (*Biblthca Lichenol.* **96**: 145, 2007; Indonesia), Werth & Sork (*Am. J. Bot.* **95**: 568, 2008; genetic structure).

Ramalinaceae C. Agardh (1821), Lecanorales (L). 36 gen. (+ 27 syn.), 679 spp. Treated in a broad sense including *Bacidiaceae* and relatives.

Lit.: Stevens (*Bull. Br. Mus. nat. Hist.* Bot. **16**: 107, 1987), Culberson *et al.* (*Bryologist* **93**: 167, 1990), Rambold & Triebel (*Notes R. bot. Gdn Edinb.* **46**: 375, 1990), Culberson *et al.* (*Am. J. Bot.* **80**: 1472, 1993), Kashiwadani & Kalb (*Lichenologist* **25**: 1, 1993), Blanchon *et al.* (*J. Hattori bot. Lab.* **79**: 43, 1996), Spjut (*Sida* Bot. Misc. **14**: 208 pp., 1996), Groner & LaGreca (*Lichenologist* **29**: 441, 1997), Lumbsch (*Lichenologist* **30**: 357, 1998), LaGreca (*Bryologist* **102**: 602, 1999), LaGreca & Lumbsch (*Lichenologist* **33**: 172, 2001), Cordeiro *et al.* (*MR* **108**: 489, 2004), Stocker-Wörgötter *et al.* (*Bryologist* **107**: 152, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny), Næsborg *et al.* (*MR* **111**: 581, 2007; phylogeny).

Ramalinomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Ramalina.

Ramalinopsis (Zahlbr.) Follmann & Huneck (1969), Ramalinaceae (L). 1, Hawaii. See Riedl (*Sydowia* **28**: 134, 1977).

Ramalinora Lumbsch, Rambold & Elix (1995), Lecanoraceae (L). 1, Australia. See LaGreca & Lumbsch (*Lichenologist* **33**: 172, 2001).

Ramalodium Nyl. (1879), Collemataceae (L). 5, Japan; New Caledonia; Tasmania. See Henssen (*Lichenologist* **3**: 29, 1965), Henssen (*Nova Hedwigia* **68**: 117, 1999).

Ramaraomyces N.K. Rao, Manohar. & Goos (1989), anamorphic *Pezizomycotina*, Hsy.≡ eH.1. 1, India. See Rao *et al.* (*Mycol.* **81**: 790, 1989).

Ramaria Fr. ex Bonord. (1851) nom. cons., Gomphaceae. *c.* 220, widespread. See Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**: 124, 1950), Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**: 542, 1950), Mann & Stuntz (*Ramaria of western Washington*, 1973; keys), Petersen (*Biblthca Mycol.* **43**, 1975; subgen. *Lentoramaria*), Petersen (*Biblthca Mycol.* **79**, 1981; subgen. *Echinoramaria*), Humpert *et al.* (*Mycol.* **93**: 465, 2001; molecular phylogenetics), Christan & Hahn (*Z. Mykol.* **71**: 7, 2005; systematics), Nouhra *et al.* (*Mycorrhiza* **15**: 55, 2005; mycorrhizal spp.).

Ramaria Holmsk. (1790) nom. rej. = Clavulinopsis fide Donk (*Persoonia* **1**: 25, 1959).

Ramariaceae Corner (1970) = Gomphaceae.

Ramaricium J. Erikss. (1954), Gomphaceae. 3, widespread. See Ginns (*Bot. Notiser* **132**: 93, 1979), Villegas *et al.* (*Fungal Diversity* **18**: 157, 2005; sporal characters).

ramarioid, with a form similar to that of the basidioma of *Ramaria*.

Ramariopsis (Donk) Corner (1950), Clavariaceae. 44, widespread. See Petersen (*Mycol.* **61**: 557, 1967; key N. Am. spp.), Pegler & Young (*TBMS* **84**: 207, 1985; basidiospore structure), García-Sandoval *et al.* (*Mycotaxon* **82**: 323, 2002; Mexico), García-Sandoval *et al.* (*Mycotaxon* **94**: 265, 2005; phylogeny).

Ramasricellites Kalgutkar & Janson. (2000), Fossil Fungi, anamorphic *Ascomycota*. 1, Tibet. See Kalgutkar & Jansonius (*AASP Contributions Series* **39**: 259, 2000).

Ramboldia Kantvilas & Elix (1994), Lecanoraceae (L). 9, Australia; Papua New Guinea. See Kantvilas *et al.* (*Lichenologist* **31**: 213, 1999), Kantvilas & Elix (*Lichenologist* **39**: 135, 2007; key), Kalb *et al.* (*Nova Hedwigia* **86**: 23, 2008; phylogeny).

Ramgea Brumm. (1992), Thelebolaceae. 1, Netherlands. See Brummelen (*Persoonia* Suppl. **14**: 577, 1992), Brummelin (*Persoonia* **16**: 425, 1998), Hoog *et al.* (*Stud. Mycol.* **51**: 33, 2005).

Ramicandelaber Y. Ogawa, S. Hayashi, Degawa & Yaguchi (2001), Kickxellaceae. 2, Japan. See Ogawa *et al.* (*Mycoscience* **42**: 193, 2001), Kurihara *et al.* (*MR* **108**: 1143, 2004; n.sp. Japan), Ogawa *et al.* (*Nippon Kingakukai Kaiho* **46**: 13, 2005; phylogeny).

Ramicephala Voglmayr & Delg.-Rodr. (2003), anamorphic *Pezizomycotina*. 1 (aeroaquatic), Cuba. See Voglmayr & Delgado-Rodríguez (*MR* **107**: 237, 2003).

Ramichloridium Stahel ex de Hoog (1977), anamorphic *Mycosphaerellaceae*, Hso.0eP.10. 27, widespread. The genus is polyphyletic. See de Hoog *et al.* (*TBMS* **81**: 485, 1983; relationships with *Stenella* and *Veronaea*), Campbell & Al-Hedaithy (*J. Med. Vet. Mycol.* **31**: 325, 1993; *R. mackenziei*, phaeohyphomycosis of the brain), Samuels & Candoussau (*Nova Hedwigia* **62**: 47, 1996; teleomorph), Untereiner (*Mycol.* **89**: 120, 1997; teleomorph), Sutton *et al.* (*J. Clin. Microbiol.* **36**: 708, 1998; phaeohyphomycosis), Haase *et al.* (*Stud. Mycol.* **43**: 80, 1999; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Arzanlou *et al.* (*Stud. Mycol.* **58**: 57, 2007; phylogeny, polyphyly).

Ramicola Velen. (1929) = Simocybe fide Kuyper (*in litt.*).

ramicolous, living on branches.

Ramoconidiifera B. Sutton, Carmarán & A.I. Romero (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Argentina. See Sutton *et al.* (*MR* **100**: 1338, 1996).

ramoconidium, an apical branch of a conidiophore which secedes and functions as a conidium, as in

Cladosporium and *Subramaniomyces*.

Ramonia Stizenb. (1862), ? Gyalectaceae (L). 17, widespread. See Vězda (*Folia geobot. phytotax.* **2**: 311, 1967), Coppins (*Lichenologist* **19**: 409, 1987; key 4 Br. spp.), Coppins *et al.* (*Graphis Scripta* **6**: 89, 1994; Sweden), Lücking *et al.* (*Mycol.* **96**: 283, 2004; phylogeny).

Ramophialophora M. Calduch, Stchigel, Gené & Guarro (2004), anamorphic *Sordariales*. 1, Spain. See Calduch *et al.* (*Stud. Mycol.* **50**: 84, 2004).

Ramosiella Syd. & P. Syd. (1917) = Anhellia fide von Arx (*Persoonia* **2**: 421, 1963).

Ramosphaerella Laib. (1921) = Mycosphaerella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Ramsaysphaera H.D. Pflug (1978), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (*c.* 3400 million yr old Swartkoppie chert), S. Africa.

Ramsbottom (John; 1885-1974; England). Taxonomist (1910-1930) then Keeper of Botany (1930 onwards), British Museum (Natural History). Wrote extensively on many aspects of mycology including taxonomy, nomenclature, and history (q.v.) and did much to popularize the study of fungi. *Publs. Edible Fungi* (1944); *Poisonous Fungi* (1944); *Mushrooms and Toadstools; a Study of the Activities of Fungi* (1953). *Biogs, obits etc.* Gregory (*TBMS* **65**: 1, 1975) [portrait]; Grummann (1974: 411); Stafleu & Cowan (*TL-2* **4**: 574, 1983).

Ramsbottomia W.D. Buckley (1923), Pyronemataceae. 3, widespread (boreal; temperate). See Benkert & Schumacher (*Agarica* **6**: 28, 1985), Caillet & Moyne (*Bull. Soc. Hist. nat. Doubs* **84**: 9, 1991; keys), Kullman & van Brummelen (*Persoonia* **15**: 93, 1992), Yao & Spooner (*MR* **99**: 1521, 1995; Brit. spp.), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Ramularia Sacc. (1880) = Ramularia Unger fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Ramularia Unger (1833) nom. cons., anamorphic *Mycosphaerella*, Hso.0eH/≡ eH.3/10. 138 (causing leaf spots), widespread (esp. temperate). *R. vallisumbrosae* (*Narcissus* white mould). See Hughes (*TBMS* **32**: 50, 1949), Vimba (*The flora of the genus Ramularia Sacc. in the Latvian SSR*, 1970), Braun (*Int. J. Mycol. Lichenol.* **3**: 271, 1988), Deighton (*TBMS* **90**: 330, 1988; spp. on *Salix*), Sutton & Waller (*TBMS* **90**: 55, 1988; spp. on *Gramineae*), Braun (*Nova Hedwigia* **47**: 335, 1989), Braun (*Nova Hedwigia* **53**: 291, 1991; related genera), Braun & Sutton (*Taxon* **112**: 656, 1991; conservation), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**, 1995), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 11, 1998; monogr., subgen. keys), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Goodwin *et al.* (*Phytopathology* **91**: 648, 2001; phylogeny), Braun *et al.* (*Australas. Pl. Path.* **34**: 509, 2005; checklist, Australia), Havis *et al.* (*FEMS Microbiol. Lett.* **256**: 217, 2006; on *Hordeum*).

Ramulariaceae Nann. (1934) = Mycosphaerellaceae.

Ramulariites Babajan & Tasl. (1973), Fossil Fungi. 1 (Tertiary), former USSR.

Ramulariopsis Speg. (1910), anamorphic *Mycosphaerella*, Hso.1-≡ eH.3. 4, S. America. See Deighton (*TBMS* **59**: 185, 1972), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**: 313, 1998; key).

Ramulariospora Bubák (1914) = Phacidiella P. Karst. fide Sutton (*Mycol. Pap.* **141**, 1977).

Ramularisphaerella Kleb. (1918) = Mycosphaerella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Ramularites Pia (1927), Fossil Fungi. 1 (Oligocene), Europe.

Ramulaspera Lindr. (1902), anamorphic *Pezizomycotina*, Hso.0eH.?. 2, Europe. See Griffiths (*TBMS* **40**: 232, 1957).

Ramulina Velen. (1947) [non *Ramulina* Thurm. 1863, fossil ? *Algae*] = Pseudombrophila fide Svrček (*Acta Mus. Nat. Prag.* **32B**: 115, 1976).

Ramulispora Miura (1920), anamorphic *Mycosphaerellaceae*, Cpd.≡ eH.10. 18, widespread (temperate). See also *Oculimacula* and *Helgardia*. See Rawla (*TBMS* **60**: 285, 1973), von Arx (*Proc. K. ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **86**: 36, 1983; syn. with *Pseudocercosporella*), Wallwork & Spooner (*TBMS* **91**: 703, 1988; *Tapesia* teleomorph of *P. herpotrichoides*), Creighton (*Pl. Path.* **38**: 484, 1989; identification of W-type and R-type isolates of *P. herpotrichoides*), Nicholson *et al.* (*Pl. Path.* **40**: 584, 1991; DNA markers for classification of *P. herpotrichoides*), Fitt *in* Singh *et al.* (Eds) (*Plant Diseases of International importance: diseases of Cereals and Pulses*, 1992), Priestley *et al.* (*Pl. Path.* **41**: 591, 1992; comparison of isoenzyme and DNA markers for *P. herpotrichoides*), Thomas *et al.* (*J. Gen. Microbiol.* **138**: 2305, 1992; identification of R- and W-types of *P. herpotrichoides* by DNA probes), Frei & Wenzel (*J. Phytopath.* **139**: 229, 1993; genomic DNA gene probes), Hocart *et al.* (*MR* **97**: 967, 1993; parasexuality), Nicholson & Rezanoor (*MR* **98**: 13, 1994; identification of pathotypes of *P. herpotrichoides* by random amplified polymorphic DNA), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**, 1995), Robbertse *et al.* (*S. Afr. J. Bot.* **61**: 43, 1995; spp. causing eyespot of wheat), Stewart *et al.* (*MR* **103**: 1491, 1999), Kwasna *et al.* (*MR* **104**: 765, 2000; UK), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Goodwin *et al.* (*Phytopathology* **91**: 648, 2001; phylogeny), Crous *et al.* (*Eur. J. Pl. Path.* **109**: 841, 2003; phylogeny, separation of eyespot disease-causing spp.).

ramus (1) (pl. **-i**), a branch (Lat.); (2) (of a penicillus), a cell bearing a verticil of 'metulae' and phialides.

ramycin, see fusidic acid.

rangiferoid, branched like a reindeer's horn.

Ranojevicia Bubák (1910), anamorphic *Pezizomycotina*, Hsp.0eH.?. 1, Europe.

Rapacea E. Horak (1999) = Cortinarius fide Peintner *et al.* (*Mycotaxon* **83**: 447, 2002).

RAPD, see Molecular biology.

Raperia Subram. & Rajendran (1976) = Aspergillus fide Samson (*Stud. Mycol.* **18**: 1, 1979), von Arx (*Mycotaxon* **26**: 119, 1986; teleom. and affinities with *Onygenaceae*), Pitt *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 9, 2000; synonym).

Raphanozon P. Kumm. (1871) nom. rej. ≡ Telamonia.

raphe (of *Chaetomella*), the longitudinal dehiscence mechanism. See Di Cosmo & Cole (*CJB* **58**: 1129, 1980; ultrastr. development).

raphides, needle-shaped crystals; as hyphae inside some lichen thalli.

Raphiospora A. Massal. (1853) nom. rej. = Arthrorhaphis fide Jørgensen & Santesson (*Taxon* **42**: 881,

1993).

Rasutoria M.E. Barr (1987), Euantennariaceae. 4, widespread (tropical). Perhaps better placed in *Mycosphaerellaceae*, but molecular data are inconclusive. See Barr (*Mycotaxon* **29**: 501, 1987), Winton *et al.* (*Mycol.* **99**: 240, 2007; phylogeny).

Ratnagiriathyrites R.K. Saxena & N.K. Misra (1990), Fossil Fungi, Ascomycota. 1. See Saxena & Misra (*Palaeobotanist* **38**: 268, 1989).

Ravenelia Berk. (1853), Raveneliaceae. *c.* 200 (on *Leguminosae* esp. *Mimosoideae*, 1 on *Zygophyllaceae*), widespread (tropical to subtropical). *R. esculenta* is edible. See Narasimhan & Thirumalachar (*Phytopath. Z.* **41**: 97, 1961; *R. esculenta*) See, Hiremath & Pavgi (*Mycopathologia* **59**: 95, 1976; morphology), Cummins (*Rust fungi on legumes and composites in North America*, 1978; key 61 spp.), El-Gazzar (*Symb. Bot. Upsal.* **44**: 182, 1979), Mordue (*TBMS* **90**: 473, 1988; SEM of III), Hennen & Cummins (*Rep. Tottori Mycol. Inst.* **28**: 1, 1990), Berndt (*MR* **101**: 23, 1997; haustorial types), Rezende & Dianese (*Fitopatol. Brasil* **26**: 627, 2001; Brazilian cerrado), Hernández & Hennen (*MR* **106**: 954, 2002; Argentina), Wood (*South African Journal of Botany* **72**: 534, 2006; southern African).

Raveneliaceae Leppik (1972), Pucciniales. 26 gen. (+ 14 syn.), *c.* 323 spp.

Lit.: Savile (*CJB* **67**: 2983, 1989), Reenen & Merwe (*Phytophylactica* **24**: 127, 1992), Berndt (*MR* **101**: 23, 1997), Hennen *et al.* (*Mycol.* **90**: 1079, 1998), Gjærum *et al.* (*Lidia* **5**: 91, 2000), Hennen (*Mycol.* **92**: 315, 2000), Hernández & Hennen (*MR* **106**: 954, 2002), Ono (*Mycoscience* **43**: 421, 2002), Cummins & Hiratsuka (*Illustr. Reduviasporonites L.R. Wilson (1962), Fossil Fungi. 1 (Permian), USA.

Reference collections. For fungi, reference collections are essential to secure the application of scientific

names (see Nomenclature), to serve as vouchers supporting the occurrence of species or material used in research, and as the raw materials for new systematic and other investigations. As for animals and plants, fungal reference collections are also, no less than art galleries and great libraries, an irreplaceable part of the cultural heritage of each country, although this is rarely recognized. Reference collections of fungi are of two main types: (1) Genetic resource collections (q.v.; culture collections) hold material in a living or metabolically inactive state from which they can be resuscitated; and (2) Reference collections of non-living material, including dried specimens attached to plant, rock or other substrata, dried cultures, microscope slides, colour transparencies, drawings and paintings, and ultrastructural mounts. Collections of dried fungal material have often been referred to inappropriately as herbaria (q.v.), but as fungi are not plants, and not always kept with plants, the more general term is preferable, particularly where living and dried material are stored by the same institution.

An immense amount of information related to knowledge of the distribution and ecology of fungi is stored in the world's mycological collections; this is increasingly being captured in computerized databases so that it can be made more accessible, and a substantial but still small proportion of that information is already available on-line (see Internet).

Most institutional collections have unique acronyms (generally retained unchanged despite name changes of the institutions), a selection of which are included in this edn of the *Dictionary* (e.g. **BPI**, **DAOM**, **IMI**, **K**, **L**, **LE**, **UPS**); collections of living cultures are given acronyms by the World Data Center for Microorganisms (see Genetic resource collections) - where possible the same acronym is used under both systems, and compatibility is maintained with acronyms used for plant reference collections. Acronyms are commonly associated with collection accession numbers in mycological publications to make it clear what material was employed.

Lit.: **General** (see also Internet: Fungal reference collections): Hall & Minter (*International mycological directory*, edn 3, 1994), Hawksworth (*Mycologist's handbook*, 1974), Laundon (*Lichenologist* **11**: 1, 1974).

Regional: **Australia**, Walker (*Mycological herbaria and culture collections in Australia*, 1980); **British Isles**, Hawksworth & Seaward (*Lichenology in the British Isles 1568-1975*, 1977), Kent & Allen (*British and Irish herbaria*, 1984); **Germany**, Scholz (*Boletus* **12**(2): 33, 1989; lichens); **Israel**, Ferber (*Israel national collections of natural history*, 1985); **Italy**, Ciferri (*Taxon* **1**: 126, 1952), Tretiach & Passadore (*Notiz. Soc. Lich. Ital.* **3** (*Suppl.*), 1990); **New Zealand**, Wright (*N.Z. reflexed (of an edge), turned up or back (Fig. 19G).

Refractohilum D. Hawksw. (1977), anamorphic *Pezizomycotina*, Hso.0eH/≡ eH.19. 6 (on lichens), widespread (temperate). See Hawksworth (*J. Linn. Soc.* Bot. **75**: 204, 1977), Castañeda Ruíz *et al.* (*Mycotaxon* **68**: 23, 1998).

Regiocrella P. Chaverri & K.T. Hodge (2006), Clavicipitaceae. 2, Cameroon; China. See Chaverri & Hodge (*Mycol.* **97**: 1232, 2005).

Rehm (Heinrich; 1828-1916; Germany). Student, Erlangen, München, Heidelberg; Dr med. (1852); medical studies, Prague then Vienna (1853-1854); physician (1854-1898). In his time, the foremost expert on ascomycetes, particularly discomycetes, particularly from central Europe, but also from North America, the Philippines and South America. Most specimens in the fungal reference collection in Stockholm (S). *Publs.* Ascomyceten: Hysteriaceen und Discomyceten. *Rabenhorst?s Kryptogamen-Flora von Deutschland, Oesterreich und der Schweiz* (1896). *Biogs, obits etc.* Anon. (*Österreichische Botanische Zeitschrift* **66**: 212, 1916); Grummann (1974: 39); Stafleu & Cowan (*TL-2* **4**: 652, 1983).

Rehmia Kremp. (1861) = Rhizocarpon fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Rehmiella G. Winter (1883) = Gnomonia fide Barr (*Mycol. Mem.* **7**: 232 pp., 1978).

Rehmiellopsis Bubák & Kabát (1910) = Delphinella fide Barr (*Contr. Univ. Mich. Herb.* **9**, 1972).

Rehmiodothis Theiss. & Syd. (1914), Phyllachoraceae. 7 (on living leaves of *Melastomataceae*), Asia. Possibly belongs rather to the Dothideomycetes. See Katumoto (*TMSJ* **32**: 37, 1991), Pearce & Hyde (*Fungal Diversity Res. Ser.* **17**: 308 pp., 2006; Australia).

Rehmiomycella E. Müll. (1962), Dothideomycetes. 1, Brazil. See Müller (*Beitr. Kryptfl. Schweiz* **11** no. 2: 601, 1962).

Rehmiomyces (Sacc. & P. Syd.) Syd. (1904) ≡ Rehmiomycella.

Rehmiomyces Henn. (1904) = Dictyonia fide Clements & Shear (*Gen. Fung.*, 1931).

Reichlingia Diederich & Scheid. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1 (lichenicolous), Germany. See Diederich & Scheidegger (*Bull. Soc. Nat. luxemb.* **97**: 4, 1996).

Reimnitzia Kalb (2001), Thelotrematаceae (L). 1, widespread. See Kalb (*Mycotaxon* **79**: 325, 2001), Frisch (*Biblthca Lichenol.* **92**: 3, 2006).

reindeer lichen (-moss), mainly *Cladonia stellaris* and *C. rangiferina*, species grazed by reindeer and caribou. Partially digested thalli from stomach contents of freshly-killed reindeer are highly nutritious, rich in vitamins A and B, and considered a delicacy by some native peoples. Affected by radiation pollution, particularly from Chernobyl, leading to food-chain concerns (Skuterud *et al.*, *J. Env. Radioactivity* **83**: 231, 2005).

Reinkella Darb. (1897) = Roccella fide Choisy (*Bull. Soc. bot. Fr.* **104**: 333, 1957), Tehler (*CJB* **68**: 2458, 1990; cladistics), Follmann (*Biblthca Lichenol.* **67**: 14, 1997), Tehler *et al.* (*Symb. bot. upsal.* **32** no. 1: 255, 1997; on *Roccella*), Myllys *et al.* (*Bryologist* **101**: 70, 1998; phylogeny).

Reinkellomyces Cif. & Tomas. (1953) ≡ Reinkella.

Reisneria Velen. (1922) = Gloeophyllum fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Relhanum Gray (1821) ≡ Verpa.

Relicina (Hale & Kurok.) Hale (1974), Parmeliaceae (L). 48, widespread. See Hale (*Smithson. Contr. bot.* **26**, 1975; monogr.), Elix (*Biblthca Lichenol.* **62**, 1996; revision), Elix (*Mycotaxon* **69**: 129, 1998; key), Noicharoen *et al.* (*Mycotaxon* **85**: 325, 2003; Thailand), Blanco *et al.* (*Mol. Phylogen. Evol.* **39**: 52, 2006; phylogeny), Divakar *et al.* (*Mol. Phylogen. Evol.* **40**: 448, 2006; phylogeny).

Relicinopsis Elix & Verdon (1986), Parmeliaceae (L). 5, S. Africa; Australasia. See Elix & Verdon (*Mycotaxon* **27**: 281, 1986), Divakar & Upreti (*Parmelioid Lichens in India* (A Revisionary Study), 2005).

religion (use of mushrooms in), see entheogen, ethnomycology, hallucinogenic fungi, soma.

Remersonia Samson & Seifert (1997), anamorphic *Pezizomycotina*, Hso.?.?. 1, Europe. See Seifert *et al.* (*CJB* **75**: 1160, 1997).

Remispora Linder (1944), Halosphaeriaceae. 6 (marine), widespread. See Johnson *et al.* (*Bot. Mar.* **27**: 557, 1984), Manimohan *et al.* (*MR* **97**: 1190, 1993).

Remleria Raitv. (2004), Hyaloscyphaceae. 1, widespread. See Raitviir (*Scripta Mycologica* Tartu **20**: 109, 2004).

remote (of lamellae), proximal end free and at some distance from the stipe.

Renatobasidium Hauerslev (1993), Auriculariales. 1, Europe. See Hauerslev (*Mycotaxon* **49**: 228, 1993).

reniform, kidney-like in form; fabiform (Fig. 23.7).

Reniforma Pore & Sorenson (1990), anamorphic *Microbotryales*. 1 (basidiomycetous yeast), USA. See Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Scorzetti *et al.* (*FEMS Yeast Research* **2**: 495, 2002; phylogeny), Aime *et al.* (*Mycol.* **98**: 896, 2006; phylogeny).

Renispora Sigler & J.W. Carmich. (1979), Onygenaceae. Anamorph *Chrysosporium*. 1, USA. See Sugiyama *et al.* (*Mycoscience* **40**: 251, 1999; DNA), Sugiyama & Mikawa (*Mycoscience* **42**: 413, 2001; phylogeny).

repand (of a pileus), having a waved edge which is turned back.

repeating spore, a spore which gives rise to the same type of mycelium as that on which it developed.

repetition (spore germination by), producing a new spore like the first.

Repetobasidiaceae Jülich (1982) = Hydnaceae.

Repetobasidiellum J. Erikss. & Hjortstam (1981), Hydnaceae. 1, widespread (northern Europe). See Pegler & Roberts (*Mycologist* **14**: 52, 2000; UK).

Repetobasidiopsis Dhingra & Avneet P. Singh (2006), Polyporales. 1, India. See Dhingra & Singh (*Mycotaxon* **97**: 116, 2006).

Repetobasidium J. Erikss. (1958), Agaricomycetes. 11, widespread. *Hymenochaetales* or *Agaricales* (*Rickenella* clade). See Eriksson (*Symb. bot. upsal.* **16** no. 1: 67, 1958).

Repetophragma Subram. (1992), anamorphic *Dothideomycetes*, Hso.≡ eP.19. 11, widespread. See Subramanian (*Proc. Indian natn Sci. Acad.* Part B. Biol. Sci. **58**: 185, 1992), Shenoy *et al.* (*MR* **110**: 916, 2006; phylogeny).

reproductocentric (of *Chytridiales*), having development of one (**mono-**, **monogenocentric**) or more reproductive structures at the centre of gravity of the thallus; genocentric. See Karling (*Am. J. Bot.* **19**: 54, 1932). Cf. mono- and polycentric.

Requienella Fabre (1883), Requienellaceae (±L). 3, widespread (north temperate). See Boise (*Mycol.* **78**: 37, 1986), Aptroot (*Biblthca Lichenol.* **44**, 1991; monogr.).

Requienellaceae Boise (1986), Pyrenulales. 7 gen. (+ 2 syn.), 21 spp.

Lit.: Boise (*Mycol.* **78**: 37, 1986), Harris (*Mem. N. Y. bot. Gdn* **49**: 74, 1989), Aptroot (*Biblthca Lichenol.* **44**, 1991), Alias *et al.* (*MR* **100**: 580, 1996), Poonyth *et al.* (*Fungal Diversity* **4**: 101, 2000).

Resendea Bat. (1961), ? Microthyriaceae. 2, S. America. See Batista (*Brotéria* Sér. Ci. Nat. **30**: 87, 1961).

Resinicium Parmasto (1968), Agaricomycetes. 5, widespread. *Hymenochaetales* or *Agaricales* (*Rickenella* clade). See Parmasto (*Consp. System. Corticiac.*: 97, 1968).

Resinomycena Redhead & Singer (1981), Mycenaceae. 8, N. America. See Redhead & Singer (*Mycotaxon* **13**: 151, 1981), Antonín & Noordeloos (*A monograph of the genera Hemimycena,* □, 2004).

Resiomeria J.I.R. Larsson (1986), Microsporidia. 1. See Larsson (*Protistologica* **22**: 379, 1986).

resistance, the power of an organism to overcome, completely or in some degree, the effect of a pathogen or other damaging factor. **acquired -**, a non-inherited resistance response in a normally susceptible host following a predisposing treatment. See immunity, axeny.

resistant sporangium, see meiosporangium.

resting sporangium, see meiosporangium.

resting spore (1) a spore germinating after a resting period (frequently after overwintering), as does an oospore or a teliospore; a 'winter spore'; (2) an encysted zygote formed after the fusion of gametes, meiosis occuring on germination to produce planospores which encyst to produce gametes (*Blastocladiales*).

Restiosporium Vánky (2000), Websdaneaceae. 21 (in seeds of *Restionaceae*), Australia. See Vánky (*Mycotaxon* **74**: 343, 2000), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002; New Zealand), Vánky & Shivas (*Fungal Diversity* **14**, 2003; Australia), Vánky (*Mycol. Balcanica* **3**: 19, 2006; key).

Resupinataceae Jülich (1982) nom. rej. = Tricholomataceae.

resupinate (of basidiomata), flat on the substrate with the hymenium on the outer side.

Resupinatus Nees ex Gray (1821) nom. rej., Tricholomataceae. *c.* 20, widespread. See Thorn *et al.* (*Mycol.* **92**: 241, 2000; phylogeny), Thorn *et al.* (*Mycol.* **97**: 1140, 2005; Puerto Rico).

retention (of surfaces), the ability of a surface to hold a fungicide or other crop protectant. Cf. adherance.

Retiarius D.L. Olivier (1978), anamorphic *Pezizomycotina*, Hso.1bH.10. 2 (on pollen), S. Africa. See Olivier (*TBMS* **71**: 193, 1978).

Retiboletus Manfr. Binder & Bresinsky (2002), Boletaceae. 5, north temperate. See Binder & Bresinsky (*Feddes Repert.* **113**: 36, 2002).

Reticellites D.L.E. Glass, D.D. Br. & Elsik (1987), Fossil Fungi. 1 (upper Eocene), USA. See Ethridge Glass *et al.* (*Pollen Spores* **28**: 414, 1986).

Reticularia Baumg. (1790) = Lobaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

reticulate, like a net; netted (Fig. 20.12).

Reticulatisporonites Elsik (1968), Fossil Fungi. 1 (Paleocene), USA.

Reticulocephalis Benny, R.K. Benj. & P.M. Kirk (1992), Sigmoideomycetaceae. 2, USA; British Isles.

Reticulosporidium Thor (1930) nom. dub., ? Fungi.

Retidiporites C.P. Varma & Rawat (1963), Fossil Fungi ? Fungi. 1 (Eocene), India.

Retigerus Raddi (1829) = Phallus fide Stalpers (*in litt.*).

Retihelicosporonites Ramanujam & Rao (1979), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Miocene), India. ? Fossil *Hiospira.*

Retinocyclus Fuckel (1871) ≡ Tromera A. Massal. ex Körb.

Retocybe Velen. (1947) = Delicatula fide Kuyper (*in litt.*).

retraction septum, see septum (adventitious).

Retroa P.F. Cannon (1991), Phyllachoraceae. 2 (on living legume leaves), S. America. See Cannon (*Mycol. Pap.* **163**, 1991).

Retroconis de Hoog & Bat. Vegte (1989), anamorphic *Pezizomycotina*, Hso.0eP.3. 1, old world. See de Hoog & Batenburg-van der Vegte (*Stud. Mycol.* **31**: 99, 1989).

retroculture, a reisolate of a pathogen from a host into which it had been experimentally introduced.

retroneme, a bipartite tubular hair.

retrorse, backward.

Retrostium Nakagiri & Tad. Ito (1997), ? Spathulosporaceae. 1 (on marine red algae), Japan. See Nakagiri & Ito (*Mycol.* **89**: 484, 1997).

revalidated, see devalidated.

revolute, having the edge rolled back or up (Fig. 19H).

Reyesiella Sacc. (1917) ≡ Anthomycetella.

Reymanella Marcink. (1979), Fossil Fungi. 1 (Jurassic), Poland.

RFLP, see Molecular biology.

Rhabdium P.A. Dang. (1903) [non *Rhabdium* Wallr. 1833, *Algae*] = Harpochytrium fide Atkinson (*Ann. mycol.* **1**: 479, 1903).

Rhabdoclema Syd. (1939), anamorphic *Pezizomycotina*, Cpd.0eH.?. 2, S. America.

Rhabdocline Syd. (1922), Hemiphacidiaceae. Anamorphs *Meria*, *Rhabdogloeum*. 3, widespread (north temperate). *R. pseudotsugae* (needle cast of *Pseudotsuga menziesii*). See Parker & Reid (*CJB* **47**: 1533, 1969; infraspecific taxa), Sherwood-Pike *et al.* (*CJB* **64**: 1849, 1986), Stone (*CJB* **65**: 2614, 1987; devel.), Gernandt *et al.* (*Mycol.* **89**: 735, 1997; DNA), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Stone & Gernandt (*Mycotaxon* **91**: 115, 2005; revision), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Rhabdodiscus Vain. (1921) = Ocellularia fide Hale (*Bull. Br. Mus. nat. hist.* Bot. **8**: 227, 1981).

Rhabdogloeopsis Petr. (1925), anamorphic *Pezizomycotina*, Cac.0eH.10. 1, USA.

Rhabdogloeum Syd. (1922), anamorphic *Rhabdocline*, Cac.0eH.15. 3, N. America. See Stone & Gernandt (*Mycotaxon* **91**: 115, 2005).

Rhabdomyces Balbiani (1889), anamorphic *Pezizomycotina*, Hso.?.?. 1, France.

Rhabdopsora Müll. Arg. (1888), Verrucariaceae (L). 1, Brazil. See Hawksworth (*SA* **9**: 24, 1991).

Rhabdopsoromyces Cif. & Tomas. (1953) ≡ Rhabdopsora.

Rhabdospora (Durieu & Mont. ex Sacc.) Sacc. (1884) nom. cons., anamorphic *Mycosphaerellaceae*, Cpd.≡ fH.?. 151, widespread. See Verkley & Priest (*Stud. Mycol.* **45**: 123, 2000; status).

Rhabdosporium, see *Rabdosporium.*

Rhabdostroma Syd. & P. Syd. (1916) = Apiospora fide Barr (*Mycol.* **68**, 1976).

Rhabdostromella Höhn. (1915), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Rhabdostromellina Höhn. (1917) = Coleophoma fide Sutton (*Mycol. Pap.* **141**, 1977).

Rhabdostromina Died. (1921) = Coleophoma fide Petrak (*Annls mycol.* **27**: 324, 1929).

Rhabdothyrella Höhn. (1917) = Leptothyrium fide Clements & Shear (*Gen. Fung.*, 1931).

Rhabdothyrium Höhn. (1915) = Leptothyrium fide Clements & Shear (*Gen. Fung.*, 1931).

Rhachomyces Thaxt. (1895), Laboulbeniaceae. *c.* 71, widespread. See Balazuc (*Annls Soc. ent. Fr.* N.S. **6**: 677, 1970), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Santamaría (*Nova Hedwigia* **68**: 351, 1999; Spain), Hughes *et al.* (*Mycol.* **96**: 1355, 2004; New Zealand), Rossi (*Nova Hedwigia* **83**: 129, 2006; on cave beetles), Santamaría & Faille (*Nova Hedwigia* **85**: 159, 2007; Pyrenees).

Rhacodiella Peyronel (1919) = Myrioconium Syd. fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Rhacodiopsis Donk (1975) ≡ Racodium Fr.

Rhacodium, see *Racodium Fr.*

Rhacophyllus Berk. & Broome (1871), anamorphic *Coprinus*. 1, Asia; Africa. See Petch (*TBMS* **11**: 238, 1926), Redhead *et al.* (*Taxon* **49**: 789, 2000; anamorphic of *Coprinopsis clastophyllus*).

Rhadinomyces Thaxt. (1893) ? = Corethromyces fide Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

rhagadiose, having deep cracks.

Rhagadolobium Henn. & Lindau (1896), Parmulariaceae. 10 (on *Pteridophyta*), widespread (esp. tropical). See Dingley (*N.Z. Jl Bot.* **10**: 74, 1972; NZ), Swart (*TBMS* **91**: 581, 1988; on *Dicksonia*).

Rhagadostoma Körb. (1865), Nitschkiaceae. 6 (lichenicolous), Europe. See Hawksworth (*TBMS* **74**: 363, 1980), Navarro-Rosinés & Hladun (*Bull. Soc. linn. Provence* **45**: 431, 1994), Navarro-Rosinés *et al.* (*Bull. Soc. linn. Provence* **50**: 233, 1999).

Rhagadostomella Etayo (2002), Nitschkiaceae. 1 (lichenicolous), Colombia. See Etayo (*Biblthca Lichenol.* **84**: 109, 2002).

Rhagidiasporidium Thor (1930) nom. dub., ? Fungi.

Rhamphoria Niessl (1876), ? Annulatascaceae. Anamorph *Phaeoisaria*-like. 9 (from wood), widespread (esp. temperate). See Sivanesan (*TBMS* **67**: 469, 1976), Réblová & Winka (*Mycol.* **93**: 478, 2001; DNA), Campbell & Shearer (*Mycol.* **96**: 822, 2004; phylogeny), Réblová (*Mycol.* **98**: 68, 2006).

Rhamphosphaeria Kirschst. (1936), Pezizomycotina. 1, Europe.

Rhamphospora D.D. Cunn. (1888), Rhamphosporaceae. 1 (on leaf of *Nymphaeaceae*), widespread. See Reid (*TBMS* **52**: 25, 1969), Vánky (*Illustrated genera of smut fungi*, 1987).

Rhamphosporaceae R. Bauer & Oberw. (1997), Doassansiales. 1 gen., 1 spp.

Lit.: Vánky (*Cryptog. Stud.* **1**: 159 pp., 1987), Bauer *et al.* (*CJB* **75**: 1273, 1997), Begerow *et al.* (*CJB* **75**: 2045, 1998), Begerow *et al.* (*MR* **106**: 1392, 2002), Begerow *et al.* (*Mycol. Progr.* **1**: 187, 2002).

Rhaphidicyrtis Vain. (1921), Pyrenulales (L). 1, widespread (temperate). See Aguirre-Hudson (*Bull. Br. Mus. nat. hist.* Bot. **21**: 85, 1991).

Rhaphidophora Ces. & De Not. (1863) [non *Rhaphidophora* Hassk. 1842, *Araceae*] = Gaeumannomyces fide Walker (*Mycotaxon* **11**: 1, 1980).

Rhaphidospora Fr. (1849) [non *Rhaphidospora* Nees 1832, *Acanthaceae*] ≡ Rhaphidophora.

Rheophila Cépède & F. Picard (1907) = Peyritschiella fide Cépède & Picard (*Bull. Sci. Fr. Belg.* **42**: 251, 1908).

Rheumatopeltis F. Stevens (1927) = Trabutia fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Rhexoacrodictys W.A. Baker & Morgan-Jones (2002), anamorphic *Pezizomycotina*, H?.?.?. 4, widespread. See Baker *et al.* (*Mycotaxon* **82**: 98, 2002), Baker & Morgan-Jones (*Mycotaxon* **85**: 371, 2003).

Rhexoampullifera P.M. Kirk (1982), anamorphic *Pezizomycotina*, Hso.≡ eP.40. 1, British Isles; Brazil. See Kirk (*TBMS* **78**: 299, 1982), Castañeda *et al.* (*Mycol.* **93**: 168, 2001).

Rhexocercosporidium U. Braun (1994), anamorphic *Helotiales*, Hso.≡ eP.11. 1, Europe; Canada. See Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**, 1995), Reeleder *et al.* (*Phytopathology* **96**: 1243, 2006; on ginseng), Reeleder (*Mycol.* **99**: 91, 2007; on ginseng).

Rhexodenticula W.A. Baker & Morgan-Jones (2001), anamorphic *Pezizomycotina*. 2, Cuba; S. Africa. See Baker *et al.* (*Mycotaxon* **79**: 363, 2001), Mel'nik *et al.* (*Mycol. Progr.* **3**: 19, 2004; S Africa).

Rhexographium M. Morelet (1995) = Graphium fide Morelet (*Annales de la Société des Sciences Naturelles et d'Archéologie de Toulon et du Var* **47**: 90, 1995), Jacobs *et al.* (*Mycol.* **95**: 714, 2003).

rhexolytic, secession of conidia involving the circumscissile splitting of the periclinal wall of the cell below the basal conidial septum (Cole & Samson, *Patterns of development in conidial fungi*, 1979) rather than the septum itself; fracture. Cf. schizolytic.

Rhexophiale Th. Fr. (1860) = Sagiolechia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Henssen (*Biblthca Lichenol.* **58**: 123, 1995).

Rhexoprolifer Matsush. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Transvaal. See Matsushima (*Matsush. Mycol. Mem.* **9**: 24, 1996).

Rhexosporium Udagawa & Furuya (1977), Sordariales. 1, Japan. See Udagawa & Furuya (*TMSJ* **18**: 302, 1977).

Rhexothecium Samson & Mouch. (1975), Eremomycetaceae. Anamorph *Trichosporiella*-like. 1, Egypt; Kenya. See Malloch & Sigler (*CJB* **66**: 1929, 1988).

Rhinocephalum Kamyschko (1961) = Arthrinium fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Rhinocladiella Kamyschko (1960) [non *Rhinocladiella* Nannf. 1934] = Chrysosporium fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Rhinocladiella Nannf. (1934), anamorphic *Capronia*, Hso.0eH.10. 10, widespread. See cellar fungus. See de Hoog (*Stud. Mycol.* **15**, 1977), Onofri & Castagnola (*Mycotaxon* **18**: 337, 1983; gen. synonymy), Iwatsu *et al.* (*Mycotaxon* **28**: 199, 1987; conidiogenesis), Untereiner (*Mycol.* **89**: 120, 1997; teleomorph), Haase *et al.* (*Stud. Mycol.* **43**: 80, 1999; phylogeny), Untereiner & Naveau (*Mycol.* **91**: 67, 1999; phylogeny), Hoog *et al.* (*J. Clin. Microbiol.* **41**: 4767, 2003), Tribe *et al.* (*Mycologist* **20**: 171, 2006).

Rhinocladiopsis Kamyschko (1961) = Chrysosporium fide Carmichael (*in litt.*).

Rhinocladium Sacc. & Marchal (1885), anamorphic *Pezizomycotina*, Hso.0eP.1. 9, widespread. See Mercado Sierra & Castañeda Ruiz (*Acta Bot. Cubana* **50**: 1, 1987; Cuba), Furlanetto & Dianese (*MR* **100**: 244, 1996; Brazil), Mercado Sierra *et al.* (*Mycotaxon* **63**: 155, 1997; Mexico).

Rhinodinomyces E.A. Thomas ex Cif. & Tomas. (1953) = Rinodina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

rhinosporidiosis, polypoid growths in the nose and other organs of humans, horse, etc., caused by *Rhinosporidium seeberi* [formerly classified among the fungi, now considered to be a protozoan].

Rhinotrichella G. Arnaud ex de Hoog (1977), anamorphic *Pezizomycotina*, Hso.0eP.10. 2, Japan. See Matsushima & Matsushima (*Matsush. Mycol. Mem.* **8**: 45, 1995), Crous *et al.* (*S. Afr. J. Bot.* **62**: 89, 1996).

Rhinotrichum Corda (1837) nom. dub., anamorphic *Pezizomycotina*. See Carmichael *et al.* (*Genera of Hyphomycetes*, 1980).

Rhipidiomyces Thaxt. (1926), Laboulbeniaceae. 1, S. America. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Rhipidium Wallr. (1833) nom. rej. ≡ Schizophyllum.

Rhipidocarpon (Theiss.) Theiss. & Syd. (1915), Parmulariaceae. 1, Java; Philippines.

Rhipidocephalum Trail (1888), anamorphic *Pezizomycotina*, Hso.0eH.?. 1, British Isles.

Rhipidonema Mattir. (1881) = Dictyonema C. Agardh ex Kunth fide Parmasto (*Nova Hedwigia* **29**: 99, 1978).

Rhipidonematomyces Cif. & Tomas. (1954) ≡ Rhipidonema.

Rhizidiaceae J. Schröt. (1886) = Chytridiaceae.

Rhizidiocystis Sideris (1929), ? Chytridiales. 1, Hawaii.

Rhizidiopsis Sparrow (1933) = Podochytrium fide Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960).

Rhizidium A. Braun (1856), Chytridiaceae. *c.* 17, widespread. See Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960; key).

Rhizina Fr. (1815), Rhizinaceae. 1 or 2, widespread (north temperate). See Abbott & Currah (*Mycotaxon* **62**: 1, 1997; N. Am.), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Vasiliauskas & Stenlid (*Mycol.* **93**: 447, 2001), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).

rhizina (pl. **-ae**), a root-like hair or thread; the attachment organs of many foliose lichens (e.g. *Parmelia*); rhizine; they may be divided into several types, for details see Gyelnik (*Bot. Közl.* **24**: 122, 1927), Hale & Kurokawa (*Contr. U.S. natn Herb.* **36**: 122, 1964), Hannemann (*Bibl. Lich.* **1**, 1973). Cf. hyphal net.

Rhizinaceae Bonord. (1851), Pezizales. 2 gen., 3 spp.

Lit.: Weber & Bresinsky (*Persoonia* Suppl. **14**: 553, 1992), Abbott & Currah (*Mycotaxon* **62**: 1, 1997), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Lygis *et al.* (*Mycol.* **97**: 788, 2005), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

rhizinose-strand ('Rhizinenstränge'), a rhizine-like organ of attachment in squamulose (placodioid) lichens (e.g. *Toninia*), which is tough and much

branched. At least 3 types occur. See Poelt & Baumgartner (*Öst. bot. Z.* **111**: 1, 1964), Hannemann (*Bibl. Lich.* **1**, 1973). Cf. hyphal net.

Rhizoblepharia Rifai (1968), Pyronemataceae. 2, Australia; Jamaica. See Erb (*Phytologia* **24**: 11, 1972).

Rhizocalyx Petr. (1928), Helotiaceae. Anamorph *Rhizothyrium*. 1 (on *Abies*), Siberia.

Rhizocarpaceae M. Choisy ex Hafellner (1984), Rhizocarpales (±L). 4 gen. (+ 14 syn.), 228 spp.

Lit.: Timdal & Holtan-Hartwig (*Graphis Scripta* **2**: 41, 1988), Poelt (*Mitt. bot. StSamml.* Münch. **29**: 515, 1990), Feuerer (*Biblthca Lichenol.* **39**: 218 pp., 1991), Rambold *et al.* (*Cryptog. Bryol.-Lichénol.* **19**: 247, 1998), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998), Ihlen & Ekman (*Biol. J. Linn. Soc.* **77**: 535, 2002), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004), Grube *et al.* (*MR* **108**: 1111, 2004), Ihlen (*MR* **108**: 533, 2004), Wedin *et al.* (*MR* **109**: 159, 2005), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Rhizocarpales Miądl. et al. (2007). Lecanoromycetidae. 2 fam., 12 gen., 489 spp. Fams:
(1) **Catillariaceae**
(2) **Rhizocarpaceae**
For *Lit.* see under fam.

Rhizocarpon Ramond ex DC. (1805), Rhizocarpaceae (±L). *c.* 224, widespread (esp. temperate and boreal). See also map lichen. See Runemark (*Op. bot. Soc. bot. Lund* **2**, 1956; yellow spp. Eur.), Thomson (*Nova Hedwigia* **14**: 421, 1967; arctic), Feurer (*Ber. bayer. bot. Ges.* **49**: 59, 1978; C. Eur.), Hertel & Leuckert (*Herzogia* **5**: 25, 1979; lichenicolous spp.), Honegger (*Lichenologist* **12**: 157, 1980; ultrastr., posn), Geyer *et al.* (*Pl. Syst. Evol.* **145**: 41, 1984; key *R. superficale* group), Innes (*Boreas* **14**: 83, 1985; lichenometry nomencl.), Timdal & Holtan-Hartwig (*Graphis Scripta* **2**: 41, 1988; key Scandinavian spp.), Poelt (*Mitt. bot. StSamml., München* **29**: 515, 1990; key 28 parasitic spp.), Rambold *et al.* (*Cryptog. Bryol.-Lichénol.* **19**: 247, 1998; asci), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Fryday (*Lichenologist* **32**: 207, 2000; UK), Fryday (*Lichenologist* **34**: 451, 2002; UK), Ihlen (*MR* **108**: 533, 2004; non-yellow spp.), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Rhizocarponomyces Cif. & Tomas. (1953) = Rhizocarpon fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Rhizochaete Gresl., Nakasone & Rajchenb. (2004), Phanerochaetaceae. 6, widespread. See Greslebin *et al.* (*Mycol.* **96**: 261, 2004).

Rhizocladosporium Crous & U. Braun (2007), anamorphic *Helotiales*. 1, Japan. See Crous *et al.* (*Stud. Mycol.* **58**: 33, 2007).

Rhizoclosmatium H.E. Petersen (1903), Chytridiaceae. 4, widespread.

Rhizoctonia DC. (1805) nom. cons., anamorphic *Thanatephorus*. *c.* 1, widespread. *R. solani* s.l. is a serious pathogen of a wide variety of crops. In a wide sense *Rhizoctonia* has also been used for mycelial anamorphs belonging to *Athelia* (*Fibulorhizoctonia*), *Helicobasidium* (*Thanatophytum*), *Sebacina* (*Opadorhiza*), *Tulasnella* (*Epulorhiza*), *Waitea* (*Chrysorhiza*), and even to ascomycetous species (*Ascorhizoctonia*). See Parmeter (Ed.) (*Rhizoctonia solani. Biology and pathogenicity*, 1970), Carling *et al.* (*Phytopathology* **77**: 1609, 1987; new anastomosis group AG-9), Moore (*Mycotaxon* **29**: 91, 1987; segregated genera), Ogoshi (*Ann. Rev. Phytopath.* **25**: 125, 1987; ecology and pathology), Liu *et al.* (*Phytopathology* **79**: 1205, 1989; isozyme phylogeny), Mordue *et al.* (*MR* **92**: 78, 1989; integrated approach to taxonomy), Yang *et al.* (*MR* **93**: 429, 1989; sclerotial morphogenesis), Andersen (*Mycotaxon* **37**: 25, 1990; hyphal morphology), Cruickshank (*MR* **94**: 938, 1990; pectic zymograms), Jabaji-Hare *et al.* (*Can. J. Pl. Path.* **12**: 393, 1990; anastomosis group relationships using cloned DNA probes), Liu *et al.* (*Can. J. Pl. Path.* **12**: 376, 1990; *R. solani* group 2 relationships by isozyme analysis), Burpee & Martin (*Pl. Dis.* **76**: 112, 1991; spp. associated with turfgrasses), Cubeta *et al.* (*Phytopathology* **81**: 1395, 1991; anastomosis groups characterized by RA analysis of amplified rRNA gene), Kellens & Peumans (*MR* **95**: 1235, 1991; biochemistry and serology of lectins), Sneh *et al.* (*Identification of Rhizoctonia species*, 1991), Wako *et al.* (*J. Gen. Microbiol.* **137**: 2817, 1991; unique DNA plasmid pRS64 associated with chromosomal DNA), Johnk & Jones (*Phytopathology* **83**: 278, 1993; analysis of fatty acids), Andersen & Stalpers (*Mycotaxon* **51**: 437, 1994; check list of 119 names), Vilgalys & Cubeta (*Ann. Rev. Phytopath.* **32**: 135, 1994; molecular systematics), Sneh *et al.* (Eds) (*Rhizoctonia species: taxonomy, molecular biology, ecology, pathology and disease control*, 1996), Roberts (*Rhizoctonia-forming fungi*, 1999), Weerasena *et al.* (*MR* **108**: 649, 2004; DNA probe and a PCR based diagnostic assay), Matsumoto (*Mycoscience* **46**: 319, 2005; fatty acids and anastomosis relationships), González *et al.* (*Mol. Phylogen. Evol.* **40**: 459, 2006; ribosomal DNA and β-tubulin sequences).

Rhizodiscina Hafellner (1979), Patellariaceae. 1 (on wood), widespread (temperate). See Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Rhizogaster Reinsch (1875) nom. dub., ? Fungi.

Rhizogene Syd. & P. Syd. (1921), Venturiaceae. 1 (on *Symphoricarpos*), N. America. See Hafellner (*Nova Hedwigia* **27**: 903, 1976).

Rhizohypha Chodat & Sigr. (1911), anamorphic *Pezizomycotina*, Sc.-.-. 1 (mycorrhizal), Europe.

rhizoid, a root-like structure consisting of anucleate filaments; branched, extension of a chytrid thallus acting as a feeding organ (Karling, *Am. J. Bot.* **19**: 44, 1932), cf. haustorium, rhizina, and holdfast; **-al**, having, or made up of, rhizoids.

Rhizolecia Hertel (1984), ? Lecideaceae (L). 1, New Zealand. See Hertel (*Nova Hedwigia* Beih. **79**: 427, 1984).

Rhizomarasmius R.H. Petersen (2000), Physalacriaceae. 2. See Petersen (*Mycotaxon* **75**: 333, 2000).

rhizomorph, a root-like aggregation of hyphae having a well-defined apical meristem (cf. mycelial cord) and frequently differentiated into a rind of small dark-coloured cells surrounding a central core of elongated colourless cells. See Snider (*Mycol.* **51**: 693, 1961; *Armillaria mellea*), Jacques-Felix (*BSMF* **83**: 1, 1967; *Marasmius*, **84**: 161, 1969; agarics).

Rhizomorpha Ach. (1809) nom. dub., Fungi (?L).

Rhizomorpha Roth (1791) nom. dub. ? = Armillaria fide Donk (*Taxon* **11**: 97, 1962; rhizomorphs of *Armillaria mellea*).

Rhizomorphaceae Chevall. (1826) = Marasmiaceae.

Rhizomorphites Göpp. (1848), Fossil Fungi. 3 (Carboniferous, Jurassic), Europe; USA.

Rhizomucor Lucet & Costantin (1900), Mucoraceae. 6, widespread. See Schipper (*Stud. Mycol.* **17**: 53, 1978), Zheng & Chen (*Mycosystema* **4**: 45, 1991; key), Deploey (*Mycol.* **84**: 77, 1992; spore germination), Rajak *et al.* (*Mycopathologia* **118**: 109, 1992; keratinolysis), Zheng & Chen (*Mycosystema* **6**: 1, 1993; key), Zheng & Hu (*Mycotaxon* **56**: 455, 1995; endophyte), Zheng & Jiang (*Mycotaxon* **56**: 455, 1995), Roux *et al.* (*Proc. Microsc. Soc. S. Afr.* **26**: 42, 1996; ultrastr.), Vastag *et al.* (*J. Clin. Microbiol.* **36**: 2155, 1998; identification), Vágvölgyi *et al.* (*MR* **103**: 318, 1999; status of *R. tauricus*), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Iwen *et al.* (*J. Clin. Microbiol.* **43**: 5819, 2005; molecular identification Molecular identification), Nyilasi *et al.* (*Clin. Microbiol. Infect.* **14**: 393, 2008; molecular identification), Richardson & Lass-Flörl (*Clin. Microbiol. Infect.* **14** Suppl. 4: 5, 2008; mucormycosis, review).

rhizomycelium, a rhizoidal system which resembles mycelium, e.g. thallus of the *Cladochytriaceae* (Karling, *Am. J. Bot.* **19**: 53, 1932).

Rhizomyces Thaxt. (1896), Laboulbeniaceae. 10, Africa. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Rhizonema Thwaites (1849) = Dictyonema C. Agardh ex Kunth fide Parmasto (*Nova Hedwigia* **29**: 99, 1978).

Rhizophagites Rosend. (1943), Fossil Fungi. 3 (Cretaceous, Pleistocene), N. America. See Butler (*TBMS* **22**: 274, 1939) = Glomus (Glom.) fide, Yao *et al.* (*Kew Bull.* **50**: 349, 1995).

Rhizophagus P.A. Dang. (1896) ? = Glomus fide Gerdemann & Trappe (*Mycol. Mem.* **5**, 1974).

Rhizophidites Daugherty (1941), Fossil Fungi, Chytridiomycetes. 1 (Triassic), USA.

Rhizophila K.D. Hyde & E.B.G. Jones (1989), Pezizomycotina. 1 (marine), Seychelles. See Hyde & Jones (*Mycotaxon* **34**: 527, 1989), Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991).

Rhizophlyctidaceae H.E. Petersen (1909) = Spizellomycetaceae.

Rhizophlyctis A. Fisch. (1892), ? Spizellomycetaceae. *c.* 10, widespread. See Sparrow (*Aquatic Phycomycetes* Edn 2: 438, 1960; key), Barr & Désaulniers (*CJB* **64**: 561, 1986), Blackwell & Powell (*Mycotaxon* **70**: 213, 1999).

Rhizophoma Petr. & Syd. (1927) = Rhizosphaera fide Kobayasi (*Bull. Govt For. Exp. Stn* **204**: 91, 1969).

Rhizophydiaceae Letcher (2006), Rhizophydiales. 1 gen. (+ 6 syn.), 100 spp.

Rhizophydiales Letcher (2006). Chytridiomycetes. 3 fam., 5 gen., 104 spp. Fams:
(1) **Kappamycetaceae**
(2) **Rhizophydiaceae**
(3) **Terramycetaceae**

Lit.: Letcher *et al.* (*MR* **110**: 898, 2006), James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), Hibbett *et al.* (*MR* **111**: 109, 2007), and see under Familes.

Rhizophydium Schenk (1858), Rhizophydiaceae. *c.* 100, widespread. See Sparrow (*Aquatic Phycomycetes* Edn 2: 231, 1960; key), Chen & Chien (*Taiwania* **41**: 105, 1996; zoospore ultrastr.), Letcher *et al.* (*Mycol.* **96**: 162, 2004; North America, Australia).

Rhizophyton Zopf (1887) = Rhizophydium fide Minden (*Krypt.-Fl. Brandenburg augr. Gebiete*, 1911).

Rhizoplaca Zopf (1905), Lecanoraceae (L). 11, widespread. See Leuckert *et al.* (*Nova Hedwigia* **28**: 71, 1977), Weber (*Mycotaxon* **8**: 559, 1979), Wei (*Acta Mycol. Sin.* **3**: 207, 1984; key 4 spp. China), McCune (*Bryologist* **90**: 6, 1987; N. Am.), Roux *et al.* (*CJB* **71**: 1660, 1993; posn), Arup & Grube (*CJB* **78**: 318, 2000; polyphyly), Wei & Wei (*Mycosystema* **24**: 24, 2005; *R. chrysolecua* group), Zhou & Wei (*Mycosystema* **25**: 376, 2006; polyphyly, reln with *Rhizoplacopsidaceae*), Zhou *et al.* (*Mycol.* **98**: 57, 2006; genetic variation).

Rhizoplacopsidaceae J.C. Wei & Q.M. Zhou (2006), Umbilicariales. 1 gen., 1 spp. See Wei & Zhou (*Mycosystema* **25**: 381, 2006).

Rhizoplacopsis J.C. Wei & Q.M. Zhou (2006), Rhizoplacopsidaceae. 1, China. See Wei & Zhou (*Mycosystema* **25**: 381, 2006).

rhizoplane, the surface of a root. See Lynch (Ed.) (*The rhizosphere*, 1990).

rhizoplast, see blepharoplast.

Rhizopodella (Cooke) Boud. (1885) ≡ Plectania.

rhizopodium, a branched process (pseudopodium) from a plasmodium. Cf. filopodium.

Rhizopodomyces Thaxt. (1931), Laboulbeniaceae. 7, America. See Benjamin (*Aliso* **9**: 379, 1979; key), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

Rhizopodopsis Boedijn (1959), Mucoraceae. 1, Java. See Boedijn (*Sydowia* **12**: 220, 1958).

Rhizopogon Fr. (1817), Rhizopogonaceae. *c.* 150 (ectomycorrhizal with *Pinaceae*, one with *Adenostoma* (*Rosaceae*)), widespread (north temperate; introduced with pines in southern hemisphere. See Smith & Zeller (*Mem. N. Y. bot. Gdn* **14**, 1966; key N. Am. spp.), Hosford & Trappe (*TMSJ* **29**: 63, 1988; Japan), Martín (*The genus Rhizopogon in Europe*, 1996), Johannesson & Martín (*Mycotaxon* **71**: 267, 1999; phylogeny), Molina *et al.* (*Rhizopogon – Ectomycorrhizal fungi, key genera in profile*, 1999; ecology), Grubisha *et al.* (*Mycol.* **93**: 82, 2001; phylogeny), Martín (*Mycotaxon* **78**: 191, 2001), Grubisha *et al.* (*Mycol.* **94**: 607, 2002), Grubisha *et al.* (*Mycotaxon* **93**: 345, 2005).

Rhizopogonaceae Gäum. & C.W. Dodge (1928), Boletales. 3 gen. (+ 3 syn.), 152 spp.

Lit.: Bruns *et al.* (*Nature* **339**: 140, 1989; relat. with *Suillus*), Martín (*Edic. Espec. Soc. Catalana Micol.* **5**: 173 pp., 1996), Martín *et al.* (*MR* **102**: 855, 1998), Johannesson & Martín (*Mycotaxon* **71**: 267, 1999), Molina *et al.* (*Ectomycorrhizal Fungi*: 129, 1999), Grubisha *et al.* (*Mycol.* **93**: 82, 2001), Jarosch (*Biblthca Mycol.* **191**: 158 pp., 2001), Martín (*Karstenia* **41**: 23, 2001), Grubisha *et al.* (*Mycol.* **94**: 607, 2002), Martín & Raidl (*Mycotaxon* **84**: 221, 2002), Kretzer *et al.* (*Mycol.* **95**: 480, 2003), Kretzer *et al.* (*New Phytol.* **161**: 313, 2004).

Rhizopogoniella Soehner (1953) = Hymenogaster fide Gross *et al.* (*Beih. Sydowia* **2**: 210, 1980).

Rhizopus Ehrenb. (1821) nom. cons., Mucoraceae. *c.* 9, widespread. *R. stolonifer* (syn. *R. nigricans*) is a common saprobe and facultative parasite of mature fruits and vegetables. See Dabinett & Wellman (*CJB* **51**: 2053, 1973; numerical taxonomy), Gauger (*J. Gen. Microbiol.* **101**: 211, 1977; genetics), Seviour *et al.* (*CJB* **61**: 2374, 1983), Schipper (*Stud. Mycol.* **25**: 1, 1984), Schipper & Stalpers (*Stud. Mycol.* **25**: 20, 1984), Yuan & Jong (*Mycotaxon* **20**: 397, 1984), Ellis (*Mycol.* **77**: 243, 1985), Schipper *et al.* (*J. Gen. Microbiol.* **131**: 2359, 1985; hybridization), Sevior *et al.* (*TBMS* **84**: 701, 1985), Ellis (*Mycol.* **78**: 508,

1986; DNA), Ho (*Trans. Mycol. Soc. Rep. China* **3**: 73, 1988), Huang & Yu (*Mycosystema* **1**: 61, 1988; electrophoresis), Polonelli *et al.* (*Antonie van Leeuwenhoek* **54**: 5, 1988; antigens), Chen & Chen (*Taiwania* **35**: 191, 1990), Liou *et al.* (*Mycol. Monogr.* **3**, 1990), Liou *et al.* (*TMSJ* **32**: 535, 1991; SEM of sporangiospores), El Ghaouth *et al.* (*MR* **96**: 769, 1992; post harvest), Frye & Reinhardt (*Mycopathologia* **124**: 139, 1993), Jong & McManus (*Mycotaxon* **47**: 161, 1993; computer coding), Schipper & Samson (*Mycotaxon* **50**: 475, 1994), Ho (*Fung. Sci.* **10**: 29, 1995), Takagi & Horiuchi (*Food Biotechnology, Microorganisms*: 535, 1995), Schipper *et al.* (*J. Med. Vet. Mycol.* **34**: 199, 1996; mucormycosis & azygosporogenesis), Weitzman *et al.* (*Mycotaxon* **59**: 217, 1996), Winkler *et al.* (*J. Clin. Microbiol.* **34**: 2585, 1996; mucormycosis), Ho (*Bot. Bull. Acad. Sin.* Taipei **39**: 269, 1998; ultrastr.), Zheng & Chen (*Mycotaxon* **69**: 181, 1998), Vágvölgyi *et al.* (*Antonie van Leeuwenhoek* **86**: 181, 2004; Genetic variability in *Rhizopus stolonifer*), Partida-Martinez & Hertweck (*Nature* **437**: 884, 2005; endosymbiotic bacterium (*Berkholderia*) produces rhizoxin), Abe *et al.* (*Biosc., Biotechn., Biochem.* **70**: 2387, 2006; phylogeny), Machouart *et al.* (*J. Clin. Microbiol.* **44**: 805, 2006; PCR-restriction fragment length polymorphism), Liu *et al.* (*Sydowia* **59**: 235, 2007; phylogeny), Zheng *et al.* (*Sydowia* **59**: 273, 2007; monogr.), Nyilasi *et al.* (*Clin. Microbiol. Infect.* **14**: 393, 2008; molecular identification), Richardson & Lass-Flörl (*Clin. Microbiol. Infect.* **14** Suppl. 4: 5, 2008; mucormycosis, review).

Rhizopycnis D.F. Farr (1998), anamorphic *Dothideomycetes*, Cpd.?.?. 1, USA; Europe. See Farr *et al.* (*Mycol.* **90**: 291, 1998), Armengol *et al.* (*Pl. Path.* **52**: 68, 2003; Spain), Ghignone *et al.* (*Eur. J. Pl. Path.* **109**: 861, 2003; molecular diagnostics).

Rhizoscyphus W.Y. Zhuang & Korf (2004), Helotiaceae. 2, widespread. See Zhang & Zhuang (*Nova Hedwigia* **78**: 481, 2004).

Rhizosiphon Scherff. (1926), Chytridiales. 3, Europe.

Rhizosphaera L. Mangin & Har. (1907), anamorphic *Phaeocryptopus*, Cpd.0eH.15. 6 (on conifers), widespread. *R. kalkhoffii* (on pine needles). See Petrak (*Annls mycol.* **36**: 9, 1938), Sutton (*The Coelomycetes*, 1980), Juzwik (*Pl. Dis.* **77**: 630, 1993; *R. kalkhoffii* on *Picea*), Butin & Kehr (*MR* **104**: 1012, 2000), Tsuneda *et al.* (*Mycol.* **96**: 1128, 2004; phylogeny).

Rhizosphaerella Höhn. (1917) ? = Phoma Sacc. fide Sutton (*Mycol. Pap.* **141**, 1977).

Rhizosphaerina B. Sutton (1986), anamorphic *Pezizomycotina*, St.0eP.15. 1, Australia; S.E. Asia. See Sutton (*Sydowia* **38**: 332, 1985).

rhizosphere, the region immediately surrounding a root and influenced by its presence, particularly from proteins and sugars released by the plant; the range of fungi, bacteria and other microorganisms is frequently richer than that of the soil away from a root. See Katznelson *et al.* (*Bot. Rev.* **14**: 543, 1948).

Rhizosporium Rabenh. (1844) ? = Phloeoconis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Rhizostilbella Wolk (1914), anamorphic *Ascobolus*, Hsy.?0eH.?. 1, Java. See Seifert (*Stud. Mycol.* **27**: 1, 1985; used for anamorph, *Sphaerostilbe repens*, of *Nectria mauritiicola*).

Rhizostroma Fr. (1819) nom. dub., anamorphic *Pezizomycotina*. See Donk (*Taxon* **11**: 98, 1962).

Rhizotexis Theiss. & Syd. (1917), Englerulaceae. 1, Natal.

Rhizothyriaceae Tehon ex Bat. & Cif. (1959) = Helotiaceae.

Rhizothyrium Naumov (1915), anamorphic *Rhizocalyx*, Cpt.≡ eH.?. 2, Russia; Chile.

Rhodactina Pegler & T.W.K. Young (1989), Boletaceae. 1, India. See Yang *et al.* (*Mycotaxon* **96**: 133, 2006).

Rhodesia Grove (1937), anamorphic *Helotiales*, Cac.0eH.15. 1, Germany.

Rhodesiopsis B. Sutton & R. Campb. (1979), anamorphic *Pezizomycotina*, Cac.0eH.19. 1, British Isles; Australia. See Sutton & Campbell (*Nova Hedwigia* **30**: 289, 1978).

Rhodoarrhenia Singer (1964), Bolbitiaceae. 8, widespread (tropical). See Singer (*Sydowia* **17**: 142, 1964; key).

Rhodobolites Beck (1923) = Tylopilus fide Singer (*Farlowia* **2**: 223, 1945).

Rhodocarpon Lönnr. (1858) ≡ Endocarpon.

Rhodocephalus Corda (1837) ? = Aspergillus fide Thom (*Manual of the Aspergilli*, 1945).

Rhodochytrium Lagerh. (1893), ? Chlorophyta. 1, widespread (north temperate). Possibly a member of the Algae.

Rhodococcus Zopf (1891), Actinobacteria. q.v.

Rhodocollybia Singer (1939), Marasmiaceae. *c.* 20, widespread. See Antonín & Noordeloos (*Libri Botanici* **17**, 1997; Eur. spp.), Antonín *et al.* (*Mycotaxon* **63**: 359, 1997; taxonomy), Mata *et al.* (*Mycol. Progr.* **3**: 337, 2004; neotropical montane forests spp.), Wilson & Desjardin (*Mycol.* **97**: 667, 2005; phylogeny).

Rhodocybe Maire (1926) = Entoloma.

Rhodocybella T.J. Baroni & R.H. Petersen (1987) = Entoloma fide Kuyper (*in litt.*).

Rhodocyphella W.B. Cooke (1961) = Stigmatolemma fide Donk (*Beih. Nova Hedwigia* **5**, 1962).

Rhodofomes Kotl. & Pouzar (1990) = Fomitopsis fide Ryvarden (*Syn. Fung.* **5**: 218, 1991).

Rhodogaster E. Horak (1964) = Entoloma. Basidioma gasteroid. fide Kuyper (*in litt.*), Horak (*Sydowia* **17**: 190, 1964), Horak & Moreno (*Sydowia* **50**: 187, 1998; *Rhodogaster calongei* sp. nov. from northern Spain).

Rhodomyces Wettst. (1885) = Phaffia fide Kreger-van Rij (Ed.) (*Yeasts, a taxonomic study* 3rd edn, 1984), Boekhout *et al.* (*Taxon* **48**: 147, 1999; nomencl.) = Sporidiobolus (Sporidiobol.) fide.

Rhodonia Niemelä (2005), Polyporaceae. 1, Europe. See Niemelä (*Karstenia* **45**: 79, 2005).

Rhodopaxillus Maire (1913) = Lepista fide Singer (*Agaric. mod. Tax.*, 1951).

Rhodopeziza Hohmeyer & J. Moravec (1995), Pezizaceae. 1, Tierra del Fuego. See Moravec (*Czech Mycol.* **47**: 260, 1995).

Rhodophana Kühner (1971) = Rhodocybe fide Kuyper (*in litt.*).

Rhodophyllaceae Singer (1951) = Entolomataceae.

Rhodophyllus Quél. (1886) = Entoloma fide Hesler (*Entoloma in southeastern North America*, 1967; key 200 spp.), Largent & Benedict (*Madroño* **21**: 32, 1971; gen. defin.), Romagnesi (*Bull. Soc. linn. Lyon* **43**: 325, 1974), Singer (*Agaric. mod. Tax.* edn 3, 1975), Kühner (*BSMF* **93**: 445, 1978; alpine spp.), Romagnesi & Gilles (*Beih. Nova Hedwigia* **59**, 1979;

key 200 spp. Ivory Coast etc.).

Rhodoporus Quél. ex Bataille (1908) ≡ Tylopilus.

Rhodoscypha Dissing & Sivertsen (1983), Pyronemataceae. 1, widespread. See Lohmeyer (*Z. Mykol.* **50**: 147, 1984), Hohmeyer (*Mitt. Arbeitsgem. Pilzk. Niederrhein* **6**: 11, 1988), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Rhodoseptoria Naumov (1913) = Polystigmina fide Clements & Shear (*Gen. Fung.*, 1931).

Rhodosporidium Banno (1967), Sporidiobolales. Anamorph *Rhodotorula*. 6 (often from sea water), widespread. See Fell *et al.* (*Can. J. Microbiol.* **19**: 643, 1973; key), Swann & Taylor (*Stud. Mycol.* **38**: 147, 1995; mol. phylogeny), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Sampaio *et al.* (*Int. J. Syst. Evol. Microbiol.* **51**: 687, 2001; polyphasic taxonomy), Aime *et al.* (*Mycol.* **98**: 896, 2006; phylogeny).

rhodosporous, having light-red spores.

Rhodosporus J. Schröt. (1889) ≡ Pluteus.

Rhodosticta Woron. (1911), anamorphic *Polystigma*, St.0eH.15. 3, Asia; USA.

Rhodotarzetta Dissing & Sivertsen (1983), Pyronemataceae. 1 (on burnt ground), Europe. See Hohmeyer (*Mitt. Arbeitsgem. Pilzk. Niederrhein* **6**: 11, 1988), Yao & Spooner (*MR* **106**: 1243, 2002), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Rhodothallus Bat. & Cif. (1959), anamorphic *Pezizomycotina*, Cpt.-.-. 1, Brazil. See Batista & Ciferri (*Mycopath. Mycol. appl.* **11**: 96, 1959).

Rhodothrix Vain. (1921) = Nectria. Material has not been examined recently. fide Santesson (*Svensk bot. Tidskr.* **43**: 547, 1949).

Rhodotorula F.C. Harrison (1927), anamorphic *Rhodosporidium, Erythrobasidium*. c. 40, widespread. See Fell *et al.* (*Stud. Mycol.* **38**: 129, 1995; mol. phylogeny, 2000; mol. phylogeny), Suh *et al.* (*J. gen. appl. Microbiol.* Tokyo **42**: 1, 1996; mol. phylogeny), Golubev & Churkina (*Mikrobiologiya* **66**: 254, 1997; mycocons), Sampaio *et al.* (*Can. J. Microbiol.* **45**: 491, 1999; utilization aromatic compounds), Gadanho *et al.* (*CJB* **47**: 213, 2001; polyphasic taxonomy), Nagahama *et al.* (*Int. J. Syst. Evol. Microbiol.* **53**: 897, 2003; n.sp. from deep-sea floor).

Rhodotus Maire (1926), Physalacriaceae. 1, Europe; N. America. See Pegler & Young (*Kew Bull.* **30**: 19, 1975; spore ornament.), Kühner (*Hyménomycètes agaricoïdes*, 1980), Legon & Pegler (*Mycologist* **5**: 147, 1991).

Rhodoveronaea Arzanlou, W. Gams & Crous (2007), anamorphic *Annulatascaceae*. 1, Germany. See Arzanlou *et al.* (*Stud. Mycol.* **58**: 57, 2007).

Rhodozyma Phaff, M.W. Mill., Yoney. & Soneda (1972), anamorphic *Xanthophyllomyces*. 1, Alaska; Japan. See Kurtzman & Fell (*Yeasts, a taxonomic study* 4th edn, 1998).

Rhombiella Liro (1939), anamorphic *Thecaphora*. 1.

rhomboidal, resembling an equilateral not right-angled parallelogram (a rhomboid); quadrangular (Fig. 23.22).

Rhombostilbella Zimm. (1902), anamorphic *Pezizomycotina*, Hsy.0eH.10. 2 (on *Capnodiaceae*), Java; Brazil. See Pirozynski (*Mycol. Pap.* **90**, 1963; key), Kendrick (*CJB* **81**: 75, 2003).

Rhopalidium Mont. (1856) = Alternaria fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **119**: 670, 1910).

Rhopalocladium Schroers, Samuels & W. Gams (1999), anamorphic *Nectriopsis*, Hso.?.?. 1 (on myxomycete), USA. See Schroers *et al.* (*Mycol.* **91**: 375, 1999), Schroers (*Stud. Mycol.* **46**: 1, 2001).

Rhopaloconidium Petr. (1952) = Miuraea fide Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**, 1995).

Rhopalocystis Grove (1911) = Aspergillus fide Raper & Fennell (*The genus Aspergillus*, 1965).

Rhopalogaster J.R. Johnst. (1902), Rhizopogonaceae. 1, USA.

Rhopalomyces Corda (1839), Helicocephalidaceae. 7, widespread. See Costantin (*Bull. Soc. bot. Fr.* **33**: 489, 1886), Thaxter (*Bot. Gaz.* **16**: 14, 1891), Berlese (*BSMF* **10**: 94, 1892), Marchal (*Revue Mycol.* Paris **15**: 7, 1893), Drechsler (*Bull. Torrey bot. Club* **82**: 473, 1955), Ellis (*Mycol.* **55**: 183, 1963), Barron (*CJB* **51**: 2505, 1973; biology), Stalpers (*Proc. K. ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **77**: 383, 1974), Benjamin *in* Kendrick (Ed.) (*The Whole Fungus* **2**: 573, 1979), Barron (*Mycol.* **72**: 427, 1980; biology), Cano *et al.* (*Nova Hedwigia* **49**: 427, 1989), James *et al.* (*Nature* **443**: 818, 2006; phylogeny), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

Rhopalomyces Harder & Sörgel (1938) [non *Rhopalomyces* Corda 1839] = Blastocladiella fide Couch & Whiffen (*Am. J. Bot.* **29**: 582, 1942).

Rhopalophlyctis Karling (1945), Chytridiaceae. 1, Brazil; N. America.

Rhopalopsis Cooke (1883) ≡ Kretzschmaria.

Rhopalospora, see *Ropalospora*.

Rhopalostroma D. Hawksw. (1977), Xylariaceae. Anamorph *Nodulisporium*-like. 11, Africa; Asia. See Hawksworth & Whalley (*TBMS* **84**: 560, 1985), Whalley *et al.* (*Botanical Journal of Scotland* **50**: 185, 1998; Thailand), Stadler *et al.* (*MR* **108**: 239, 2004; chemistry), Triebel *et al.* (*Nova Hedwigia* **80**: 25, 2005; phylogeny).

Rhopographella (Henn.) Sacc. & Trotter (1913), Pezizomycotina. 1, Brazil.

Rhopographina Theiss. & Syd. (1915) = Ophiodothella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Rhopographus Nitschke ex Fuckel (1870), ? Pleosporales. 6 (on *Pteridophyta*), widespread. See Obrist (*Phytopath. Z.* **35**: 367, 1959), Barr (*Mycotaxon* **43**: 371, 1992; posn).

Rhymbocarpus Zopf (1896), Odontotremataceae. 9 (on lichens, esp. *Rhizocarpon*), Europe. See Coppins *et al.* (*SA* **10**: 51, 1991), Diederich & Etayo (*Lichenologist* **32**: 423, 2000).

Rhymovis Pers. ex Rabenh. (1844) ≡ Paxillus.

Rhynchodiplodia Briosi & Farneti (1906), anamorphic *Pezizomycotina*, Cpd.1eP.?. 1, Italy.

Rhynchogastrema B. Metzler & Oberw. (1989), Rhynchogastremataceae. 1, Europe. See Metzler & Oberwinkler (*Syst. Appl. Microbiol.* **12**: 281, 1989).

Rhynchogastremataceae Oberw. & B. Metzler (1989), Tremellales. 1 gen., 1 spp.

Lit.: Metzler *et al.* (*Syst. Appl. Microbiol.* **12**: 280, 1989), Sampaio *et al.* (*Mycol.* **94**: 874, 2002).

Rhynchomelas Clem. (1909) = Melanospora Corda fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Rhynchomeliola Speg. (1884), ? Chaetothyriomycetidae. 3, S. America; Australasia. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Lee *et al.* (*Mycol.* **95**: 902, 2003).

Rhynchomyces Sacc. & Marchal ex Marchal (1885) ≡

Mycorhynchus.

Rhynchomyces Willk. (1866), anamorphic *Pezizomycotina*, Hso.≡ eP.?. 1, Europe.

Rhynchonectria Höhn. (1902) ? = Pyxidiophora fide Hawksworth & Webster (*TBMS* **68**: 329, 1977), Lundqvist (*Bot. Notiser* **133**: 121, 1980), Malloch & Blackwell (*CJB* **68**: 1712, 1990), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999; type material no longer extant).

Rhynchophoma P. Karst. (1884) = Ceratostomella fide Petrak (*Sydowia* **7**: 298, 1953), Verkley (*Nova Hedwigia* **75**: 433, 2002; revision).

Rhynchophoromyces Thaxt. (1908), Ceratomycetaceae. 8, widespread. See Majewski & Sugiyama (*TMSJ* **27**: 425, 1986; Borneo), Santamaría (*Nova Hedwigia* **68**: 351, 1999; Iberian peninsula).

Rhynchophorus Hollós (1926) = Ceratopycnis fide Clements & Shear (*Gen. Fung.*, 1931).

Rhynchoseptoria Unamuno (1940), anamorphic *Pezizomycotina*, Cpd.≡ eH.?. 1, Morocco.

Rhynchosphaeria (Sacc.) Berl. (1891), Pezizomycotina. 7, widespread.

Rhynchosporina Arx (1957), anamorphic *Pezizomycotina*, Hso.0eH.15. 2, N. America. See von Arx (*Verh. K. ned. Akad. Wet. Amst.* C **51**: 19, 1957), Wu *et al.* (*Mycoscience* **38**: 11, 1997).

Rhynchosporium Heinsen ex A.B. Frank (1897), anamorphic *Helotiales*, Hso.1eH.19. 3, widespread (temperate). *R. secalis* (barley and rye leaf blotch). See Owen (*TBMS* **41**: 99, 1958), Owen (*TBMS* **46**: 604, 1963), Williams & Owen (*TBMS* **60**: 223, 1973; physiol. specialization on barley), Ryan *et al.* (*Rhynchosporium secalis A keyword index to the literature*, 1987), Goodwin *et al.* (*Phytopathology* **80**: 1330, 1990; nomencl. *R. secalis* pathotypes), Beer (*Zentralbl. Mikrobiol.* **146**: 339, 1991; review *R. secalis*), Goodwin *et al.* (*MR* **97**: 49, 1993; isozyme variation), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 254, 1995; key), McDonald *et al.* (*Phytopathology* **89**: 639, 1999; genetic diversity, Australia), Robbertse & Crous (*S. Afr. J. Sci.* **96**: 391, 2000; S Africa), Newton *et al.* (*Z. PflKrankh. PflPath. PflSchutz* **108**: 446, 2001; UK), Goodwin (*MR* **106**: 645, 2002; posn), Crous *et al.* (*Eur. J. Pl. Path.* **109**: 841, 2003; phylogeny), Korff *et al.* (*J. Phytopath.* **152**: 106, 2004; genetic diversity).

rhynchosporous, having beaked spores.

Rhynchostoma P. Karst. (1870), ? Chaetothyriomycetidae. Anamorph *Arthropycnis*. 11, widespread. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Constantinescu & Tibell (*Nova Hedwigia* **55**: 169, 1992; anamorph), Lee *et al.* (*Mycol.* **95**: 902, 2003; phylogeny).

Rhynchostomopsis Petr. & Syd. (1923) = Amphisphaeria fide Aptroot (*Stud. Mycol.* **37**, 1995).

Rhynchostrigula Bat., J.L. Bezerra & Cavalc. (1966) = Strigula fide Lücking *et al.* (*Lichenologist* **30**: 170, 1998).

Rhynchotheca Kleb. (1933) nom. dub., Fungi. See Sutton (*Mycol. Pap.* **141**, 1977).

Rhyncomeliola, see *Rhynchomeliola*.

Rhyparobius, see *Ryparobius*.

Rhytidenglerula Höhn. (1918), Englerulaceae. Anamorph *Capnodiastrum*. c. 10, widespread. See Castlebury *et al.* (*Mycotaxon* **54**: 461, 1995).

Rhytidhysterium Sacc. (1883) ≡ Rhytidhysteron.

Rhytidhysteron Speg. (1881), Patellariaceae. Anamorphs *Diplodia*-like, *Aposphaeria*-like. 4, widespread (esp. tropical). See Samuels & Müller (*Sydowia* **32**: 277, 1979), Kutorga & Hawksworth (*SA* **15**: 1, 1997), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999; DNA), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000; phylogeny).

Rhytidiella Zalasky (1968), ? Cucurbitariaceae. Anamorph *Phaeoseptoria*. 3, Canada; Sweden. See Aguirre-Hudson (*Bull. Br. Mus. nat. hist.* Bot. **21**: 85, 1991), Johnston (*N.Z. Jl Bot.* **45**: 151, 2007).

Rhytidocaulon Nyl. ex Elenkin (1916) nom. rej. prop. = Letharia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Rhytidopeziza Speg. (1885) = Rhytidhysteron fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Rhytidospora Jeng & Cain (1977), Ceratostomataceae. 3, widespread. See Krug & Jeng (*Mycotaxon* **10**: 41, 1979), Guarro (*Mycol.* **75**: 927, 1983), Valldosera *et al.* (*MR* **95**: 243, 1991; SEM).

Rhytisma Fr. (1818), Rhytismataceae. Anamorph *Melasmia*. 18, widespread. *R. acerinum* and *R. punctatum* (tar spot of *Acer*), *R. salicinum* (of *Salix*). See also air pollution. See Duravetz & Morgan-Jones (*CJB* **49**: 1267, 1971; ontogeny), Rath (*Rivista Micol.* **35**: 43, 1992; key 6 Italian spp.), Hudler & Jensen-Tracy (*Mycotaxon* **68**: 405, 1998), Landvik *et al.* (*Mycoscience* **39**: 49, 1998; DNA), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Vasil'eva (*Mikol. Fitopatol.* **36**: 17, 2002; E Russia), Hou & Piepenbring (*Mycopathologia* **159**: 299, 2005; China), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Rhytismataceae Chevall. (1826) nom. cons., Rhytismatales. 55 gen. (+ 30 syn.), 728 spp.

Lit.: Minter (*Mycol. Pap.* **147**: 54 pp., 1981), Cannon & Minter (*Mycol. Pap.* **155**, 1986; Indian subcont., key 14 gen.), Cannon & Minter (*Mycol. Pap.* **155**: 123 pp., 1986), Minter *in* Peterson (Ed.) (*Recent research on conifer needle diseases*: 71, 1986; illustr. 14 gen.), Johnston (*N.Z. Jl Bot.* **29**: 395, 405, 1991; NZ spp.), Johnston (*Mycotaxon* **52**: 221, 1994; ascospore sheaths), Johnston (*Aust. Syst. Bot.* **13**: 199, 2000), Stone *et al.* (*Microbial Endophytes*: 3, 2000), Gernandt *et al.* (*Mycol.* **93**: 915, 2001), Johnston (*Mycol. Pap.* **176**: 239 pp., 2001), Johnston (*Aust. Syst. U.S.A.* **101**: 10107, 2004), Sokolski *et al.* (*Mycol.* **96**: 1261, 2004), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Rhytismatales M.E. Barr ex Minter (1986). Leotiomycetes. 3 fam., 83 gen., 795 spp. Ascomata apothecial, immersed, sometimes erumpent, opening by longitudinal or radial splits, often within black clypeate pseudostromatic tissue. Interascal tissue of simple paraphyses, often anastomosing near the base, often with mucous coating, often swollen at the apices. Asci cylindrical, thin-walled, usually not differentiated at the apex, rarely blueing in iodine, often releasing spores through an irregular split. Ascospores usually hyaline and aseptate, often elongated, often with a mucous sheath. Anamorphs coelomycetous. Saprobes and necrotrophic parasites, sometimes endophytic, on leaves, also on bark and wood, mainly temp. Fams:

(1) **Ascodichaenaceae**
(2) **Cudoniaceae**

(3) **Rhytismataceae** (syn. *Phacidiaceae* auct.)
Lit.: Cannon & Minter (*Mycol. Pap.* **155**: 1986; Indian subcont.), Darker (*Contr. Arnold Arb.* **1**, 1932; on conifers, *CJB* **45**: 1399, 1967; gen. revis.), Hunt & Ziller (*Mycotaxon* **6**: 481, 1978; host-gen. keys on conifers), Livsey & Minter (*CJB* **72**: 549, 1994; circumscription, fams), Minter (*in* Capretti *et al.* (Eds), *Shoot and foliage diseases in forest trees*: 65, 1995; Eur. spp. on conifers, illustr., key, 20 gen.), Minter & Cannon (*TBMS* **83**: 65, 1984; ascospore discharge), Pirozynski & Weresub (*in* Kendrick (Ed.), *The whole fungus* **1**: 93, 1979; biogeogr.), Sherwood (*Occ. Pap. Farlow Herb.* **15**, 1980; key 13 gen.), Tehon (*Ill. Biol. Monogr.* **13** (4), 1935; *Lophodermium* s.l.).

Rhytismella P. Karst. (1884) ≡ Cliostomum.

Rhytismites Mesch. (1892), Fossil Fungi. 27 (Cretaceous, Tertiary), Europe.

Rhytismopsis Geyl. (1887), Fossil Fungi. 1 (Eocene), Indonesia. = Rhytismites (Fossil fungi) fide Meschinelli (1892).

Ribaldia Cif. (1954) = Asteroma fide Sutton (*Mycol. Pap.* **141**, 1977).

Ricasolia A. Massal. (1855) = Solenopsora fide Aptroot (*in litt.*).

Ricasolia De Not. (1846) = Lobaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Ricasoliomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Ricasolia De Not.

Riccia L. (1753), Hepaticae. Hepaticae.

Riccoa Cavara (1903) = Heydenia fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **124**: 56, 1915).

Richonia Boud. (1885), Zopfiaceae. 1, France. See Hawksworth (*CJB* **57**: 91, 1979).

Richoniella Costantin & L.M. Dufour (1916) = Entoloma. Basidioma gasteroid. fide Kuyper (*in litt.*), Dring & Pegler (*Kew Bull.* **32**: 563, 1978; key), Sarasini (*Rivista di Micologia* **37**: 19, 1994).

Richoniellaceae Jülich (1982) = Entolomataceae.

Rick (Johann; 1869-1946; Austria, later Brazil). School teacher, Feldkirch (1894-1898); theological student, Valkenburg, Netherlands (1899-1902) [priest]; teacher (1903-1915) then social worker (1915-1929) then Professor of Theology (1929-1942), São Leopoldo, Rio Grande do Sul; in São Salvador, Rio Grande do Sul (1942-1946). With Theissen (q.v.) a pioneer explorer of the mycota of Brazil. Collections are widely distributed (**B**, **BPI**, **CUP**, **FH**, **IAC**, **IACM**, **K**, **MICH**, **PACA**, **R**, **RB**, **S**, **SFPA** and **SI**). *Publs.* His publications are distributed in *Annales Mycologici*, *Broteria* and *Iheringia*. *Biogs, obits etc.* Lloyd (*Mycological Notes by C.G. Lloyd* **72**: 1286, 1924); Stafleu & Cowan (*TL-2* **4**: 780, 1983); Torrend, in Lloyd (*Mycological Notes by C.G. Lloyd* **53**: 749, 1918).

Rickella Locq. (1952) ≡ Volvolepiota.

Rickenella Raithelh. (1973), Agaricomycetes. 5, widespread. *Hymenochaetales* or *Agaricales* (*Rickenella* clade). See Kost (*La Famiglia delle Tricholomataceae*, 1986; perforate parenthosome), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000; possible posn. in russuloid clade), Redhead *et al.* (*Mycotaxon* **82**: 151, 2002; posn. in hymenochaetoid clade), Redhead *et al.* (*Mycotaxon* **83**: 19, 2002; posn. in hymenochaetoid clade), Antonín & Noordeloos (*A monograph of the genera Hemimycena*, □, 2004).

Rickia Cavara (1899), Laboulbeniaceae. 132, widespread (esp. tropical). See Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Weir (*MR* **102**: 327, 1998; Sulawesi).

Rickiella Syd. (1904) = Phillipsia fide Korf (*Aust. J. Bot.* Suppl. Ser. **10**: 77, 1983), Pfister (*Mycotaxon* **29**: 329, 1987).

Riclaretia Peyronel (1915), anamorphic *Pezizomycotina*, Hsp.0eH.15. 1, Europe.

Ricnophora Pers. (1825) = Phlebia fide Donk (*Taxon* **6**: 113, 1957).

Riddlea C.W. Dodge (1953) = Laurera fide Harris (*Acta Amazon.* Supl. **14**: 55, 1984).

RIEC (Revised Index of Ecological Continuity). The percentage occurrence of up to a maximum of 20 out of a total list of 30 selected old-forest indicator lichens that require a continuity of mature trees to persist in a site. This value has proved useful in identifying woodland of particular antiquity and long environmental continuity in the UK. See Rose (*in* Brown *et al.* (Eds), *Lichenology: progress and problems*: 279, 1976). An *NIEC* (New Index of Ecological Continuity) for use in wider areas of W. Europe uses 'main' (counted to 70) plus 'bonus' species to give a *T* value (Rose, *in* Bates & Farmer (Eds), *Bryophytes and lichens in a changing environment*: 211, 1992).

Riedera Fr. (1849) nom. dub., ? Helotiales. 1, Russia.

Riessia Fresen. (1852), anamorphic *Agaricomycetes*, Hsy.1bH.1. 4, widespread. See Goos (*Mycol.* **59**: 718, 1967; dikaryotic basidiomycete).

Riessiella Jülich (1985), anamorphic *Agaricomycetes*, Hso.≡ eP.1. 2 (with clamp connexions), S.E. Asia. See Jülich (*Int. J. Mycol. Lichenol.* **2**: 127, 1985).

Rigidoporaceae Jülich (1982) = Meripilaceae.

Rigidoporopsis I. Johans. & Ryvarden (1979) = Amylosporus fide Stalpers (*Stud. Mycol.* **40**: 129, 1996).

Rigidoporus Murrill (1905), Meripilaceae. *c.* 40, widespread. See Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 537, 1980; key 6 Afr. spp.), Corner (*Beih. Nova Hedwigia* **86**: 152, 1987; key Malaysia spp.), Gilbertson & Ryvarden (*N. Amer. Polyp.* **2**: 693, 1987; key temp. spp.), Corner (*Mycologist* **9**: 127, 1995; gen. concept), Legon (*Mycologist* **17**: 156, 2003), Ryvarden & Iturriaga (*Mycol.* **95**: 1066, 2003; Venezuela) See also record fungi.

Rikatlia P.F. Cannon (1993), ? Phyllachoraceae. 1 (from living leaves), E. Africa. See Cannon (*SA* **11**: 83, 1993).

Rileya A. Funk (1979), anamorphic *Pezizomycotina*, Cpd/St.≡ eH.19. 1, Canada. See Funk (*CJB* **57**: 7, 1979).

Rimaconus Huhndorf, F.A. Fernández, J.E. Taylor & K.D. Hyde (2001), Sordariomycetes. 1. Perhaps belonging to the *Pleurotremataceae* sensu Barr (q.v.). See Huhndorf *et al.* (*Mycol.* **93**: 1073, 2001), Huhndorf *et al.* (*Fungal Diversity* **20**: 59, 2005).

Rimbachia Pat. (1891), Tricholomataceae. *c.* 10, widespread (tropical). See Singer (*Boln Soc. argent. Bot.* **10**: 210, 1963; key), Redhead (*CJB* **62**: 865, 1984; key), Redhead *et al.* (*Mycotaxon* **83**: 19, 2002; posn. in hymenochaetoid clade), Senn-Irlet & Moreau (*Czech Mycol.* **54**: 145, 2003; alpine spp.).

Rimelia Hale & A. Fletcher (1990) = Parmotrema fide Hale & Fletcher (*Bryologist* **93**: 23, 1990), Czeczuga & Kashiwadani (*Bull. natn. Sci. Mus.* Tokyo, B **19**: 113, 1993; chemistry), Eliasaro & Adler (*Mycotaxon* **66**: 127, 1998; Brazil), Louwhoff (*Biblthca Lichenol.* **78**: 223, 2001; biogeography), Thell *et al.* (*Mycol. Robillarda Sacc. (1882) nom. cons., anamorphic *Pezizomycotina*, Cpd.1eP.10. 5, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Robillardiella S. Takim. (1943) nom. dub., ? Dothideales.

Robincola Velen. (1947), ? Helotiales. 1, former Czechoslovakia.

Robledia Chardón (1929) = Botryostroma fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Roburnia Velen. (1947), ? Helotiales. 1, former Czechoslovakia.

Roccella DC. (1805) nom. cons., Roccellaceae (L). 26, widespread. See Tavares (*Revta Fac. Cienc. Lisb.* sect. C **6**: 125, 1958; dyeing), Tehler (*CJB* **68**: 2458, 1990; cladistics), Follmann *et al.* (*J. Hattori bot. Lab.* **75**: 345, 1994), Myllys *et al.* (*Mol. Phylogen. Evol.*

12: 295, 1999), Myllys *et al.* (*Curr. Genet.* **36**: 79, 1999; DNA), Follmann & Werner (*Biblthca Lichenol.* **75**: 1, 2000; evolution), Follmann (*J. Hattori bot. Lab.* **90**: 251, 2001; key S American spp.), Follmann (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **30-32**: 61, 2002; biogeography), Tehler *et al.* (*Symb. bot. upsal.* **34** no. 1: 405, 2004; phylogeny, Europe, Macaronesia, Mediterranean), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **34**: 512, 2005; phylogeny), Tehler (*Biblthca Lichenol.* **95**: 517, 2007), Tehler & Irestedt (*Cladistics* **23**: 432, 2007).

Roccellaceae Chevall. (1826), Arthoniales (±L). 46 gen. (+ 62 syn.), 779 spp.

Lit.: Darbishire (*Bibl. bot.* **45**, 1898), Follmann (*Nova Hedwigia* **31**: 285, 1979), Torrente & Egea (*Biblthca Lichenol.* **32**, 1989; Mediterranean, N. Afr.), Torrente & Egea (*Biblthca Lichenol.* **32**: 282 pp., 1989), Tehler (*CJB* **68**: 2458, 1990), Thor (*Op. bot.* **103**: 92 pp., 1991), Egea *et al.* (*Pl. Syst. Evol.* **187**: 103, 1993), Feige *et al.* (*Cryptog. bot.* **3**: 101, 1993), Follman *et al.* (*Herzogia* **9**: 653, 1993; chemistry), Lücking & Matzer (*Nova Hedwigia* **63**: 109, 1996), Tehler & Egea (*Lichenologist* **29**: 397, 1997), Tehler *et al.* (*Symb. bot. upsal.* **32**: 255, 1997), Grube (*Bryologist* **101**: 377, 1998), Henssen & Thor (*Nordic Jl Bot.* **18**: 95, 1998), Lohtander *et al.* (*Bryologist* **101**: 404, 1998), Lohtander *et al.* (*Lichenologist* **30**: 341, 1998), Myllys *et al.* (*Bryologist* **101**: 70, 1998), Follmann & Peine (*J. Hattori bot. Lab.* **87**: 259, 1999), Myllys *et al.* (*Lichenologist* **31**: 461, 1999; DNA), Sparrius (*Biblthca Lichenol.* **89**: 141 pp., 2004), Tehler *et al.* (*Symb. bot. upsal.* **34** no. 1: 405, 2004), Ertz *et al.* (*Biblthca Lichenol.* **91**: 155 pp., 2005).

Roccellaria Darb. (1897) nom. rej. prop. = Roccellina See Tehler (*CJB* **68**: 2458, 1990; cladistics), Grube (*Bryologist* **101**: 377, 1998), Follmann (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **30-32**: 61, 2002; biogeography), Tehler (*Taxon* **56**: 254, 2007; nomencl.).

Roccellina Darb. (1898) nom. cons. prop., Roccellaceae (L). 32, widespread. See Tehler (*Op. Bot.* **70**, 1983; key), Tehler (*CJB* **68**: 2458, 1990; cladistics), Tehler (*Acta Bot. Fenn.* **150**: 185, 1994; phylogeny), Lohtander *et al.* (*Lichenologist* **30**: 341, 1998; dispersal), Myllys *et al.* (*Lichenologist* **31**: 461, 1999; phylogeny), Follmann (*J. Hattori bot. Lab.* **90**: 251, 2001; key S American spp.), Follmann (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **30-32**: 61, 2002; biogeography), Tehler (*Taxon* **56**: 254, 2007; nomencl.), Tehler & Irestedt (*Cladistics* **23**: 432, 2007).

Roccellinastraceae Hafellner (1984) = Pilocarpaceae.

Roccellinastrum Follmann (1968), ? Pilocarpaceae (L). 3, Chile; Tasmania. See Kantvilas (*Lichenologist* **22**: 79, 1990), Andersen & Ekman (*MR* **109**: 21, 2005; phylogeny).

Roccellodea Darb. (1932) = Roccella fide Weber (*Mycotaxon* **27**: 451, 1986), Follmann (*Akt. lichenol. Mitt.* Essen **5**: 20, 1994), Follmann (*J. Hattori Bot. Lab.* **85**: 257, 1998), Follmann *et al.* (*J. Hattori bot. Lab.* **85**: 245, 1998).

Roccellographa J. Steiner (1902), Roccellaceae (L). 1, Socotra. See Tehler (*CJB* **68**: 2458, 1990; cladistics), Myllys *et al.* (*Lichenologist* **31**: 461, 1999; phylogeny).

Roccellographomyces Cif. & Tomas. (1953) ≡ Roccellographa.

Roccellomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Roccella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Roccellopsis Elenkin (1929) = Roccella fide Eriksson & Hawksworth (*SA* **6**: 150, 1987).

Rocellinastrum (orthographic variant), see *Roccellinastrum.*

rock hair, pendent brown, grey to black species of *Bryoria* which resemble human hair.

rock tripe, edible lichens of the genus *Umbilicaria*; *U. esculenta*, 'Iwatake', is still eaten in Japan; for details of its use see Sato (*Nova Hedw.* **16**: 505, 1969), Mattick (*Nova Hedw.* **16**: 511, 1969).

rodlet, structural unit of conidial and some hyphal walls composed of particles *c.* 50 Å diam. arranged in linear series (Hess *et al.*, *Mycol.* **60**: 290, 1968).

Rodríguez Hernández (Miguel; 1949-2003; Cuba). Lecturer, Universidad Central de Las Villas (1973-1974); Lecturer, Universidad de la Habana and mycologist, then Head of the Mycological Laboratory, then Scientific Director, Jardín Botánico Nacional, Havana (1974-2003). An expert on tropical epiphyllous ascomycetes. As first and second President of the Asociación Latino-Americana de Micología (1990-1993, 1993-1996), and as organizing committee chairman for the first and second Congreso Latino-Americano de Micología (Havana, 1993, 1996), he played a pivotal role in developing an infrastructure for Latin American mycology. His later collaboration in digitizing fungal records from the Caribbean resulted in production of one of the largest regional checklists ever produced in mycology. *Publs.* (with Minter & Mena Portales) *Fungi of the Caribbean, an Annotated Checklist* (2001). *Biogs, obits etc.* Guzmán (*Inoculum* **55**: 43, 2004).

Rodwaya Syd. & P. Syd. (1901) = Gyrodon fide Singer (*Farlowia* **2**: 223, 1945).

Rodwayella Spooner (1986), Hyaloscyphaceae. 4, widespread (temperate). See Spooner in Dennis (*Fungi Hebrid.*: 383, 1986), Spooner (*Biblthca Mycol.* **116**, 1987).

Roesleria Thüm. & Pass. (1877), Roesleriaceae. 1 (on *Vitis* roots), Europe; N. America. See Arnaud (*Annls Épiphyt.* **16**: 235, 1930), Redhead (*CJB* **62**: 2514, 1985), Nieder (*Pflanzensch.* **3**: 24, 1987), Yao & Spooner (*Kew Bull.* **54**: 683, 1999).

Roesleriaceae Y.J. Yao & Spooner (1999), Pezizomycotina (inc. sed.). 2 gen. (+ 1 syn.), 3 spp.

Lit.: Redhead (*CJB* **62**: 2514, 1984), Véghelyi (*Acta phytopath. entom. Hung.* **24**: 293, 1989), Yao & Spooner (*Kew Bull.* **54**: 683, 1999).

Roeslerina Redhead (1985), Roesleriaceae. 2, Europe; N. America. See Redhead (*CJB* **62**: 2514, 1985), Yao & Spooner (*Kew Bull.* **54**: 683, 1999).

Roestelia Rebent. (1804), anamorphic *Gymnosporangium*. 14, widespread. Anamorph name for (I). See Kern (*Revised taxonomic account of Gymnosporangium*, 1973), Lee & Kakishima (*Mycoscience* **40**: 109, 1999; ultrastr.).

roestelioid (of an aecium), long and tube-like, as in *Gymnosporangium.*

Rogellia Döbbeler (1999), Odontotremataceae. 1, Tierra del Fuego. See Döbbeler (*Haussknechtia* Beih. **9**: 79, 1999), Döbbeler (*MR* **111**: 1406, 2007).

Rogergoosiella A. Hern. Gut. & J. Mena (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Cuba. See Hernández Gutiérrez & Mena Portales (*MR* **100**:

1483, 1996).

Rogersella Liberta & A.J. Navas (1978), Schizoporaceae. 1, widespread. See Langer (*Biblthca Mycol.* **154**, 1994; sub *Hyphodontia*).

Rogersia Shearer & J.L. Crane (1976) = Filosporella fide Crane & Shearer (*Mycotaxon* **6**: 27, 1977).

Rogersiomyces J.L. Crane & Schokn. (1978), Sporidiobolaceae R.T. Moore. 1, USA; Taiwan. See Crane & Schoknecht (*Am. J. Bot.* **65**: 903, 1978), Kirschner & Chen (*Sydowia* **55**: 86, 2003; Taiwan).

Rogerson (Clark Thomas; 1918-2001; USA). Assistant in Plant Pathology, Utah State University (1938-1941); Technical Sergeant, US Army Evacuation Hospital, Solomon & Philippine Islands (1942-1945); Teaching Assistant with Fitzpatrick (q.v.), Cornell University (1946-1950); Assistant Professor then Associate Professor, Kansas State University (1950-1958); Curator of Cryptogamic Botany, New York Botanic Garden (1958 onwards). Noted for his studies of the *Hypocreales* where he was a pioneer in 'whole fungus' studies, assiduously connecting anamorphs with their teleomorphs; also contributed greatly to knowledge of the mycota of Utah. *Publs.* The hypocrealean fungi. *Mycol.* (1970); (with Samuels & Doi) *Hypocreales. Memoirs of the New York Botanic Garden* (1990); (with Rossman, Samuels & Lowen) Genera of *Bionectriaceae, Hypocreaceae*, and *Nectriaceae* (*Hypocreales, Ascomycetes*). *Studies in Mycology* (1999). *Biogs, obits etc.* Samuels & Fogel (*Mycol.* **95** (4): 773-779, 2003) [portrait].

Rogersonia Samuels & Lodge (1996), Hypocreaceae. 1, Puerto Rico. See Samuels & Lodge (*Sydowia* **48**: 250, 1996), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

rohr, extra-cellular infection apparatus of plasmodiophorids. See also schlauch and stachel.

Roigiella R.F. Castañeda (1984), anamorphic *Pezizomycotina*, Hsy.1eH.10. 1, Cuba. See Castañeda (*Revta Jardin bot. Nac.* Univ. Habana **5**: 62, 1984).

Rolfidium Moberg (1986), Ramalinaceae (L). 1, Sri Lanka. See Moberg (*Lichenologist* **18**: 305, 1986), Timdal (*Op. bot.* **110**, 1991), Ekman (*Op. bot.* **127**: 148 pp., 1996).

Rollandina Pat. (1905) = Arachniotus fide Roy *et al.* in Subramanian (Ed.) (*Taxonomy of fungi* **1**: 215, 1978), Ghosh *et al.* (*Mycotaxon* **10**: 21, 1979; SEM), Sugiyama & Mikawa (*Mycoscience* **42**: 413, 2001; phylogeny).

Rolueckia Papong, Thammath. & Boonpr. (2008), Gomphillaceae (L). 3. See Papong *et al.* (*Nova Hedwigia* **86**: 201, 2008).

Romanoa Thirum. (1954), ? Hypocreales. 1 (in soil), Italy. See Thirumalachar (*Rendiconti Ist. Sup. Sanità* (Rome) **17**: 1326, 1954).

Romellia Berl. (1900) = Togninia fide Barr (*Mycol.* **77**: 549, 1985), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006), Réblová & Mostert (*MR* **111**: 299, 2007; phylogeny).

Romellia Murrill (1904) ≡ Phaeolus.

Romellina Petr. (1955), Pezizomycotina. 1 (on insects), Java. See Petrak (*Sydowia* **9**: 597, 1955).

Romjularia Timdal (2007), Porpidiaceae (L). 1, Europe; USA. See Timdal (*Lichen Flora of the Greater Sonoran Desert Region* **3**: 287, 2007).

Ronnigeria Petr. (1947), Leptopeltidaceae. 1, Europe. See Holm & Holm (*Bot. Notiser* **130**: 115, 1977).

root nodules, of legumes are caused by nitrogen-fixing bacteria of the genus *Rhizobium*; those of spp. of *Alnus, Elaeagnus, Hippophaë* and *Myrica* by members of the *Plasmodiophorales* fide Hawker & Fraymouth (*J. gen. Microbiol.* **5**: 369, 1951).

Root rots of cereals. Various fungi are implicated, including *Cochliobolus sativus, Fusarium graminearum, Gaeumannomyces graminis, Monographella nivalis, Pythium* and *Rhizoctonia* spp. Successive cropping of the same cereal may exacerbate losses which, in the case of take-all disease cause by *G. graminis*, have been reported as up to 60% of the crop. Biological control using various fungi (e.g. *Idriella bolleyi* and *Phialophora graminicola*) may be possible. See: Deacon (*Plant pathology* **22**: 149, 1973), Duczek (*Can. J. Plant Path.* **19**: 402, 1997), Garrett (*Root disease fungi*, 1944, *Biology of root-infecting fungi*, 1956, *Pathogenic root-infecting fungi*, 1970), Simmonds (*Bot. Rev.* **7**: 308, 1941; **19**: 131, 1953). See also take-all.

Ropalospora A. Massal. (1860), Ropalosporaceae (L). 9, widespread (arctic-alpine). See Hertel (*Mitt. bot. StSamml., München* **17**: 537, 1981), Purvis *et al.* (*Lichen Flora of Great Britain and Ireland*, 1992; synonymy with *Fuscidea*), Ekman (*Bryologist* **96**: 582, 1993), Kantvilas (*Biblthca Lichenol.* **78**: 169, 2001; Tasmania), Bylin *et al.* (*Biblthca Lichenol.* **96**: 49, 2007; phylogeny).

Ropalosporaceae Hafellner (1984), Lecanoromycetidae (inc. sed.). 1 gen., 9 spp.

Lit.: Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1984), Bylin *et al.* (*Biblthca Lichenol.* **96**: 49, 2007; phylogeny).

Ropalosporia, see *Ropalospora*.

Roridella E. Horak (2005) ≡ Roridomyces.

roridins, terpinoid toxins of *Myrothecium roridum* and *M. verrucaria*; the cause of dendrochiotoxicosis (ill-thrift) in sheep, pigs, and humans.

Roridomyces Rexer (1994), Mycenaceae. 7, widespread (temperate). See Rexer (*Die Gattung Mycena s.l., Studien zu Ihrer Anatomie, Morphologie und Systematik*: [322] pp., 1994), Horak (*Röhrlinge und Blätterpilze in Europa, Fussend auf Moser, 5 Aufl. (1983): Kleine Kryptogamenflora Band 2, Teil b2. Gustav Fischer Verlag* Bestimmungsschlüssel für *Polyporales (p.p.), Boletales, Agaricales, Russulales*, 2005; as *Roridella*).

roridous, covered with drops of liquid like dew.

Rosaria N. Carter (1922), Fungi. 1.

Rosasporina Beneš (1956), Fossil Fungi. 1 (Carboniferous), former Czechoslovakia.

Roscoepoundia Kuntze (1898), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Rosellinia De Not. (1844), Xylariaceae. Anamorphs *Dematophora, Geniculosporium*. 130, widespread. Root rots caused by *R. aquila* (mulberry, *Morus*), *R. arcuata* (tea), *R. bunodes* (tropical crops), *R. necatrix* (with *Dematophora* state) (apple, vine (*Vitis*), etc.), *R. pepo* (cacao), *R. quercina* (oak, *Quercus*). See Dargan & Thind (*Mycol.* **71**: 1010, 1979; key Indian spp.), Francis (*Sydowia* **38**: 75, 1985), Petrini *et al.* (*Sydowia* **41**: 257, 1989), Ju & Rogers (*Mycol.* **82**: 342, 1990), Matzer & Hafellner (*Biblthca Lichenol.* **37**, 1990; lichenicolous taxa, now excluded), Ofong *et al.* (*MR* **95**: 189, 1991; biology, pathogenicity), Sousa & Whalley (*Beih. Sydowia* **43**: 281, 1991), Bermúdez & Carranza-Morse (*Revta Biol. trop.* **40**: 43, 1992; anamorph), Petrini (*Sydowia* **44**: 169, 1992; temperate spp.), Læssøe & Spooner

(*Kew Bull.* **49**: 1, 1993), Pande & Rao (*Czech Mycol.* **48**: 177, 1995; India), San Martín González & Rogers (*Mycotaxon* **53**: 115, 1995; Mexico), Stadler *et al.* (*MR* **105**: 1191, 2001; chemistry), Schena *et al.* (*Eur. J. Pl. Path.* **108**: 355, 2002; molecular diagnostics), Petrini (*N.Z. Jl Bot.* **41**: 71, 2003; New Zealand), Schena & Ippolito (*Journal of Plant Pathology* **85**: 15, 2003; rtPCR), Petrini & Petrini (*MR* **109**: 569, 2005; morphology), Bahl *et al.* (*Mycol.* **97**: 1102, 2005; phylogeny), Ju *et al.* (*Mycol.* **99**: 612, 2007; phylogeny).

Roselliniella Vain. (1921), Sordariomycetidae. 12 (lichenicolous), widespread. See Matzer & Hafellner (*Biblthca Lichenol.* **37**, 1990), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000).

Roselliniomyces Matzer & Hafellner (1990), Sordariomycetidae. 1 (on lichens, *Trichothelium*), Costa Rica. See Matzer (*Cryptog. Mycol.* **14**: 11, 1993), Matzer (*Mycol. Pap.* **171**: 202 pp., 1996).

Roselliniopsis Matzer & Hafellner (1990), Sordariomycetidae. 5 (on lichens), Africa; north temperate. See Matzer & Hafellner (*Biblthca Lichenol.* **37**, 1990), Matzer (*Cryptog. Mycol.* **14**: 11, 1993).

Rosellinites Mesch. (1892), Fossil Fungi. 2 (Tertiary), Europe.

Rosellinites R. Potonié (1893), Fossil Fungi. 1 (Oligocene), Germany.

Rosellinula R. Sant. (1986), Dothideomycetes. 3 (on lichens), widespread. See Santesson (*SA* **5**: 311, 1986).

Rosenscheldia Speg. (1885), Dothideomycetes. 3 or 4, widespread. See Holm (*Svensk bot. Tidskr.* **62**: 217, 1968).

Rosenscheldiella Theiss. & Syd. (1915), Venturiaceae. *c.* 13, widespread (tropical). See Hansford (*Mycol. Pap.* **15**, 1946), Swart (*TBMS* **58**: 417, 1972), Sivanesan & Shivas (*Fungal Diversity* **11**: 151, 2002).

Rosenschoeldia L. Holm (1968) ≡ Rosenscheldia.

Roseodiscus Baral (2006), Helotiaceae. 3, widespread. See Baral & Krieglsteiner (*Acta Mycologica* Warszawa **41**: 11, 2006).

Roseofavolus T. Hatt. (2003), Polyporaceae. 1, Singapore. See Stalpers (*in litt.*), Hattori (*Mycoscience* **44**: 457, 2003) = *Grifola* fide.

Roseograndinia Hjortstam & Ryvarden (2005), Phanerochaetaceae. 1, widespread. See Hjortstam & Ryvarden (*Syn. Fung.* **20**: 40, 2005).

Rossiomyces R.K. Benj. (2001), Laboulbeniaceae. 1, Poland. See Benjamin (*Aliso* **19**: 132, 2000).

Rossmania Lar.N. Vassiljeva (2001) = Tunstallia fide Vasilyeva (*Mycoscience* **42**: 401, 2001).

Rostafiński (Józef Thomasz; 1850-1928; Poland). Born in Warsaw; student (under E.A. Strasburger), Jena; student under de Bary (q.v.), Halle; Lecturer (1876-1881) then Professor of Botany (1881-1924), Cracow University. Noted for his work on *Mycetozoa*; also worked with Algae. *Publs. Śluzowce (Mycetozoa) Monografia* (1874) [re-issued with supplement, 1875]. *Biogs, obits etc.* Kulczynski (*Acta Societatis Botanicorum Poloniae* **6**: 391, 1929); Stafleu & Cowan (*TL-2* **4**: 908, 1983).

Rostafinskia Speg. (1880) nom. dub., ? Dothideomycetes.

Rostania Trevis. (1880) = Collema F.H. Wigg. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Rostkovites P. Karst. (1881) = Suillus Gray fide Singer (*Farlowia* **2**: 223, 1945).

rostrate (1) beaked; (2) (of asci), see ascus; bent tip of macroconidia of *Microsporum canis* and other anamorphic fungi.

Rostraureum Gryzenh. & M.J. Wingf. (2005), Cryphonectriaceae. 2, widespread. See Gryzenhout *et al.* (*MR* **109**: 1039, 2005), Gryzenhout *et al.* (*Mycol.* **98**: 239, 2006; phylogeny).

Rostrella Fabre (1879) = Ceratocystis fide de Hoog (*Stud. Mycol.* **7**, 1974).

Rostrella Zimm. (1900) = Ceratocystis fide Bakshi (*Mycol. Pap.* **35**, 1951).

Rostrocoronophora Munk (1953) = Gnomonia fide Bolay (*Ber. schweiz. bot. Ges.* **81**, 1972).

Rostronitschkia Fitzp. (1919), Diatrypaceae. 1, Puerto Rico. See Petrak (*Sydowia* **5**: 169, 1951), Rappaz (*Mycol. Helv.* **2**: 285, 1987).

Rostrosphaeria Tehon & E.Y. Daniels (1927) = Botryosphaeria fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Rostrospora Subram. & K. Ramakr. (1952) = Colletotrichum fide Nag Raj (*CJB* **51**: 2463, 1973).

rostrum, any beak-like process.

Rostrup (Emil; 1831-1907; Denmark). School teacher at Skaarup, southern Funen (1858-1883); lecturer (1883-1902) then Professor and Chief Consulting Pathologist (1902-1907), Royal Veterinary and Agricultural College, Copenhagen. Made significant contribution to knowledge of the fungi of Denmark; also a pioneer plant pathologist, particularly in forest pathology. Collections in Botanical Museum, Copenhagen (C) [catalogued by Lind, *Danish Fungi, as Represented in the Herbarium of E. Rostrup*, 1913]. *Publs. Plantepatologi. Haandbog i Læren om Plantesygdomme for Landbrugere Havebrugere og Skovbrugere* (1902). *Biogs, obits etc.* Grummann (1974: 679); Lind (*Danish Fungi, as Represented in the Herbarium of E. Rostrup*, pp. 1-9, 1913); Ravn (*Bericht der Deutschen Botanischen Gesellschaft* **26A**: (47), 1909); Rosenvinge (*Botanisk Tidsskrift* **28**: 185, 1908) [portrait]; Shear (*Phytopathology* **12**: 1, 1922) [portrait]; Stafleu & Cowan (*TL-2* **4**: 912, 1983).

Rostrupia Lagerh. (1889) = Puccinia fide Berndt (*in litt.*).

Rostrupiella Jørg. Koch, K.L. Pang & E.B.G. Jones (2007), Lulworthiaceae. 1, Denmark; USA. See Koch *et al.* (*Bot. Mar.* **50**: 294, 2007).

rostrupioid (of *Pucciniales*), having teliospores as in *Rostrupia*.

rosulate, in a rosette.

Rosulomyces S. Marchand & Cabral (1976), anamorphic *Pezizomycotina*, Hso.0eH.39. 1, Argentina. See de Hoog (*Stud. Mycol.* **15**, 1977).

Rota Bat., Cif. & Nascim. (1959), anamorphic *Pezizomycotina*, Cpt.1eH.?. 1, Brazil. See Batista *et al.* (*Mycopath. Mycol. appl.* **11**: 58, 1959).

Rotaea Ces. ex Schltdl. (1851), anamorphic *Pezizomycotina*, Hsy.≡ eH.?. 1, Europe.

Rotiferophthora G.L. Barron (1991), anamorphic *Cordycipitaceae*, Hso.0eH.15/16. 22 (on rotifers), widespread. See Glockling & Dick (*MR* **98**: 833, 1994), Glockling (*MR* **102**: 1142, 1998; Japan), Zare *et al.* (*Nova Hedwigia* **73**: 51, 2001).

rots (types of), see Wood-attacking fungi.

Rotula (Müll. Arg.) Müll. Arg. (1890) [non *Rotula* Lour. 1790, *Boraginaceae*] ≡ Mazosia.

Rotula Raf. (1815) nom. dub., Agaricales. See Merrill

(*Index Rafinesq.*, 1949).

Rotularia (Vain.) Zahlbr. (1923) [non *Rotularia* Sternb. 1825, fossil *Phanerogamae*] = Mazosia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Roumegueria (Sacc.) Henn. (1908), Dothideomycetes. *c.* 2, widespread (tropical).

Roumegueriella Speg. (1880), Bionectriaceae. Anamorph *Gliocladium*-like. 3 (coprophilous and in mushroom beds), widespread (temperate). See Malloch & Cain (*CJB* **50**: 61, 1972), Udagawa *et al.* (*Mycoscience* **35**: 409, 1994), Rehner & Samuels (*CJB* **73** Suppl. 1: S816, 1995; phylogeny), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Rossman *et al.* (*Mycol.* **93**: 100, 2001; rDNA phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Roumeguerites P. Karst. (1879) = Hebeloma fide Singer (*Agaric. mod. Tax.*, 1951).

Roussoella Sacc. (1888), Didymosphaeriaceae. Anamorph *Cytoplea*. 20 (mostly on *Palmae* and bamboos), widespread (tropical). See Aptroot (*Nova Hedwigia* **60**: 325, 1995; key), Hyde *et al.* (*MR* **100**: 1522, 1996), Ju *et al.* (*Mycotaxon* **58**: 419, 1996), Hyde (*MR* **101**: 609, 1997), Kang *et al.* (*Fungal Diversity* **1**: 147, 1998; DNA), Zhou *et al.* (*Cryptog. Mycol.* **24**: 191, 2003; China).

Roussoellopsis I. Hino & Katum. (1965), Dothideomycetes. 3 (on bamboo), Japan. See Hino & Katumoto (*J. Jap. Bot.* **40**: 86, 1965).

Royella R.S. Dwivedi (1960) nom. nud. = Dichotomomyces fide Scott (*TBMS* **55**: 313, 1970).

Royoporus A.B. De (1996), Polyporaceae. 3, widespread. See De (*Mycotaxon* **60**: 143, 1996).

Royoungia Castellano, Trappe & Malajczuk (1992), Boletaceae. 1, Australia. Basidioma gasteroid. See Castellano *et al.* (*Aust. Syst. Bot.* **5**: 613, 1992).

Rozella Cornu (1872), Fungi. 22, widespread. Possible the earliest diverging lineage of the *Fungi*. See Sparrow (*Aquatic Phycomycetes* Edn 2: 167, 1960; key), Held (*Bot. Rev.* **47**: 451, 1981), James *et al.* (*Mycol.* **98**: 860, 2006; phylogeny).

Rozia Cornu (1872) [non *Rozea* Besch. 1872, *Musci*] ≡ Rozella.

Rozites P. Karst. (1879) = Cortinarius fide Peintner *et al.* (*Mycotaxon* **83**: 447, 2002).

r-selection, adaptation to the rapid colonization and exploitation of newly opened or uncolonized habitats; in fungi generally involving large numbers of usually small and asexually produced and short-lived propagules, e.g. conidia, soredia; cf. K-selection. See Andrews, *in* Carroll & Wicklow (1992: 119), Armstrong (*Ecology* **57**: 953, 1976), Boyce (*Ann. Rev. Ecol.Syst.* **15**: 427, 1984), population biology, secondary species.

Rubelia Nieuwl. (1916) ≡ Sphaerosporula.

Rubeolarius Raith. (1981) = Clitocybe fide Kirk (*in litt.*).

Rubetella Tuzet, Rioux & Manier ex Manier (1964) = Smittium fide Lichtwardt (*Am. J. Bot.* **51**: 836, 1964).

Rubigo (Pers.) Roussel (1806) = Uredo fide Berndt (*in litt.*).

Rubikia H.C. Evans & Minter (1985), anamorphic *Pezizomycotina*, St.#eP.1. 1, pantropical. See Evans & Minter (*TBMS* **84**: 57, 1985), Dulymamode *et al.* (*MR* **102**: 1242, 1998; Mauritius).

Rubinoboletus Pilát & Dermek (1969) = Chalciporus fide Kuyper (*in litt.*).

rubratoxin B, a toxic metabolite of *Penicillium rubrum* P-13 (Hayes & Wilson, *Appl. Microbiol.* **16**: 1163, 1968) causing hepatitis in cattle and pigs.

Rubrinectria Rossman & Samuels (1999), Nectriaceae. Anamorph *Nalanthamala*. 1 (dead wood etc.), widespread (pantropical). See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Schroers *et al.* (*Mycol.* **97**: 375, 2005; phylogeny, anamorph).

Rubromadurella Talice (1935) = Madurella fide Ciferri & Redaelli (*Mycopathologia* **3**: 182, 1941).

Rubroporus Log.-Leite, Ryvarden & Groposo (2002), Polyporaceae. 1, Brazil. See Loguercio-Leite *et al.* (*Mycotaxon* **83**: 224, 2002).

Rubrotricha Lücking, Sérus. & Vězda (2005), Gomphillaceae (L). 1, Ecuador. See Lücking *et al.* (*Lichenologist* **37**: 165, 2005).

ruderal (1) living in waste places; (2) (of fungi) having a high growth rate, rapidly germinating spores, and a short life expectancy due to exhaustion of the available nutrients; cf. zymogenous (see autochthonous), sugar fungus.

Rudetum Lloyd (1919) = Septobasidium fide Stevenson & Cash (*Bull. Lloyd Libr. Mus.* **35**: 47, 1936).

Ruggieria Cif. & Montemart. (1958), anamorphic *Pezizomycotina*, St.0fH.?. 1, Italy. *R. glaucescens* on *Citrus* (melanose).

Rugosaria Raf. (1833) nom. inval. ≡ Gemmularia.

rugose, wrinkled (Fig. 20.14). Cf. rugulose.

Rugosomyces Raithelh. (1979) = Calocybe fide Kuyper (*in litt.*).

Rugosospora Heinem. (1973), Agaricaceae. 2, widespread (tropical). See Heinemann (*Bull. Jard. Bot. Nat. Belg.* **43**: 12, 1973).

rugulose, delicately wrinkled. Cf. rugose.

Ruhlandiella Henn. (1903), Pezizaceae. 1, widespread (probably native to Australia). See also *Muciturbo*. See Dissing & Korf (*Mycotaxon* **12**: 290, 1980), Warcup & Talbot (*MR* **92**: 95, 1989), Galán & Moreno (*Mycotaxon* **68**: 265, 1998; Europe), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

rum, see spirits.

rumen fungi, see anaerobic fungi.

Ruminomyces Y.W. Ho (1990) = Anaeromyces fide Letcher (*in litt.*).

Rumpomycetes. Class within the *Chytridiomycota* distinguished by the presence of a rumposome (q.v.) and including *Chytridiales* and *Monoblepharidales* but excluding *Spizellomycetales* (Cavalier-Smith, *in* Rayner *et al.* (Eds), *Evolutionary biology of the fungi*: 339, 1987). See James *et al.* (2000).

rumposome, an organelle in zoospores of certain *Chytridiomycota* located close to the cell wall; tooth-like in section and honey-comb like in surface view; see *Rumpomycetes*.

rupestral (**rupestrine**), living on walls or rocks; cf. saxicolous.

Rupinia Speg. & Roum. (1879) [non *Rupinia* L. f. 1782, *Hepaticae*] = Heydenia fide Saccardo (*Syll. fung.* **4**: 625, 1886).

Rusavskia S.Y. Kondr. & Kärnefelt (2003) = Xanthoria fide Kondratyuk & Kärnefelt (*Ukrainian Jour. Bot.* **60**: 427, 2003), Gaya *et al.* (*MR* **112**: 528, 2008).

Ruspoliella Sambo (1937) = Solorina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Russula Pers. (1796), Russulaceae. *c.* 750, widespread. Gastroid forms are polyphyletic and have formerly been morphologically recognised as a separate genus.

See Crawshay (*The spore ornamentation of the Russulas*, 1930), Pearson (*Naturalist* Hull: 85, 1948; key Brit. spp.), Schaeffer (*Russula Monographie*, 1951), Hesler (*Mem. Torrey bot. Club* **21**, 1960), Blum (*Les Russules*, 1962; France), Hesler (*Mycol.* **53**: 605, 1962; N. Am. types), Smith (*Mycol.* **55**: 435, 1963; key), Watson (*TBMS* **49**: 11, 1966; pigments), Romagnesi (*Les Russules d'Europe et Afrique du Nord*, 1967), Rayner (*Bull. BMS* **2**: 76, 1968; keys Brit. spp.), Rayner (*Bull. BMS* **3**: 59, 1969; keys Brit. spp.), Rayner (*Bull. BMS* **3**: 89, 1969; keys Brit. spp.), Rayner (*Bull. BMS* **4**: 19, 1970; descr. Brit. spp.), Burge (*Mycol.* **71**: 977, 1979; spore structure), Pegler & Young (*TBMS* **72**: 353, 1979), Rayner (*Keys to British species of Russula* edn 3, 1985), Sarnari (*Monografia illustrata del genere Russula in Europa*, 1998), Miller *et al.* (*Mycol.* **93**: 344, 2001; phylogeny), Lebel (*N.Z. Jl Bot.* **40**: 489, 2002; New Zealand gasteroid spp.), Miller & Buyck (*MR* **106**: 259, 2002; phylogeny European spp.), Lebel (*Aust. Syst. Bot.* **16**: 401, 2003; australasian spp.), Moënne-Loccoz & Reumaux (*Les Russules Émétiques, Prolégomènes à Une Monographie des Emeticinae d'Europe et d'Amérique du Nord*: 264 pp., 2003), Miller (*Mycotaxon* **89**: 283, 2004; southeastern USA), Buyck (*Cryptog. Mycol.* **26**: 85, 2005; African spp.), Buyck *et al.* (*Boll. Gruppo Micol. 'G. Bresadola'* **46**: 57, 2003; Costa Rica).

Russulaceae Lotsy (1907), Russulales. 5 gen. (+ 18 syn.), 1243 spp.

Lit.: Singer & Smith (*Mem. Torrey bot. Club* **21**, 1960), Smith (*Mycol.* **54**: 626, 1962), Pegler & Young (*TBMS* **72**: 353, 1973), Beaton *et al.* (*Kew Bull.* **33**: 669, 1984; Austr. spp.), Mueller & Gardes (*MR* **95**: 592, 1991), Mueller (*Fieldiana, Bot.* **30**: 158 pp., 1992), Bougher *et al.* (*MR* **97**: 613, 1993; generic delimitation), Mueller & Ammirati (*Am. J. Bot.* **80**: 322, 1993), Henrion *et al.* (*Mol. Ecol.* **3**: 571, 1994), Mueller *et al.* (*Mycol.* **85**: 890, 1993), Buyck (*Russulales News* **3**: 3, 1995), Sweeney *et al.* (*MR* **100**: 1515, 1996), Mueller (*Revta Biol. trop.* **44**: 131, 1996), Mueller (*Mycotaxon* **61**: 205, 1997), Buyck & Horak (*Mycol.* **91**: 532, 1999), Gherbi *et al.* (*Mol. Ecol.* **8**: 2003, 1999), Kropp & Mueller (*Laccaria – Ectomycorrhizal fungi, key genera in profile*, 1999; generic classification), Martín *et al.* (*MR* **103**: 203, 1999), Martin *et al.* (*Microbiology (Reading)* **145**: 1605, 1999), Hibbett *et al.* (*Nature* **407**: 506, 2000), Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000), Bougher & Lebel (*Aust. Syst. Bot.* **14**: 439, 2001), Fiore-Donno & Martin (*New Phytol.* **152**: 533, 2001), Miller *et al.* (*Mycol.* **93**: 344, 2001; phylogeny), Binder & Bresinsky (*Mycol.* **94**: 85, 2002), Binder & Hibbett (*Mol. Phylogen. Evol.* **22**: 76, 2002), Eberhardt (*Mycol. Progr.* **1**: 201, 2002), Miller & Buyck (*MR* **106**: 259, 2002), Moncalvo *et al.* (*Mol. Phylogen. Evol.* **23**: 357, 2002), Desjardin (*Mycol.* **95**: 148, 2003), Larsson & Larsson (*Mycol.* **95**: 1037, 2003), Lebel (*Aust. Syst. Bot.* **16**: 401, 2003), Miller & Henkel (*Mem. N. Y. bot. Gdn* **89**: 297, 2004), Shimono *et al.* (*Mycoscience* **45**: 303, 2004), Wang *et al.* (*Nova Hedwigia* **79**: 511, 2004).

Russulales Kreisel ex P.M. Kirk, P.F. Cannon & J.C. David (2001). Agaricomycetes. 12 fam., 80 gen., 1767 spp. Ectomycorrhizal, saprobic or pathogenic on trees, basidiomata epigeous or partly hypogeous, cosmopolitan.

The order *Russulales* has the same circumscription as the russuloid clade in Hibbett & Thorn (*The Mycota* **7B**, 2001). It contains lamellate, poroid, hydnoid and gastroid representatives. The classification is based on Miller *et al.* (*Mycol.* **98**: 960, 2006). Fams:
(1) **Albatrellaceae**
(2) **Amylostereaceae**
(3) **Auriscalpiaceae**
(4) **Bondarzewiaceae**
(5) **Echinodontiaceae**
(6) **Hericiaceae**
(7) **Hybogasteraceae**
(8) **Lachnocladiaceae**
(9) **Peniophoraceae**
(10) **Russulaceae**
(11) **Stephanosporaceae**
(12) **Stereaceae**

Lit.: Heim (*TBMS* **30**: 161, 1948; phylogeny and classification), Malençon (*Recueil trav. crypt. L. Mangin*: 377, 1931), Pegler & Young (*TBMS* **72**: 353, 1979; classification, spore structure), Singer *et al.* (*Beih. Nova Hedw.* **77**, 1983), Singer & Smith (*Mem. Torrey bot. Tottori Mycol. Inst.* **31**: 1, 1993; Japanese spp.), and under fams.

Russulina J. Schröt. (1889) = Russula fide Singer & Smith (*A monograph on the genus Galerina Earle*, 1964).

Russuliopsis J. Schröt. (1889) ≡ Laccaria.

rust (1) a disease caused by one of the *Pucciniales*; (2) one of the *Pucciniales*; (3) a disease with 'rusty' symptoms; **black (stem)** - of cereals, *Puccinia graminis*; **blister** - of *Pinus* and *Ribes*, *Cronartium ribicola*; **brown (leaf)** - of barley, *P. hordei*; of rye and wheat, *P. recondita*; **crown** - of oats, *P. coronata*; **red** -, (1) urediniospore state of cereal rusts, esp. *Puccinia graminis*; (2) (of tea) the alga *Cephaleuros*; **white** - (1) (esp *Cruciferae*) = white blister; (2) (of *Chrysanthemum*) = *P. horiana*; **yellow (stripe)** - of cereals, *P. striiformis*.

Ruthea Opat. (1836) ≡ Paxillus.

Ruthiaceae Bat., J.A. Lima & M.A. Tatlasse{?} (1962) = Strigulaceae.

Rutola J.L. Crane & Schokn. (1978), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 1, widespread. See Crane & Schoknecht (*CJB* **55**: 3015, 1977).

Rutstroemia P. Karst. (1871) nom. cons., Rutstroemiaceae. Anamorphs *Myrioconium*, *Phialophora*-like. *c.* 75, widespread. See Holm (*TBMS* **67**: 333, 1976), Korf & Dumont (*Mycotaxon* **5**: 517, 1977; status), Holm (*Mycotaxon* **7**: 139, 1978; status), Kohn & Schumacher (*Mycotaxon* **18**: 531, 1983), Kohn & Schumacher (*Taxon* **33**: 507, 1984; nomencl.), Baral (*SA* **13**: 113, 1994; concept), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny).

Rutstroemiaceae Holst-Jensen, L.M. Kohn & T. Schumach. (1997), Helotiales. 7 gen. (+ 8 syn.), 223 spp.

Lit.: Korf & Zhuang (*Mycotaxon* **24**: 361, 1985),

Baral (*Z. Mykol.* **53**: 119, 1987), Spooner (*Biblthca Mycol.* **116**: 711 pp., 1987), Kohn & Grenville (*CJB* **67**: 371, 1989; anatomy), Zhuang (*Mycosystema* **8-9**: 15, 1995), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Schumacher & Holst-Jensen (*Mycoscience* **38**: 55, 1997), Zhuang & Wang (*Mycotaxon* **64**: 449, 1997), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006).

Ruzenia O. Hilber ex A.N. Mill. & Huhndorf (2004), Lasiosphaeriaceae. Anamorph *Selenosporella*-like. 2. See Miller & Huhndorf (*MR* **108**: 26, 2004; separation from *Lasiosphaeria*).

Ryparobius Boud. (1869) = Thelebolus fide Kimbrough & Korf (*Am. J. Bot.* **54**: 9, 1967).

Ryssospora Fayod (1889) = Pholiota fide Kuyper (*in litt.*).

Ryvardenia Rajchenb. (1994), Polyporaceae. 2, widespread. See Rajchenberg (*Nordic Jl Bot.* **14**: 436, 1994).

SA, see Media.

Saagaromyces K.L. Pang & E.B.G. Jones (2003), Halosphaeriaceae. 3, widespread. See Pang *et al.* (*Mycol. Progr.* **2**: 35, 2003).

Sabalicola K.D. Hyde (1995), ? Xylariaceae. 1, USA. See Hyde (*Nova Hedwigia* **60**: 596, 1995).

Sablicola E.B.G. Jones, K.L. Pang & Vrijmoed (2004), Halosphaeriaceae. 1, China. See Pang *et al.* (*CJB* **82**: 486, 2004).

Sabouraud (Raymond; 1864-1938; France). Voluntary military service, Lille (1885); student, Hôpital Cochin, Paris (1887); intern, Hôpital St Louis, Paris (1889-1890); medic, Hôpital St Antoine, Paris (1891-1894); Head of Laboratory (1894-1897) then Head of the Ecole Lailler (1897-1928), Hôpital St Louis, Paris. A dermatologist of Paris who revived and amplified the work of Gruby (q.v.); noted for his monumental researches on the dermatophytes; introduced procedures which shortened the treatment period for *tinea capitis* from 2 years to 3 months removing the need for segregated schools for infected children; his name is familiar to mycologists through 'Sabouraud agar'; also an amateur sculptor. *Publs. Les Teignes* (1910). *Biogs, obits etc.* Grigoraki (*Mycopathologia et Mycologia Applicata* **2**: 171, 1939) [bibliography, portrait]; Pautrier (*Annales de Dermatologie*, Série 7, **9**: 275, 1938) [portrait]; Pignot (*Mycopathologia et Mycologia Applicata* **7**: 348, 1956) [portrait].

Sabouraudiella Boedijn (1953) = Trichophyton fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sabouraudites M. Ota & Langeron (1923) ≡ Microsporum.

Saccardaea Cavara (1894) nom. dub., anamorphic *Pezizomycotina*. See Tulloch (*Mycol. Pap.* **130**: 36, 1972).

Saccardia Cooke (1878), Saccardiaceae. 3, widespread (subtropical). See von Arx (*Persoonia* **2**: 421, 1963).

Saccardiaceae Höhn. (1909), ? Dothideomycetes (inc. sed.). 11 gen. (+ 7 syn.), 35 spp.

Lit.: Barr (*Mycotaxon* **29**: 501, 1987), Hsieh *et al.* (*MR* **101**: 897, 1997), Inácio & Dianese (*MR* **102**: 695, 1998).

Saccardinula Speg. (1885), Elsinoaceae. 5, widespread (tropical). See Barr (*Mem. N. Y. bot. Gdn* **62**, 1990).

Saccardo (Pier Andrea; 1845-1920; Italy). Doctorate, University of Padua (1867); Professor of Natural History (1869) then Professor of Botany and Prefect of the Botanic Gardens (1879), University of Padua. Established *Michelia* (1877-1881), a short-lived journal important for the number of new fungal taxa described in it; distributed exsiccati, prepared an early mycological colour chart (see Colour) and made a special study of pyrenomycetes and anamorphic fungi; his outstanding contribution was the *Sylloge Fungorum Omnium hucusque Cognitorum*, a huge compendium on which all systematic mycology rests. By Saccardo's time the amount of printed work on systematic mycology was great; much was hard to obtain, and it was in no order; for these reasons, Saccardo took up the work of listing with Latin descriptions, all the genera and species of fungi of which there was then knowledge; to do this it was frequently necessary to make new arrangements of old groups, and 'emendations' of numbers of genera and species; he made special use of his system of 'spore groups' (see Anamorphic fungi) and his classification has had to be taken into account by all later systematic mycologists; most of the genera and species of non-lichen-forming fungi described up to 1920 are listed [these volumes are freely available on-line; see Internet: catalogues & thesauri]. His specimens are in the fungal reference collection at Padua (**PAD**) [see Gola, *L'erbario di P.A. Saccardo, Catalogo*, 1930]. *Publs. Fungi Veneti Novi vel Critici* (1873-1878) [a series of individual papers published in *Atti della Società Veneto-Trentina di Scienze Naturali*, *Nuovo Giornale Botanico Italiano* and *Michelia*]; *Fungi Italici Autographice Delineati* (1877-1886) [1,500 small coloured figs]; (with P. Sydow (q.v.), A.N. Berlese (q.v.), G.B. de Toni, Mussat, D. Saccardo [his sone], Traverso & others) *Sylloge Fungorum Omnium hucusque Cognitorum* vols 1-23 (1882-1925) [vols 24-26 were issued after his death, between 1926 and 1972]. *Biogs, obits etc.* Grummann (1974: 521); Paganelli, *in* Minelli [ed.] (*The Botanical Garden of Padua 1545-1995*: 118, 1995); Stafleu & Cowan (*TL-2* **4**: 1023, 1983); Zalin & Lazzari (*Carteggio Bresadola-Saccardo*, 1987) [correspondence].

Saccardoa Trevis. (1869) nom. rej. = Pseudocyphellaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Saccardoella Speg. (1879), Sordariomycetes. 2 or 19, widespread. See Hawksworth & Eriksson (*SA* **10**: 52, 1991), Hyde (*Mycol.* **84**: 803, 1992), Barr (*Mycotaxon* **51**: 191, 1994; posn), Fallah & Shearer (*Mycol.* **93**: 566, 2001), Cai *et al.* (*Mycotaxon* **84**: 255, 2002; Philippines).

Saccardomyces Henn. (1904) = Schweinitziella fide Pirozynski (*Kew Bull.* **31**: 595, 1977).

saccate, like a sac or bag.

Saccharomycetales Kudryavtsev (1960). Saccharomycetidae. 13 fam., 88 gen., 906 spp. Mycelium absent or poorly developed, where present usually with septa which have a series of minute pores rather than a single simple pore; vegetative cells proliferating by budding (blastically) or by fission (thallically), the walls usually lacking chitin except around bud scars, sometimes with J+ gel; ascomata absent; asci formed singly or in chains, sometimes not strongly differentiated morphologically from vegetative cells, usually at least eventually evanescent; ascospores varied in shape, sometimes with equatorial or asymmetric thickenings. The teleomorphic ascomycetous yeasts, cosmop. in a very wide range of habitats. Fams:

saddle fungus, ascomata of *Helvella* spp.

saddle-back fungus (dryad's saddle), basidioma of *Polyporus squamosus*.

Saeenkia Kudrjanzev (1960) = Saccharomycodes fide Lodder (*Yeasts, a taxonomic study* 2nd edn, 1970).

Safety, Laboratory. Health & Safety legislation for places of work appropriate to the country in which the laboratory is operating should always be consulted. In addition to normal good laboratory practice (for example wearing suitable protective clothing, and prohibition of eating and smoking), further precautions should be taken to avoid laboratory hazards specific to mycology (e.g. see the European Community Directive 2000/54/CE on protection of workers from risks related to exposure to biological agents at work, website: http://europa.eu/eur-lex/pri/en/oj/dat/2000/l_262/l_26220001017en00210045.pdf; the UK Advisory Committee on Dangerous Pathogens, website: www.hse.gov.uk/aboutus/meetings/acdp).

It must be remembered that many fungi pathogenic for humans are 'opportunistic', widespread saprobes, and their full potential to effect human health is rarely known (see Smith, *Opportunistic mycoses of man and other animals*, 1989). Fungi and other organisms can enter the body through the mouth, lungs, broken or unbroken skin, and the conjunctiva. However, in a laboratory the route of infection may not be

the same as when the disease is acquired elsewhere. Potential hazards may be greater in the laboratory than in nature if fungi are being grown in substantial numbers, transferred from one container to another, and manipulated, increasing the risk of infection. The main routes of infection are accidential inoculation, accidential ingestion, splashing into the face and eyes, spillage and direct contact. Good laboratory practice to keep cultures pure normally prevents their escape to cause infection, but note that the conditions provided for the growth of a particular fungus may also be suitable for the growth of a potentially hazardous contaminant.

Special precautions should be taken when harvesting bulk cultures or large quantities of spores. Fungi may also cause allergic reactions or mycotoxicoses (poisoning) and therefore contact with them and the materials or equipment they have been in contact with must be avoided.

Great care must be taken in handling the pathogens of coccidioidomycosis, histoplasmosis, and other systemic mycoses for there are many instances of laboratory infections by these fungi resulting in illness or even death (see Hanel & Kruse, *Misc. Publ. Fort Detrich, Dept. Army* **27**, 1967; laboratory acquired mycoses).

In the European Community, the European Directive 2000/54/CE allocates fungi (and other organisms) to four hazard groups. Similar categories exist in other countries. See also *Biosafety in microbiological and biomedical laboratories* edn 4, 1999; downloadable in PDF format from www.cdc.gov/od/ohs/biosfty/bmbl4/bmbl4toc.htm; *Categorization of pathogens according to hazard and categories of containment*, edn 2, 1990):

Group 1: A biological agent that is most unlikely to cause human disease.

Group 2: A biological agent that may cause human disease and which might be a hazard to laboratory workers but is unlikely to spread in the community. Laboratory exposure rarely produces infection and effective prophylaxis or treatment is available.

Group 3: A biological agent that may cause severe human disease and present a serious hazard to laboratory workers. It may present a risk of spread in the community but there is usually effective prophylaxis or treatment.

Group 4: A biological agent that causes severe human disease and is a serious hazard to laboratory workers. It may present a high risk of spread in the community and there is usually no effective prophylaxis or treatment.

Most fungi belong to category 1. The European Union directive (see above) lists the following species in category 2: *Aspergillus fumigatus*, *Candida* spp., *Cryptococcus neoformans*, *Emmonsia parva*, *Epidermophyton floccosum*, *Fonsecaea* spp., *Madurella* spp., *Microsporum* spp., *Neotestudina rosatii*, *Penicillium marneffii*, *Scedosporium apiospermum*, *Sporothrix schenkii* and *Trichophyton* spp. Only 5 fungi are included in category 3: *Blastomyces dermatitidis*, *Cladophialophora bantiana*, *Histoplasma capsulatum*, *Coccidioides immitis* and *Paracoccidioides brasiliensis* [*Note*: teleomorph names only listed where the fungi are pleomorphic; see generic entries for those of the anamorphs]. No fungi are placed in category 4. Other classifications of hazardous organisms are available (e.g. US Public Health Service, *Classification of etiologic agents on the basis of hazard*, 1974 [also as an appendix to *Biosafety in microbiological and biomedical laboratories*, see above]; World Health Organization, *Laboratory biosafety manual*, edn 3, 2004; as a downloadable PDF file from www.who.int/csr/delibepidemics/WHO_CDS_CSR_LYO_2004_11/en/).

Increasing containment levels are prescribed by Health and Safety regulations for these hazard categories in most countries, and information on those which apply should be sought from appropriate national agencies before starting work with listed organisms.

Saitoella Goto, Sugiy., Hamam. & Komag. (1987), anamorphic *Protomycetaceae*, Hso.0eH.3/10. 1 (from soil), Himalaya. See Goto *et al.* (*J. gen. appl. Microbiol.* Tokyo **33**: 76, 1987), Nishida & Sugiyama (*Mol. Biol. Evol.* **10**: 431, 1993), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997), Ahearn *et al. in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 600, 1998), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny).

Saitomyces Ricker (1906) ≡ Actinocephalum.

Sakaguchia Y. Yamada, K. Maeda & Mikata (1994), Cystobasidiomycetes. 1 (from sea water), Antarctica. See Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Scorzetti *et al.* (*FEMS Yeast Research* **2**: 495, 2002).

Sakireeta Subram. & K. Ramakr. (1957) = Tiarosporella fide Sutton (*Mycol. Pap.* **141**, 1977).

Saksenaea S.B. Saksena (1953), Radiomycetaceae. 1, widespread. See Ellis & Hesseltine (*Mycol.* **66**: 85, 1974), Ajello *et al.* (*Mycol.* **68**: 53, 1976; on humans), Ellis & Ajello (*Mycol.* **74**: 144, 1982), Chien *et al.* (*TMSJ* **33**: 443, 1992), Mathews *et al.* (*J. Mycol. Médic.* **3**: 95, 1993; causing zygomycosis, lit. review), Pillai & Ahmed (*Curr. Sci.* **65**: 291, 1993), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Prabhu & Patel (*Clin. Microbiol. Infect.* **10** Suppl. 1: 31, 2004; zygomycosis, review).

Saksenaeaceae Hesselt. & J.J. Ellis (1974) = Radiomycetaceae.
Lit.: Kirk (*in litt.*).

Saliastrum Kujala (1946), anamorphic *Pezizomycotina*, Hso.0bP.1. 1, Europe; Canada. See Redhead & Perrin (*CJB* **50**: 2083, 1972), Sutton (*Mycol. Pap.* **141**, 1977).

Salmonia S. Blumer & E. Müll. (1964) = Brasiliomyces fide Braun (*Nova Hedwigia* **34**: 704, 1981).

Salmonomyces Chidd. (1959) = Erysiphe fide Zheng (*Mycotaxon* **22**: 209, 1985).

Salsuginea K.D. Hyde (1991), Dothideomycetes. 1 (marine), Thailand. See Eriksson & Hawksworth (*SA* **11**: 73, 1992; posn).

saltation (of fungi), mutation; dissociation; see Variation in fungi.

Samarospora Rostr. (1892), ? Eurotiales. 1, Europe.

Samarosporella Linder (1944) nom. dub., Fungi. See Kohlmeyer (*CJB* **50**: 1951, 1972).

Samboa Tomas. & Cif. (1952) nom. dub. ? = Buellia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Samboamyces Cif. & Tomas. (1953) ≡ Samboa.

Sambucina Velen. (1947), ? Helotiales. 1, former Czechoslovakia.

sambucinin, see enniatin.

Sampaioa Gonz. Frag. (1923) = Mycoglaena fide Checa (*Mycotaxon* **63**: 467, 1997).

Samuelsia Chaverri & K.T. Hodge (2008), Clavicipitaceae. 5, neotropics. See Chaverri *et al.* (*Stud. Mycol.* **60**, 2008; phylogeny).

Samukuta Subram. & K. Ramakr. (1957) = Neottiospora fide Nag Raj (*CJB* **51**: 2463, 1973).

Sand dune fungi. Sand dunes have a characteristic mycota of both microfungi (Moreau & Moreau, *Rev. Mycol.* **6**: 49, 1941, Dickinson & Kent, *TBMS* **58**: 269, 1972) and macrofungi (Andersson, *Op. bot. Soc. bot. Lund* **2**, 1950, Bon, *BSMF* **86**: 79, 1970, Picardy; **88**: 15, 1972; *Lepiota*, Courtecuisse, *Docums Mycol.* fasc. 57-58, 66, 1984-1986, Høiland, *Blyttia* **33**: 127, 1975, **35**: 139, 1977, **36**: 69, 1978, Jaiswal & Rodrigues (*Curr. Sci.* **80**: 827, 2001; mycorrhizal fungi in coastal dunes of Goa, India), Singer (*Mycopathologia* **34**: 129, 1968; on south Atlantic coast from Uruguay to Bahía Blanca, Argentina), Watling & Rotheroe, *Proc. R. Soc. Edinb.* **96**: 111, 1989) which, like that of flowering plants, exhibits a zonation from the shore sand to fixed dune (Wallace, *Trans. Devon. Ass. Advmt Sci.* **86**: 201, 1954; Cordoba *et al.* (*Mycoscience* **42**: 379, 2001; diversity gradients of mycorrhizal fungi in coastal dunes of Brazil)). Macrofungi play a role in facilitating dune colonization by flowering plants and in sustaining coastal dune systems (Logan *et al.*, *Aust. J. Pl. Physiol.* **16**: 141, 1989; mycorrhizal fungi enhancing Australian coastal dune ecosystems), both by the action of fungal hyphae in accretion of sand particles and as mycorrhizal symbionts (see Rotheroe, *in* Pegler *et al.* (Eds), *Fungi of Europe*, 1993). Characteristic lichen communities frequently develop on stable sand dunes and are usually dominated by species of *Cladonia*; succession in the lichen communities is correlated with the stability of the substratum (see James *et al.*, *in* Seaward (Ed.), *Lichen ecology*: 400, 1977). See also Ecology, Marine fungi.

Sandersoniomyces R.K. Benj. (1968), Laboulbeniaceae. 1, USA. See Benjamin (*Aliso* **10**: 345, 1983), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

sandimmum, see cyclosporin A.

Sanjuanomyces R.F. Castañeda & W.B. Kendr. (1991), anamorphic *Pezizomycotina*, Hso.≡ eP.24. 1, Cuba. See Castañeda Ruiz & Kendrick (*Univ. Waterloo Biol. Ser.* **35**: 93, 1991).

Santapauella Mundk. & Thirum. (1945) = Phragmidiella fide Thirumalachar & Mundkur (*Indian Phytopath.* **2**: 193, 1949).

Santapauinda Subram. (1994), anamorphic *Pezizomycotina*, Hso.#eP.1. 1, India. See Subramanian (*Kavaka* **20/21**: 58, 1992/1993).

Santessonia Hale & Vobis (1978), Caliciaceae (L). 6, Africa; S. America. See Sérusiaux & Wessels (*Mycotaxon* **19**: 479, 1984; key), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Nordin & Mattsson (*Lichenologist* **33**: 3, 2001; phylogeny), Helms *et al.* (*Mycol.* **95**: 1078, 2003; phylogeny), Follmann (*J. Hattori bot. Lab.* **100**: 651, 2006; revision, S America).

Santessoniella Henssen (1997), ? Pannariaceae (L). 11, widespread (temperate). See Henssen (*Symb. bot. upsal.* **32**: 75, 1997), Henssen (*Lichenologist* **32**: 57, 2000; S America), Henssen & Kantvilas (*Lichenologist* **32**: 149, 2000; Tasmania), Jørgensen (*Biblthca Lichenol.* **88**: 229, 2004), Spribille *et al.* (*Biblthca Lichenol.* **96**: 287, 2007; N America).

Santessoniolichen Tomas. & Cif. (1952) = Naetrocymbe Körb. fide Harris (*More Dematiaceous Hyphomycetes*, 1995).

Santessoniomyces Cif. & Tomas. (1953) ≡ Santessoniolichen.

Santiella Tassi (1900) = Passeriniella fide Sutton & Sellar (*CJB* **44**: 1505, 1966).

Sappinia P.A. Dang. (1896) nom. dub., Protozoa. Excluded from *Mycetozoa* by Olive (1975: 6).

saprobe (saprogen, saprotroph), an organism using dead organic material as food, and commonly causing its decay (saprobe is the preferred term for fungi); **saprobic, saprogen-ic (-ous), saprophilous, saprotrophic** (adj.). See Hudson (*Fungal saprophytism*, edn 2, 1980), saprophyte.

Saprochaetaceae Coker & Shanor ex D.T.S. Wagner & Dawes (1970) = Dipodascaceae.

Saprochaete Coker & Shanor (1939), anamorphic *Magnusiomyces*, Hso.0fH.10. 14, widespread. See Wagner & Dawes (*J. Elisha Mitchell scient. Soc.* **55**: 163, 1939), Hoog & Smith (*Stud. Mycol.* **50**: 489, 2004; revision, phylogeny).

Saprogaster Fogel & States (2001), Phallales. 1, USA. See Fogel & States (*Mycotaxon* **80**: 317, 2001).

saprogen, a saprobe (q.v.).

Saprophragma K.B. Deshp. & K.S. Deshp. (1966), anamorphic *Pezizomycotina*, Hso.≡ eH.?. 1, India. See Deshpande & Deshpande (*Mycopathologia* **30**: 200, 1966).

saprophyte, a plant feeding by external digestion of dead organic matter; commonly misapplied to fungi where saprobe (q.v.) is the preferred term.

Saprotaphrina Verona & Rambelli (1962) nom. nud., anamorphic *Pezizomycotina*. Used for the yeast phase of *Taphrina*.

saprotroph (1) a saprobe (q.v.); (2) a necrophyte on dead material which is not part of a living host (Münch), cf. perthophyte.

Sapucchaka K. Ramakr. (1956), ? Microthyriaceae. 1, India. See von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Sarawakus Lloyd (1924), Hypocreaceae. Anamorphs *Gliocladium*-like, *Trichoderma*-like, *Verticillium*-like. 11 (from wood and bark), widespread (tropical). See Samuels & Rossman (*Mycol.* **84**: 26, 1992; key), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Sarbhoy (Ashok Kumar; 1939-2006; India). BSc (1956), MSc (1959), PhD (1963), Assistant Professor of Botany (1962-1965), Allahabad University; Commonwealth Mycological Institute (1965-1967); Mycologist (1969-1972), Senior Mycologist (1972-1986), Principal Scientist (1986-1997), Professor (1997-1999), Emeritus Scientist (2000-2003), Indian Agricultural Research Institute, New Delhi. Responsible for development of the *Indian Type Culture Collection*. *Principal mycological publications*. (with L.V. Gangawane & D.K. Agarwal) *Compendium of Soil Borne Plant Pathogens* (1987); (with S.P. Raychaudhuri & A. Johnston) *History of Plant Pathology of South East Asia* (1996); *Textbook of Mycology* (2006). *Biogs, obits etc.* Smith (*World Federation for Culture Collections Newsletter* January 2007) [portrait].

Sarbhoyomyces Saikia (1981), anamorphic *Pezizomycotina*, Hsy.0eH.?. 1, India. See Saikia (*Curr. Sci.* **50**: 949, 1981).

Sarcanthia Raf. (1817) nom. dub., Fungi. No spp. included.

Sarcinella Sacc. (1880), anamorphic *Schiffnerula*, Hso.#eP.1. 27, widespread. See Hughes (*CJB* **61**: 1727, 1984), Hughes (*Mycol.* **82**: 657, 1990), Hosagoudar (*Zoos' Print Journal* **18**: 1071, 2003).

Sarcinellaceae Nann. (1934) = Englerulaceae.

sarciniform, bundle-like, as the dictyospore of *Stemphylium botryosum*.

Sarcinodochium Höhn. (1905), anamorphic *Pezizomycotina*, Hsp.#eH.?. 1, Europe.

Sarcinomyces Lindner (1898), anamorphic *Eurotiomycetes*, Hso.#eH.21. 2, widespread. See Jong & King (*Mycotaxon* **3**: 397, 1976), Hermanides-Nijhof (*Stud. Mycol.* **15**: 173, 1977), Wollenzien *et al.* (*Antonie van Leeuwenhoek* **71**: 281, 1997; Mediterranean), Uijthoff *et al.* (*Medical Mycology* **36**: 143, 1998; phylogeny), Sterflinger *et al.* (*Stud. Mycol.* **43**: 5, 1999; phylogeny, ecology), Sterflinger & Prillinger (*Antonie van Leeuwenhoek* **80**: 275, 2001; Austria), Bogomolova & Minter (*Mycotaxon* **86**: 195, 2003).

Sarcinomyces Oho (1926) ≡ Sarcinosporon fide Jong & King (*Mycotaxon* **3**: 397, 1976).

Sarcinosporon D.S. King & S.C. Jong (1975), anamorphic *Pezizomycotina*, Hso.0eH.10. 1 (from humans), widespread. See King & Jong (*Mycotaxon* **3**: 92, 1975).

Sarcinulella B. Sutton & Alcorn (1983) = Anisomeridium fide Purvis *et al.* (*Lichen Flora of Great Britain and Ireland*, 1992).

sarcodimitic, see Hyphal analysis.

Sarcodon Quél. ex P. Karst. (1881), Bankeraceae. 36, widespread. See Maas Geesteranus & Nannfeldt (*Svensk bot. Tidskr.* **63**: 401, 1969), Singer (*Beih. Nova Hedwigia* **77**, 1983), Stalpers (*Stud. Mycol.* **35**: 168 pp., 1993; key), Schmidt-Stohn (*Boletus* **24**: 48, 2000; *Sarcodon imbriatus* and *S. squamosus*).

Sarcodontaceae Bondartsev & Singer ex Singer (1983) = Bankeraceae.

Sarcodontia Schulzer (1866), Meruliaceae. 2, widespread (boreal). See Stalpers (*Folia Cryptog. Estonica* **33**: 133, 1998).

Sarcographa Fée (1824), Graphidaceae (L). *c.* 74, widespread (tropical). See Pant (*Geophytology* **20**: 48, 1991; 3 spp., India), Nakanishi *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **28**: 107, 2002; Vanuatu), Staiger (*Biblthca Lichenol.* **85**, 2002; monogr.), Archer (*Telopea* **10**: 589, 2004; Australia), Archer (*Biblthca Lichenol.* **94**, 2006; Australia), Staiger *et al.* (*MR* **110**: 765, 2006; phylogeny), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is).

Sarcographina Müll. Arg. (1887), Graphidaceae (L). 2, widespread. See Pant (*Geophytology* **20**: 48, 1991; India), Archer (*Telopea* **10**: 589, 2004; Australia), Archer (*Biblthca Lichenol.* **94**, 2006; Australia), Staiger *et al.* (*MR* **110**: 765, 2006; phylogeny), Lücking *et al.* (*Biblthca Lichenol.* **95**: 429, 2007; Costa Rica).

Sarcographomyces Cif. & Tomas. (1953) = Sarcographa fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sarcogyne Flot. (1850) nom. rej. = Polysporina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sarcogyne Flot. (1851) nom. cons., Acarosporaceae (L). 30, widespread. See Jørgensen & Santesson (*Taxon* **42**: 881, 1993; nomencl.), Seppelt *et al.* (*Lichenologist* **30**: 249, 1998), Lutzoni *et al.* (*Am. J. Bot.* **91**: 1446, 2004; phylogeny), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny), Crewe *et al.* (*MR* **110**: 521, 2006; phylogeny), Miąd-

likowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny, polyphyly).

Sarcoleotia S. Ito & S. Imai (1934), ? Geoglossaceae. 1, widespread. See Schumacher & Sivertsen *in* Laursen *et al.* (Eds) (*Arctic and Alpine Mycology* **2**: 163, 1987), Jumpponen *et al.* (*CJB* **75**: 2228, 1998), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Sarcoloma Locq. (1979) = Hebeloma fide Kuyper (*in litt.*).

Sarcomelas Raf. (1817) nom. dub., Fungi.

Sarcomyces Massee (1891), Helotiales. 1, America.

Sarcomyxa P. Karst. (1891), Marasmiaceae. 1, widespread.

Sarconemus Raf. (1815) nom. dub., ? Fungi.

Sarconiptera Raitv. (2003), Dermateaceae. 1, Greenland. See Raitviir (*Mycotaxon* **87**: 363, 2003).

Sarcopaxillus Zmitr., V. Malysheva & E. Malysheva (2004), Paxillaceae. 1, Europe (northern). See Zmitrovich *et al.* (*Folia Cryptogamica Petropolitana* **1**: 52, 2004).

Sarcophoma Höhn. (1916), anamorphic *Discosphaerina*, St.0eH.15. 1, widespread. See van der Aa (*Persoonia* **8**: 283, 1975).

Sarcopodium Ehrenb. (1818), anamorphic *Pezizomycotina*, Hsp.0-1eH.15. 11, widespread. See Ellis (*More Dematiaceous Hyphomycetes*, 1976), Sutton (*TBMS* **76**: 97, 1981), Watanabe (*Mycol.* **85**: 520, 1993; Japan), Guarro *et al.* (*J. Clin. Microbiol.* **40**: 3071, 2002; from human).

Sarcoporia P. Karst. (1894), Fomitopsidaceae. 7, widespread. See Ko *et al.* (*Mycol.* **93**: 270, 2001; misapplied), Niemelä & Kinnunen (*Karstenia* **45**: 77, 2005; correct name for *Parmastomyces*) see *Erastia*.

Sarcopyrenia Nyl. (1858), ? Verrucariaceae (±L). 3 (on lichens), widespread (northern hemisphere). See Navarino-Rosinés & Hladún (*Candollea* **45**: 469, 1990), Aguirre-Hudson (*Bull. Br. Mus. nat. hist.* Bot. **21**: 85, 1991).

Sarcopyreniaceae Nav.-Ros. & Cl. Roux (1998) = Verrucariaceae.

Sarcopyreniomyces Cif. & Tomas. (1953) ≡ Sarcopyrenia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sarcopyreniopsis Cif. & Tomas. (1953) ≡ Sarcopyrenia.

Sarcorhopalum Rabenh. (1851) = Taphrina fide Mix (*Kansas Univ. Sci. Bull.* **33**: 1, 1949).

Sarcosagium A. Massal. (1856), Thelocarpaceae (L). 1, widespread (temperate). See Poelt & Vězda (*Best. europ. Flecht.*, 1977), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny).

Sarcoscypha (Fr.) Boud. (1885), Sarcoscyphaceae. Anamorph *Molliardiomyces*. *c.* 28, widespread (north temperate). See Denison (*Mycol.* **64**: 609, 1972), Baral (*Z. Mykol.* **50**: 117, 1984; key 5 spp.), Harrington (*Mycotaxon* **38**: 417, 1990; 3 spp. N. Am.), Benkert (*Gleditschia* **19**: 173, 1991), Zhuang (*Mycosystema* **5**: 65, 1993; SEM), Harrington (*Harvard Pap. Bot.* **10**: 53, 1997; 5 spp.), Harrington & Potter (*Mycol.* **89**: 258, 1997; ITS), Harrington (*Mycol.* **90**: 235, 1998; DNA), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Zhuang (*Mycotaxon* **76**: 1, 2000; distrib.), Weinstein *et al.* (*Mycol.* **94**: 673, 2002; phylogeny), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Sarcoscyphaceae Le Gal ex Eckblad (1968), Pezizales. 13 gen. (+ 8 syn.), 102 spp.

Lit.: Paden (*Mycotaxon* **25**: 165, 1986), Cabello (*Boln Soc. argent. Bot.* **25**: 395, 1988; numerical taxonomy), Pfister (*Mem. N. Y. bot. Gdn* **49**: 339, 1989), Bellemère *et al.* (*Cryptog. Mycol.* **11**: 203, 1990; ultrastr.), Benkert (*Gleditschia* **19**: 173, 1991; keys German spp.), Butterfill & Spooner (*Mycologist* **9**: 20, 1995), Li & Kimbrough (*Int. J. Pl. Sarcosphaera Auersw. (1869), Pezizaceae. 1 (hypogeous), N. America; Europe. See Trappe (*Mycotaxon* **2**: 109, 1975), Brandrud *et al.* (*Blyttia* **44**: 113, 1986), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Bohlin (*MR* **108**: 3, 2004; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Tedersoo *et al.* (*New Phytol.* **170**: 581, 2006; ectomycorrhiza).

Sarcostroma Cooke (1871), anamorphic *Griphosphaerioma*. 1, widespread. See Sutton (*Mycol. Pap.* **138**, 1975), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Jeewon *et al.* (*Mol. Phylogen. Evol.* **25**: 378, 2002; phylogeny), Ono & Kobayashi (*Mycoscience* **44**: 109, 2003; Japan, teleomorph), Lee *et al.* (*Stud. Mycol.* **55**: 175, 2006; S Africa).

Sarcostromella Boedijn (1959) = Camarops fide Nannfeldt (*Svensk bot. Tidskr.* **66**: 335, 1972).

Sarcostromellaceae Boedijn (1959) = Boliniaceae.

sarcotrimitic, see Hyphal analysis.

Sarcotrochila Höhn. (1917), Hemiphacidiaceae. Anamorph *Rhabdogloeopsis*. 4 (on conifers), N. America; Europe. See Korf (*Mycol.* **54**: 12, 1962), Dennis (*British Ascomycetes, addenda and corrigenda*: 22, 1981), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phy-

logeny), Stone & Gernandt (*Mycotaxon* **91**: 115, 2005).

Sarcoxylon Cooke (1883), Xylariaceae. 2, Asia; Africa. See Rogers (*Mycol.* **73**: 28, 1981), Læssøe (*SA* **8**: 25, 1989).

Sarcoxylum Clem. & Shear (1931) nom. nud. ≡ Sarcoxylon.

Sarea Fr. (1825), ? Leotiomycetes. Anamorphs *Epithyrium*, *Pycnidiella*. 2 (on resin), widespread (temperate). See Hawksworth & Sherwood (*CJB* **59**: 357, 1981), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Sarocladium W. Gams & D. Hawksw. (1976), anamorphic *Hypocreales*, Hso.0eH.15. 3 (on *Oryza*), Asia; USA. See Boa & Brady (*TBMS* **89**: 161, 1987), Chen *et al.* (*Acta Mycol. Sin.* Suppl. **1**: 318, 1987; purple sheath disease of rice), Bridge *et al.* (*Pl. Path.* **38**: 239, 1989; *Bambusa* blight), Joe & Manibhushanrao (*Z. PflKrankh. PflPath. PflSchutz* **102**: 291, 1995; chemistry), Bills *et al.* (*MR* **108**: 1291, 2004; chemistry, phylogeny), Ayyadurai *et al.* (*Curr. Microbiol.* **50**: 319, 2005; genetic variation).

Sarophorum Syd. & P. Syd. (1916), anamorphic *Penicilliopsis*. See Malloch & Cain (*CJB* **50**: 2613, 1972), Pitt & Samson (*Regnum veg.* **128**: 13, 1993), Ogawa & Sugiyama (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 149, 2000; phylogeny), Hsieh & Ju (*Mycol.* **94**: 539, 2002; teleomorph).

Sarrameana Vězda & P. James (1973), ? Fuscideaceae (L). 3, widespread. See Vězda & Kantvilas (*Lichenologist* **20**: 179, 1988), Aptroot & Sipman (*Willdenowia* **20**: 221, 1991), Kantvilas & Vězda (*Nordic Jl Bot.* **16**: 325, 1996).

Sarrameanaceae Hafellner (1984), Ostropomycetidae (inc. sed.). 1 gen., 5 spp. See Lumbsch *et al.* (*Lichenologist* **39**: 509, 2007; Australia), Lumbsch *et al.* (*Nova Hedwigia* **86**: 105, 2008).

Sartorya Vuill. (1927) nom. dub., Pezizomycotina. See also *Neosartorya*. See Malloch & Cain (*CJB* **50**: 61, 1972).

Sartvellia Berk. (1857) ≡ Dasyspora.

Satchmopsis B. Sutton & Hodges (1975), anamorphic *Pezizomycotina*, Ccu.0eH.15. 3, widespread. See Sutton & Pascoe (*TBMS* **88**: 169, 1987), Crous *et al.* (*Stud. Mycol.* **55**: 53, 2006).

Sathropeltis Bat. & Matta (1959) = Myriangiella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

satratoxins, toxins of *Stachybotrys atra* (syn. *S. alternans*); the cause of stachybotryotoxicosis in farm animals and humans.

saturnine (of ascospores), having a flat edge round the middle (as in some *Hansenula* spp.).

Saturnispora Z.W. Liu & Kurtzman (1991), Pichiaceae. 4, widespread. See Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 387, 1998), Morais *et al.* (*Int. J. Syst. Evol. Microbiol.* **55**: 1725, 2005), Kurtzman (*FEMS Yeast Res.* **6**: 288, 2006), Suh *et al.* (*Mycol.* **98**: 1006, 2006).

Saturnomyces Cain (1956) = Emericellopsis fide Gilman (*Manual of soil fungi*, 1956).

Satwalekera D. Rao, V.G. Rao & P.Rag. Rao (1970) = Torula fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Satyrus Bosc (1811) = Phallus fide Stalpers (*in litt.*).

Sauvageautia Har. (1892) = Urosporella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Savile (Douglas Barton Osborne; 1909-2000; Ireland). BA & MSc, Macdonald College, Quebec, Canada (1928-1934); PhD, University of Michigan (1935-1939); Royal Canadian Airforce (1939-1943); Division of Botany and Plant Pathology, Ottawa, 1943-1974; Fellow of the Royal Society of Canada; DSc, McGill University (1978); MSA Distinguished Mycologist (1988). Pioneer exploring the mycota of northern Canada, making major contributions on rust biodiversity and co-evolution of fungi and plants. *Publs.* An extensive series of papers on rusts and co-evolution, mainly in *CJB*, *Canadian Field Naturalist* and *Mycol.*, with many contributions to *Fungi Canadenses*. *Biogs, obits etc.* Parmelee (*Mycol.* **93**: 807, 2001).

Savoryella E.B.G. Jones & R.A. Eaton (1969), ? Sordariomycetidae. 11, Europe; Asia. See Jones & Hyde (*Bot. Mar.* **35**: 83, 1992; posn), Read *et al.* (*CJB* **71**: 273, 1993; ultrastr.), Hyde (*Mycoscience* **35**: 59, 1994), Ho *et al.* (*MR* **101**: 803, 1997), Chang *et al.* (*MR* **102**: 709, 1998; Taiwan).

Săvulescu (Traian; 1889-1963; Romania). Professor of Systematic Botany and Phytopathology, Agricultural College, Herastrau-Bucarest (1922). Mycologist and plant pathologist, noted for his studies on rusts and smuts. *Publs. Monographia Uredinalelor din R.P.R.* 2 vols (1953); *Ustilaginalele din R.P.R.* 2 vols (1957). *Biogs, obits etc.* Urban (Česká Mykologie 17: 163, 1963); Bontea (*Review of Tropical Plant Pathology* **7**: 35, 1993); Sandu-Ville (*Sydowia* **18**: 1, 1965) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **5**: 91, 1985).

Savulescua Petr. (1959), Diaporthales. 1, Puerto Rico. See Petrak (*Acad. Republ. Pop. Romine*: 591, 1959).

Savulescuella Cif. (1959), anamorphic *Doassansiaceae*. 3.

Sawada (Kaneyoshi; 1888-1950; Japan). Pioneer of Asian mycology. Described over 2500 species of fungi from Taiwan. *Publs.* [Descriptive Catalogue of Formosan Fungi] [*Special Bulletin of the Agricultural Experiment Station of the Government of Formosa*], 10 vols (1919-1944) [in Japanese]. *Biogs, obits etc.* Stafleu & Cowan (*TL-2* **5**: 92, 1985).

Sawadaea Miyabe (1914), Erysiphaceae. Anamorph *Oidium* subgen. *Octagoidium*. 9, widespread. *S. bicornis* (syn. *Uncinula aceris*; powdery mildew of sycamore, *Acer*). See Zheng & Chen (*Acta Microbiol. Sin.* **20**: 35, 1980), Braun (*Beih. Nova Hedwigia* **89**, 1987), Mori *et al.* (*Mycoscience* **41**: 437, 2000; phylogeny), Cunnington *et al.* (*Australas. Mycol.* **23**: 37, 2004; Australia), Hirose *et al.* (*MR* **109**: 912, 2005; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Sawadaia, see *Sawadaea*.

saxicolous, growing on rocks. A few fungi are able to live on saxicolous substrata (Kobluk & Kahle, *Bull. Can. Pet. Geol.* **25**: 208, 1977; bibliogr.); *Lichenothelia* (q.v.) is primarily saxicolous. Rocks are one of the main substrata for lichens and the lit. on the latter is vast, see refs. cited under Ecology. Lichens can also change the mineral composition of rocks through the action of oxalic acid, etching being visible by SEM (see Syers & Iskandar, *in* Ahmadjian & Hale (Eds), *The Lichens*: 225, 1974, Jones *et al.*, *Lichenologist* **12**: 277, 1980). See also Biodeterioration.

scab, as delimited by Jenkins (*Phytopath.* **23**: 389, 1933), a plant disease having hyperplastic scab-like lesions; cf. anthracnose. - of apple (*Venturia in-

aequalis), cherry (*V. cerasi*), pear (*V. pirina*); cereals (*Gibberella zeae*, frequently as *G. saubinettii*, and *Fusarium* spp.), citrus (*Elsinoë fawcettii*), peach (*Fusicladium carpophilum*); **powdery** - of potato (*Spongospora subterranea*).

Scabradiporites Y.K. Mathur (1966), Fossil Fungi. 1 (Paleocene), India. See Mathur (*Quarterly Journal of the Geological, Mining & Metallurgical Society of India* **38**: 43, 1966).

scabrid, rough with delicate and irregular projections.

Scabropezia Dissing & Pfister (1981), Pezizaceae. 3. See Hirsch (*Agarica* **6**: 241, 1985; key Eur. spp.), Norman & Egger (*Mycol.* **91**: 820, 1999; phylogeny), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Spooner (*Czech Mycol.* **52**: 259, 2001; as *Plicariella*), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

scabrous, rough.

Scalaria Lázaro Ibiza (1916) = Phellinus fide Wagner & Fischer (*MR* **105**: 777, 2001).

Scalarispora Buriticá & J.F. Hennen (1994), Phakopsoraceae. 1 (on *Ampelopsis* (*Vitaceae*)), Taiwan. See Buriticá & Hennen (*Revta Acad. colomb. cienc. exact. fis. nat.* **19**: 61, 1994) Cf. *Pucciniostele*.

Scalenomyces I.I. Tav. (1985), Laboulbeniaceae. 1, Sardinia. See Tavares (*Mycol. Mem.* **9**: 313, 1985).

Scalidium Hellb. (1867) = Scoliciosporum fide Poelt & Vězda (*Biblthca Lichenol.* **16**, 1981), Santesson (*Lichens of Norway and Sweden*, 1984).

Scanning electron microscopy (SEM). The scanning electron microscope images a sample surface by scanning it with a high-energy beam of electrons in a raster scan pattern; the electrons interact with the sample surface to produce signals with information about its topography. The resulting images are at much higher magnification and resolution than possible with light microscopy, and with much greater depth of field. Samples are coated prior to examination with a thin layer of gold, palladium or aluminium, or with more recent technology may be examined frozen and even uncoated. When linked to a computer, the analogue signal can be converted to digital form, allowing specimens to be measured, counted and mapped. The technique has been very widely used in mycology to resolve fungal structures, particularly appressoria, asci, basidia, conidiogenous cells, hyphae, fruitbodies and spores.

Lit.: Heywood (Ed.) (*Scanning electron microscopy: systematic and evolutionary applications*, 1971), Claugher (Ed.) (*Scanning electron microscopy in taxonomy and functional morphology*, 1990). See Microscopy, Ultrastructure.

Scaphidiomyces Thaxt. (1912), Laboulbeniaceae. 4, S. America; West Africa. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Scaphidium Clem. (1901), anamorphic *Pezizomycotina*, St.1eH.19. 1, USA.

Scaphis Eschw. (1824) = Graphis fide Staiger (*Biblthca Lichenol.* **85**, 2002).

Scaphophoeum Ehrenb. ex Wallr. (1833) ≡ Schizophyllum.

scar (1) (of yeasts), **bud** -, on parent cell; **birth** -, on daughter cell; (2) (of anamorphic fungi), at conidiogenous locus and conidial base/apex, left after secession of conidium.

scariose, thin; paper-like.

scarlet (elf) cup, the ascoma of *Sarcoscypha coccinea*.

Scedosporium Sacc. ex Castell. & Chalm. (1919), anamorphic *Pseudallescheria*, Hso.0eH.19. 4 (on humans, other animals and from hay), widespread (subtropical). See Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973), Salkin *et al.* (*J. Clin. Microbiol.* **26**: 498, 1988; *S. inflatum*, an emerging pathogen), Dykstra *et al.* (*Mycol.* **81**: 896, 1989; TEM of conidiogenesis), Issakainen *et al.* (*J. Med. Vet. Mycol.* **35**: 389, 1997; SSU rDNA), Wedde *et al.* (*Medical Mycol.* **36**: 61, 1998; PCR-based identification), Issakainen *et al.* (*MR* **103**: 1179, 1999; relationship with *Petriella*), Okada *et al.* (*CJB* **76**: 1495, 1998; phylogeny), Rainer *et al.* (*J. Clin. Microbiol.* **38**: 3267, 2000; molecular variability), Zouhair *et al.* (*Journal of Medical Microbiology* **50**: 925, 2001; strain typing), Solé *et al.* (*Medical Mycology* **41**: 293, 2003; strain typing), Gilgado *et al.* (*J. Scelobelonium (Sacc.) Höhn. (1905) = Crocicreas fide Carpenter (*Mem. N. Y. bot. Gdn* **33**: 1, 1981).

Scelophoromyces Thaxt. (1912), Laboulbeniaceae. 1, America. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Scenidium (Klotzsch) Kuntze (1898) = Hexagonia Fr. fide Jülich (*Persoonia* **12**: 107, 1984).

Scenomyces F. Stevens (1927), anamorphic *Pezizomycotina*, Cpt.-.-. 1, Panama.

Scepastocarpus Santam. (2004), Laboulbeniaceae. 1, Spain. See Santamaría (*Mycol.* **96**: 764, 2004).

Sceptrifera Deighton (1965), anamorphic *Pezizomycotina*, Hsy.1eP.10/12. 1, Philippines. See Deighton (*Mycol. Pap.* **101**: 37, 1965).

Sceptromyces Corda (1831) = Aspergillus fide Engelke (*Hedwigia* **41**: 219, 1902).

Schachtia Schulzer (1866) [non *Schachtia* H. Karst. 1859, *Rubiaceae*] = Fenestella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Schadonia Körb. (1859), Ramalinaceae (L). 3, widespread (north temperate). See Ekman (*Op. bot.* **127**: 148 pp., 1996), Upreti & Nayaka (*Mycotaxon* **97**: 275, 2006; India).

Schadoniaceae Hafellner (1984) = Ramalinaceae.

Schaereria Körb. (1855) nom. cons., Schaereriaceae (L). 11, widespread (esp. temperate). See Schneider (*Biblthca Lichenol.* **13**, 1980), Eriksson & Hawksworth (*SA* **12**: 42, 1993; posn), Lunke *et al.* (*Bryologist* **99**: 53, 1996), Kantvilas (*Lichenologist* **31**: 231, 1999; Tasmania), Fryday & Common (*Bryologist* **104**: 109, 2001; Falkland Is), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **31**: 822, 2004; phylogeny), Schmull & Spribille (*Lichenologist* **37**: 527, 2005), Wedin *et al.* (*MR* **109**: 159, 2005; phylogeny).

Schaereriaceae M. Choisy ex Hafellner (1984), Ostropomycetidae (inc. sed.). 1 gen. (+ 1 syn.), 11 spp.

Lit.: Lumbsch *et al.* (*MR* **111**: 257, 2007; phylogeny), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Scharifia Petr. (1955), Pezizomycotina. 1, Iran. See Petrak (*Sydowia* **9**: 448, 1955).

Schasmaria (Ach.) Gray (1821) = Cladonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

scheda (pl. -**ae**), **schedula** (pl. -**ae**), (Latin), label(s), esp. printed labels relating to sets of dried specimens (exsiccati; q.v.).

Scheleobrachea S. Hughes (1958) = Pithomyces fide

Ellis (*Dematiaceous Hyphomycetes*, 1971).

Schenckiella Henn. (1893), Saccardiaceae. 1, S. America.

Schenella T. Macbr. (1911), Geastraceae. 4, widespread. See Estrada-Torres *et al.* (*Mycol.* **97**: 139, 2005).

Scherffelia Sparrow (1933) [non *Scherffelia* Pascher 1911, *Algae*] ≡ Scherffeliomyces.

Scherffeliomyces Sparrow (1934), Chytridiaceae. 1, Europe; N. America.

Scherffeliomycopsis Geitler (1962), Chytridiaceae. 1 (on *Coleochaete*), Austria; Poland. See Skirgiełło & Szymańska (*Feddes Repert.* **113**: 128, 2002; Poland).

Schiffnerula Höhn. (1909), Englerulaceae. Anamorphs *Questieriella*, *Sarcinella*. *c*. 36, widespread (esp. warmer areas). See Hansford (*Mycol. Pap.* **15**, 1946), Hughes (*CJB* **62**: 2213, 1984), Hughes (*Mycol.* **82**: 657, 1990), Hosagoudar (*Zoos' Print Journal* **18**: 1071, 2003).

Schinzia Nägeli (1842) [non *Dennstätt*, 1818] = Entorrhiza fide Vánky (*Illustrated genera of smut fungi*, 1987).

Schinzinia Fayod (1889), Agaricaceae. 1, E. Africa.

Schismatomma Flot. & Körb. ex A. Massal. (1852), Roccellaceae (±L). 11, widespread. See Torrente & Egea (*Biblthca Lichenol.* **32**, 1989), Tehler (*CJB* **68**: 2458, 1990; cladistics), Tehler (*Op. Bot.* **118**: 1, 1993; key), Tehler (*Mycotaxon* **51**: 31, 1994), Grube (*Bryologist* **101**: 377, 1998; phylogeny), Myllys *et al.* (*Lichenologist* **31**: 461, 1999; phylogeny), Follmann (*Mitteilungen aus dem Institut für Allgemeine Botanik Hamburg* **30-32**: 61, 2002; biogeography), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **34**: 512, 2005; phylogeny), Ertz & Diederich (*Bryologist* **109**: 415, 2006; lichenicolous habit, Mexico), Tehler & Irestedt (*Cladistics* **23**: 432, 2007).

Schismatommatomyces Cif. & Tomas. (1953) = Schismatomma.

Schistodes Theiss. (1918) = Perisporiopsis Henn. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Schistophoron Stirt. (1876), ? Graphidaceae (L). 2, widespread. See Tibell (*Lichenologist* **14**: 219, 1982), Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Aptroot & Sipman (*Biblthca Lichenol.* **96**: 21, 2007; key).

Schistoplaca Brusse (1987) = Lecanora fide Lumbsch & Feige (*Mycotaxon* **52**: 429, 1994), Ekman (*Op. bot.* **127**: 148 pp., 1996).

Schistostoma Stirt. (1878) = Graphis fide Salisbury (*Lichenologist* **6**: 126, 1974).

Schizacrospermum Henn. (1899) nom. dub., Fungi. See Walker (*Mycotaxon* **11**: 1, 1980).

schizidium, a propagule formed by upper layers of a lichen thallus splitting off as scale-like segments from the main lobes (e.g. the lobule-like structures in *Fulgensia bracteata* subsp. *deformis*). See Poelt (*Flora, Jena* **159**: 23, 1980). Fig. 22G.

Schizmaturus (Corda) Kalchbr. (1880) = Lysurus fide Dring (*Kew Bull.* **35**: 1, 1980).

schizobiont, bacteria once considered to be additional symbionts of lichens.

Schizoblastosporion Cif. (1930), anamorphic *Saccharomycetales*, Hso.0eH.10. 2, widespread. See Smith *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 602, 1998), Schweigkofler *et al.* (*Organ. Divers. Evol.* **2**: 1, 2002), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Schizoblastosporon Hara (1936) ≡ Schizoblastosporion.

Schizocapnodium Fairm. (1921), Nitschkiaceae. 1 (from wood), USA; India. See Nannfeldt (*Svensk bot. Tidskr.* **65**: 49, 1971; syn. of *Nitschkia*), Subramanian & Sekar (*Kavaka* **18**: 19, 1993), Huhndorf *et al.* (*MR* **108**: 1384, 2004).

Schizocephalum Preuss (1852) = Haplographium fide Saccardo (*Syll. fung.* **4**: 306, 1886).

Schizochora Syd. & P. Syd. (1913), Phyllachoraceae. 3 (from living leaves), widespread. See von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Schizochorella Höhn. (1918) = Hypoderma De Not. fide Minter (*in litt.*).

Schizoderma Ehrenb. (1818) = Leptostroma fide Sutton (*Mycol. Pap.* **141**, 1977).

Schizoderma Kunze (1825), anamorphic *Pezizomycotina*, Cac.?.?. 1, Germany.

Schizodiplodia Zambett. (1955) = Didymosporiella fide Sutton (*Mycol. Pap.* **141**, 1977).

Schizodiscus Brusse (1988), Porpidiaceae (L). 1, Natal. See Brusse (*Bothalia* **18**: 94, 1988).

schizogenous, formed by cracking or splitting, cf. lysigenous.

schizogony, the process of division of a schizont.

Schizographa Nyl. (1857) nom. dub., Fungi.

Schizolaboulbenia Middelh. (1957) = Laboulbenia fide Benjamin *in* Thaxter (*Mem. Am. Acad. Arts Sci. 1896-1931* **12-16**, 1971).

schizolytic, secession of conidia involving a splitting of the delimiting septum so that one half of the cross-wall becomes the base of the seceding conidium and the other half remains at the apex of the conidiogenous cell (Cole & Samson, *Patterns of development in conidial fungi*, 1979). Cf. rhexolytic.

Schizoma Nyl. ex Cromb. (1894) = Thyrea fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

Schizomeromyces Thaxt. (1931) = Clematomyces fide Tavares (*Mycol. Mem.* **9**, 1985).

Schizonella J. Schröt. (1877), Anthracoideaceae. 4 (on *Cyperaceae*), widespread (esp. Europe; N. America). See Vánky (*Mycotaxon* **69**: 102, 1998; key).

Schizonia Pers. (1828) ≡ Schizophyllum.

schizont, a vegetative thallus, having no wall, which undergoes simple or multiple division.

Schizontopeltis Bat. & H. Maia (1962) = Schizothyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Schizoparmaceae Rossman (2007), Diaporthales. 3 gen. (+ 5 syn.), 32 spp.

Lit.: Rossman *et al.* (*Mycoscience* **48**: 135, 2007; phylogeny).

Schizoparme Shear (1923), Schizoparmaceae. Anamorph *Pilidiella*. 7 (from leaves), widespread. See Samuels *et al.* (*Mycotaxon* **46**: 459, 1993), Van Niekerk *et al.* (*MR* **108**: 283, 2004; phylogeny, anamorph), Rossman *et al.* (*Mycoscience* **48**: 135, 2007; review).

Schizopelte Th. Fr. (1875), Roccellaceae (L). 1, N. America. See Tehler (*CJB* **68**: 2458, 1990; cladistics), Grube (*Bryologist* **101**: 377, 1998), Myllys *et al.* (*Bryologist* **101**: 70, 1998), Myllys *et al.* (*Lichenologist* **31**: 461, 1999; phylogeny).

Schizopeltis Bat. & I.H. Lima (1959) = Schizothyrium fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Schizopeltomyces Cif. & Tomas. (1953) ≡ Schizopelte.

Schizophoma Kleb. (1933) ? = Sclerophoma fide Sutton (*Mycol. Pap.* **141**, 1977).

Schizophyllaceae Quél. (1888), Agaricales. 2 gen. (+

11 syn.), 7 spp.

Lit.: Cooke (*Mycol.* **53**: 575, 1961; *Schizophyllum*), Donk (*Persoonia* **3**: 199, 1964), Nuss (*Hoppea* **39**: 127, 1980), Stalpers (*Persoonia* **13**: 495, 1988), Sigler *et al.* (*J. Med. Vet. Mycol.* **35**: 365, 1997), Ginns (*Mycol.* **90**: 19, 1998), James *et al.* (*Evolution* Lancaster, Pa. **53**: 1665, 1999), Buzina *et al.* (*J. Clin. Microbiol.* **39**: 2391, 2001), James & Vilgalys (*Mol. Ecol.* **10**: 471, 2001), Kano *et al.* (*J. Clin. Microbiol.* **40**: 3535, 2002), Moncalvo *et al.* (*Mol. Phylogen. Evol.* **23**: 357, 2002), Bodensteiner *et al.* (*Mol. Phylogen. Evol.* **33**: 501, 2004), Larsson *et al.* (*MR* **108**: 983, 2004), Wei & Dai (*Mycosystema* **23**: 437, 2004).

Schizophyllales = Agaricales.

Schizophyllum Fr. (1815), Schizophyllaceae. 6 (wood rot; pathogenic for humans), widespread. See Watling & Sweeney (*Sabouraudia* **12**: 214, 1974; cultural chars.), Buzina *et al.* (*J. Clin. Microbiol.* **39**: 2391, 2001; molecular identification), Baron *et al.* (*J. Clin. Microbiol.* **44**: 3042, 2006; diagnosis).

Schizophyllus, see *Schizophyllum*.

Schizopora Velen. (1922) nom. rej., Schizoporaceae. 4, widespread. See Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 315, 1980), Langer (*Biblthca Mycol.* **154**, 1994; sub *Hyphodontia*), Paulus *et al.* (*MR* **104**: 1155, 2000), Lim & Jung (*Mycobiology* **29**: 194, 2001; Korean spp.).

Schizoporaceae Jülich (1982), Hymenochaetales. 14 gen. (+ 6 syn.), 109 spp.

Lit.: Hallenberg (*Mycotaxon* **27**: 361, 1986), Nakasone (*Mycol. Mem.* **15**: 412 pp., 1990), Langer (*Biblthca Mycol.* **154**: 298 pp., 1994), Ginns (*Mycol.* **90**: 19, 1998), Langer (*Folia cryptog. Estonica* **33**: 57, 1998), Paulus *et al.* (*MR* **104**: 1155, 2000), Hjortstam (*Windahlia* **24**: 1, 1998), Hjortstam & Ryvarden (*Syn. Fung.* **15**: 8, 2002), Greslebin & Rajchenberg (*N.Z. Jl Bot.* **41**: 437, 2003), Larsson *et al.* (*MR* **108**: 983, 2004), Martín & Montón (*Bol. Sanid. Veg.* Plagas **30**: 93, 2004), Binder *et al.* (*Systematics and Biodiversity* **3**: 113, 2005), Küffer & Senn-Irlet (*Mycol. Progr.* **4**: 77, 2005).

Schizosaccharis Clem. & Shear (1931) ≡ Schizosaccharomyces.

Schizosaccharomyces Lindner (1893), Schizosaccharomycetaceae. 1 or 4, widespread. See Bridge & May (*J. gen. Microbiol.* **130**: 1921, 1984; numerical taxonomy), Kreger-van Rij (Ed.) (*Yeasts, a taxonomic study* 3rd edn, 1984; key), Mikata & Banno (*IFO Res. Comm.* **13**: 45, 1987; ascospores), Barnett *et al.* (*Yeasts: Characteristics and Identification* 2nd edn, 1990), Cox *in* Wheals *et al.* (Eds) (*Yeast* Chichester **6**: 7, 1995; genetic analysis), Munz & Kohli *in* Wheals *et al.* (Eds) (*Yeast* Chichester **6**: 583, 1995; chromosome maps), Sipiczki (*Antonie van Leeuwenhoek* **68**: 119, 1995; phylogeny), Sprague *in* Wheals *et al.* (Eds) (*Yeast* Chichester **6**: 411, 1995; mating types), Vaughan-Martini & Martini *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 391, 1998), Wood (*Nature* Lond. **415** no. 6874: 871, 2002; genome), Lopandic *et al.* (*Mycol. Progr.* **4**: 205, 2005; phylogeny), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Schizosaccharomycetaceae Beij. ex Klöcker (1905), Schizosaccharomycetales. 2 gen. (+ 3 syn.), 5 spp.

Lit.: Eriksson *et al.* (*SA* **11**: 119, 1993), Egel *in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **1**: 251, 1994), Munz & Kohli (*The Yeasts* Vol. 6. Yeast Genetics. Edn 2: 583, 1995), Sipiczki (*Antonie van Leeuwenhoek* **68**: 119, 1995), Jeffery *et al.* (*Antonie van Leeuwenhoek* **72**: 327, 1997), Kurtzman & Blanz *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 69, 1998), Sugiyama (*Mycoscience* **39**: 487, 1998), Vaughan-Martini & Martini *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 391, 1998), Esteve-Zarzoso *et al.* (*Int. J. Syst. Bacteriol.* **49**: 329, 1999), Mikata & Yamada (*Res. Commun.* Inst. Ferm., Osaka **19**: 41, 1997), Wood (*Nature* Lond. **415** no. 6874: 871, 2002), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny).

Schizosaccharomycetales O.E. Erikss. (1994). Schizosaccharomycetidae. 1 fam., 2 gen., 5 spp. Fam.:

Schizosaccharomycetaceae

The name has been used by Prillinger *et al.* (*Z. Mykol.* **56**: 219, 1990) to include *Protomycetales* and *Taphrinales* which they considered intermediate between *Ascomycota* and *Basidiomycota*.

Lit.: Eriksson *et al.* (*SA* **11**: 119, 1993), Jeffery *et al.* (*Antonie van Leeuwenhoek* **72**: 327, 1997; lipids), Kurtzman & Blanz (*The Yeasts, a taxonomic Study*: 69, 1998), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997), Sugiyama (*Mycoscience* **39**: 487, 1998).

Schizosaccharomycetes O.E. Erikss. & Winka (1997), Taphrinomycotina. 1 ord., 1 fam., 2 gen., 5 spp. The fission yeasts. Ord.:

Schizosaccharomycetales

For *Lit.* see ord. and fam.

Schizosaccharomycetidae, see *Schizosaccharomycetes.*

Schizospora Dietel (1895) [non *Schizospora* Reinsch 1875, *Algae*] = Pucciniosira fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Schizosporaceae Dietel (1897) = Pucciniosiraceae.

Schizostege Theiss. (1917) [non *Schizostege* W.F. Hillebr. 1888, *Pteridophyta*] = Saccothecium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Schizostoma Ces. & De Not. ex Sacc. (1878) [non *Schizostoma* Ehrenb. ex Lév. 1846] = Xenolophium fide Holm & Yue (*Acta Mycol. Sin.* Suppl. **1**: 82, 1986), Huhndorf (*Mycol.* **85**: 490, 1993), Barr & Mathiassen (*Mycotaxon* **69**: 159, 1998).

Schizostoma Ehrenb. ex Lév. (1846), Agaricaceae. 1, widespread (subtropical dry areas). See Long & Stouffer (*Mycol.* **35**: 21, 1943), Lunghini (*Bollettino dell'Associazione Micologica ed Ecologica Romana* **17**: 22, 2001), Sarasini (*Rivista di Micologia* **46**: 7, 2003; mediterranean).

Schizothecium Corda (1838) nom. rej., Lasiosphaeriaceae. 1 (coprophilous), widespread. See Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny), Cai *et al.* (*Fungal Diversity* **19**: 1, 2005; phylogeny), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005; phylogeny, wall structure), Hu *et al.* (*Cryptog. Mycol.* **27**: 89, 2006; China).

Schizothyra Bat. & C.A.A. Costa (1957), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Batista & Costa (*An. Soc. Biol. Pernambuco* **15**: 409, 1957).

Schizothyrella Thüm. (1880), anamorphic *Pezizomycotina*. 5, Europe; USA.

Schizothyrellina Petr. (1922) nom. nud. = Phacidiella P. Karst. fide Sutton (*Mycol. Pap.* **141**, 1977).

Schizothyriaceae Höhn. ex Trotter, Sacc., D. Sacc. & Traverso (1928), Capnodiales. 16 gen. (+ 28 syn.), 52 spp. More molecular data are needed, but placement of the family seems clear.

Lit.: von Arx & Müller (*Stud. Mycol.* **9**, 1975), Eriksson (*Op. Bot.* **60**, 1981), Farr (*Mycol.* **79**: 97, 1987), Williamson & Sutton (*Pl. Dis.* **84**: 714, 2000), Batzer *et al.* (*Mycol.* **100**: 232, 2008; phylogeny).

Schizothyrina Bat. & I.H. Lima (1959) = Schizothyrium fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Schizothyrioma Höhn. (1917), Helotiales. 2, Europe. See Holm (*Svensk bot. Tidskr.* **65**: 208, 1971), Nauta & Spooner (*Mycologist* **14**: 65, 2000; UK).

Schizothyrium Desm. (1849), Schizothyriaceae. Anamorph *Zygophiala*. c. 13, widespread (esp. tropical). *S. pomi* (fly speck of apple and pear). See von Arx & Müller (*Stud. Mycol.* **9**, 1975), Katumoto (*TMSJ* **27**: 1, 1986), Petrini *et al.* (*Mycol. helv.* **3**: 263, 1989), Kohlmeyer *et al.* (*CJB* **76**: 467, 1998), Batzer *et al.* (*Mycol.* **97**: 1268, 2005; phylogeny), Batzer *et al.* (*Mycol.* **100**: 232, 2008; phylogeny).

Schizothyropsis Bat. & A.F. Vital (1960), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Paraguay. See Batista & Vital (*Atas Inst. Micol. Univ. Recife* **1**: 355, 1960).

Schizotorula Krassiln. (1954) nom. inval., Fungi. A lapsus for *Schizotorulopsis*.

Schizotorulopsis Cif. (1930) nom. dub., Bacteria. ? Based on bacteria.

Schizotrichella E.F. Morris (1956) = Colletotrichum fide Sutton (*Mycol. Pap.* **141**, 1977).

Schizotrichum McAlpine (1903), anamorphic *Pezizomycotina*, Hso.0fH.10. 2, Australia; Bermuda.

schizotype, a syntype taken to be the type of name by the exclusion of other syntypes; an implicit lectotype, but not acceptable as a formal typification; see type.

Schizoxylon Pers. (1810), Stictidaceae. 33, widespread (esp. temperate). See Sherwood (*Mycotaxon* **6**: 215, 1977; key), Johnston (*Mycotaxon* **24**: 349, 1985; anamorph), Wedin *et al.* (*Lichenologist* **37**: 67, 2005; phylogeny).

Schizoxylum Pers. (1822) ≡ Schizoxylon.

schlauch, open-ended extension of the rohr, orientated toward the cytoplasm of encysted zoospore of plasmodiophorids. See also rohr and stachel.

Schmitzomia Fr. (1849) = Stictis fide Sherwood (*Mycotaxon* **6**: 215, 1977).

Schnablia Sacc. & P. Syd. (1899), ? Helotiales. 1, Europe.

Schneepia Speg. (1885) = Parmularia Lév. fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962), Inácio & Cannon (*MR* **107**: 82, 2003).

Schoenbornia Bubák (1906) = Hymenopsis fide Sutton (*Mycol. Pap.* **141**, 1977).

Schoenleinium Johan-Olsen (1897) = Trichophyton fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Schrakia Hafellner (1979), ? Patellariaceae. 1, N. & S. America. See Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Schroedera D.J. Morris & A. Adams (2002), Microsporidia. 2. See Morris & Adams (*Acta Protozool.* **41**: 395, 2002).

Schroeterella Syd. (1922) [non *Schroeterella* Herzog 1916, *Musci*] = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Schroeteria G. Winter (1881), anamorphic *Pezizomycotina*. 6 (in seeds of *Veronica*), Asia; Europe. smut-like. See Vánky (*Sydowia* **34**: 157, 1981; monogr.), Nagler *et al.* (*Mycol.* **81**: 884, 1989; ascomycete affinities), Vánky (*Mycol. Balcanica* **1**: 175, 2004).

Schroeteriaster Magnus (1896), Pucciniales. 1 (on *Ranunculus* (I) (*Ranunculaceae*); on *Rumex* (II, III) (*Polygonaceae*)), Europe. See Mains (*Annls mycol.* **32**: 256, 1934) = Uromyces (Puccin.) fide, Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Schulzeria Bres. & Schulzer (1886) nom. dub. ? = Leucoagaricus fide Kuyper (*in litt.*).

Schvartsman (Sofiya Ruvinovna; 1912-1975; Ukraine, later Russia, Kazakhstan). Laboratory assistant, Adamy Aul, Adygea Autonomous Region (1930); student, Moscow State University (1931-1940); Senior Lecturer in Botany, Kazakh State University, Alma Ata (1940-1961); founder (1941) then Head (1943-1961) of the Department of Lower Plants, Botanical Institute of the Kazakh SSR Academy of Sciences. Major contributions to the mycota of Kazakhstan, as initiator, organizer and editor-in-chief of the [*Flora of Cryptogamic Plants of Kazakhstan*] [in Russian]. *Publs.* (with various collaborators) [*Flora of Cryptogamic Plants of Kazakhstan*] 8 vols (1960-1973) [in Russian]. *Biogs, obits etc.* Vasyagina & Byzova ([*Mikologiya i Fitopatologiya*] **12**: 176, 1978 [in Russian]).

Schwanniomyces Klöcker (1909), Saccharomycetales. 6. See Kurtzman & Robnett (*Yeast* Chichester **7**: 61, 1991), Yamada *et al.* (*J. gen. appl. Microbiol.* Tokyo **37**: 523, 1991), Nakase *et al.* *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 157, 1998).

Schwarzmannia Pisareva (1968), anamorphic *Pezizomycotina*, Cac.1eP.19. 1, Kazakhstan. See Pisareva (*Botanicheskie Materialy* Gerbariya Instituta Botaniki, Akademiya Nauk Kazakhskoĭ SSR **5**: 72, 1968).

Schweinitz (Lewis David von; 1780-1834; USA). Born, Bethlehem, Pennsylvania; educated in Saxony, Germany (1798-1808); church administrator, Salem, North Carolina (1812 onwards). The first important mycologist of his country, Schweinitz learned mycology in Saxony with Albertini, continuing this interest on return to the USA in 1812; a careful observer who had one of the best compound microscopes of his day, he sent parts of his specimens to co-workers in Europe and America. *Publs.* (with Albertini) *Conspectus Fungorum in Lusatiae* (1805); *Synopsis Fungorum Carolinae Superioris* (1822); *Synopsis Fungorum in America Boreali* (1832) [an account of all the fungi (about 4,000) then known in North America]. *Biogs, obits etc.* Rogers (*Mycol.* **69**: 223, 1977); Shear (*Plant World* **5**: 45, 1902) [portrait]; Shear & Stevens (*Mycol.* **9**: 191, 1917); Shear & Stevens (*Memoirs of the Torrey Botanical Club* **16**: 119, 1921, Schweinitz-Torrey correspondence); Stafleu & Cowan (*TL-2* **5**: 437, 1985).

Schweinitzia Grev. (1823) [non *Schweinitzia* Elliott ex Nuttall 1818, *Pyrolaceae*] = Podaxis fide Kuyper (*in litt.*).

Schweinitzia Massee (1895) ? = Velutaria fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Schweinitziella Speg. (1888), Sordariomycetes. 3 (on fungi), widespread (tropical). See Pirozynski (*Kew Bull.* **31**: 595, 1977).

Schwendener (Simon; 1829-1919; Switzerland). Student, Geneva then Zürich (1856-1857) [under C. Nägeli]; Assistant (1857-1860), then Lecturer (1860-

1867) Munich; Professor of Botany, Basle (1867-1877); Professor of Botany, Tübingen (1877-1878); Professor of Botany and Director of Botanical Institute, Berlin (1878-1909). Elucidated true nature of the components of lichen symbiosis. *Publs. Verhandlungen der Schweizerischen Naturforschenden Gesellschaft in Rheinfelden* Aarau **51**: 88, 1867; *Die Algentypen der Flechtengonidien*, 1869. *Biogs, obits etc.* Ainsworth (*Introduction to the History of Mycology*, 1976); Vines (*Proceedings of the Linnean Society* 1919-20: 47, 1921); Stafleu & Cowan (*TL-2* **5**: 443, 1985).

Scindalma Hill ex Kuntze (1898) = Phellinus fide Pegler (*The polypores [Bull. BMS Suppl.]*, 1973).

Sciniatosporium Kalchbr. ex Morgan-Jones (1971) ≡ Seimatosporium fide Sutton (*TBMS* **58**: 164, 1972).

Sciodothis Clem. (1909) = Tomasellia fide Harris (*in litt.*).

Scipionospora E.K.C. Bylén & J.I.R. Larsson (1995), Microsporidia. 1.

Scirrhia Nitschke ex Fuckel (1870), ? Capnodiales. Anamorph *Lecanosticta*. 9, widespread. *S. acicola* (brown needle blight of pine). See Siggers (*Tech. Bull. U.S. Dept. Agric.* **870**, 1944), Obrist (*Phytopath. Z.* **35**: 370, 1959), Barr (*Contr. Univ. Mich. Herb.* **9**: 523, 1972), von Arx & Müller (*Stud. Mycol.* **9**, 1975; ? = *Metameris* p.p.), Butin (*Sydowia* **38**: 20, 1986; anam.), Kohlmeyer *et al.* (*CJB* **74**: 1830, 1996).

Scirrhiachora Theiss. & Syd. (1915), Mycosphaerellaceae. 1, Europe. See von Arx & Müller (*Stud. Mycol.* **9**, 1975), Aptroot (*CBS Diversity Ser.* **5**, 2006).

Scirrhiella Speg. (1885) = Apiospora fide Barr (*Mycol.* **68**, 1976).

Scirrhiopsis Henn. (1905) nom. dub., Fungi.

Scirrhodothis Theiss. & Syd. (1915) = Metameris fide Barr (*Mycotaxon* **43**: 371, 1992).

Scirrhophoma Petr. (1941), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Scirrhophragma Theiss. & Syd. (1915) = Metameris fide Barr (*Mycotaxon* **43**: 371, 1992).

scissile (of the flesh of a pileus), separating into horizontal layers.

Scitovszkya Schulzer (1866) = Mucor Fresen. fide Hesseltine (*Mycol.* **47**: 344, 1955).

Sclerangium Lév. (1848) = Scleroderma fide Stalpers (*in litt.*).

sclerobasidium, see basidium.

sclerocarps, sclerotium-like modified ascomata permanently lacking a sexual capacity and acting as sclerotia, as in *Varicosporina ramulosa* (Kohlmeyer & Charles, *CJB* **59**: 1787, 1981).

Sclerochaeta Höhn. (1917) = Chaetopyrena Pass. fide Höhnel (*Hedwigia* **60**: 129, 1918).

Sclerochaetella Höhn. (1917) = Diploplenodomus fide Petrak (*Annls mycol.* **42**: 58, 1944).

Sclerocleista Subram. (1972), Trichocomaceae. Anamorph *Aspergillus*. 2. See von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981), Pitt & Samson (*Regnum veg.* **128**: 13, 1993), Bainbridge (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 373, 2000; phylogeny), Tamura *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 357, 2000; phylogeny), Klich (*Identification of Common Aspergillus Species*: 116 pp., 2002).

Sclerococcum Fr. (1825), anamorphic *Pezizomycotina*, Hsp.#eP.1/10. 15 (on lichens), Europe. See Hawksworth (*TBMS* **65**: 219, 1975), Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **6**: 181, 1979), Diederich & Scholz (*Biblthca Lichenol.* **57**: 113, 1995), Etayo & Calatayud (*Annln naturh. Mus. Wien* Ser. B, Bot. Zool. **100**: 677, 1998; Spain).

Scleroconidioma Tsuneda, Currah & Thormann (2000), anamorphic *Dothideomycetes*. 1, Canada. See Tsuneda *et al.* (*CJB* **78**: 1295, 2000), Tsuneda *et al.* (*Mycol.* **93**: 1164, 2001; ontogeny), Hambleton *et al.* (*Mycol.* **95**: 959, 2003; phylogeny), Tsuneda *et al.* (*Mycol.* **96**: 1128, 2004; phylogeny).

Scleroconium Syd. (1935), anamorphic *Pezizomycotina*, Hsp.0eH.6. 1, S. America.

Sclerocrana Samuels & L.M. Kohn (1987), Sclerotiniaceae. 1, New Zealand. See Samuels & Kohn (*Sydowia* **39**: 202, 1987).

Sclerocystis Berk. & Broome (1873), Glomeraceae. 1, widespread (tropical). See Almeida & Schenk (*Mycol.* **82**: 703, 1990; revision), Wu (*Mycotaxon* **47**: 25, 1993), Wu (*Mycotaxon* **49**: 327, 1993; revision), Wu & Chen (*TMSJ* **34**: 283, 1993), Wang *et al.* (*Acta Mycol. Sin.* **15**: 161, 1996), Yao *et al.* (*Genera of Endogonales*: 229 pp., 1996), Redecker *et al.* (*Mycol.* **92**: 282, 2000; phylogeny, *S. coremioides* transferred to *Glomus*), Degawa (*Memoirs of the National Science Museum* Tokyo **37**: 119, 2001; Japan).

Sclerodepsis Cooke (1890) = Trametes fide Ryvarden (*Gen. Polyp.*: 222, 1991).

Scleroderma Pers. (1801), Sclerodermataceae. *c.* 30, widespread. See Guzmán (*Darwiniana* **16**: 233, 1970; key), Rifai (*TMSJ* **28**: 97, 1987; Malesia, key), Sarasini (*Boll. Gruppo Micol. 'G. Bresadola'* **34**: 119, 1991; Italy), Richter (*Mycotaxon* **45**: 461, 1992; cultures), Sims *et al.* (*Mycotaxon* **56**: 403, 1995; key), Jeffries (*Scleroderma – Ectomycorrhizal fungi, key genera in profile*, 1999; ecology), Poumarat (*Bulletin Semestriel de la Fédèration des Associations Mycologiques Méditerranéennes* **15**: 40, 1999; Europ., key), Watling (*Mycoscience* **47**: 18, 2006).

Sclerodermataceae Corda (1842), Boletales. 6 gen. (+ 23 syn.), 39 spp.

Lit.: Dick (*TBMS* **57**: 417, 1971), Gill & Watling (*Pl. Syst. Evol.* **154**: 225, 1986), Richter (*Mycotaxon* **45**: 461, 1992), Orlovich & Ashford (*Protoplasma* **178**: 66, 1994), Pegler *et al.* (*British Puffballs, Earthstars and Stinkhorns* An Account of the British Gasteroid Fungi: 255 pp., 1995), Sims *et al.* (*Mycotaxon* **56**: 403, 1995), Bruns *et al.* (*Mol. Ecol.* **5**: 257, 1998), Junghans *et al.* (*Mycorrhiza* **7**: 243, 1998), Sims *et al.* (*MR* **103**: 449, 1999), Guzmán & Ovrebo (*Mycol.* **92**: 174, 2000), Díez *et al.* (*New Phytol.* **149**: 577, 2001), Binder & Bresinsky (*Mycol.* **94**: 85, 2002), Cairney (*New Phytol.* **153**: 199, 2002), Kasuya *et al.* (*Mycoscience* **43**: 475, 2002), Martin *et al.* (*New Phytol.* **153**: 345, 2002), Hitchcock *et al.* (*MR* **107**: 699, 2003), Kanchanaprayudh *et al.* (*Mycoscience* **44**: 287, 2003), Moyersoen *et al.* (*New Phytol.* **160**: 569, 2003), Watling & Sims (*Mem N. Y. bot. Gdn* **89**: 93, 2004), Watling (*Mycoscience* **47**: 18, 2006).

Sclerodermatales = Boletales.

Sclerodermatopsis Torrend (1923) ? = Xylaria Hill ex Schrank fide Læssøe (*SA* **13**: 43, 1994).

Scleroderris (Fr.) Bonord. (1851) = Godronia fide Groves (*CJB* **43**: 1195, 1965).

Sclerodiscus Pat. (1890), anamorphic *Pezizomycotina*, St.0eP.?. 1, Asia.

Sclerodon P. Karst. (1889) ≡ Gloiodon.

Sclerodothiorella Died. (1912), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Sclerodothis Höhn. (1918) = Leptosphaeria fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Sclerogaster R. Hesse (1891), Sclerogastraceae. 10, Europe; America. See Dodge & Zeller (*Ann. Mo. bot. Gdn* **23**: 565, 1937), Fogel (*Mycol.* **82**: 655, 1990; N. Am. key).

Sclerogastraceae Locq. ex P.M. Kirk (2008), Geastrales. 1 gen., 10 spp.

Scleroglossum Hara (1948) = Scleromitrula fide Korf *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 249, 1973).

Scleroglossum Pers. (1820) = Acrospermum fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sclerogone Warcup (1990), Endogonaceae. 1, Australia. See Warcup *in* Sanders *et al.* (Eds) (*Endomycorrhizas*: 53, 1975; culture), Warcup (*MR* **94**: 173, 1990), Yao *et al.* (*Kew Bull.* **50**: 349, 1995), Yao *et al.* (*Genera of Endogonales*: 229 pp., 1996).

Sclerographa (Vain.) Zahlbr. (1923) = Opegrapha Ach. fide Upreti & Singh (*Beitr. Biol. Pfl.* **62**: 233, 1987).

Sclerographiopsis Deighton (1973), anamorphic *Pezizomycotina*, Hsy.≡ eP.3. 1, Sierra Leone. See Sutton & Pascoe (*Aust. J. Bot.* **35**: 183, 1987; cf. *Tandonella*).

Sclerographium Berk. (1854), anamorphic *Pezizomycotina*, Hsy.#eP.10. 4, Asia; Africa. See Deighton (*Mycol. Pap.* **78**, 1960).

Scleroma Fr. (1838) = Pleurotus fide Kuyper (*in litt.*) *Pleurotus* is not yet conserved against *Scleroma*.

Scleromeris Syd. (1926), anamorphic *Pezizomycotina*, St.0eP.?. 1, C. America.

Scleromitra Corda (1829) = Pistillaria Fr. fide Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**, 1950).

Scleromitrula S. Imai (1941), Rutstroemiaceae. Anamorph *Myrioconium*. 6, widespread. See Kohn & Nagasawa (*TMSJ* **25**: 127, 1984), Spooner (*Biblthca Mycol.* **116**, 1987), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny, as *Verpatinia*), Schumacher & Holst-Jensen (*Mycoscience* **38**: 55, 1997; phylogeny, syn. *Verpatinia*), Wang *et al.* (*Am. J. Bot.* **92**: 1565, 2005; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Scleromium Linds. (1869) nom. inval. ≡ Pseudographis.

Scleroparodia Petr. (1934) = Ascochytopsis fide Sutton (*Mycol. Pap.* **141**, 1977).

Scleropezicula Verkley (1999), Helotiales. Anamorph *Cryptosympodula*. 1, Canada; Europe. See Verkley (*Stud. Mycol.* **44**: 132, 1999), Verkley *et al.* (*MR* **107**: 689, 2003; phylogeny).

Sclerophoma Höhn. (1909), anamorphic *Sydowia, Xenomeris*, St.0eH.15. 30, widespread. See Hermanides-Nijhof (*Stud. Mycol.* **15**: 166, 1977; as *Dothichiza*), Müller & Hallaksela (*MR* **102**: 1190, 1998).

Sclerophomella Höhn. (1917) = Phoma Sacc. fide Sutton (*Mycol. Pap.* **141**, 1977).

Sclerophomina Höhn. (1917) = Phoma Sacc. fide Sutton (*Mycol. Pap.* **141**, 1977).

Sclerophora Chevall. (1826), Coniocybaceae (L). 6, widespread (temperate). See Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Yao & Spooner (*Kew Bull.* **54**: 683, 1999).

Sclerophoraceae Körb. (1846) = Coniocybaceae.

Sclerophytomyces, see *Peterjamesia*.

Sclerophyton Eschw. (1824), Roccellaceae (L). 27, widespread. See Egea & Torrente (*Bryologist* **98**: 207, 1995; N. Am.), Makhija & Adawadkar (*Lichenologist* **34**: 347, 2002; India), Archer (*Mycotaxon* **87**: 85, 2003; Australasia), Sparrius (*Biblthca Lichenol.* **89**, 2004; monogr.), Sparrius *et al.* (*Lichenologist* **37**: 285, 2005; soredia), Hawksworth (*Lichenologist* **38**: 187, 2006; nomencl.).

Sclerophytonomyces Cif. & Tomas. (1953) ≡ Sclerophyton.

Sclerophytonomyces Cif. & Tomas. ex Sparrius (2004) nom. inval. = Peterjamesia fide Sparrius (*Biblthca Lichenol.* **89**: 84, 2004), Hawksworth (*Lichenologist* **38**: 187, 2006).

Scleroplea (Sacc.) Oudem. (1900) = Pyrenophora fide Anon. (*Sydowia* **5**: 248, 1951).

scleroplectenchyma, plectenchyma (q.v.) composed of very thick-walled conglutinate cells. See Yoshimura & Shimada (*Bull. Kochi Gakuen Jun. Coll.* **11**: 13, 1990); stereome.

Scleropleella Höhn. (1918) = Leptosphaerulina fide Barr (*Contr. Univ. Mich. Herb.* **9**, 1972).

scleroprosoplectenchyma, see plectenchyma.

Scleropycnis Syd. & P. Syd. (1911), anamorphic *Pezizomycotina*, St.0eH.15. 2, Europe. See Sutton & Livsey (*TBMS* **88**: 271, 1987; gen. redescription).

Scleropycnium Heald & C.E. Lewis (1912) ? = Phomopsis (Sacc.) Bubák. fide Sutton (*Mycol. Pap.* **141**, 1977).

Scleropyrenium H. Harada (1993), Verrucariaceae (L). 2, Japan. See Harada (*Nat. Hist. Res.* **2**: 131, 1993), Harada (*Lichenology* **1**: 76, 2002).

Sclerosphaeropsis Bubák (1914) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Sclerosporis Stach & A. Chandra (1956), Fossil Fungi. 1 (Carboniferous, Tertiary), Europe. See Stach & Pickhardt (*Palaeontologische Zeitschrift* **31**: 140, 1957).

Sclerostagonospora Höhn. (1917), anamorphic *Pleosporales*. See Petrak (*Annls mycol.* **23**: 4, 1925), Sutton (*The Coelomycetes*, 1980), Crous & Palm (*MR* **103**: 1299, 1999).

Sclerostilbum Povah (1932) = Tilachlidiopsis fide Stalpers (*CJB* **69**: 6, 1990).

Sclerotelium Syd. (1921) = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Sclerotheca Bubák & Vleugel (1908) [non *Sclerotheca* DC. 1839, *Campanulaceae*] = Camarosporium fide Sutton (*The Coelomycetes*, 1980).

sclerothionine, a plant growth promoting metabolic product of *Sclerotinia libertiana* (Matsu & Satomura, *Agr. biol. Chem.* **32**: 611, 1968).

Sclerothyrium Höhn. (1918) = Microsphaeropsis Höhn. fide Sutton (*Mycol. Pap.* **141**, 1977).

Sclerotiaceae Dumort. (1822) = Typhulaceae.

sclerotic cell, see muriform cell.

Sclerotiella A.K. Sarbhoy & A. Sarbhoy (1975), anamorphic *Pezizomycotina*, Sc.-.-. 1, India. See Sarbhoy & Sarbhoy (*Maharashtra Vidnyan Mandir, Patrika* **9**: 91, 1974).

Sclerotinia Fuckel (1870) nom. cons., Sclerotiniaceae. Anamorphs *Myrioconium*, *Sclerotium*. 14, widespread. *S. minor* and *S. sclerotiorum* (plurivorous), *S. trifoliorum* (clover rot). See Kohn (*Mycotaxon* **9**: 365, 1979; monogr., key, 259 epithets), Spooner

(*Biblthca Mycol.* **116**, 1987), Kohli *et al.* (*Mol. Ecol.* **4**: 69, 1995; clonality), Kohli & Kohn (*Mol. Ecol.* **5**: 773, 1996; mitochondrial haplotypes), Cubeta *et al.* (*Phytopathology* **87**: 1000, 1997; clonality), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Willetts (*MR* **101**: 939, 1997; evolution, review), Holst-Jensen *et al.* (*Nordic Jl Bot.* **18**: 705, 1999; phylogeny), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Freeman *et al.* (*Eur. J. Pl. Path.* **108**: 877, 2002; molecular diagnostics), Meinhardt *et al.* (*Fitopatol. Brasil* **27**: 211, 2002; genetic diversity, Brazil), Kim & Cho (*Pl. Path. J.* **19**: 69, 2003; on *Cruciferae*), Viji *et al.* (*Pl. Dis.* **88**: 1269, 2004; on turfgrass, N America), Ekins *et al.* (*MR* **110**: 1193, 2006; homothallism), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Sclerotiniaceae Whetzel (1945), Helotiales. 47 gen. (+ 28 syn.), 284 spp.

Lit.: Whetzel (*Mycol.* **37**: 648, 1945; fams.), Buchwald (*Kgl. Veter. Landboh. Aarsskr.*, 1949), Dumont & Korf (*Mycol.* **63**: 157, 1971; gen. nomencl.), Schwegler (*Schweiz. Z. Pilzk.* **56**: 49, 1978; genetics), Kohn (*Mycotaxon* **9**: 365, 1979), Schumacher & Kohn (*CJB* **63**: 1610, 1985), Spooner (*Biblthca Mycol.* **116**, 1987; gen. concepts), Kohn (*TBMS* **91**: 639, 1988; protein electroph.), Kohn & Grenville (*CJB* **67**: 371, 1989; anatomy, histochem.), Kohn & Grenville (*CJB* **67**: 394, 1989; ultrastr.), Batra (*Mycol. Mem.* **16**: 246 pp., 1991), Novak & Kohn (*Appl. Environm. Microbiol.* **57**: 525, 1991; protein electrophor.), Verkley (*MR* **97**: 179, 1993; ultrastr.), Zhuang (*Acta Mycol. Sin.* **13**: 13, 1994; China), Anderson & Kohn (*Ann. Rev. Phytopath.* **33**: 369, 1995), Cubeta *et al.* (*Phytopathology* **87**: 1000, 1997), Holst-Jensen *et al.* (*Am. J. Bot.* **84**: 686, 1997), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny), Schumacher & Holst-Jensen (*Mycoscience* **38**: 55, 1997), Willetts (*MR* **101**: 939, 1997; evolution, review), Anderson & Kohn (*Trends in Ecology & Evolution* **13**: 444, 1998), Fulton *et al.* (*Eur. J. Pl. Path.* **105**: 495, 1999), Giraud *et al.* (*Phytopathology* **89**: 967, 1999), Holst-Jensen *et al.* (*Nordic Jl Bot.* **18**: 705, 1998), Holst-Jensen *et al.* (*Mol. Biol. Evol.* **16**: 114, 1999; evolution), Taylor *et al.* (*Ann. Rev. Phytopath.* **37**: 197, 1999), Förster & Adaskaveg (*Phytopathology* **90**: 171, 2000), Côté *et al.* (*Mycol.* **96**: 240, 2004), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006).

Sclerotiomyces Woron. (1926) ? = Sclerotium fide Stalpers (*in litt.*).

Sclerotiopsis Speg. (1882) = Pilidium fide Petrak (*Sydowia* **5**: 328, 1951), Palm (*Mycol.* **83**: 787, 1991).

Sclerotites A. Massal. (1857), Fossil Fungi. 16 (Tertiary), Europe; USA.

Sclerotites E. Jeffrey & Chrysler (1906), Fossil Fungi. 6 (Tertiary), Europe; USA.

Sclerotium Tode (1790), anamorphic *Athelia, Myriosclerotinia, Sclerotinia, Typhula*. 100, widespread. *S. cepivorum* (onion (*Allium*) white rot), *S. oryzae* (on rice), *S. rolfsii* (plurivorous; teleomorph *Athelia rolfsii*), *S. tuliparum* (grey bulb rot of tulip), *S. delphinii*, *S. microsclerotium*. A number of the earlier spp. are anamorphs of *Basidiomycota*, *Ascomycota*, etc. See Aycock (*Tech. Bull. N. Carol. agric. Exp. Stn* **174**, 1966; *S. rolfsii*), Backhouse & Stewart (*TBMS* **89**: 561, 1987; histochemistry), Hanlin & Tortolero (*CJB* **67**: 1852, 1989; morphology *S. coffeicola*), Punja & Damiani (*Mycol.* **88**: 694, 1996), Cartwright *et al.* (*Mycol.* **89**: 163, 1997; mycoparasite of *S. oryzae*), Almeida *et al.* (*J. Phytopath.* **149**: 493, 2001; genotypic diversity *S. rolfsii*), Okabe & Matsumoto (*MR* **107**: 164, 2003; phylogeny).

sclerotium (1) a firm, frequently rounded, mass of hyphae with or without the addition of host tissue or soil, normally having no spores in or on it (cf. bulbil, stroma); see Willetts (*Biol. Rev.* **46**: 387, 1971; survival, **47**: 515, 1972; morphogenesis), Willetts & Bullock (*MR* **96**: 801, 1992; developm. biology). A sclerotium may give rise to a fruit body, a stroma (as in ergot), or mycelium. See blackfellows' bread, stone fungi, tuckahoe, Anamorphic fungi. (2) (of *Mycetozoa*), the firm, resting condition of a plasmodium.

Sclerozythia Petch (1937), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, British Isles.

Sclerozythia Petr. (1955) [non *Sclerozythia* Petch 1937] ≡ Neozythia.

scobiculate, in fine grains, like sawdust.

scocho, see Fermented food and drinks.

Scodellina Gray (1821) ≡ Peziza Fr.

Scolecactis Clem. (1909) = Bactrospora fide Egea & Torrente (*Cryptog. Bryol.-Lichénol.* **14**: 329, 1993).

Scoleciasis Roum. & Fautrey (1889) nom. dub. = Leptosphaeria fide Sutton (*in litt.*), Pennycook & McKenzie (*Mycotaxon* **82**: 145, 2002).

Scoleciocarpus Berk. (1843) = Arachnion fide Demoulin (*Nova Hedwigia* **21**: 646, 1972).

scolecite, see Woronin's hypha.

Scolecites (orthographic variant), see *Skolekites*.

Scolecobasidiella M.B. Ellis (1971), anamorphic *Pezizomycotina*, Hso.1eP.10. 1, Somalia. See Ellis (*Mycol. Pap.* **125**: 12, 1971).

Scolecobasidium E.V. Abbott (1927), anamorphic *Pezizomycotina*, Hso.1eP.11. 15, widespread. See Barron & Busch (*CJB* **40**: 77, 1962; key), Graniti (*G. bot. ital.* n.s. **69**: 364, 1963; gen. concept), de Hoog & von Arx (*Kavaka* **1**: 55, 1973; monotypic), de Hoog (*Stud. Mycol.* **26**: 51, 1985; key), Horré *et al.* (*Stud. Mycol.* **43**: 194, 1999), Liu & Zhang (*Mycosystema* **25**: 386, 2006).

Scolecobasis Clem. & Shear (1931) ≡ Scolecobasidium.

Scolecobonaria Bat. (1962), Dothideomycetes. 2, Taiwan; USA. See Batista (*Beih. Sydowia* **3**: 97, 1962).

Scolecoccoidea F. Stevens (1927) = Coccodiella fide Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973), Pirozynski (*Mycol.* **65**: 164, 1973).

Scolecodochium K. Matsush. & Matsush. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Malaysia. See Matsushima & Matsushima (*Matsush. Mycol. Mem.* **9**: 36, 1996).

Scolecodothis Theiss. & Syd. (1914) = Ophiodothella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Scolecodothopsis F. Stevens (1924) = Diatractium fide Cannon (*MR* **92**: 327, 1989).

Scoleconectria Seaver (1909) = Nectria fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Scolecopeltella Speg. (1923) = Micropeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Scolecopeltidella J.M. Mend. (1925) nom. dub., Pezizomycotina. See Petrak (*Sydowia* **5**: 190, 1951), von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Scolecopeltidium F. Stevens & Manter (1925), ? Mi-

crothyriaceae. *c.* 80, widespread (tropical). See Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; Australia).

Scolecopeltis Speg. (1889) = Micropeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Scolecopeltium Clem. & Shear (1931) ≡ Scolecopeltidium.

Scolecopeltopsis Höhn. (1909) = Micropeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

scolecospore, a spore resembling an amerospore (q.v.) but with or without septa and a length/width ratio › 15:1. See Anamorphic fungi.

Scolecosporiella Höhn. (1923) nom. nud., Fungi. 1. See Sutton (*CJB* **46**: 189, 1968; key).

Scolecosporiella Petr. (1921), anamorphic *Phaeosphaeria*, Cpd.≡ -#eP.1. 6, widespread. See Sutton (*CJB* **46**: 189, 1968; key), Sutton (*The Coelomycetes*, 1980), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Scolecosporites R.T. Lange & P.H. Sm. (1971), Fossil Fungi. 1 (Paleocene), Australia.

Scolecosporium, see *Scolicosporium*.

Scolecostigmina U. Braun (1999), anamorphic *Capnodiales*, Hso.?.?. 19, widespread. See Braun *et al.* (*N.Z. Jl Bot.* **37**: 323, 1999).

Scolecostroma Bat. & Peres (1960) = Lophium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Scolecotheca Søchting & B. Sutton (1997), anamorphic *Pezizomycotina*, Cpd.?.?. 1, Europe (northern). See Søchting & Sutton (*MR* **101**: 1366, 1997).

Scolecotrichum, see *Scolicotrichum*.

Scolecoxyphium Cif. & Bat. (1956), anamorphic *Capnodium*, Hsp.0eH.?. 4, widespread (tropical). See Hughes (*Mycol.* **68**: 693, 1976).

Scolecozythia Curzi (1927), anamorphic *Pezizomycotina*, St.0fH.?. 1, Italy.

Scoliciosporomyces Cif. & Tomas. (1953) = Scoliciosporum fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Scoliciosporum A. Massal. (1852), Lecanorales (L). 13, widespread (temperate). See Vězda (*Folia geobot. phytotax.* **13**: 397, 1978; key), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **31**: 822, 2004; phylogeny), Andersen & Ekman (*MR* **109**: 21, 2005; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Scolicosporium Lib. ex Roum. (1880), anamorphic *Asteromassaria*, Cac.≡ eP.1. 4, Europe. See Sutton (*Mycol. Pap.* **138**, 1975), Spooner & Kirk (*TBMS* **78**: 247, 1982; relationship with *Excipularia*), Constantinescu (*Mycotaxon* **42**: 467, 1991).

Scolicotrichum Kunze (1817) nom. conf., anamorphic *Pezizomycotina*. See also *Passalora*. See Höhnel (*Zbl. Bakt.* Abt. II **60**: 1, 1932), Hughes (*CJB* **36**: 727, 1958).

Scoliocarpon Nyl. (1858), Pezizomycotina. 1, N. America.

Scolionema Theiss. & Syd. (1918), Parodiopsidaceae. 1, S.E. Asia.

Scoliotidium Bat. & Cavalc. (1963), anamorphic *Pezizomycotina*, Cpt.≡ eH.?. 1, Brazil. See Batista & Cavalcanti (*Publções Inst. Micol. Recife* **395**: 11, 1963).

Scopaphoma Dearn. & House (1925), anamorphic *Pezizomycotina*, Cpd.1eH.1. 1, USA.

Scopella Mains (1939) = Maravalia fide Ono (*Mycol.* **76**: 892, 1984).

Scopellopsis T.S. Ramakr. & K. Ramakr. (1947) = Maravalia fide Thirumalachar & Mundkur (*Indian Phytopath.* **2**: 193, 1949).

Scopinella Lév. (1849), Sordariales. 7, widespread (temperate). See Cannon & Hawksworth (*J. Linn. Soc.* Bot. **84**: 115, 1982; key), Tsuneda (*Rep. Tottori mycol. Inst.* **22**: 82, 1984; ontogeny), Tsuneda *et al.* (*TMSJ* **26**: 221, 1985; SEM, posn), Stchigel *et al.* (*Mycol.* **98**: 815, 2006).

Scoptria Nitschke (1867) nom. rej. = Eutypella. Anamorph links with *Phaeoisaria* require confirmation. fide Rappaz (*Mycol. Helv.* **2**: 285, 1987).

Scopula Arnaud (1952) = Gloiosphaera fide Wang (*Mycol.* **63**: 890, 1971).

Scopularia Preuss (1851) nom. dub., Pezizomycotina. See Kendrick (*CJB* **42**: 1119, 1964).

Scopulariella Gjaerum (1971), anamorphic *Pezizomycotina*, Hsy.1eH.4. 1, Denmark. See Gjaerum (*Friesia* **9**: 416, 1971).

Scopulariopsis Bainier (1907), anamorphic *Microascus*, Hso.0eH.19. 22 (saprobic and pathogenic to animals), widespread. *S. fimicola*, white plaster mould of mushroom beds; *S. brevicaulis* has been used for the detection of arsenic and was proposed as an agent of cot death (q.v.). See Raper & Thom (*Manual of the Penicillia*, 1949), Morton & Smith (*Mycol. Pap.* **86**, 1963; descr. & illustr. 18 spp.), Abbott *et al.* (*Mycol.* **90**: 297, 1998; teleomorph), Abbott & Sigler (*Mycol.* **93**: 1211, 2001; heterothallism), Abbott *et al.* (*Mycol.* **94**: 362, 2002), Issakainen *et al.* (*Medical Mycology* **41**: 31, 2003; phylogeny).

Scopulina Lév. (1846) [non *Scopulina* Dumort. 1882, *Hepaticae*] ≡ Scopinella.

Scopulodontia Hjortstam (1998), Russulales. 2. See Hjortstam *et al.* (*Kew Bull.* **53**: 820, 1998), Nakasone (*Cryptog. Mycol.* **24**: 131, 2003).

Scopuloides (Massee) Höhn. & Litsch. (1908), Meruliaceae. 5, widespread. See Boidin *et al.* (*Cryptog. Mycol.* **14**: 195, 1993; key Eur. spp.).

Scoriadopsis J.M. Mend. (1930), ? Capnodiaceae. 1, S. America.

Scorias Fr. (1825), Capnodiaceae. Anamorphs *Conidiocarpus*, *Scolecoxyphium*. 3, widespread (tropical). See Reynolds (*Mycotaxon* **8**: 417, 1979), Reynolds (*Mycotaxon* **27**: 377, 1986), Reynolds (*CJB* **76**: 2125, 1998; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

scorpioid, a branching system in which the laterals are curved so that they all appear to arise from one side of the main stem, as in *Cladonia arbuscula*.

Scorpiosporium S.H. Iqbal (1974), anamorphic *Pezizomycotina*, Hso.0bP.1. 4, British Isles. See Iqbal (*Biologia* Lahore **20**: 17, 1974).

Scortechinia Sacc. (1885), Scortechiniaceae. 1 (from wood etc.), widespread. See Nannfeldt (*Svensk bot. Tidskr.* **69**: 49, 1975), Nannfeldt (*Svensk bot. Tidskr.* **69**: 289, 1975), Subramanian & Sekar (*Kavaka* **18**: 19, 1993), Huhndorf *et al.* (*MR* **108**: 1384, 2004; phylogeny), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny).

Scortechinia Sacc. (1891) = Scortechinia Sacc. (1885). Typified differently from *Scortechinia* Sacc. (1885), but the two types are conspecific. fide Nannfeldt (*Svensk bot. Tidskr.* **69**: 49, 289, 1975).

Scortechiniaceae Huhndorf, A.N. Mill. & F.A. Fernández (2004), Coronophorales. 3 gen., 3 spp. See Huhndorf *et al.* (*MR* **108**: 1384, 2004; phylogeny), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny).

Scortechiniella Arx & E. Müll. (1954) = Nitschkia fide Nannfeldt (*Svensk bot. Tidskr.* **66**: 49, 1975).
Scortechiniellopsis Sivan. (1974) = Nitschkia fide Nannfeldt (*Svensk bot. Tidskr.* **66**: 49, 1975).
Scorteus Earle (1909) = Marasmius fide Pennington (*North Amer. Flora* **9**: 250, 1915).
Scothelius Bat., J.L. Bezerra & Cavalc. (1965), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Batista *et al.* (*Atas Inst. Micol. Univ. Pernambuco* **2**: 302, 1965).
Scotiosphaeria Sivan. (1977), Pezizomycotina. 1, British Isles. See Sivanesan (*TBMS* **69**: 119, 1977).
Scotoderma Jülich (1974), Stereaceae. 1, British Isles. See Jülich (*Proc. K. Ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **77**: 149, 1974).
Scotomyces Jülich (1978), Ceratobasidiaceae. 1, widespread. See Roberts (*Rhizoctonia-forming fungi*, 1999), Wojewoda (*Acta Mycologica* Warszawa **38**: 3, 2003; Poland).
screening, routine testing of organisms or chemical substances for a particular property (e.g. for antibiotic production, fungicidal effect, etc.). See Dreyfuss (*Sydowia* **39**: 22, 1987; pharmaceutical prospecting), Bioprospecting.
scrobiculate (1) roughened; resembling sawdust; (2) (of lichens), coarsely pitted; foveolate.
scrupose, rough with very small hard points.
Sculptolumina Marbach (2000), Caliciaceae (L). 2, pantropical. See Marbach (*Biblthca Lichenol.* **74**: 296, 2000).
scutate, like a round plate or shield.
Scutellaria Baumg. (1790) nom. dub., Lecanorales.
Scutelliformis Salazar-Yepes, Pardo-Card. & Buriticá (2007), Phragmidiaceae. Anamorph *Gerwasia*. 1, S. America. See Salazar Yepes, M.; Pardo Cardona, V.M.; Buriticá Céspedes, P. (*Caldasia* **29**: 105, 2007).
Scutellinia (Cooke) Lambotte (1887) nom. cons., Pyronemataceae. 66, widespread (esp. north temperate). See Kaushal *et al.* (*Biblthca Mycol.* **91**: 583, 1983; key 14 spp. India), Schumacher (*Mycotaxon* **33**: 149, 1988; 144 excl. names), Schumacher (*Op. Bot.* **101**: 101, 1990; monogr.), Wu & Kimbrough (*Bot. Gaz.* **152**: 421, 1992; ascospores), van Brummelen (*Persoonia* **15**: 129, 1993; ultrastr.), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Paal *et al.* (*Persoonia* **16**: 491, 1998; Netherlands), Wang (*Bull. natn. Mus. Nat. Sci.* Taiwan **11**: 119, 1998; Taiwan), Matocec (*Mycotaxon* **76**: 481, 2000; Croatia), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).
Scutelloidea Tim (1971) = Rosenscheldiella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Scutellospora C. Walker & F.E. Sanders (1986), Gigasporaceae. 32, widespread. See Koske & Walker (*Mycol.* **77**: 702, 1985), Koske & Walker (*Mycotaxon* **27**: 219, 1986), Walker & Saunders (*Mycotaxon* **27**: 169, 1986), Morton & Koske (*Mycol.* **80**: 520, 1988), Koske & Halvorson (*Mycol.* **81**: 927, 1989), Spain *et al.* (*Mycotaxon* **35**: 219, 1989), Błaszkowski (*Mycol.* **83**: 537, 1991), Walker *et al.* (*Cryptog. Mycol.* **14**: 279, 1993), Franke & Morton (*CJB* **72**: 122, 1994; revision, phylogeny), Koske & Gemma (*Mycol.* **87**: 678, 1995), Morton (*Mycol.* **87**: 127, 1995; development, phylogeny), Thingstrup *et al.* (*MR* **99**: 1225, 1995; detection), Yao *et al.* (*Genera of Endogonales*: 229 pp., 1996), Walker *et al.* (*Ann. Bot.* **82**: 721, 1998), Bever & Morton (*Am. J. Bot.* **86**: 1209, 1999; genetic variation), Redecker *et al.* (*Fungal Genetics Biol.* **28**: 238, 1999; phylogeny), Stürmer & Morton (*MR* **103**: 949, 1999), Souza *et al.* (*MR* **109**: 697, 2005; morphological, ontogenetic and molecular characterization of *Scutellospora reticulata*), Dotzler *et al.* (*Mycol. Progr.* **5**: 178, 2006; germination shields in *Scutellospora* from the 400 million-year-old Rhynie chert), Redecker & Raab (*Mycol.* **98**: 885, 2006; phylogeny), Silva *et al.* (*Mycotaxon* **94**: 293, 2005; key).
Scutellosporites Dotzler, M. Krings, T.N. Taylor & Agerer (2006), Fossil Fungi. 1.
Scutellum Speg. (1881) nom. dub., Fungi. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).
scutellum, see thyriothecium.
Scutiger Paulet (1793) nom. inval., Albatrellaceae. 1. See Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).
Scutigeraceae Bondartsev & Singer (1941) = Albatrellaceae.
Scutisporium Preuss (1851) = Stemphylium fide Saccardo (*Syll. fung.* **4**: 519, 1886).
Scutisporus K. Ando & Tubaki (1985), anamorphic *Pezizomycotina*, Hso.#eH.1/10. 1, Japan. See Ando & Tubaki (*TMSJ* **26**: 153, 1985).
Scutobelonium Graddon (1984), Helotiales. 1, British Isles. See Graddon (*TBMS* **83**: 377, 1984), Nauta & Spooner (*Mycologist* **14**: 65, 2000).
Scutomollisia Nannf. (1976), Helotiales. *c.* 14, widespread (northern & central Europe). See Graddon (*TBMS* **74**: 265, 1980), Hein & Scheuer (*Sydowia* **38**: 125, 1986), Nauta & Spooner (*Mycologist* **14**: 65, 2000).
Scutomyces J.L. Bezerra & Cavalc. (1972) = Microtheliopsis fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).
Scutopeltis Bat. & H. Maia (1957), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Ghana. See Batista & Maia (*Revta Biol.* Lisb. **1**: 123, 1957).
Scutopycnis Bat. (1957), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, USA. See Batista (*An. Soc. Biol. Pernambuco* **15**: 422, 1957).
Scutoscypha Graddon (1980) = Calycellina fide Baral & Krieglsteiner (*Beih. Sydowia* **6**, 1985), Raitviir (*Scripta Mycol.* **20**, 2004).
Scutula Tul. (1852) nom. cons., Ramalinaceae (±L). 13 (in lichens), widespread. See Hawksworth (*TBMS* **74**: 363, 1980), Rambold & Triebel (*Biblthca Lichenol.* **48**, 1992), Jørgensen & Santesson (*Taxon* **42**: 881, 1993; nomencl.), Triebel *et al.* (*Symb. bot. upsal.* **32**: 323, 1997), Andersen & Ekman (*MR* **109**: 21, 2005; phylogeny), Wedin *et al.* (*Lichenologist* **39**: 329, 2007; N Hemisphere, key).
Scutularia P. Karst. (1885) = Xylogramma fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).
Scutulopsis Velen. (1934), ? Helotiales. 1, former Czechoslovakia.
scutulum (pl. **-a**), cup-like crust or mat of hyphae produced in the follicles of the scalp or the body in infections by *Trichophyton schoenleinii*.
Scypharia (Quél.) Quél. (1886) [non *Scypharia* Miers 1860, *Rhamnaceae*] = Sarcoscypha fide Denison (*Mycol.* **64**: 616, 1972).
Scyphiphorus Vent. (1799) ≡ Pyxidium Hill.
scyphoid, cup-like.
Scyphophora Gray (1821) ≡ Pyxidium Hill.
Scyphophorus Ach. ex Michx. (1803) ≡ Pyxidium Hill.

Scyphopilus P. Karst. (1881) = Thelephora fide Killermann *in* Engler & Prantl (*Naturl. Pflanzenfam.* 2, 1928).

Scyphorus Raf. (1814) ≡ Pyxidium Hill.

Scyphorus Raf. (1815) ≡ Scyphophora.

Scyphospora L.A. Kantsch. (1928), anamorphic *Apiospora*, Cac.0eP.1. 1, widespread. See Sivanesan (*TBMS* **81**: 313, 1983; teleomorph).

Scyphostroma Starbäck (1899) = Subicularium fide Eriksson (*SA* **8**: 77, 1989).

scyphus, a cup-like apex of a lichenized podetium, as in *Cladonia fimbriata*.

Scytalidium Pesante (1957), anamorphic *Helotiales*, Hso.0-1eP.38. 18, widespread. A polyphyletic genus; see also *Neofusicoccum*. See Sigler & Carmichael (*Mycotaxon* **4**: 395, 1976; key 6 spp.), Sigler & Wang (*Mycol.* **82**: 399, 1990), Straatsma & Samson (*MR* **97**: 321, 1993; taxonomy of *S. thermophilum*), Marriott *et al.* (*J. Clin. Microbiol.* **35**: 2949, 1997; from human), Roeijmans *et al.* (*J. Med. Vet. Mycol.* **35**: 181, 1997; DNA), Currah *et al.* (*Karstenia* **39**: 65, 1999; from roots), Lacaz *et al.* (*Revista do Instituto de Medicina Tropical de São Paulo* **41**: 319, 1999; synanamorphs, onychomycosis), Lyons *et al.* (*MR* **104**: 1431, 2000; molecular variation), Machouart-Dubach *et al.* (*FEMS Microbiol. Lett.* **208**: 187, 2001; phylogeny), Dunn *et al.* (*J. Clin. Microbiol.* **41**: 5817, 2003; from human), Machouart *et al.* (*FEMS Microbiol. Lett.* **238**: 455, 2004; phylogeny), Hambleton & Sigler (*Stud. Mycol.* **53**: 1, 2005; phylogeny), Crous *et al.* (*Stud. Mycol.* **55**: 99, 2006; phylogeny).

Scytenium Gray (1821) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Scytinopogon Singer (1945), Clavariaceae. 4, Europe. See Zhang & Yang (*Mycosystema* **22**: 663, 2003), García-Sandoval *et al.* (*Mycotaxon* **89**: 185, 2004; systematics), García-Sandoval *et al.* (*Mycotaxon* **94**: 265, 2005).

Scytinopogonaceae Jülich (1982) = Clavariaceae.

Scytinostroma Donk (1956), Lachnocladiaceae. 32, widespread. See Boidin & Lanquetin (*Biblthca Mycol.* **114**, 1987; key), Stalpers (*Stud. Mycol.* **40**: 103, 1996; key), Larsson & Larsson (*Mycol.* **95**: 1037, 2003; phylogeny).

Scytinostromella Parmasto (1968), Russulales. 5, widespread. See Freeman & Petersen (*Mycol.* **71**: 85, 1979; key), Ginns & Freeman (*Biblthca Mycol.* **157**, 1994; N. Am. spp.), Spirin (*Novosti Sistematiki Nizshikh Nov. sist. Niz. Rast.* **36**: 66, 2002; Russia).

Scytinotopsis Singer (1936) nom. nud. = Resupinatus fide Singer (*Agaric. mod. Tax.*, 1951).

Scytinotus P. Karst. (1879) = Panellus fide Singer (*Agaric. mod. Tax.*, 1951).

Scytonema C. Agardh ex Bornet & Flahault (1887), Algae. Algae.

Scytopezis Clem. (1903) nom. dub., Fungi. See Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

SEA, see Media.

Searchomyces B.S. Mehrotra & M.D. Mehrotra (1963) = Amblyosporium fide Pirozynski (*CJB* **47**: 325, 1969).

Seaver (Fred Jay; 1877-1970; USA). Student, Morningside College, Sioux City, Iowa (1902); PhD, Iowa State University (1912); Director of Laboratories (1908-1911) then Curator (1911-1943) then Head Curator (1943-1948), New York Botanic Garden. Associate Editor (1909-1924) then Editor (1925-1932) then Editor-in-Chief (1935-1947) of *Mycol.*; author of 125 papers, mainly on discomycete systematics; surveyed mycotas of the West Indies with Chardón (q.v.) and Whetzel (q.v.). *Publs.* Hypocreales. *North American Flora* (1910); *North American Cup Fungi (Operculates)* (1928) [suppl. edn, 1942]; *North American Cup Fungi (Inoperculates)* (1951). *Biogs, obits etc.* Rogerson (*Mycol.* **65**: 721, 1973) [portrait]; Stafleu & Cowan (*TL-2* **5**: 463, 1985).

Seaverinia Whetzel (1945), Sclerotiniaceae. Anamorph *Verrucobotrys*. 1, N. America.

Sebacina Tul. & C. Tul. (1871), Sebacinaceae. Anamorph *Opadorhiza*. 9, widespread. See Glen *et al.* (*Mycorrhiza* **12**: 243, 2002; mycorhizal with *Eucalyptus*), Selosse *et al.* (*Mol. Ecol.* **11**: 1831, 2002; ectomycorrhizae), Roberts (*Sydowia* **55**: 348, 2003; N. America), Weiss *et al.* (*MR* **108**: 1003, 2004; mycorrhizae).

Sebacinaceae K. Wells & Oberw. (1982), Sebacinales. 8 gen. (+ 5 syn.), 29 spp.

Lit.: Stalpers & Andersen *in* Sneh *et al.* (Eds) (*Rhizoctonia Species* Taxonomy, Molecular Biology, Ecology, Pathology and Disease Control: 58, 1996), Weiss & Oberwinkler (*MR* **105**: 403, 2001), Selosse *et al.* (*New Phytol.* **155**: 183, 2002), Roberts (*Sydowia* **55**: 348, 2003), McCormick *et al.* (*New Phytol.* **163**: 425, 2004), Walker & Parrent (*Mem. N. Y. bot. Gdn* **89**: 291, 2004), Weiss *et al.* (*MR* **108**: 1003, 2004).

Sebacinales M. Weiss, Selosse, Rexer, A. Urb. & Oberw. (2004). Agaricomycetes. 1 fam., 9 gen., 30 spp. Fam.:

Sebacinaceae

For *Lit.* see under fam.

Sebacinella Hauerslev (1977) = Oliveonia fide Roberts (*Rhizoctonia-forming fungi*, 1999).

seceding (1) (of lamellae), at first joined to the stipe (adnate), then free; separating from the stipe; (2) (of conidia), at first attached to the conidiogenous cell, then separating by schizolysis or rhexolysis; secession.

Secoliga Norman (1853) = Gyalecta Ach. fide Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1984).

Secoligella (Müll. Arg.) Vain. (1896) = Aspidothelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

secondary metabolite, a compound, generally produced in a phase subsequent to growth, which is not an essential intermediary of the central metabolism, often with an unusual chemical structure and found as a mixture of closely related chemicals (see *Secondary metabolites: their structure and function* [*CIBA Foundation Symp.* **171**], 1992); e.g. antibiotics, Metabolic products, mycotoxins. See Stadler & Keller (Eds) (Fungal secondary metabolite research. *MR* **112**, 2008). See also extrolite, metabolic products.

secondary mycelium (of *Agaricomycotina*), the dikaryotic mycelium resulting from plasmogamy in the primary mycelium (q.v.); mycelium developed from the base of a basidioma (Corner).

secondary spores (of basidiomycetes), spores other than basidiospores.

Secotiaceae Tul. (1845) = Agaricaceae.

secotioid (of *Agaricomycotina*), the margin of the pileus does not break free from the stipe (or if it does the pileus never fully expands), lamellae convoluted and anastomosed, basidiospores not ballistosporic; phylogeny of a - **syndrome**, see Thiers (*Mycol.* **76**: 1,

1984).

Secotium Kunze (1840), Agaricaceae. *c*. 10, widespread (esp. warm and arid areas). See Singer & Smith (*Madroño* **15**: 152, 1960).

sectoring, 'mutation' or selection in plate cultures resulting in one or more sectors of the culture having a changed form of growth.

secund, having parts directed to one side only; cf. scorpioid.

Sedecula Zeller (1941), ? Agaricales. 1, USA. See Jülich (*Biblthca Mycol.* **85**, 1992).

Seed-borne fungi. Are frequently important in connexion with the transmission of plant diseases, esp. into new areas. Examples include are: *Ascochyta pisi, Colletotrichum lindemuthianum, Microdochium panattonianum, Gloeotinea temulenta, Phoma betae, P. lingam, Septoria apiicola, Sphaerella linorum, Uromyces betae* and *Ustilago nuda* in the seed (controlled by the use of hot water sterilization or sometimes by seed disinfectants); *Polyspora lini, Puccinia antirrhini, Tilletia tritici, Urocystis agropyri, Ustilago avenae, U. hordei*, and other smuts as spores on the surface of the seed (controlled by the use of seed disinfectants); *Claviceps purpurea, Sclerotinia trifoliorum* and *Sclerotium rolfsii* as sclerotia with the seed.

Lit.: Agarwal & Sinclair (Eds) (*Principles of seed pathology*, 2 vols, 1987-9), Agarwal *et al.* (*Phytopath. Pap.* **30**, 1989; testing of rice), Doyer (*Manual of seed-borne diseases*, 1938), Dykstra (*Bot. Rev.* **27**: 445, 1961; production resistant seed), 1991), Jeffs (Ed.) (*Seed treatment*, 1986), Malone & Muskett (*Proc. Internat. Seed Testing Assn* **29** (2), 1964; descr. 77 spp.), Martin (Ed.) (*Seed treatment: progress and prospects. Virg. agric. Exp. Stn* **245**, 1931; bibliogr.), Singh & Mathur (*Histopathology of seed-borne infections*, 2004), Singh *et al.* (*An illustrated manual on identification of some seed-borne aspergilli, fusaria, penicillia and their mycotoxins*, Watanabe (*Pictorial atlas of soil and seed fungi: morphologies of cultured fungi*, 2002).

Segestrella Fr. (1831) ≡ Segestria.

Segestria Fr. (1825) = Porina Müll. Arg. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), McCarthy & Malcolm (*Lichenologist* **29**: 1, 1997).

segment (of a dictyospore), a part of the spore cut off by an A-trans-septum (Eriksson, *Opera bot.* **60**, 1981); see septum.

segregate (in taxonomy), a taxon based on part of an earlier taxon.

Seifertia Partr. & Morgan-Jones (2002), anamorphic *Pezizomycotina*, H?.?.?. 1, widespread. *S. azaleae* (*Rhododendron* leaf and bud scorch). See Kaneko *et al.* (*Ann. phytopath. Soc. Japan* **54**: 323, 1988; as *Pycnostysanus*), Partridge & Morgan-Jones (*Mycotaxon*, 2002).

Seimatoantlerium Strobel, E. Ford, J. Yi Li, J. Sears, Sidhu & W.M. Hess (1999) = Pestalotiopsis fide Bashyal *et al.* (*Mycotaxon* **72**: 33, 1999), Strobel *et al.* (*Syst. Appl. Microbiol.* **22**: 432, 1999).

Seimatosporiella Abbas, B. Sutton & Ghaffar (1998) nom. inval., anamorphic *Pezizomycotina*, Hso.?.?. 1, Pakistan. See Abbas *et al.* (*Pakist. J. Bot.* **30**: 271, 1998).

Seimatosporiopsis B. Sutton, Ghaffer & Abbas (1972), anamorphic *Pezizomycotina*, Cpd.≡ eP.19. 1, Pakistan. See Sutton *et al.* (*TBMS* **59**: 295, 1972), Abbas *et al.* (*Pakist. J. Bot.* **34**: 449, 2002).

Seimatosporium Corda (1833), anamorphic *Discostroma*, Cac/Ccu.≡ eP.19. 47, widespread. See Sutton (*The Coelomycetes*, 1980), Kang *et al.* (*MR* **103**: 53, 1999), Jeewon *et al.* (*Mol. Phylogen. Evol.* **25**: 378, 2002; phylogeny), Jeewon *et al.* (*MR* **107**: 1392, 2003; phylogeny), Hatakeyama & Harada (*Mycoscience* **45**: 106, 2004), Zimowska (*Phytopathologia Polonica* **34**: 41, 2004).

seiospore, a dry dispersal spore.

Seiridiella P. Karst. (1890) ? = Phragmotrichum fide Sutton & Pirozynski (*TBMS* **48**: 363, 1965).

Seiridina Höhn. (1930) = Seimatosporium fide Sutton (*Mycol. Pap.* **97**, 1964).

Seiridium Nees (1816), anamorphic *Lepteutypa, Blogiascospora*, Cac.≡ eP.19. 30, widespread. See Nag Raj & Kendrick (*Sydowia* **38**: 179, 1986), Chou (*Eur. J. For. Path.* **19**: 435, 1989; spp. on *Cupressus*), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Viljoen *et al.* (*Exp. Mycol.* **17**: 323, 1993; spp. on cypress compared by sequence data), Nag Raj & Mel'nik (*Mycotaxon* **50**: 435, 1994), Barnes *et al.* (*Pl. Septotinia Whetzel ex J.W. Groves & M.E. Elliott (1961), Sclerotiniaceae. Anamorph *Septotis*. 2, widespread (temperate). See Groves & Elliott (*Mycol.* **29**:

134, 1961).

Septotis N.F. Buchw. ex Arx (1970), anamorphic *Septotinia*, Cac.≡ eH.39. 2, N. America; Europe. See Sutton (*Mycol.* **72**: 208, 1980).

Septotrapelia Aptroot & Chaves (2007), Pilocarpaceae (L). 1, Costa Rica. See Aptroot *et al.* (*J. Hattori bot. Lab.* **100**: 617, 2006).

Septotrichum Corda (1840) nom. dub., Plantae. Based on a leaf outgrowth fide Bonorden (1851).

Septotrullula Höhn. (1902), anamorphic *Pezizomycotina*, Hsp.≡ eH.38. 1, widespread. See Sutton & Pirozynski (*TBMS* **48**: 355, 1965).

septum (pl. **septa**), a cell wall or partition; Talbot (*Taxon* **17**: 622, 1968) distinguishes **primary** -, a septum formed in direct association with nuclear division (by constriction, mitosis, or meiosis) separating the daughter cells and having a pore (see Markham, *MR* **98**: 1089, 1994; review) which may be modified as a dolipore (Fig. 13) (q.v.; in basidiomycetes) or be associated with Woronin bodies (in ascomycetes; see Kimbrough, *in* Hawksworth, 1994: 127, ultrastr.), and **adventitious** - (retraction or retaining septum, 'cloison de retrait'), a septum formed in the absence of, or independently of, nuclear division, esp. in association with the movement of cytoplasm from one part of the fungus to another; primary septa are characteristic of higher fungi, adventitious septa of lower fungi where nuclear division is by constriction; **angular** - (Eriksson, *Ark. Bot.* II **6**: 339, 1967), oblique septum; **longiseptum**, a longitudinal septum within a spore (Reynolds, *Mycol.* **63**: 1173, 1971); **oblique** -, a septum within a segment of a spore arising at an oblique angle to that delimiting the segment (Eriksson, *Opera bot.* **60**, 1981); **trans-**, a transverse septum within a spore (Reynolds, 1971), which may be an **A trans-septum** (forming a segment) or a **B trans-septum** (laid down in a segment after division by a longiseptum; never in macrocephalic spores) (Eriksson, 1981). Ascospores in which the septation proceeds from the primary septum towards the poles, so that immature spores have longer end cells are termed **macrocephalic** (Fig. 22A); those in which it proceeds by each trans-septum dividing a segment into two of ± equal lengths are **microcephalic** (Fig. 22B) (Eriksson, 1967, 1981), Curry & Kimbrough (*Mycol.* **75**: 781, 1983; *Pezizaceae*). See also Anamorphic fungi, euseptum, distoseptum, multiperforate septum, and Fig. 22.

Sepultaria (Cooke) Boud. (1885) = Geopora fide Burdsall (*Mycol.* **60**: 504, 1968), Yao & Spooner (*MR* **100**: 72, 1996), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Sepultariella Kutorga (2000), Pyronemataceae. 1, widespread. See Kutorga (*Lietuvos Grybai* **3**: 188, 2000).

sequestrate, fungal fruit-bodies which have evolved from having exposed hymenia and forcibly discharged spores to a closed or even hypogeous habit in which spores are retained in the fruit-body until it decays or is eaten by an animal vector. Many sequestrate taxa can be clearly recognized as being derived from specific spore-discharging ancestors, e.g. *Rhizopogon* from *Suillus*.

Serda Adans. (1763) nom. rej. = Gloeophyllum fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Serendipita P. Roberts (1993), Auriculariales. 8, widespread. See Roberts (*MR* **97**: 474, 1993), Trichies (*BSMF* **118**: 351, 2002; France n.sp.).

Serenomyces Petr. (1952), Phaeochoraceae. 5 (on *Palmae*), widespread (tropical). See Barr *et al.* (*Mycol.* **81**: 47, 1989; key), Hyde *et al.* (*SA* **15**: 117, 1997), Hyde & Cannon (*Mycol. Pap.* **175**: 114, 1999).

Sericeocybe Rob Henry (1993) nom. inval. = Cortinarius fide Kuyper (*in litt.*).

Sericeomyces Heinem. (1978) = Leucoagaricus fide Kuyper (*in litt.*).

sericeous, like silk.

Seriella Fr. (1849) nom. dub., Pezizomycotina.

serioplectenchyma, see plectenchyma.

Serology. Serological methods, which depend on the ability of a fungus to act as an antigen (q.v.), have two main mycological applications: (1) for the identification of fungi or investigations into the relationships between different fungi; (2) for the diagnosis of infections of humans and other vertebrates by fungal pathogens.

For identification, a preparation of the unknown fungus is tested with antiserum prepared against a named fungus when a reaction indicates that the two fungi have antigens in common and are therefore conspecific or closely related. An antiserum prepared from one fungus may, however, not infrequently also give a reaction ('cross-reaction') with other fungi indicating the possession of some antigens in common. This may be taken to be evidence of phylogenetic relatedness. *Phymatotrichum omnivorum* antiserum, for example, gives a reaction with certain gasteromycetes. Because of such cross-reactions and the difficulty of obtaining purified fungal antigens serological identification of fungi is in a less developed state than that for bacteria and viruses.

Serological diagnosis of infection (or past infection) of humans or animals by fungal pathogens is a medical mycological technique of proven utility for a number of important mycoses. In N. Am., for example, millions of humans and domestic and farm animals are marked for life by antibodies induced by subclinical or mild attacks of coccidioidomycosis and histoplasmosis as revealed by testing the reaction of the skin or blood serum to coccidioidin and histoplasmin (q.v.), antigens prepared from the pathogens (See also blastomycin, oidiomycin, spherulin, sporotrichin.).

The antigen-antibody (antiserum) reaction may be tested in several ways. The most useful techniques are based on agglutination or precipitation (see antigen). In the first the antigenic particles are usually whole fungal cells but an alternative is to adsorb the antigen onto particles of latex or charcoal. In the second, the reaction is demonstrated by the formation of a precipitate when the antiserum (antibody) is added to a tube containing the corresponding antigen in solution or when antibody and antigen are allowed to diffuse towards one another in a clear agar gel. See also anaphylaxis, complement-fixation, ELISA.

Setosporella Mustafa & Abdul-Wahid (1989), anamorphic *Pezizomycotina*, Hso.0eP.?36. 1 (from soil), Egypt. See Mustafa & Abdul-Wahid (*MR* **93**: 227, 1989).

Setosynnema D.E. Shaw & B. Sutton (1985), anamorphic *Pezizomycotina*, Hsy.0fH.10. 1 (aero-aquatic), Australia; Papua New Guinea. See Shaw & Sutton (*J. Linn. Soc.* Bot. **91**: 33, 1985).

setula (Lat., a little bristle), (1) a delicate hair-like appendage arising from a conidium, as in *Dinemasporium*; (2) (in hymenomycetes), a thick-walled, pigmented, terminal element of a tramal cystidium.

setule (in hymenomycetes), a thin-walled, rarely pigmented, usually lageniform cystidium on the pileus or stipe.

Setulipes Antonín (1987), Marasmiaceae. *c.* 25, widespread (north temperate). See Antonín *et al.* (*Mycotaxon* **63**: 359, 1997; taxonomy), Antonín (*Mycotaxon* **88**: 53, 2003; tropical African spp.), Wilson & Desjardin (*Mycol.* **97**: 667, 2005; phylogeny; in *Gymnopus* clade), Antonín (*Monograph of Marasmius, Gloiocephala, Plalaeocephala and Setulipes in Tropical Africa*, 2007), Antonín & Buyck (*MR* **111**: 919, 2007; tropical African spp.; key).

setulose (Lat., setulosus), covered with fine bristles or hairs; cf. setaceous.

Seuratia Pat. (1904), Seuratiaceae (?L). Anamorph *Atichia*. 5, widespread. See Meeker (*CJB* **53**: 2462, 1975), Meeker (*CJB* **53**: 2485, 1975; key, morphology), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; Australia).

Seuratiaceae Vuill. ex M.E. Barr (1987), Pezizomycotina (inc. sed.). 3 gen. (+ 10 syn.), 12 spp.

Lit.: Meeker (*CJB* **53**: 2464, 1975), Eriksson (*Mycotaxon* **15**: 249, 1982), Rodríguez Hernández & Camino Vilaró (*Revta Jardín bot. Nac.* Univ. Habana **6**: 61, 1985), Sutton (*Sydowia* **38**: 324, 1985), Barr (*Mycotaxon* **29**: 501, 1987), Sivanesan & Hsieh (*MR* **99**: 1295, 1995).

Seuratiopsis Woron. (1934), ? Seuratiaceae. 1, Crimea.

sewage fungus, *Leptomitus lacteus*, found in polluted water, sometimes blocking sewage filters.

Sex. In some fungi reproduction is by asexual methods only, in others it is parthenogenic, but in most there is a sexual process. Probably one third of all fungi have more than one type of reproduction, frequently in two well-marked phases (the 'teleomorph' and 'anamorph') which may have separate names (see Nomenclature).

As in the *Algae* and *Bryophyta*, the sexual or assimilative phase is generally haploid (i.e. a gametophytic generation), though in basidiomycetes (see under) the cells are commonly dikaryotic. In most Fungi (but not Mycetozoa) nuclear fusion is not till shortly before meiosis and the development of 'sexual' spores. For a life-cycle summary of an hypothetical typical filamentous fungus see Fig. 36, and for *Pucciniales* see Fig. 25.

Fungi having sex organs are commonly monoecious, infrequently dioecious. If sex organs are not present or (as in basidiomycetes and *Mucorales*) are of like morphology the fungus is (1) homothallic (q.v.), when one haploid mycelium is able to give a sporocarp or (2) heterothallic (q.v.), when there are two or more haploid mycelial types and diploidization must be effected for sporocarp development to take place. Heterothallic mycelia may be different (sexually dimorphic) or, more commonly, alike in form so that, as the 'sexes' may be determined only by chemical methods, they are generally named + and -.

In bipolar species sporocarp development is dependent on two factors, and in tetrapolar species on four. When segregation in a tetrapolar species takes place at the second division of meiosis one basidium may give all four types of spore, but when segregation is at the first division only two types (A_1B_1 and A_2B_2 or A_1B_2 and A_2B_1) are produced by one basidium. Normal basidiocarps are generally produced only when the secondary mycelium resulting from the fusion of primary mycelia is of the genotype $A_1B_1A_2B_2$ (Buller, 1941). These various genetical

devices favour or ensure outbreeding or inbreeding. As Esser has pointed out incompatibility is of 2 main types: (1) **homogenic incompatibility** (e.g. bipolar and tetrapolar systems) in which mating is prevented between strains having the same factor(s) so that inbreeding is prevented and outbreeding encouraged, and (2) **heterogenic incompatibility** in which mating is prevented between strains having different factors so that outbreeding is prevented and inbreeding encouraged.

Two genes determine mating type and, in *Coprinus cinereus*, these have been extensively studied, with more than 12,000 mating types already identified.

Singer (Rolf; 1906-1994; Germany, later Austria, Spain, Russia, USA, Argentina, Chile). Born at Schliersee in south Germany, studying chemistry at the University of Munich; PhD student of Wettstein, Vienna (1928-1931); subsequently lived and worked in Barcelona (1933-1935), Leningrad [St Petersburg] (1935-1940) [Dr Biol. Sci.], Harvard (1941-1947), Tucumán (1948-1960), Buenos Aires (1960-1969), Santiago (1967-1968), and Chicago (1968-1994) [associate of the Field Museum and University of Illinois]. Made major contributions to the overall understanding of *Agaricales* and to neotropical agaricology, describing some 2,450 new fungi in about 400 publications in 9 languages; also made important contributions on ethnomycology, mycorrhizas, nomenclature, and truffles. His collections are distributed among at least 42 institutions. *Publs. The Agaricales in Modern Taxonomy*, 1951 [edn 4, 1986, the most recent, treats 230 genera]. *Biogs, obits etc.* Mueller (*Mycol.* **87**: 144, 1995); M. Singer (*Mycologists and Other Taxa*, 1984).

slaframine, a toxin of *Rhizoctonia leguminicola*; the cause of the slobber syndrome in livestock.

Slide Making. The following mounting procedures are those most frequently used for microscopic examination of fungi. For details of methods see Dring in Booth (Ed.) (Methods in microbiology 4: 95, 1971) Waller & Lenné (*Plant pathologist's pocketbook*, 2001), Gams *et al.* (*CBS Course of mycology*, edn 3, 1987).

Squash mount

The most widely used preparation for microscopic examination of fungi. A small portion of fungal material is removed from a culture or specimen using a mounted needle or scalpel blade and transferred to a drop of a suitable mountant on a microscope slide (see mounting fluid and stains). If necessary the material can be teased apart using a second needle and a coverslip applied. To release contents from fruit-bodies, light pressure on the coverslip is required. Air bubbles are released by gentle heating of the slide over a spirit lamp or bunsen flame. If necessary slides can be made permanent by sealing the cover slip with two layers of nail varnish. To apply this successfully, excess mounting fluid must first be removed from around the cover slip.

An improved technique involving use of a double cover-glass for preparing permanent microscope mounts was described by Kohlmeyer & Kohlmeyer (*Mycologist* **10**: 107, 1996).

Agar block mount

Used to observe undisturbed structures in anamorphic fungi (e.g. Penicillium, Aspergillus and Fusarium) grown on low-nutrient, translucent media. See Samson *et al.* (*Introduction to Food-borne fungi*, edn 5, 1996). From a sporulating area of the colony an agar block 0.5-1cm in diameter is removed with a sterilized scalpel blade and placed fungus side up on a microscope slide. A drop of water is placed on the block and a cover slip applied. The slide can then be examined under a light microscope.

Cellophane tape mount

These are used to prepare rapid mounts of fungi from leaf surfaces and agar cultures. See Butler & Mann (*Phytopathology* **49**: 231, 1959). A short length of clear adhesive single-sided tape is cut and the sticky side pressed gently on to the fungal material. The tape with fungus attached is then lowered, fungus side down, on to a drop of mounting fluid on a microscope slide and is pressed down firmly. If required a second drop of mountant can be applied to the top surface of the tape and a cover slip applied.

Slide culture

A culture grown directly on the surface of a slide and cover slip. Mainly used to examine conidial development in anamorphic fungi but also useful for observing appressoria in the genus *Colletotrichum*. A square block of nutrient agar is placed on a sterile microscope slide supported on a bent glass rod in a Petri dish which serves as a damp chamber. The four sides of the block are inoculated with the fungus and a sterile cover slip is lowered on to the block. Sterile water is then added to the base of the dish. When sporulation has occurred, the cover slip with attached mycelium is removed and carefully lowered, fungus side down on to a drop of mountant on a slide. The agar block is removed from the slide, leaving mycelium attached to the glass. A drop of stain is applied to this and a clean cover slip added thus two mounts can be prepared from each slide culture. Air bubbles can be expelled by heating the slide gently on a hot plate overnight. Mounts are made permanent by sealing with nail varnish if required. See Riddell (*Mycol.* **42**: 265, 1950).

Film culture

Using sterilized tweezers, add molten agar to one side of a coverslip so that it is covered by a thin film. When this has cooled, place it agar downwards on an inoculated block of nutrient agar as for slide cultures. After the fungus has grown into the agar film, the coverslip may be removed and mounted on a separate microscope slide with or without mounting fluid.

Hand-cut sections

For examining the structure and arrangement of fruit-bodies in plant tissues, vertical sections can be cut by hand. See Fox (*Principles of diagnostics in plant pathology*, 1993). Material to be cut is supported in elder pith, cork or polystyrene and thin sections cut with a razor blade (it is easier to cut thinner sections using a double-edge razor blades, but the additional upward-pointing blade makes this more hazardous). Sections are transferred with a mounted needle to a drop of mountant on a microscope slide and a cover slip applied.

Microtome-cut sections

Use of a freezing microtome provides the most satisfactory method for obtaining thin vertical sections of fungal fruit-bodies from plant tissues or cultures. See Waller & Lenné (*Plant pathologist's pocketbook*, 516 pp., 2001). Material is soaked for several hours in gum arabic solution. Dry specimens are best soaked overnight. The microtome stage is cooled to around -20°C with a supply of CO_2 or freon gas and a few drops of glue placed on the stage and allowed to freeze. This provides a platform on which to mount the material. The specimen is placed on the frozen glue block with the aid of a mounted needle and aligned carefully. A layer of glue is then allowed to freeze around the specimen. Required section thickness is set and sections are cut by rocking the blade across the specimen. Using a fine paint brush, sections are transferred to water contained in a watch glass. A fine mounted needle is used to transfer sections to a drop of mountant on a slide. A cover slip is then applied and the mount made permanent if required by sealing with nail varnish.

Slimacomyces Minter (1986), anamorphic *Pezizomycotina*, Hso.0-≡ hP.1. 2, British Isles. See Minter (*Bull. Br. mycol. Soc.* **20**: 23, 1986).

slime, a wet, generally sticky, substance; mucus; **- flux**, a thick liquid from the stems or branches of trees made up of, or having a connexion with, fungi and bacteria (Ogilvie, *TBMS* **9**: 167, 1924; Stautz, *Phytopath. Z.* **3**: 163, 1931); **- moulds**, the *Acrasiomycota*, *Dictyosteliomycota*, and *Mycetozoa*; **- spore**, a spore that becomes separated with slime from the cell producing it (Mason, 1937), cf. dry spore. See Gloiosporae.

slug (in slime moulds), the aggregated pseudoplasmodium of *Dictyosteliomycota.*

Smardaea Svrček (1969), Pyronemataceae. 7, widespread (north temperate). See Dissing (*Sydowia* **38**: 35, 1986), Cao *et al.* (*Acta Mycol. Sin.* **9**: 282, 1990), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Smarodsia Raitv. & Vimba (2006), Pyronemataceae. 1, Latvia. See Vimba & Raitviir (*Folia cryptog. Estonica* **42**: 91, 2006).

Smell. See Chiron & Michelot (*Cryptogamie Mycologie* **26**: 299, 2005; detailed review). It seems likely that many fungi produce aromatic volatile chemicals, but these may be in quantities insufficient for detection by the human nose. Those which can be detected are often characteristic and sometimes of great economic value. Given that importance, investigation of fungal smell has been surprisingly limited. The odours of truffles and other underground fungi attract various animals including insects, rodents and larger mammals which are participants in a mutualistic arrangement for spore dispersal (see Animal mycophagists). In the case of truffles, the smell is particularly prized in gastronomy, and there has been extensive research into the volatile chemicals responsible (e.g. Pacioni *et al.*, *MR* **94**: 201, 1990); animals can be trained to find truffles using their scent (or even using potatoes injected with the main pure chemical ingredient). Components of some perfumes are obtained from actinomycetes, lichens, and truffles. The spicy ester, methyl cinnamate, produced by *Tricholoma matsutake*, while attractive to humans, is a powerful slug repellent (Wood & Lefevre, *Biochemical systematics and ecology* **35**: 634, 2007). Badcock (*TBMS* **23**: 188, 1939) describes the smells of wood-attacking fungi in culture. The distinctive 'coconut' smell of some *Trichoderma* colonies in pure culture is familiar to many laboratory mycologists. The smell of 'stinking' smut (bunt) of wheat (*Tilletia laevis*) is that of trimethylamine, $(CH_3)_3N$ (Hanna *et al.*, *J. biol. Chem.* **97**: 351, 1932; *Phytopath.* **22**: 978, 1932). A smell of mould is often associated with natural decaying materials, such as forest leaf litter, and with decaying building materials and other artefacts. A sweet smell has been reported in association with the spruce endophyte, *Tryblidiopsis pinastri*, although its function remains unknown (Livsey & Minter, *Can. J. Bot.* **72**: 549, 1994). Some fungi, e.g. ergots and rusts, produce sweet smells which may attract insects for dispersal of the spores (Steinebrunner *et al.*, *J. Chemical Ecol.* **34**: 1573, 2008); this may be associated with floral mimicry (Roy, *Nature* **362**: 56, 1993). Other fungi, e.g. *Phallus impudicus*, produce strong odours usually repulsive to humans, but attractive to insects associated with spore dispersal. The odours of basidiomycete species are often of diagnostic value, although in field mycology evaluation can be rather subjective. Gilbert (*Méthode de mycologie descriptive*, 1934; *BSMF* **48**: 241, 1932; **50**: 25, 1935) made a classification of the smells of natural basidiomata (see also Imler, *BSMF* **68**: 400, 1952; Josserand, 1952: 63; Locquin, *Petite flore des champignons de France* **1**: 97, 1956). See also Taste.

Smeringomyces Thaxt. (1908), Laboulbeniaceae. 4, widespread. See Weir & Rossi (*CJB* **75**: 791, 1997; New Zealand).

Smith (Alexander Hanchett; 1904-1986; USA). University of Michigan (1934-1972). Agaricologist; monographed *Mycena* (q.v.); see also Macromycetes, USA. *Biogs, obits etc.* Rogers (*Mushroom* **5**: 17, 1987); Thiers (*Mycol.* **79**: 811, 1987) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **5**: 662, 1985).

Smith (Annie Lorrain; 1854-1937; Scotland, later England). Originally a governess; an 'unofficial worker', British Museum (Natural History), London. Her first publications were on seaweeds; she was associated with early work on seed testing; prepared exhibits on microfungi for the British Museum (Natural History) London; President of the British Mycological Society (1907); she completed J.M. Crombie's *A monograph of lichens found in Great Britain* (2 vols, 1894, 1911) and is best known for her work on lichen-forming fungi. *Publs. A Monograph of the British Lichens* (vol. 1, 1918; vol. 2, 1926); *A Handbook of British Lichens* (1921) [for a time the standard English introduction to the subject; reprint 1975]. *Biogs, obits etc.* Gepp & Rendle (*Journal of Botany* London **75**: 328, 1937); Grummann (1974: 240); Stafleu & Cowan (*TL-2* **5**: 663, 1985).

Smith (Erwin Frink; 1854-1927; USA). Plant pathologist and bacteriologist, USDA (1886-1927). First interested in peach yellows, later specializing in bacterial pathogens of plants. *Publs. Bacteria in Relation to Plant Disease* 3 vols (1911-1914); *Introduction to Bacterial Diseases of Plants* (1920). *Biogs, obits etc.* Rogers (*Erwin Frink Smith. A story of North American Plant Pathology*, 1952); Stafleu & Cowan (*TL-2* **5**: 669, 1985); Verma (*Review of Tropical Plant Pathology* **7**: 25, 1993).

Smith (Worthington George; 1835-1917; England). Architect, wood engraver and book illustrator; artist for the *Gardeners' Chronicle* (1869-1910) and *Floral Magazine* (1870-1876). An amateur mycologist and antiquarian who regularly attended meetings of the Woolhope Club (a precursor of the British Mycological Society), making humorous reports in *Gardeners' Chronicle* and a series of cartoons in other periodicals. A founder member and early President of the British Mycological Society, who also restored the models of fungi in the British Museum made by J. Sowerby (q.v.). *Biogs, obits etc.* Ainsworth (*Mycologist* **4**(1): 32, 1990) [portrait]; Stafleu & Cowan (*TL-2* **5**: 706, 1985).

Smithiogaster J.E. Wright (1975), Agaricaceae. 1, Argentina. Basidioma gasteroid. See Wright (*Nova Hedwigia* Beihefte **51**: 360, 1975), Salusso (*Docums Mycol.* **23** no. 91: 13, 1993).

Smithiomyces Singer (1944), Agaricaceae. 2, America (tropical); Europe (introduced). See Singer (*Mycol.* **36**: 366, 1944).

Smithiozyma Van der Walt, Kock & Y. Yamada (1995) = Lipomyces fide Gouliamova *et al.* (*Antonie van Leeuwenhoek* **74**: 283, 1998), Smith *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 248,

1998), Kurtzman *et al.* (*FEMS Yeast Res.* **7**: 1027, 2007; phylogeny).

Smittium R.A. Poiss. (1937), Legeriomycetaceae. 75 (in *Diptera*), widespread. See Williams (*Mycol.* **75**: 242, 1983; trichospore germination and zygospores), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; biology, key), Williams & Lichtwardt (*Mycol.* **79**: 832, 1987), Horn (*Mycol.* **81**: 742, 1989; ultrastr.), Horn (*MR* **93**: 303, 1989; spore extrusion), Sato *et al.* (*TMSJ* **30**: 51, 1989; ultrastr.), Horn (*Exp. Mycol.* **14**: 113, 1990; physiology & spore extrusion), Lichtwardt & Williams (*CJB* **68**: 1057, 1990), Williams & Lichtwardt (*CJB* **68**: 1045, 1990), Lichtwardt & Williams (*CJB* **70**: 1193, 1992), Lichtwardt & Williams (*Mycol.* **84**: 392, 1992), Lichtwardt & Williams (*Mycol.* **84**: 384, 1992), Valle & Santamaría (*Mycol.* **96**: 682, 2004; Iberian peninsula), White & Lichtwardt (*Mycol.* **96**: 891, 2004; Norway), Strongman & Xu (*Mycol.* **98**: 479, 2006; China), White (*MR* **110**: 1011, 2006; phylogeny), Strongman (*CJB* **85**: 949, 2007; Canada).

smut (1) a disease caused by one of the *Ustilaginales*, esp. a member of the *Ustilaginaceae* (cf. bunt); (2) a smut fungus. **- spore**, a chlamydospore of a - fungus; ustilospore; ustospore; **covered -**, a smut in which the mature spore mass keeps for a time within a covering of host (or fungal) tissue, frequently till after the sorus becomes free from the host: of barley, oats *Ustilago segetium* (syn. *U. hordei*, *U. kolleri*); sorghum, *Sporisorium sorghi*; wheat (**bunt, stinking -**), *Tilletia caries* and *T. laevis* (syn. *T. foetida*); (dwarf bunt), *T. controversa*. **'fig -'**, *Aspergillus niger*; **flag -** of wheat, see stripe smut. **loose -**, a smut in which the spores are as an uncovered mass of powder becoming free from the host plant by wind and rain; of barley and wheat, *Ustilago segetum* var. *tritici* (syn. *U. nuda*); oats, *U. segetum* var. *avenae*; sorghum, *S. cruenta*. **stripe -**, of grasses, *U. striiformis*; rye, *Urocystis occulta*; wheat, *U. agropyri*.

sociation, society, see Phytosociology.

Societies and organizations. In very general terms, mycological societies function at three levels: international, national and local. The *International Mycological Association* (IMA) is global in scope. It constitutes the Section for General Mycology of the International Union of Biological Societies (IUBS), the primary biological component of the International Council of Scientific Unions (ICSU). The IMA also organizes the periodic International Mycological Congresses (q.v.), and has Regional Committees which are mostly organized through a series of affiliated continental-level mycological societies: the African Mycological Association, Asociación Latinoamericana de Micología, Australasian Mycological Society, European Mycological Association, International Mycological Association Committee for Asia and Mycological Society of America. Although the geographical area each covers is still in places ill-defined, these organize periodic continental-level congresses. Within each continent there are various societies functioning at a regional or national level. Some of these societies in practice are international in outlook and may themselves be affiliated to the *IMA*. Many countries, particularly in Africa, Asia, the Caribbean and Oceania, do not have any national mycological society, and some countries have no mycological societies at all, although in others there may be large numbers of local societies.

In many parts of the world there are parallel structures and societies for lichen-forming fungi (the International Association of Lichenologists is associated with the IUBS and participates in International Mycological Congresses), edible and medicinal fungi (the International Society for Mushroom Science arranges independent international congresses), fungi of medical and veterinary significance (the International Society for Human and Animal Mycology arranges independent international congresses), and for fungal plant pathogens (the International Society for Plant Pathology is associated with the IUBS); there are also certain mycological societies which cannot be categorized geographically because they are defined by their specialist interests, such as the International Mycorrhiza Society.

The picture is complicated by the fact that some botanical and microbiological societies also have mycological sections, and some executive functions relating purely to mycology are administered by those bodies. Issues related to the formal system of naming fungi are considered through the Permanent Committee on Fungi which reports through the General Committee on Botanical Nomenclature to International Botanical Congresses (see Nomenclature); the International Association for Plant Taxonomy also covers fungi. Within microbiology, mycological interests are represented by the Mycology Division of the International Union of Microbiological Societies. In addition there are two IUBS/IUMS inter-Union commissions: the International Commission on the Taxonomy of Fungi, and the World Federation for Culture Collections.

Since the previous edn of this *Dictionary*, the number of mycological societies has grown substantially. The *International Mycological Directory*, which has listed these societies since 1971, is now available on-line (see Internet), and should be consulted for up-to-date information.

See also BioNET-INTERNATIONAL, MIRCEN.

sociomycie, see mycosociology.

soft rot, a decomposition of plant parts (fruits, roots, stems, etc.) by fungi or bacteria resulting in the tissues becoming soft.

Soil fungi. The soil normally has large numbers of fungi (mostly anamorphic fungi, *Mucorales*, *Ascomycota*, *Chytridiomycetes* and *Oomycetes*) accompanied by even larger numbers of bacteria (and actinomycetes), although with the exception of rhizosphere soil, the fungal biomass almost everywhere exceeds that of bacteria. Soil fungi are important for keeping the soil fertile, though some may cause disease, particularly of plants. Some components of the soil mycota are cosmopolitan. These often opportunistic species grow when and where suitable nutrition can be found. They are the fungi most frequently isolated from soil using conventional techniques, and have been termed ruderals. Although cosmopolitan, environment, geographical location, climate and the soil physico-chemical properties have an effect on their proportions within the soil: for example *Penicillium* is more frequent than *Aspergillus* in temperate areas while in warmer areas the opposite is true. The mycelium of basidiomycetes is most frequent under trees and contributes to a second main category of soil fungi, the mycorrhizal species. Usually more than half of the fungal biomass is of basidiomycetes, although these are missed by most isolation techniques.

Peat bogs have large numbers of fungi (Dooley & Dickinson, *Irish J. agric. Res.* **10**: 195, 1971). See also Sand dune fungi.

The chief work of soil fungi relates to decomposition and recycling organic residues. Fungi are important in the early stages of the decomposition of plant material, immobilizing large amounts of nitrogen (N) as protein. Cellulose and lignin are the most important plant cell wall components that are mainly decomposed in litter and soil by fungi. For the latter mainly basidiomycetes but also some ascomycetes are responsible. Lichenized fungi with cyanobacterial partners take a part in the nitrogen cycle, as these fix nitrogen from the air.

There are complex biological relations between the different soil organisms themselves (see Antagonism) and between them and plants (see Mycorrhiza, rhizosphere) on which they may be parasites. Reinking and Mann (fide Garrett, 1939) grouped soil fungi as, (1) having a wide distribution (the 'soil inhabitants') and (2) the 'soil invaders', having a limited distribution, e.g. most parasitic root-infecting fungi.

A common method for the investigation of the soil biota is that of plating a series of dilutions of the soil (for problems in quantification see James and Sutherland, *Can. J. Res.* C **17**: 73, 97, **18**: 347, 435, 1939-40). Other techniques used are 'direct observation' (Conn, *Soil Sci.* **26**: 257, 1928), the Cholodny slide (Conn, *Tech. Bull. N.Y. Sta. agric. Exp. Stn* **204**, 1932), and Warcup's soil plate (*Nature* **166**: 117, 1950). Washing roots (Harley & Waid, *TBMS* **38**: 105, 1955) or soil particles (Parkinson & Williams; Gams & Domsch, *Arch. Microbiol.* **58**: 134, 1967; Bååth, *CJB* **66**: 1566, 1988), Bills & Polishook (*Mycol.* **86**: 187, 1994) shifts the balance in favour of slow-growing and poorly sporulating fungi that may be active as mycelium in the soil.

Bot.* **91**: 449, 2004; phylogeny), Wang *et al.* (*Lichenology* **4**: 1, 2005; photomorph), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Solorinaceae Bayrh. (1851) = Peltigeraceae.

Solorinaria (Vain.) Gyeln. (1935), Lichinaceae (L). 2, Europe.

Solorinella Anzi (1860) nom. rej. = Gyalidea fide Thor (*Nordic Jl Bot.* **4**: 823, 1985), Vězda & Poelt (*Phyton* Horn **30**: 47, 1990), Farkas & Lökös (*Acta Bot. Fenn.* **150**: 21, 1994; distrib.), Henssen & Lücking (*Ann. bot. fenn.* **39**: 273, 2002; ontogeny, morphology), Aptroot & Lücking (*Biblthca Lichenol.* **86**: 53, 2003; morphology).

Solorinellaceae Vězda & Poelt (1990) = Asterothyriaceae. See Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Solorinellomyces Cif. & Tomas. (1953) ≡ Solorinella.

Solorinina Nyl. (1884) = Solorina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Solorinomyces E.A. Thomas ex Cif. & Tomas. (1953) = Solorina.

Solosympodiella Matsush. (1971), anamorphic *Pezizomycotina*, Hso.0-1eH.10. 7, Papua New Guinea. See de Hoog (*Stud. Mycol.* **26**: 54, 1985; key).

Soloterminospora Matsush. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Cape Province. See Matsushima (*Matsush. Mycol. Mem.* **9**: 25, 1996).

Solutoparies Whiffen ex W.H. Blackw. & M.J. Powell (1998), Chytridiaceae. 1, USA. See Blackwell & Powell (*Mycotaxon* **67**: 464, 1998).

soma (1) body, excluding reproductive parts or phase; (2) in Aryan religion, *Amanita muscaria* (Allegro, *The sacred mushroom and the cross*, 1970; Wasson, *Soma: the divine mushroom of immortality*, 1968, *The wondrous mushroom*, 1980; Whittier, *The brewing of soma*, 1872); **-tic**, pertaining to the soma. See also ethnomycology, hallucinogenic fungi.

Somatexis Toro (1934) = Aphanostigme fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

somatogamy, fusion of somatic (vegetative) cells or hyphae involving plasmogamy but not karyogamy.

Somion Adans. (1763) nom. rej. = Spongipellis fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Sommerfeltia Flörke ex Sommerf. (1827) nom. rej. prop. = Solorina fide Zahlbruckner (*Catalogus Lichenum Universalis* 3, 1925).

Sonderhenia H.J. Swart & J. Walker (1988), anamorphic *Mycosphaerella*, Cpd.≡ eP.19. 1, widespread. See Swart & Walker (*TBMS* **90**: 640, 1988), Crous (*Mycol. Mem.* **21**: 170 pp., 1998), Verkley & Priest (*Stud. Mycol.* **45**: 123, 2000), Crous *et al.* (*MR* **105**: 425, 2001; phylogeny), Hunter *et al.* (*MR* **108**: 672, 2004; S Africa), Hunter *et al.* (*Stud. Mycol.* **55**: 147, 2006; phylogeny).

sooty moulds, used for fungi forming dense dark mats of hyphae on living leaves in the tropics, esp. *Capnodiales* (fams: *Asterinaceae, Antennulariaceae, Capnodiaceae, Chaetothyriaceae, Euantennariaceae, Meliolinaceae, Metacapnodiaceae*), *Chaetothyriales* (fam.: *Chaetothyriaceae*), *Meliolales* (fam.: *Meliolaceae*), and their anamorphs. See Hughes (*Mycol.* **68**: 693, 1976; genera and interrelationships). Also *Lit.* under *Dothideales*.

Sopagraha Subram. & Sudha (1979) = Arachnophora fide Sutton (*in litt.*).

Sophronia Pers. (1827) [non *Sophronia* Licht. ex Roem. & Schult. 1817, *Iridaceae*] = Phallus fide Stalpers (*in litt.*).

Soppittiella Massee (1892) = Cristella fide Donk (*Persoonia* **4**: 329, 1966).

soralium (pl. **-ia**), decorticate portions of a lichen thallus where **soredia** are located. Usually formed from medullary tissues thrusting upwards through the cortical layers and so sometimes with the chemistry of the medulla rather than of the cortex. Soralia may be **diffuse** (the upper surface of the lichen becoming a continuous soredial mass), or **delimited** (i.e. confined to well-defined areas), and can be classified according to where they originate. They can arise on tubercles (**tuberculate -**) or as fissures (**fissural -**) in some genera (Hawksworth, *Lichenologist* **5**: 181, 1972). Soralia can arise at the tips of isidia, and in some taxa the soralia can contain a mixture of soredia and isidia-like structures.

Lit.: Du Rietz (*Svensk bot. Tidskr.* **18**: 371, 1924; soralium types).

See Spore discharge and dispersal, Spore germination.

Sorataea Syd. (1930), Uropyxidaceae. *c.* 6 (on *Leguminosae*), S. America; Asia; W. Africa. See Eboh & Cummins (*Mycol.* **72**: 203, 1980), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Sorauer (Paul Carl Moritz; 1839-1916; Germany). Student, Berlin (1862); Doctorate, Rostock (1867); Assistant, Agricultural Museum, Berlin (1867-1868); Assistant, Agricultural Experiment Station, Dahme, Brandenburg (1868-1872); Head, Experimental Station for Plant Physiology, Imperial Cider Institute, Proskau (1872-1893); retired to Berlin. First editor of *Zeitschrift für Pflanzenkrankheiten* (1891-1916). *Publs. Handbuch der Pflanzenkrankheiten* (1874) [2 Aufl., 1886; 3 Aufl. (with Lindau & Rehm), 1905-1908]; *Atlas der Pflanzenkrankheiten* (1887-1893). *Biogs, obits etc.* Stafleu & Cowan (*TL-2* **5**: 749, 1985); Wittmack (*Bericht der Deutschen Botanischen Gesellschaft* **34**: (50), 1917).

Sordaria Ces. & De Not. (1863) nom. cons., Sordariaceae. 12 (esp. coprophilous), widespread. See Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972), Read & Beckett (*CJB* **63**: 281, 1985; ascoma ontogeny), Barrasa *et al.* (*Persoonia* **13**: 83, 1986; narrow-spored spp.), Guarro & von Arx (*Persoonia* **13**: 369, 1987; key 14 spp., list spp. names), Beatty *et al.* (*MR* **98**: 1309, 1994; genetics), Pöggeler (*Curr. Sordariales Chadef. ex D. Hawksw. & O.E. Erikss. (1986). Sordariomycetidae. 5 fam., 97 gen., 854 spp. Stromata absent or rarely present as subicular tissue. Ascomata perithecial or cleistothecial, thin- or thick-walled, often hairy, membranous to carbonaceous, olivaceous to black. Interascal tissue composed of wide thin-walled evanescent paraphyses, or lacking altogether. Asci cylindrical or clavate, persistent or evanescent, not fissitunicate, when persistent usually with a small J- apical ring. Ascospores ± always with at least one dark cell, with germ pore, often with a gelatinous sheath or appendages. Anamorphs usually absent or spermatial. Saprobes on rotting wood and soil, coprophilous, some fungicolous, many cellulolytic. Fams:

(1) **Cephalothecaceae**
(2) **Chaetomiaceae** (syn. *Achaetomiaceae*)
(3) **Lasiosphaeriaceae** (syn. *Tripterosporaceae*)
(4) **Sordariaceae** (syn. *Neurosporaceae*)

sorophore (of *Acrasiales*), a sorocarp stalk.

Sorosporella Sorokīn (1888), anamorphic *Hypocreales*, Hso.0eH.?. 1 (on insects), widespread (north temperate). See Speare (*J. agric. Res.* **18**: 399, 1920), Pendland & Boucias (*Mycopathologia* **99**: 25, 1987; SEM and TEM), Evans & Shah (*MR* **106**: 737, 2002; ecology, morphology).

Sorosporium F. Rudolphi (1829) nom. rej. = Thecaphora fide Vánky (*in litt.*) cf. *Sporisorium*.

Sorosporonites X. Mu (1977), Fossil Fungi. 1, China.

Sorothelia Körb. (1865) ? = Endococcus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

sorus, a fruiting structure in certain fungi, esp. the spore mass in *Pucciniales* and *Ustilaginales*; a group of fruit-bodies, as in *Synchytriaceae*.

Sousa da Câmara (Manuel; 1871-1955; Portugal). Member of staff (from 1901), Lecturer (from 1905), then Senior Lecturer and Researcher (working on fungal phytopathology), then Professor of Parasitology & Phytopathology (1914-1941), also Head of Laboratory of Plant Pathology, Vice-Director (1912-1918) and Director (1918-1942), Institututo Superior de Agronomia e Veterinária, Lisbon. An outstanding taxonomist of fungi significant in plant pathology, particularly coelomycetes; he was the author or co-

author of 491 taxa; through publication of his series of reports and a comprehensive catalogue of fungi (1902-1955) he made a significant contribution to the knowledge of the mycota of Portugal. *Publs. Mycetes aliquot Lusitaniae* I-XII (1936-1951); *Fungi Lusitaniae* I-XIII (1952-1955); *Catalogus Systematicus Fungorum Omnium Lusitaniae*, 2 vols. (1956-1958). *Biogs, obits etc.* Natividade (*Sep. Bol. Soc. Port. Ciências Naturais*, 2a Serie, **5**: I, 1955); Oliveira (*Agronomia Lusitana* **17**: I, 1955) [portrait]; Stafleu & Cowan (*TL-2* **5**: 758, 1985).

Sowerby (James; 1757-1822; England). Born, London; trained as an artist, became a teacher of drawing and painting. Famous illustrator of fungi and plants; also prepared models of larger edible and poisonous fungi, now in the British Museum (Natural History), London; advised British government regarding fungal decay of wooden warships during the Napoleonic wars; his children and their descendants included a dozen naturalists and illustrators. *Publs. Coloured Figures of English Fungi or Mushrooms* 3 vols (1795-1803) [suppl. 1809-1815; for dates of publication see Ramsbottom *TBMS* **18**: 167, 1933]. *Biogs, obits etc.* Ainsworth (*Mycologist* **2**: 125, 1988) [portrait]; Anon. (*Oxford Dictionary of National Biography* concise edn **3**: 2802, 1993); Grummann (1974: 381); Stafleu & Cowan (*TL-2* **5**: 759, 1985).

Spathulosporales Kohlm. (1973) = Lulworthiales.

Spathulosporomycetidae, Locq. (1984), see *Sordariomycetes*.

Spatulosporonites Z.C. Song (1999), Fossil Fungi. 1. See Song *et al.* (*Fossil Spores and Pollen of China* **1**: 825, 1999).

spawn (1) (n.), mycelium, esp. that used for starting mushroom cultures (q.v.); (2) (v.), to put inoculum (spawn) into a mushroom bed or other substrate.

special form (forma specialis, f. sp.; formae speciales, ff. spp., pl.), an informal rank in a Classification (q.v.) not regulated by the Code (see Nomenclature) and used for parasitic fungi characterized from a physiological standpoint (e.g. by the ability to cause disease in particular hosts) but scarcely or not at all from a morphological standpoint; e.g. *Fusarium oxysporum* f.sp. *cubense* (Panama disease of banana) and f.sp. *elaeidis* (wilt of oil palm); first used by Eriksson (*Ber. dtsch bot. Ges.* **12**: 292, 1894) in rusts, and now extensively used in some genera (over 120 ff. spp. in *F. oxysporum*; Armstrong & Armstrong *in* Nelson *et al.* (Eds), *Fusarium: diseases, biology, taxonomy*: 391, 1981), although not always in a parallel manner; best viewed as a temporary category while further research as to taxonomic status is in progress (Hawksworth, *in* Hawksworth (Ed.), *The identification and characterization of pest organisms*: 93, 1994); comparable to 'pathovar' as used for plant pathogenic bacteria (Young *et al.*, *ROPP* **70**: 211, 1991). See Plant pathology.

species (1) (colloquially), one sort of organism; (2) (scientifically), the lowest principal rank in the nomenclatural hierarchy (see Classification), consisting of two elements (a binomial): a generic name and a species epithet.

There is much debate as to how species should be defined, and a variety of concepts have been proposed: (1) **morpho - (morphological -, phenetic -)**, the traditional approach recognizing units that could be delimited on the basis of morphological characters, and ideally by discontinuities in several such; (2) **biological - (cryptic-, sibling -)**, actually or potentially interbreeding populations reproductively isolated from other such groups, whether or not they are distinguishable morphologically; (3) **phylogenetic - (evolutionary -)**, based on measureable differences in biochemical, molecular or any other characters assessed by cladistic analysis (see Cladistics) and especially well-suited for groups in which no sexual reproduction is known (e.g. **clonal -**, anamorphic fungi); (4) **ecological -**, based on adaptation to particular niches rather than reproductive isolation (e.g. to particular hosts); (5) **polythetic -**, based on a combination of characters, not all of which are necessarily present in each individual. The **aggregate - (aggr.)**, rarely used in mycology, has been used for groups of closely related morphospecies only distinguishable with difficulty.

The morphospecies concept has predominated in mycology, although in the past some mycologists have frequently taken the host of a parasitic fungus into account (in some cases giving different specific names to like forms on unlike hosts). Population studies (see Population biology) and molecular data are, however, increasingly showing that many morphospecies comprise several biological and(or) phylogenetic species; it is likely that species characterized other than by morphology will increasingly be recognized, especially where these cause different plant diseases (see also special forms).

In lichen-forming fungi, **- pairs (Artenpaare)** are also recognized. Otherwise identical species one of which is fertile (the **primary -**), and the other reproduces vegetatively (the **secondary -**). Primary and secondary species generally have identical secondary metabolites, but the secondary species tend to have much wider geographical ranges. Molecular data are starting to chellenge this interpretation of speciation. See Culberson & Culberson (*Science* **180**: 196, 1973), Poelt (*Vortr. bot. Ges.*, n.f. **4**: 187, 1970, *Bot. Notiser* **125**: 77, 1972), Mattsson & Lumbsch (*Taxon* **38**: 238, 1989), Tehler (*Taxon* **31**: 708, 1982), Myllys *et al.* (*Mycol.* **93**: 335, 2001; molecular characterization).

Lit.: Andersson (*Taxon* **39**: 375, 1990; ecological spp.), Brasier (*in* Rayner *et al.* (Eds), *Evolutionary biology of the fungi*: 231, 1987; dynamics fungal speciation), Burges (*in* Lousley (Ed.), *Species studies in the British flora*: 65, 1955), Ciferri (*Ann. Myc.* **30**: 122, 1932), Claridge & Boddy (*in* Hawksworth (Ed.), *Identification and characterization of pest organisms*: 261, 1994; recognition systems), Burnett (*TBMS* **81**: 1, 1983; speciation in fungi), Ereshefsky (Ed.) (*The units of evolution: essays on the nature of species*, 1992; collected key papers), Hawksworth (*Mycologist's handbook*, 1974), Heywood (*Taxon* **27**: 26, 1963; aggregate spp.), Mason (*TBMS* **24**: 115, 1940), Perkins (*in* Bennett & Lasure (Eds), *More gene manipulations in fungi*: 3, 1991), Poelt (*in* Hawksworth (Ed.), *Ascomycete systematics*: 273, 1994; concepts in lichens), Regenmortel (*Intervirol.* **31**: 241, 1990; polythetic spp.), Rieppel (*in* Scotland *et al.* (Eds), *Models in phylogeny reconstruction*: 31, 1994; phylogenetic spp.).

Speerschneidera Trevis. (1861), Ramalinaceae (L). 1, N. America. See Hafellner & Egan (*Lichenologist* **13**: 11, 1981), Ekman (*Op. bot.* **127**: 148 pp., 1996; N America), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **31**: 822, 2004; phylogeny), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **34**: 512, 2005; phylogeny).

Spegazzini (Carlo Luigi; 1858-1926; Italy, later Argentina). Acting professor (*c.* 1880-1884) then Assistant Professor of Botany (1884-1887), Universidad de Buenos Aires; Director of the Provincial University, La Plata (1887-1912); Director, Ministry of Agriculture (1912 onwards). Father of South American mycology, with pioneering works on the fungi of Argentina, Brazil, Chile, Paraguay and Uruguay; after Saccardo (q.v.) responsible for more nomenclatural novelties than any other mycologist; shipwrecked, Tierra del Fuego (1882); the Spegazzini Glacier in southern Argentina, and the Asociación Spegazzini (the Argentine society for non-medical mycology) are named in his honour. Collections in the Instituto de Botánica C. Spegazzini, La Plata (**LPS**). *Publs* [see also Farr, An annotated list of Spegazzini's fungus taxa. *Bibliotheca Mycologica* **35**, 2 vols, 1978]. Fungi Argentini. *Anales de la Sociedad Científica*

Argentina (1880-1882); Fungi Guaranitici. *Anales de la Sociedad Científica Argentina* (1883-1889); Fungi Patagonici. *Boletín de la Academia Nacional de Ciencias* Córdoba (1887); Fungi Fuegiani. *Boletín de la Academia Nacional de Ciencias* Córdoba (1887). *Biogs, obits etc.* Grummann (1974: 522); Molfino (*Anales de la Sociedad Científica Argentina* **108**: 7, 1929); Murrill (*Mycol.* **16**: 200, 1924); Stafleu & Cowan (*TL-2* **5**: 776, 1985); see also *Spegazzini - Dibujos de Hongos, una Biblioteca Digitalizada / Spegazzini's Drawings of Fungi, a Digitized Library* www.cybertruffle.org.uk/spegazzini.

Spegazzinia Sacc. (1879), anamorphic *Pezizomycotina*, Hso/Hsp.0bP.27. 7, widespread. See Hughes (*Mycol. Pap.* **50**, 1953), Roquebert (*Revue Mycol.* Paris **42**: 309, 1978; conidiogenesis), Chen & Tzean (*Fungal Science* Taipei **15**: 81, 2000; Taiwan).

Spegazziniella Bat. & I.H. Lima (1959) ? = Myriangiella fide Luttrell *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 135, 1973).

Spegazzinites Félix (1894), Fossil Fungi. 1 (Neogene, Pleistocene), widespread.

Spegazzinula Sacc. (1883) ≡ Dubitatio fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Speira Corda (1837) = Dictyosporium fide Guéguen (*BSMF* **21**: 98, 1905).

Speiropsis Tubaki (1958), anamorphic *Pezizomycotina*, Hso.1bH.10. 7, widespread. See Petersen (*Mycol.* **55**: 26, 1963), Kuthubutheen & Nawawi (*TBMS* **89**: 584, 1987; key), Keshava Prasad & Bhat (*Mycotaxon* **82**: 127, 2002; India).

Spelaeomyces Fresen. (1863) ? = Daedalea fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

sperm, a male sex cell, typically motile; **-atiophore**, a spermatia-producing or -supporting structure; **-atium** (pl. **-a**), a 'sex' (+ or -) cell, e.g. a pycniospore; a microconidium in discomycetes and pyrenomycetes; a non-motile gamete, as in *Laboulbeniales*; **-atization**, the placing of spermatia on structures (receptive hyphae, etc.) for diploidization; **-odochidium**, a fruitbody having spermodochia in a lysigenous cavity in the suscept tissue (Whetzel, *Mycol.* **35**: 337, 1943); **-odochium**, a spermogonium having no wall (Whetzel, *Mycol.* **29**: 135, 1937); **-ogonium (-agone, -agonium)**, a walled structure in which spermatia are produced, as in ascomycetes; a pycnium of a rust; a lichen pycnidium (obsol.).

Spermatodermia Wallr. (1833) ≡ Spermodermia.

Spermatodium Fée ex Trevis. (1860) ≡ Endophis fide Aguirre-Hudson (*Bull. Br. Mus. nat. hist.* Bot. **21**: 85, 1991), Hafellner & Kalb (*Biblthca Lichenol.* **57**: 161, 1995).

Spermatoloncha Speg. (1908), anamorphic *Pezizomycotina*, Hso.1bH.10. 1, S. America; Africa.

Spermochaetella Cif. (1954), anamorphic *Pezizomycotina*, Cpd.1eP.?. 1, S. America. See Ciferri (*Sydowia* **8**: 245, 1954).

Spermodermia Tode (1790) ? = Hypoxylon Bull. fide Höhnel (*Mykol. Unters.* **1**: 362, 1923).

Spermoedia Fr. (1822) = Claviceps fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Spermophthora S.F. Ashby & W. Nowell (1926) = Eremothecium fide de Hoog *et al. in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 201, 1998).

Spermophthoraceae Guilliermond. (1928) = Metschnikowiaceae.

Spermophthorales = Saccharomycetales.

Spermophyllosticta Kamilov (1972) nom. nud., anamorphic *Mycosphaerellaceae*.

spermoplane, the surface of a seed; **spermosphere**, the microhabitat around a seed in soil (Verona, *Ann. Inst. Pasteur* **105**: 75, 1963). Cf. phylloplane; rhizoplane.

Spermospora R. Sprague (1948), anamorphic *Pezizomycotina*, Hso.≡ eH.1/10. 10, widespread. See Deighton (*TBMS* **51**: 41, 1968), MacGarvie & O'Rourke (*Iran. Jl agric. Res.* **8**: 151, 1969), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 236, 1995; key).

Spermosporella Deighton (1969), anamorphic *Pezizomycotina*, Hso.1-≡ eH.10. 3 (on *Meliola*), Sierra Leone; Uganda. See Deighton (*Mycol. Pap.* **118**: 21, 1969), Matsushima & Matsushima (*Matsush. Mycol. Mem.* **8**: 45, 1995), Johnston (*N.Z. Jl Bot.* **37**: 289, 1999; contrast with *Annellospermosporella*).

Spermosporina U. Braun (1993) nom. rej. = Plectosporium fide Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 245, 1995; key), Gams *et al.* (*Taxon* **53**: 193, 2004; nomencl.).

Spermotrichum Kuntze (1898), anamorphic *Pezizomycotina*, Ccu.0fH.?. 1, Paraguay.

Sphacelia Lév. (1827), anamorphic *Claviceps*, Cpd.0eH.?. 7, widespread. See Loveless (*TBMS* **47**: 205, 1964; identification), Frederickson *et al.* (*MR* **93**: 497, 1989; conidiation), White (*Neotyphodium/Grass Interactions Proceedings of the Third International Symposium on Acremonium/Grass Interactions, held May 28-31, 1997, in Athens, Georgia*: 27, 1997), Hodge (*Mycology Series* **19**: 75, 2003), Pažoutová *et al.* (*MR* **108**: 126, 2004), Walker (*Australas. Pl. Path.* **33**: 211, 2004).

Sphaceliopsis Speg. (1910) = Ephelis fide Diehl (*USDA agric. Monogr.* **4**, 1950).

sphacelium, the structure forming conidia in *Claviceps* from which the sclerotium develops (Fredrickson *et al.*, *MR* **95**: 1101, 1991).

Sphaceloma de Bary (1874), anamorphic *Elsinöe*, Cac.0eH.16. 52, widespread. Causing anthracnose and scab diseases. *S. rosarum* (rose leaf spot). See Jenkins & Bitancourt (*Mycol.* **33**: 338, 1941), Sivanesan & Gómez (*TBMS* **85**: 370, 1985), Gonzalez & Pons (*Ernstia*: 1, 1986; *S. manihoticola*, disease), Spiers & Hopcroft (*N.Z. Jl Bot.* **30**: 353, 1992; ontogeny), Song & Koh (*Korean Jl Pl. Path.* **14**: 303, 1998; on *Citrus*), Alvarez & Molina (*Pl. Dis.* **84**: 423, 2000; on *Manihot*), Swart *et al.* (*Mycol.* **93**: 366, 2001; on *Proteaceae*), Alvarez *et al.* (*Pl. Dis.* **87**: 1322, 2003; on *Manihot*), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Sphacelotheca de Bary (1884), Microbotryaceae. 7 (on *Polygonaceae*), widespread. See Langdon & Fullerton (*Mycotaxon* **6**: 421, 1978; gen. delimitation), Vánky & Oberwinkler (*Beih. Nova Hedwigia* **107**, 1994) cf. *Sporisorium*.

Sphaerangium Seaver (1951) [non *Sphaerangium* Schimp. 1860, *Musci*] = Pezicula Tul. & C. Tul. fide Verkley (*Stud. Mycol.* **44**: 180 pp., 1999).

Sphaerella (Fr.) Rabenh. (1856) [non *Sphaerella* Sommerf. 1824, *Algae*] ≡ Mycosphaerella fide Corlett (*Mycol. Mem.* **18**, 1991; list of names), Aptroot (*CBS Diversity Ser.* **5**, 2006; nomenclator).

Sphaerella Ces. & De Not. (1863) = Mycosphaerella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sphaerellaceae Nitschke (1869) = Mycosphaerella-

ceae.
Sphaerellopsis Cooke (1883), anamorphic *Eudarluca*, St.1-≡ eH.15/19. 3 (on *Uredinales*), widespread. See Mel'nik (*Nov. Sist. niz. Rast.* **13**: 91, 1976), Sutton (*Mycol. Pap.* **141**, 1977), Sutton (*The Coelomycetes*, 1980), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Yuan *et al.* (*MR* **102**: 866, 1998; on *Phragmidium violaceum*), Driessen *et al.* (*Australas. Pl. Path.* **33**: 463, 2004; Australia), Liesebach & Zaspel (*Forest Pathology* **34**: 293, 2004; genetic diversity on willow rusts), Liesebach & Zaspel (*Rust Diseases of Willow and Poplar*: 231, 2005; Europe), Nischwitz *et al.* (*MR* **109**: 421, 2005; phylogeny, host specialization), Bayon *et al.* (*MR* **110**: 1200, 2006; genetic diversity).
Sphaerellopsis Kleb. (1918) = Venturia Sacc. fide Holm (*Taxon* **24**: 275, 1975), von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Sphaerellothecium Zopf (1897), Mycosphaerellaceae. 4 (on lichens), widespread. See Roux & Triebel (*Bull. Soc. linn. Provence* **45**: 451, 1994; descr. 4 spp.).
Sphaeria Haller (1768) nom. rej. = Hypoxylon Bull. Formerly used for most fungi with either perithecia or pycnidia. fide Wakefield (*TBMS* **24**: 286, 1940), Donk (*Regnum veg.* **34**: 16, 1964).
Sphaeriaceae Fr. (1825) = Xylariaceae. s. str. (obsol.).
Sphaerialea Sousa da Câmara (1926) ? = Sphaerulina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Sphaeriales S. str., see *Xylariales*; s. lat., see *Sordariomycetes*.
Sphaerialites Venkatach. & R.K. Kar (1969), Fossil Fungi ? Fungi. 1 (Tertiary), India.
Sphaericeps Welw. & Curr. (1868) = Battarrea fide Cunningham (*Gast. Austr. N.Z.*: 131, 1944).
Sphaeridiobolus (Boud.) Boud. (1885) = Ascobolus fide van Brummelen (*Persoonia* Suppl. **1**: 1, 1967).
Sphaeridium Fresen. (1852), anamorphic *Pezizomycotina*, Hsy.0eH.?. 5, widespread.
SphaerioidaceaeSacc. (1884). (syn. *Phomaceae*, *Sphaeropsidaceae*). See *Sphaeropsidales*.
Sphaeriopsis Geyl. (1887), Fossil Fungi, Pyronemataceae. 1 (Eocene), Indonesia. = Sphaerites (Fossil fungi) fide Meschinelli (1892).
Sphaeriostromella Bubák (1916), anamorphic *Pezizomycotina*, St.0fH.?. 1, Europe.
Sphaeriothyrium Bubák (1916), anamorphic *Pezizomycotina*, St.0eH.15. 2, Europe.
Sphaerites Unger (1850), Fossil Fungi. 110 (Cretaceous, Tertiary), Europe; N. America.
Sphaerobasidioscypha Agerer (1983), Cyphellaceae. 2, New Zealand; Venezuela. See Agerer (*Mitt. bot. StSamml.* Münch. **19**: 294, 1983).
Sphaerobasidium Oberw. (1965), Hydnodontaceae. 4, widespread. See Oberwinkler (*Sydowia* **19**: 57, 1965).
Sphaerobolaceae J. Schröt. (1889) = Geastraceae.
Sphaerobolales = Geastrales.
Sphaerobolus Tode (1790), Geastraceae. 2 (on wood or coprophilous), widespread. See Ingold (*TBMS* **58**: 179, 1972; review), Flegler (*Mycol.* **76**: 944, 1984; cultural char.), Geml *et al.* (*Mycol.* **97**: 680, 2005; systematics).
Sphaerocarpus Ehrh. (1793), Lecanorales (L). 1, Europe.
Sphaerocephalum Weber ex F.H. Wigg. (1780) ? = Calicium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Sphaerocephalus Battarra ex Earle (1909) [non *Sphaerocephalus* Lag. ex DC. 1812, *Compositae*] = Tricholoma fide Singer (*Agaric. mod. Tax.*, 1951).
Sphaerochaetia Bat. & Cif. (1962) = Chaetothyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Sphaerocista Preuss (1852) = Topospora fide Groves (*CJB* **43**: 1195, 1965).
Sphaerocladia Stüben (1939) = Blastocladiella fide Couch & Whiffen (*Am. J. Bot.* **29**: 582, 1942).
Sphaerocolla P. Karst. (1892), anamorphic *Pezizomycotina*, Hsp.0eH.3. 2, Europe; S. America. See Donk (*Taxon* **11**: 99, 1962).
Sphaerocordyceps Kobayasi (1981), ? Clavicipitaceae. 2, widespread. See Kobayasi (*Bull. natn. Sci. Mus.* Tokyo, B **7**: 2, 1981).
Sphaerocreas Sacc. & Ellis (1882) = Glomus fide Gerdemann & Trappe (*Mycol. Mem.* **5**, 1974).
Sphaerocybe Magrou & Marneffe (1946), anamorphic *Pezizomycotina*, Hsy.?.?. 1, Europe.
sphaerocysts, globose cells in tissues of fungi, e.g. *Russula* and *Lactarius*.
Sphaeroderma Fuckel (1875) = Melanospora Corda fide Cannon & Hawksworth (*J. Linn. Soc.* Bot. **84**: 115, 1982).
Sphaerodermatella Seaver (1909) ? = Coniochaeta fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Sphaerodermella Höhn. (1907) = Coniochaeta fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).
Sphaerodes Clem. (1909), Ceratostomataceae. 12, widespread. See Cannon & Hawksworth (*J. Linn. Soc.* Bot. **84**: 115, 1982; key), García *et al.* (*Stud. Mycol.* **50**: 63, 2004; Spain), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny).
Sphaerodothella C.A. Pearce & K.D. Hyde (2001), Phyllachoraceae. 1, Australia. See Pearce & Hyde (*Fungal Diversity* **6**: 83, 2001), Pearce & Hyde (*Fungal Diversity Res. Ser.* **17**: 308 pp., 2006).
Sphaerodothis (Sacc. & P. Syd.) Shear (1909), Phyllachoraceae. 21 (on palm leaves), S.E. Asia. Now restricted to palm-inhabiting species. See Joly (*Bull. Res. Counc. Israel* D **10**: 187, 1961; key), Cannon (*Stud. Mycol.* **31**: 49, 1989; on *Gramineae*), Hyde & Cannon (*Mycol. Pap.* **175**: 114, 1999).
Sphaerognomonia Potebnia ex Höhn. (1917) = Apiosporopsis fide Reid & Dowsett (*CJB* **68**: 2398, 1990).
Sphaerognomoniella Naumov & Kusnezowa (1952), ? Diaporthales. 1, former USSR. See Naumov & Kusnezowa (*Bot. Mater. Otd. Sporov. Rast. Bot. Inst. Komarova Akad. Nauk S.S.S.R.* **8**: 153, 1952).
Sphaerographium Sacc. (1884), anamorphic *Helotiales*, St.0fH.15. 11, widespread (north temperate). See Verkley (*Mycol.* **93**: 205, 2001), Verkley (*Nova Hedwigia* **75**: 433, 2002; revision), Rossman *et al.* (*Mycol. Progr.* **3**: 275, 2004; phylogeny).
Sphaerolina Fuckel (1860) = Schizoxylon fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932), Sherwood (*Mycotaxon* **6**: 215, 1977).
Sphaeromma H.B.P. Upadhyay (1964), anamorphic *Pezizomycotina*, Cpd.≡ eH.?. 1 (lichenicolous), Brazil. See Upadhyay (*Publções Inst. Micol. Recife* **402**: 4, 1964), Matzer (*Mycol. Pap.* **171**: 202 pp., 1996).
Sphaeromonas E. Liebet. (1910), Chytridiomycetes. 1, Europe. See Orpin (*J. gen. Microbiol.* **94**: 270, 1976).
Sphaeromphale A. Massal. (1854) = Staurothele fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8,

1995).

Sphaeromphale Rchb. (1828) ≡ Segestria.

Sphaeromyces G. Arnaud (1954) nom. inval., anamorphic *Pezizomycotina*.

Sphaeromyces Mont. (1845) ? = Aspergillus.

Sphaeromycetella G. Arnaud (1954) = Chloridium fide Gams & Holubová-Jechová (*Stud. Mycol.* **13**, 1976).

Sphaeromyxa Spreng. (1827) ≡ Sphaeronaema.

Sphaeronaema Fr. (1815), anamorphic *Pezizomycotina*, St.0eH.?. 50, widespread. See Jaczewski (*Nouv. Mem. Soc. nat. Moscou* **15**: 277, 1898), Petch (*TBMS* **25**: 167, 1941; monotypic), Sutton (*Mycol. Pap.* **141**, 1977).

Sphaeronaemella P. Karst. (1884), Microascales. Anamorph *Gabarnaudia*. 1 or 5 (on fungi and dung), widespread (north temperate). See Cannon & Hawksworth (*J. Linn. Soc.* Bot. **84**: 115, 1982), Hausner *et al.* (*CJB* **71**: 52, 1993; posn), Seifert *et al. in* Wingfield *et al.* (Eds) (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 269, 1993), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Hausner & Reid (*CJB* **82**: 752, 2004; phylogeny).

Sphaeronaemina Höhn. (1917) ≡ Sphaeronaema.

Sphaeronemopsis Speg. (1910) = Melanospora Corda fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Sphaeropezia Sacc. (1884) = Odontotrema fide Sherwood-Pike (*Mycotaxon* **28**: 137, 1987).

Sphaeropeziella P. Karst. (1885) ? = Xylogramma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sphaerophoma Petr. (1924), anamorphic *Pezizomycotina*, St.0eH.?. 1, N. America.

Sphaerophoraceae Fr. (1831), Lecanorales (L). 5 gen. (+ 10 syn.), 32 spp.

Lit.: Henssen *et al.* (*Bot. Acta* **105**: 457, 1992), Wedin (*Pl. Syst. Evol.* **187**: 213, 1993; cladistics), Wedin (*Acta univ. upsal.* **77**, 1994; keys 23 S. Hemisph. spp.), Gargas *et al.* (*Science* N.Y. **268**: 1492, 1995), Wedin (*Symb. bot. upsal.* **31**: 102 pp., 1995; S. hemisphere), Chen (*Acta Mycol. Sin.* **15**: 105, 1996), Tibell (*Symb. bot. upsal.* **32** no. 1: 291, 1997), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998), Wedin *et al.* (*Pl. Syst. Evol.* **209**: 75, 1998), Wedin *et al.* (*Pl. Syst. Evol.* **209**: 75, 1998), Döring *et al.* (*Aust. J. Bot.* **47**: 783, 1999), Sarrión *et al.* (*Mycotaxon* **71**: 169, 1999), Wedin & Döring (*MR* **103**: 1131, 1999; phylogeny), Döring & Wedin (*Pl. Biol.* **2**: 361, 2000), Wedin *et al.* (*Lichenologist* **32**: 171, 2000; phylogeny), Högnabba & Wedin (*Cladistics* **19**: 224, 2003), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny).

Sphaerophoron, see *Sphaerophorus*.

Sphaerophoronomyces Cif. & Tomas. (1953) ≡ Sphaerophorus.

Sphaerophoropsidaceae Elenkin (1929) = Cladoniaceae.

Sphaerophoropsis Vain. (1890), Cladoniaceae (L). 2, S. America; New Zealand. See Ahti (*Lichenology in Latin America. History, Current Knowledge and Applications* [Proceedings of GLAL-3, Terceiro Encontro do Grupo Latino-Americano de Liquenólogos, São Paulo, Brazil, 24-28 September, 1997]: 109, 1998).

Sphaerophorum Schrad. (1794) nom. rej. prop. = Sphaerophorus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sphaerophorus Pers. (1794) nom. cons., Sphaerophoraceae (L). 8, widespread. See Wedin (*Nordic Jl Bot.* **10**: 539, 1990; ontogeny), Wedin (*Lichenologist* **24**: 119, 1992; S. hemisph.), Wedin (*Pl. Syst. Evol.* **187**: 213, 1993; cladistics), Wedin (*Symb. Bot. Upsal.* **31** no. 1, 1995; key, monograph), Tibell (*Symb. bot. upsal.* **32**: 291, 1997; anamorphs), Wedin & Döring (*MR* **103**: 1131, 1999; phylogeny), Döring & Wedin (*Pl. Biol.* **2**: 361, 2000; ontogeny, anatomy), Wedin *et al.* (*Lichenologist* **32**: 171, 2000; phylogeny), Högnabba & Wedin (*Cladistics* **19**: 224, 2003; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Sphaerophragmiaceae Cummins & Y. Hirats. (1983) = Raveneliaceae.

Sphaerophragmium Magnus (1891), Raveneliaceae. 18 (on *Annonaceae*, most on *Leguminosae*), widespread (tropical). See Hiremath & Pavgi (*Norw. Jl Bot.* **21**: 17, 1974; morphology), Lohsomboon *et al.* (*MR* **98**: 907, 1994; key), Piepenbring (*Mycol. Progr* **4**: 161, 2005; Panama).

sphaeroplast, see protoplast.

Sphaeropleum Link (1833) nom. dub., ? Fungi.

Sphaeroporalites Hemer & Nygreen (1967), Fossil Fungi ? Fungi. 1, Libya.

Sphaeropsidales (obsol.). Traditionally used for anamorphic fungi with pycnidial conidiomata (*Phomales*, *Phyllostictales*, etc.). Not accepted by Sutton (1973, 1980) or by Nag Raj (1981).

Sphaeropsis Flot. (1847) ≡ Thelocarpon.

Sphaeropsis Lév. (1842) nom. rej., anamorphic *Pezizomycotina*. See Hawksworth & Sherwood (*Taxon* **30**: 338, 1981).

Sphaeropsis Sacc. (1880) nom. cons., anamorphic *Botryosphaeriaceae*, Cpd.1eP.1. 3 (assoc. with canker or die-back), widespread. *S. sapinea* on conifers. See Phillips *et al.* (*Persoonia* **21**: in press, 2008).

Sphaeropus Paulet (1793) = Onygena fide Saccardo (*Syll. fung.* **20**: 230, 1911).

Sphaeropyxis Bonord. (1864) = Coniochaeta fide Petrini (*Sydowia* **44**: 169, 1993).

Sphaerosoma Klotzsch (1839), Pyronemataceae. 3 (hypogeous), N. America; Europe. See Gamundí (*Sydowia* **28**: 339, 1976; gen. concept), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Sphaerosomataceae Bail (1858) = Pyronemataceae.

Sphaerosperma Preuss (1853) = Diatrypella fide Saccardo (*Syll. fung.* **1**: 203, 1882).

Sphaerospora (Sacc.) Sacc. (1889) [non *Sphaerospora* Klatt 1864, *Iridaceae*] ≡ Sphaerosporula.

Sphaerosporella (Svrček) Svrček & Kubička (1961), Pyronemataceae. 2, widespread. See Häffner (*Beitr. Kenntn. Pilze Mitteleur.* **3**: 413, 1987), Yao & Spooner (*Kew Bull.* **51**: 385, 1996), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Wang (*Mycotaxon* **80**: 197, 2001; Taiwan), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Sphaerosporiites Babajan & Tasl. (1977), Fossil Fungi. 1 (Tertiary), former USSR.

Sphaerosporium Schwein. (1832), anamorphic *Pezizomycotina*, Hso.0eH.3. 2, widespread. See Damon & Downing (*Mycol.* **46**: 214, 1954), Partridge & Morgan-Jones (*Mycotaxon* **84**: 69, 2002).

Sphaerosporula Kuntze (1898) = Scutellinia fide Denison (*Mycol.* **51**: 605, 1959).

Sphaerostilbe Tul. & C. Tul. (1861) = Nectria fide

Rogerson (*Mycol.* **62**: 865, 1970), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Sphaerostilbella (Henn.) Sacc. & D. Sacc. (1905), Hypocreaceae. Anamorph *Gliocladium*. 4 (decaying fungi and wood), widespread. See Seifert (*Stud. Mycol.* **27**, 1985), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Põldmaa (*Stud. Mycol.* **45**: 83, 2000), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Sphaerostylidium (A. Braun) Sorokīn (1882) = Rhizophydium fide Fischer (*Rabenh. Krypt.-Fl.* **4** 2.1: 25, 1892).

Sphaerothallia Nees ex Eversm. (1831) nom. rej. = Aspicilia. Includes the 'manna lichens'; *S. esculenta* may be one of the types of manna in The Bible, and can be used in bread production. fide Follmann & Crespo (*An. Inst. bot. A.J. Cavanilles* **31**: 325, 1974), Rogers *in* Seaward (Ed.) (*Lichen ecology*: 211, 1977; thalli unattached and blown in the wind), Crespo & Barreno (*Acta Bot. Malac.* **4**: 55, 1978), Hafellner (*Acta Bot. Malac.* **16**: 133, 1991).

Sphaerotheca Desv. (1817) nom. rej. = Aecidium fide Berndt (*in litt.*).

Sphaerotheca Lév. (1851) nom. cons. = Podosphaera fide Saenz & Taylor (*CJB* **77**: 150, 1999; phylogeny), Braun & Takamatsu (*Schlechtendalia* **4**: 3, 2000), Braun *et al.* (*Schlechtendalia* **7**: 45, 2001), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny).

Sphaerothyrium Wallr. (1833) ≡ Eustegia.

Sphaerotrachys Fayod (1889) = Cortinarius fide Kauffman (*N. Amer. Fl.* **10**, 1932).

Sphaerozone Zobel (1854), Pezizaceae. 4 (hypogeous), widespread. See Beaton & Weste (*TBMS* **71**: 164, 1978), Dissing (*Mycotaxon* **30**: 2, 1980), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Sphaerozosma Corda (1842) = Sphaerosoma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sphaerula Pat. (1883) = Pistillaria Fr. fide Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**, 1950).

Sphaerulina Sacc. (1878), ? Mycosphaerellaceae. 41, widespread. *S. rehmiana* (rose leaf scorch), *S. taxi* (yew (*Taxus*) leaf spot), *S. rubi* (raspberry (*Rubus*) leaf spot). See Boerema (*Neth. Jl Pl. Path.* **69**: 76, 1963), Evans *et al.* (*MR* **97**: 59, 1993), Crous *et al.* (*Sydowia* **55**: 136, 2003; polyphyly).

Sphaerulomyces Marvanová (1977), anamorphic *Pezizomycotina*, Hso.0eH.3. 1 (aquatic), Slovakia. See Marvanová (*TBMS* **68**: 485, 1977).

Sphagnicola Velen. (1934) ≡ Ciliatula.

Sphagnomphalia Redhead, Moncalvo, Vilgalys & Lutzoni (2002) ≡ Gyroflexus.

Sphaleromyces Thaxt. (1894), Laboulbeniaceae. 3, widespread. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Spheconisca (Norman) Norman (1876), ? Verrucariaceae (L). 20, Europe. See Bachmann (*Nyt Mag. naturv.* **64**: 170, 1926).

Spheconiscomyces Cif. & Tomas. (1953) = Spheconisca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sphenospora Dietel (1892), Raveneliaceae. 8 (mostly on monocots), America (tropical); Africa. See Linder (*Mycol.* **36**: 464, 1944), Olive (*Mycol.* **39**: 409, 1947; cytology), Pereira *et al.* (*Brazilian Journal of Microbiology* **33**: 155, 2002; on orchid).

spheridium, see capitulum.

Spherites Dijkstra (1949), Fossil Fungi. 1 (Devonian), Netherlands.

spheroplast, see protoplast.

Spheropsis Raf. (1815) nom. dub.; nom. nov. for '*Sphaeria* Pers.', ? Pezizomycotina. No spp. included.

Spherospora J.J. Garcia (1991), Microsporidia. 1.

spherule (1) a sporangium-like structure in *Coccidioides* (Baker & Mrak, *Am. J. trop. Med.* **21**: 589, 1941); (2) a multinucleate cell of a resting myxomycete plasmodium.

spherulin, spherule phase coccidioidin (q.v.) (Scalarone *et al.*, *Sabouraudia* **11**: 222, 1973).

Sphinctrina Fr. (1825), Sphinctrinaceae (±L). 8 (on lichens), widespread. See Löfgren & Tibell (*Lichenologist* **11**: 109, 1979; key 5 Eur. spp.), Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Wedin & Tibell (*CJB* **75**: 1236, 1997; phylogeny), Tibell (*Nordic Lichen Flora* **1**. Introductory Parts; Calicioid Lichens and Fungi: 20, 1999; Nordic spp.), Tibell & Vinuesa (*Taxon* **54**: 427, 2005; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny).

Sphinctrinaceae M. Choisy (1950), Mycocaliciales (±L). 2 gen. (+ 2 syn.), 9 spp.

Lit.: Tibell (*Symb. bot. upsal.* **27** no. 1: 279 pp., 1987), Otto & Krebs (*Boletus* **17**: 97, 1993), Wedin & Tibell (*CJB* **75**: 1236, 1997; phylogeny), Sarrión *et al.* (*Mycotaxon* **71**: 169, 1999), Tibell & Wedin (*Mycol.* **92**: 577, 2000).

Sphinctrinella Nádv. (1942) = Mycocalicium fide Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Tibell *et al.* (*Mycotaxon* **87**: 3, 2003).

Sphinctrinopsis Woron. (1927), Caliciaceae. 1 (on *Pertusaria*), former USSR. See Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984).

Sphinctrosporium Kunze (1828) = Cladotrichum fide Saccardo (*Syll. fung.* **4**: 374, 1886).

Sphondylocephalum Stalpers (1974), anamorphic *Pezizomycotina*, Hso.0eH.6. 1, N. America. See Stalpers (*Proc. K. Ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **77**: 400, 1974).

Sphyridiomyces E.A. Thomas ex Cif. & Tomas. (1953) = Baeomyces fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sphyridium Flot. (1843) = Baeomyces fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Spicaria Harting (1846) nom. conf., anamorphic *Pezizomycotina*. See Brown & Smith (*TBMS* **40**: 22, 1957).

Spicariopsis R. Heim (1939) ? = Paecilomyces fide Samson (*Stud. Mycol.* **6**, 1974).

Spicellum Nicot & Roquebert (1976), anamorphic *Hypocreales*, Hso.0eH.10. 1, France. See Nicot & Roquebert (*Revue Mycol.* Paris **39**: 272, 1975), Seifert *et al.* (*Mycol.* **89**: 250, 1997).

Spicularia Chevall. (1826) ≡ Exidia.

Spicularia Pers. (1822), anamorphic *Pezizomycotina*, Hso.0eP.?. 1 or 2, Europe; America.

spicule (spiculum) (Tulasne; obol.), see sterigma.

Spiculogloea P. Roberts (1996), Spiculogloeales. 4, Europe. See Roberts (*Mycotaxon* **60**: 112, 1996).

Spiculogloeales R. Bauer, Begerow, J.P. Samp., M. Weiss & Oberw. (2006). Agaricostilbomycetes. 1 gen., 4 spp. No familes recognized.

spiculospore, a spore formed at the tip of a pointed structure often elongate and so resembling a spike, as

in *Hirsutella* and *Akanthomyces* (Subramanian, *Curr. Sci.* **31**: 410, 1962).

Spiculostilbella E.F. Morris (1963) = Phaeoisaria fide de Hoog & Papendorf (*Persoonia* **8**: 408, 1976).

spiculum (pl. **spicula**), see sterigma.

Spilobolus Link (1833) = Amphisphaerella fide Gams (*Taxon* **43**: 265, 1994).

Spilocaea Fr. (1819) nom. rej. = Fusicladium fide Ellis (*DH*, 1971), Ellis (*MDH*, 1976), Braun *et al.* (*Taxon* **51**: 557, 2002; nomencl.), González-Lamothe *et al.* (*FEMS Microbiol. Lett.* **210**: 149, 2002; phylogeny), Schubert *et al.* (*Schlechtendalia* **9**, 2003), Beck *et al.* (*Mycol. Progr.* **4**: 111, 2005; phylogeny).

Spilodium A. Massal. (1856) = Arthonia fide Hawksworth (*TBMS* **74**: 363, 1980).

spilodium, introduced by Lettau (*Beih. Feddes Rep.* **69**: 62, 1932) for the minute round blackish structures on the thallus of *Dirina massiliensis* caused by *Milospium graphideorum*.

Spilodochium Syd. (1927), anamorphic *Pseudoparodiella*, Hsp.0-1eP.?. 3, C. America; Australia. See Sivanesan (*TBMS* **86**: 187, 1986; teleomorph).

Spiloma Ach. (1803) = Xylographa fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Spilomataceae Chevall. (1826) = Trapeliaceae.
Lit.: Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Spilomela (Sacc.) Keissl. (1920) ≡ Pleospilis.

Spilomium Nyl. (1858) ≡ Sclerococcum fide Hawksworth (*Taxon* **55**: 528, 2006; nomencl.).

Spilomyces Petr. & Syd. (1927) = Neottiospora fide Sutton (*Mycol. Pap.* **141**, 1977).

Spilonema Bornet (1856), Coccocarpiaceae (L). 4, widespread. See Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

Spilonematopsis Å.E. Dahl (1950) = Ephebe fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

Spilonematopsis Vain. (1909) nom. nud. = Spiloma fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

Spilonemella Henssen & Tonsberg (2000), Coccocarpiaceae (L). 2, Japan; USA. See Henssen & Tønsberg (*Bryologist* **103**: 108, 2000).

Spilonemopsis Vain. (1909) nom. nud. = Spilonema fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

Spilopezis Clem. (1909) = Pseudopeziza fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Spilopodia Boud. (1885), Helotiales. Anamorphs *Discogloeum*, *Melanodiscus*. 4, Europe. See Müller (*Sydowia* **41**: 219, 1989; excl. sp.).

Spilopodiella E. Müll. (1989), Helotiales. 1, Switzerland. See Müller (*Sydowia* **41**: 219, 1989).

Spilosphaeria Rabenh. (1857) = Septoria Sacc. fide Saccardo (*Syll. fung.* **4**: 474, 1884).

Spilosphaerites A. Massal. (1857), Fossil Fungi. 2 (Miocene), Italy.

Spilosticta Syd. (1923) = Venturia Sacc. fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Spinalia Vuill. (1904), ? Dimargaritales. 1, Europe. See Benjamin (*Aliso* **4**: 321, 1959), Benjamin *in* Kendrick (Ed.) (*The Whole Fungus* **2**: 573, 1979), Wrzocek & Gajowniczek (*Acta Mycologica* Warszawa **33**: 269, 1998; Poland).

spindle, see fuseau.

spindle pole body, microtubule organizing center, functionally homologous to the animal cell centrosome.

spindle-organ, see turbinate cell.

spine, a narrow sharply pointed process; **spinule**, a small spine (in lichens see Fig. 22C); **spiny**, having spines; **spinose** (dim. **spinulose**), delicately spiny. Fig. 20.2.

Spinellus Tiegh. (1875), Phycomycetaceae. 3 (parasitic on agarics, esp. *Mycena*), widespread (north temperate). See Zycha *et al.* (*Mucorales*, 1969; key), Overton (*Notes on the genus Spinellus with comparisons to other Zygomycetes found in fungicolous associations with Basidiomycetes*, 1997), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Spiniger Stalpers (1974), anamorphic *Heterobasidion, Dichostereum, Laurilia*. 2, widespread. See Carmichael *et al.* (*Genera of Hyphomycetes*, 1980; refs).

Spinomyces Bat. & Peres (1961) nom. inval. ? = Echinoplaca fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Spinosporonites R.K. Saxena & S. Khare (1991), Fossil Fungi. 1, India. See Saxena & Khare (*Geophytology* **21**: 40, 1991).

Spinulosphaeria Sivan. (1974), Chaetosphaerellaceae. 1 (from wood), widespread. See Nannfeldt (*Svensk bot. Tidskr.* **69**: 289, 1975), Barr (*Mycotaxon* **39**: 43, 1990; posn), Subramanian & Sekar (*Kavaka* **18**: 19, 1993; placement in *Nitschkiaceae*), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny).

Spinulospora Deighton (1973), anamorphic *Pezizomycotina*, Hsp.0eH.1. 1 (on *Puccinia*), W. Africa. See Deighton (*TBMS* **61**: 195, 1973).

spiral hypha, a hypha ending in a spiral or helical coil, as in *Trichophyton* (Davidson & Gregory, *TBMS* **21**: 98, 1937).

Spiralia Grigoraki (1925) [non *Spiralia* Toula 1900, fossil ? *Algae*] = Trichophyton fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Spiralotrichum H.S. Yates (1918) nom. dub., anamorphic *Pezizomycotina*. See Mulder (*TBMS* **65**: 518, 1975).

Spiralum J.L. Mulder (1975), anamorphic *Pezizomycotina*, Hso.0-≡ hP.10. 2, Asia. See Mulder (*TBMS* **65**: 518, 1975).

Spirechina Arthur (1907) = Kuehneola fide Jackson (*Mycol.* **23**: 96, 1931).

spirits, high alcohol-content drinks obtained by distilling grape wine (**brandy**), malted barley (**whisky**), fermented rye or maize worts (**gin**), or fermented molasses (**rum**). See also pulque.

Spirodactylon R.K. Benj. (1959), Kickxellaceae. 1, USA. See Benjamin (*Aliso* **4**: 408, 1959).

Spirodecospora B.S. Lu, K.D. Hyde & W.H. Ho (1998), Xylariaceae. 2, Hong Kong; Russia. See Lu *et al.* (*Fungal Diversity* **1**: 170, 1998), Mel'nik & Hyde (*Fungal Diversity* **12**: 151, 2003).

Spiroglugea L. Léger & E. Hesse (1924), Microsporidia. 1.

Spirogramma Ferd. & Winge (1909) = Xylaria Hill ex Schrank fide Cannon (*SA* **6**: 171, 1987).

Spirographa Zahlbr. (1903), Odontotremataceae. 3 (on lichens), Europe. See Santesson (*The lichens and lichenicolous fungi of Sweden and Norway*, 1993), Holien & Triebel (*Lichenologist* **28**: 307, 1996).

Spirographomyces Cif. & Tomas. (1953) ≡ Spirographa.

Spirogyromyces Tzean & G.L. Barron (1981), ? Kickxellomycotina. 1 (in gut of *Rhabditis*), Canada. See Tzean & Barron (*CJB* **59**: 1861, 1981), Barron (*Biodiversity of Fungi* Inventory and Monitoring Methods: 435, 2004).

Spiroidium Saito (1949) nom. dub., Fungi. q.v.

Spiromastix Kuehn & G.F. Orr (1962), ? Ajellomyce-

taceae. 5, widespread. See Currah & Locquin-Linard (*CJB* **66**: 1135, 1988; key 2 spp.), Sugiyama *et al.* (*Mycoscience* **40**: 251, 1999; DNA), Udagawa & Uchiyama (*Mycoscience* **40**: 291, 1999), Sugiyama & Mikawa (*Mycoscience* **42**: 413, 2001; phylogeny), Untereiner *et al.* (*Stud. Mycol.* **47**: 25, 2002; phylogeny), Untereiner *et al.* (*Mycol.* **96**: 812, 2004), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny).

Spiromyces R.K. Benj. (1963), Kickxellaceae. 2, USA. See Benjamin (*Aliso* **5**: 273, 1963), Mikawa (*TMSJ* **16**: 146, 1975), O'Donnell *et al.* (*Mycol.* **90**: 624, 1998), James *et al.* (*Nature* **443**: 818, 2006; phylogeny), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

Spiropes Cif. (1955), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 30 (on *Meliolaceae*), widespread (esp. tropical). See Ellis (*Mycol. Pap.* **114**, 1968; key), Seifert & Hughes (*N.Z. Jl Bot.* **38**: 489, 2000).

Spirosphaera Beverw. (1953), anamorphic *Helotiales*, Hso.0-≡ hH.1. 8 (aquatic), Europe; Japan. See Hennebert (*TBMS* **51**: 13, 1968), Abdullah *et al.* (*Nova Hedwigia* **43**: 507, 1986; 2 spp. from Japan), Voglmayr (*CJB* **75**: 1772, 1997), Marvanová & Bärlocher (*Mycotaxon* **68**: 33, 1998), Voglmayr (*Stud. Mycol.* **50**: 221, 2004), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Spirospora L. Mangin & Vincens (1920) = Acrospeira fide Wiltshire (*TBMS* **21**: 233, 1938).

Spirospora Scherff. (1926), Microsporidia. 1.

Spirotremesporites Dueñas (1979), Fossil Fungi. 3 (Eocene – Pleistocene), Colombia; USA.

Spirotrichum Saito ex J.F.H. Beyma (1940) = Tritirachium fide Langeron (*Revue Mycol.* Paris **14**: 133, 1949), Paulitz & Menge (*Mycol.* **76**: 99, 1984).

Spitzenkörper. A labile vesicle-rich and actin-rich structure present in growing tips of most, but not all, fungi, whose behaviour correlates with tip growth rate and direction (Grove & Bracker, *J. Bact.* **104**: 989, 1970, López-Franco & Bracker, *Protoplasma* **195**: 90, 1996, Bourett & Howard, *Protoplasma* **163**: 199, 1991). See also Virag & Harris (*MR* **110**: 4, 2006; review of molecular research).

Spizellomyces D.J.S. Barr (1980), Spizellomycetaceae. 8, widespread. See Barr (*CJB* **58**: 2384, 1980).

Spizellomycetaceae D.J.S. Barr (1980), Spizellomycetales. 6 gen. (+ 1 syn.), 25 spp.

Lit.: Longcore *et al.* (*CJB* **73**: 1389, 1995), Chen *et al.* (*Bot. Bull. Acad. sin.* Taipei **41**: 73, 2000), Barr *in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **7A**: 93, 2001).

Spizellomycetales D.J.S. Barr (1980). Chytridiomycetes. 2 fam., 7 gen., 27 spp. Monocentric; development endogenous or exogenous; saprobic or parasitic, predominantly from soil on organic substrata including other fungi, cellulose, keratin, pollen, plant debris; cosmop.

A segregate from *Chytridiales* (q.v.) which they resemble except: zoospores of most species have more than one lipid globule, they may move in an amoeboid fashion, rhizoid tips are blunt. The order was defined using ultrastructural characters of the zoospore (Barr, *CJB* **58**: 2380, 1980). Fams:

(1) **Caulochytriaceae**
(2) **Olpidiaceae**
(3) **Spizellomycetaceae**

Lit.: Barr (*CJB* **62**: 1171, 1984; key spp. in culture), Barr & Désaulniers (*CJB* **64**: 561, 1986), James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), Hibbett *et al.* (*MR* **111**: 109, 2007), and see under Familes.

Spizomycetes. Class within the *Chytridiomycota* (Cavalier-Smith, *in* Rayner *et al.* (Eds), *Evolutionary biology of the fungi*: 339, 1987) including only *Spizellomycetales*.

Splanchnomyces Corda (1831) = Rhizopogon fide Kuyper (*in litt.*).

Splanchnomycetaceae Corda (1842) = Rhizopogonaceae.

Splanchnonema Corda (1829), Pleomassariaceae. Anamorph *Myxocyclus*. 35, Europe; N. America. See Barr (*Mycotaxon* **15**: 349, 1982), Barr (*Mycotaxon* **42**: 129, 1993; key 27 N. Am. spp.), Tanaka *et al.* (*Mycoscience* **46**: 248, 2005; Japan).

Splanchospora L.N. Vasil'eva (1998), Pyrenulales. 1, Europe. See Vasil'eva (*Nizshie Rasteniya, Griby i Mokhoobraznye Dalnego Vostoka Rossii* Griby. Tom **4**. Pirenomitsety i Lokuloaskomitsety **4**: 237, 1998).

splash (splashing) cup, an open cup-like structure (as in *Cladonia*, *Cyathus*, and the liverwort *Marchantia*), from which the reproductive bodies are discharged by falling drops of water. See Brodie (*CJB* **29**: 593, 1951); bird's nest fungi.

Spogotteria Dyko & B. Sutton (1979) = Plectronidium fide Sutton & Pascoe (*TBMS* **87**: 249, 1986).

Spolverinia A. Massal. (1856) = Phyllactinia. Also used for lichenicolous fungi. fide Junell (*Svensk bot. Tidskr.* **58**: 55, 1964), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 181 pp., 2000).

Spondylocladiella Linder (1934), anamorphic *Pezizomycotina*, Hso.≡ eP.24. 1 (on *Corticium*), Europe; N. America.

Spondylocladiopsis M.B. Ellis (1963), anamorphic *Pezizomycotina*, Hso.≡ eH.10. 1, Europe. See Ellis (*Mycol. Pap.* **87**: 15, 1963), Treigiene & Markovskaja (*Botanica Lithuanica* **9**: 285, 2003).

Spondylocladium Mart. ex Sacc. (1880) = Stachylidium fide Hughes (*CJB* **36**: 747, 1958).

Spongiasclerotes Stach & Pickh. (1957), Fossil Fungi. 1 (Carboniferous), Germany. See Stach & Pickhardt (*Palaeontologische Zeitschrift* **31**: 140, 1957).

Spongioides Lázaro Ibiza (1916) nom. dub., Polyporales.

spongiostratum, used for the hypothallus of *Anzia* and *Pannoparmelia* (Hannemann, *Bibl. Lich.* **1**, 1973). See Henssen & Dobelmann (*Bibl. Lich.* **25**: 103, 1987).

Spongiosus Lloyd ex Torrend (1920) ≡ Phaeolus.

Spongipellis Pat. (1887), Polyporaceae. 8, widespread. See Gilbertson & Ryvarden (*N. Amer. Polyp.* **2**: 723, 1987), Ipulet & Ryvarden (*Syn. Fung.* **20**: 87, 2005; Uganda).

Spongiporus Murrill (1905) = Postia fide Jülich (*Persoonia* **11**: 423, 1982).

Sponheimeria Kirschst. (1941) = Lasiobelonium Ellis & Everh. fide Baral (*SA* **13**: 113, 1994).

Spooneromyces T. Schumach. & J. Moravec (1989), Pyronemataceae. 3, Europe. See Schumacher & Moravec (*Nordic Jl Bot.* **9**: 425, 1989), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

spora, the spore content of a particular place or ecological niche; of air, see Air spora.

sporabola, the curve made by a basidiospore after discharge from its sterigma (Buller, *Researches* **1**; Ingold, 1971: 111).

Sporacestra A. Massal. (1860) ≡ Bacidia fide Coppins (*Bull. Br. Mus. nat. hist.* Bot. **11**: 203, 1983).

Sporadospora Reinsch (1875) nom. dub., Fungi. Based on appressoria. See Racovitza (*Mém. Mus. natn Hist. nat. Paris* Bot. **10**: 223, 1959; synonym of *Pseudonectria*), Lowen (*SA* **9**: 26, 1991).

sporangial vesicle, vesicle produced at the mouth of the sporangium during planont maturation and discharge. See homohylic vesicle, plasmamembranic vesicle, precipitative vesicle.

sporangiocyst (of *Chytridiales*), a resting sporangium (A. Fischer); cf. cystosorus.

sporangiolum (sporangiole), (1) (of *Mucorales*), a small sporangium with or without a columella, generally having a small number of spores; (2) a degenerating arbuscule (Janse, 1897) (obsol.).

sporangiophore, thallus element (usually morphologically differentiated) subtending one or more sporangia.

sporangiosorus, group of spherical sporangia fused together and formed from a single plasmodium; also one or more lobed sporangia formed from a single plasmodium.

sporangiospore, walled spore produced in a sporangium; **primary infestation** - (of *Eccrinales*), 1–4-nucleate, thick-walled spore which serves to transmit an infestation from one host individual to another after passage through the gut; **secondary infestation** - (of *Eccrinales*), multinucleate, thin-walled spore which germinates in the same gut as where they were produced.

sporangium (sporange), an organ enclosing endogenously generated spore(s), the walls of the spore(s) not being derived from the supporting or containing structure.

Sporastatia A. Massal. (1854), Catillariaceae (L). 4, widespread. See Grube & Poelt (*Fragm. Flor. geobot.* Suppl. **2**: 113, 1993), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

spore, a general term for a reproductive structure in fungi, bacteria, and cryptogamic plants. In fungi, a differentiated morphological form which may be: (a) specialized for dissemination; (b) produced in response to, and resistant to, adverse conditions; and/or (c) produced during or as a result of a sexual or asexual reproductive process. Commonly 1-celled, but in fungi frequently a multicelled structure (e.g. phragmospore, spore ball, etc.) which is in effect a group of 1-celled spores because every cell may produce one or more germ tubes. Thick- or thin-walled, pigmented or not, motile or non-motile.

More attention has been given to the spore than to any other fungal structure. Spore morphology (e.g. flagellation of zoospores) and development (e.g. of ascospores and basidiospores; sexual and asexual spores) provide basic taxonomic criteria and biologically spores may be differentiated into groups disseminated by wind, water, insects and other animals, etc., and those which allow a fungus to survive conditions unfavourable for growth (e.g. resting spores), although one type of spore may serve several functions (Sutton, *TBMS* **86**: 1, 1986). Vuillemin (1912) defined spores morphologically (e.g. motile and non-motile) and biologically and borrowed or coined terms for his different spore types. Most of these terms have never been in current use but the naming of spores continues (see Spore terminology).

Lit.: Chapela (*Sydowia* **43**: 1, 1991; measurement with Coulter counter), De Toledo (*Mycotaxon* **52**: 259, 1994; descriptions of), Madelin (Ed.) (*The fungus spore*, 1966), Weber & Hess (Eds) (*The fungal spore. Form and function*, 1976), Turian & Hohl (Eds) (*The fungal spore: morphogenetic controls*, 1981), Cole & Hoch (*The fungal spore and disease initiation in plants and animals*, 1991), Beakes (*in* Gow & Gadd (Eds), *The growing fungus* 339, 1995; sporulation), and the following entries.

spore ball, a unit of dispersal comprised of a more or less firmly aggregated group of spores (e.g. *Sorosporium*, *Tolyposporium*) or spores and sterile cells (e.g. *Urocystis*).

Spore charge. Airborne spores carry either a positive or negative electrostatic charge, fide Buller (**1**: 192, 1909). This charge may play an important role in dispersal and, in the case of filiform spores, may result in a change in the spore's shape: if the ends are attracted to each other, the spore will have the aerodynamics of a quoit rather than a javelin. See Allitt (*TBMS* **72**: 147, 1979), Webster *et al.* (*TBMS* **91**: 193, 1988), Gregory (*Nature* **180**: 330, 1957; *Ganoderma applanatum*, etc.), Swinbank *et al.* (*Ann. Bot., Lond.* **28**: 239, 1964; *Serpula*).

Spore discharge and dispersal. A wide range of mechanisms for spore discharge and dispersal can be found in the fungi. Most involve air, animals, water or some combination of these. To be discharged, spores must escape from, or overcome the adhesive forces attaching them to the cell(s) in or on which they developed, and in many cases also the fruitbody in or on which those cells were produced.

Air dispersal. Most spores dispersed in this way do not travel far, but a tiny proportion may travel for thousands of km. This usually implies a very low rate of successful colonization by the dispersed spores. Spores must cross the laminar boundary layer of static air that surrounds all surfaces and enter the turbulent layer beyond. Many mechanisms have developed in fungi to enable their spores readily to become airborne.

Dry passive methods of air dispersal are independent of water availability and so can occur in the absence of rain and at low humidities. Some (*Agaricales*, *Myxomycetes*) have tall sporophores which lift spores well into or through the laminar boundary layer. Release and dispersal without mechanical disturbance can occur at low wind speeds in myxomycetes with raised fruiting bodies, e.g., *Dictydium*, and with fungi producing cup-shaped fruitbodies (e.g. *Cyttaria*, *Lachnellula*, *Peziza*, many lichen-forming species) in which double eddies may occur as a result of wind blowing across the surface. However, removal of conidia from conidiophores by wind requires speeds of at least 0.4-2.0 m/s, which are seldom achieved in crops except in gusts. Passive shedding as a result of gravity or in convection currents remains of uncertain importance.

Other passive methods of air dispersal involve mechanical disturbance such as rainsplash. Although water is required to activate them, rain tap and puff & bellows mechanisms are often used to disperse dry spores. In the first, rain striking a stem causes vibration which loosens spores while the cushion of air which precedes the splash disturbs the laminar boundary layer and blows spores into the air. Bellows mechanisms are seen in *Lycoperdon* and similar fungi which have a thin, flexible, unwettable perid-

ium covering the spore mass which is depressed momentarily by raindrops or drips from foliage, expelling a puff of air carrying millions of spores from the aperture. Similarly, open cup-shaped structures ('splash cups', q.v.) produced by bird's nest fungi (*Nidulariales*), e.g., *Cyathus* spp., *Crucibulum vulgare*, and podetia lined with soredia produced by *Cladonia* use the energy of raindrops to project their contents up to 1 m.

Mist pickup has been described for *Cladosporium*. Rain and drip splash are important for fungi with spores embedded in slimy masses, e.g., *Colletotrichum lindemuthianum*, and for other non-slimy species whose spores are easily released by rain, e.g. *Venturia inaequalis*, or which also have active dispersal mechanisms, e.g. *Phytophthora infestans*.

Bubble scavenging concentrates particles, e.g. spores of aquatic fungi, from water suspension and these may then be projected into the air when surface bubbles burst. Droplets from breaking waves and waterfalls fulfil a similar function.

Active mechanisms activated by changing humidity and drying are seen in the violent twisting movements of some *Oomycota* and in water rupture mechanisms. Release through hygroscopic movement is characteristic of sporangiophores of *Phytophthora infestans* and *Peronospora hyoscyami* (syn. *P. tabacina*) and may also serve to loosen spores of some hyphomycetes, e.g. *Botrytis cinerea*, *Cladosporium*, *Drechslera*, before subsequent deflation. Water rupture occurs when tension is sufficient for the cohesion between water molecules or their adhesion to cell walls to fail resulting in the sudden formation of a gas bubble. A spore-bearing cell which had been collapsing as water was withdrawn by evaporation then suddenly returns to its former size as the gas bubble forms, flicking off the spores. The catapult effect may be enhanced by differential thickening of the conidiophore, as seen in *Deightoniella torulosa* and *Zygosporium oscheoides*.

Squirt gun mechanisms are characteristic of many *Ascomycota*, in which the spores are ejected explosively from turgid cells to a distance of 1-2 cm for small ascospores and up to 60 cm for larger ascospores, e.g. *Ascobolus immersus*. This type of discharge may result in the spore becoming electrostatically charged (see Spore charge). Asci may discharge singly from perithecia or many simultaneously from apothecia, e.g., *Sclerotinia sclerotiorum* producing a visible puff. About 0.2 mm rainfall is necessary for discharge of ascospores from perithecia of *Venturia inaequalis* in apple leaves or of *Mycospherella pinodes* in pea straw but at least 1.2 mm for ascospores from stromata of *Eutypa armeniacae*. Ascospores are usually dispersed as single spores but in *Pyrenopeziza brassicae* groups, usually of four spores, may be dispersed together.

Squirting mechanisms are also found in *Pilobolus* spp., *Basidiobolus ranarum*, *Entomophthora muscae*, *Pyricularia oryzae* and *Nigrospora sphaerica*. The sudden rounding of turgid cells can cause spores of *Conidiobolus coronata* to travel up to 4 cm and also occurs in *Epicoccum nigrum*, *Arthrinium cuspidatum*, *Sclerospora philippinensis* and the anamorph of *Xylaria furcata*.

Discharge of ballistospores and basidiospores is activated by water. The formation of a drop of liquid at the hilum end of the spore is characteristic; this is termed Buller's drop (q.v.) and has a crucial role in spore discharge. The spore is ejected 0.01-0.02 cm, sufficient for it to be able to fall freely between the gills or through pores into the free air below.

Water dispersal. Aquatic phycomycetes (*Chytridiomycota*, *Chromista*) may be dispersed in water as self-motile zoospores. Some water-dispersed spores (e.g. conidia of *Rubikia*) have many empty (vacated) cells and the air trapped within these cells may enable them to function as float chambers.

Animal dispersal. The success rate of colonization is often higher with animal-dispersed spores than with air- or water-dispersed spores. Arthropods are probably the dominant animal group involved in fungal spore dispersal. Examples include insects carrying the anamorphs of *Claviceps* spp. to new host plants, flies dispersing spores of *Phallus*, and laboulbeniomycetes being transmitted from one insect to another by touch. Other animal groups are also, however, important. Truffles and other hypogeous fungi are usually dispersed when pigs, rodents or other mammals drop fruitbody fragments while feeding. *Pilobolus* and other coprophilous fungi may be spread by animals and even require ingestion for their spores to germinate. However, they may also have an airborne dispersal phase. Humans may aid discharge and dispersal of spores through disturbance caused by agricultural practices such as mechanical harvesting and threshing.

Dispersal of spores depends on their size, shape, roughness and other characteristics and, for air dispersed spores, on wind speed and turbulence. Spore dispersal mechanisms determine the periodicity of spore release (see Air spora). Spore size and surface roughness affect the rate at which spores fall through the air and their ability to impact on stems and other obstacles. Fall rate or terminal velocity is a function of the square of the spore radius while the efficiency with which spores impact onto obstacles increases with their size. Many spores in crops and similarly dense vegetation either fall to the ground or impact onto stems and fail to escape into the air. Most that do escape are deposited within 100 m and few travel long distances. Spore clouds are spread both horizontally and vertically by eddies as they travel downwind from their source and concentrations decrease following theories of diffusion. Nevertheless, clouds of spores released in successive days and nights have been identified up to 600 km downwind of the British coast (Hirst & Hurst, *Symp. Soc. gen. Microbiol.* **17**: 307, 1967). Dispersal is ended by impaction of particles onto obstacles and by washout in rain.

It should be remembered that successful dispersal ends in deposition and results in colonization of new substratum. Many spores therefore have adaptations enabling them to adhere to suitable surfaces (e.g. mucous sheaths, radiating arms).

Lit.: Buller (**1-6**), Edmonds (*Aerobiology, the ecological systems approach*, 1979), Gregory (*TBMS* **21**: 26, 1945, *Microbiology of the atmosphere*, edn 2, 1973), Gregory & Monteith (*Airborne microbes*, 1967), Ingold (*Fungal spores, their liberation and dispersal*), 1971), Malloch & Blackwell (*in* Carroll & Wicklow, *The fungal community*, edn 2 : 147, 1992).

spore dormancy, see Spore germination.

Spore germination. Germination and dormancy in fungi have been reviewed by Sussman (*in* Ainsworth & Sussman (Eds), *The Fungi* **2**: 733, 1966), Sussman

& Douthit (*Ann. Rev. Pl. Physiol.* **24**: 311, 1973), and Gottlieb (*The germination of fungus spores*, 1978). A simple descriptive kinetics model of filamentous fungi spore germination is given by Bosch *et al.* (*Process biochemistry* **30**: 599, 1995).

Germination usually involves production of one or more germ tubes accompained by synthesis of new wall material. Protoplasm pressure and enzymic degradation of the spore wall results in emergence of the germ-tube through the spore wall. Fungal spore germination is influenced mainly by temperature, humidity, daylight and various types of radiation (Schenck *et al.*, *Mycol.* **67**: 1189, 1975; Jack & Tansey, *Mycol.* **69**: 109, 1977). Spores of basidiomycetes and some of conidial fungi are distinctly stimulated by mucin that is chemically similar to the natural spore matrix (Mahuku & Goodwin, *European Jurnal of Plant Pathology* **104**: 849, 1998). Oxygen is required for swelling of spores and the process is energy dependent. Thus aeration is necessary for formation of germ tubes during cultivation in solid state fermentation (Augur *et al.*, *Micología Aplicada Internacional* **19**: 7, 2007). Various llight wavelengths may affect the capacity of fungal spores (e.g. *Puccinia graminis*) to germinate (Calpouzos & Chang, *Plant Physiology* **47**: 729, 1971; Lucas *et al.*, *Plant Physiology* **56**: 847, 1975). Darkness increases germination of *Alternaria alternata* spores (Hatzipapas *et al.*, *MR* **106**: 1349, 2002). Radiation normally inhibits spore germination, but fungal strains with long-term exposure may show enhanced germination rates (Tugay *et al.*, *Mycol.* **98**: 521, 2006). See also Radiation and fungi.

Molecular and biochemical events during early stages of spore germination involve cAMP signalling (Fillinger *et al.*, *Mol. Microbiol.* **44**: 1001, 2002), net synthesis of lipids, with large production and later net degradation of free fatty acids (Mumford & Pappelis, *Mycopatologia* **64**: 63, 1978; Beilby & Kidby, *Journal of Lipid Research* **21**: 739, 1980). Germination can be highly dependent on the ratio of non-nutritive (not metabolizable), non-toxic carbohydrates such as L-sorbose and cellulose. Time of the spore germination is poorly correlated with water activity (Pham *et al.*, *J. Agric. Food Chem.* **47**: 4976, 1999).

Inhibition of fungal spore germination has been studied for biocontrol of plant diseases. Some plant extracts (e.g. of *Cichorium intybus*, *Eryngium creticum*, *Melia azedarach* and *Salvia fruticosa*) can suppress spore germination in species of *Alternaria*, *Botrytis*, *Cladosporium*, *Fusarium* and *Penicillium* (Abou-Jawdah, *et al.* (*J. Agric. Food Chem.* **50**: 3208, 2002; Chu *et al.*, *Plant Disease* **90**: 858, 2006). Similarly, pollen and stigma extracts of *Sorghum* can suppress spore germination of *Claviceps africana* (Prom, *Asian Journal of Plant Pathology* **1**: 12, 2007). Mandibular gland secretions of leaf-cutting ants have been shown to inhibit spore germination of conidial ascomycetes and zygomycetes which occur in their nests (Marsaro *et al.*, *Neotrop. Entomol.* **30**: 403, 2001; Rodrigues *et al.*, *Braz. J. Microbiol.* **39**: 64, 2008).

In lichenized fungi the ascospores germinate readily in water films at moderate temperatures. Percentage germination is lowest in areas of high air pollution (Kofler *et al.*, *Mém. Soc. bot. Fr.* 1968: 219, 1969). In *Xanthoria parietina* ascospores remain dormant until contact with the photobiont is made (Werner, *Mém. Soc. Sci. nat. phys. Maroc* **27**: 7, 1931). See Lichens.

Lit.: Abou-Jawdah *et al.* (*J Agric. Food Chem.* **50**: 3208, 2002), Augur *et al.* (*Micologia Aplicada Internacional* **19**: 7, 2007), Beilby & Kidby (*Journal of Lipid Research* **21**: 739, 1980), Bosch *et al.* (*Process biochemistry* **30**: 599, 1995), Calpouzos & Chang (*Plant Physiology* **47**: 729, 1971), Chu *et al.* (*Plant Disease* **90**: 858, 2006), Fillinger *et al.* (*Mol. Microbiol* **44**: 1001, 2002), Hatzipapas *et al.* (*Mycological Research* **106**: 1349, 2002), Jack & Tansey (*Mycol.* **69**: 109, 1977), Lucas *et al.* (*Plant Physiology* **56**: 847, 1975), Mahuku & Goodwin (*Eur. Phytopath.* **8**: 281, 1970), Mumford & Pappelis (*Mycopathologia* **64**: 63, 1978), Pham *et al.* (*J. Agric. Food Chem.* **47**: 4976, 1999), Prom (*Asian J. Plant Path* **1**: 12, 2007), Rodrigues *et al.* (*Braz. J. Microbiol.* **39**: 64, 2008), Schenck *et al. Mycol.* **67**: 1189, 1975), Tugay *et al.* (*Mycol.* **98**: 521, 2006). See also *Lit.* under Spore discharge and dispersal.

spore groups, for Saccardo's spore groups see Anamorphic fungi. Also see Conidial nomenclature, Sphaeriales.

spore horn, see cirrus.

spore longevity. see Longevity.

spore print, the deposit of basidioma obtained by allowing spores from a basidiocarp to fall onto a sheet of paper (white or coloured) placed below the lamellae or pores. See Singer (1975: 5).

spore specific gravity, Buller (**1**: 153, 1909) determined the Specific Gravity (SG) of various agaric spores as 1.02-1.43.

spore terminology. see aboospore, acro-, adia-, aecio-, aleurio-, alpha-, amero-, amphi-, annello- (under annellidic), aplano-, arthro-, asco-, azygo-, ballisto-, basidio-, beta- -, blasto-, botryo-aleurio-, botryoblasto-, chlamydo-, clostero-, conidiole, conidium, cyst, deuteroconidium, dia-, dictyochlamydo-, dictyoporo-, dictyo-, didymo-, diploconidium, dispersal -, di-, dry -, ecto-, endoconidium, endo-, fragmentation -, fuseau, ganglio-, gasteroconidium, gastero-, gemma, gonosphere, haploconidium, helico-, hemi-asco-, hemi-, isthmo-, loculo- (see Loculomycetes), macroconidium, macro-, meio-, memno-, meri-, meristem arthro-, meristem blasto-, meso-, microconidium, micro-endo-, micro-, mischoblastiomorph, mito-, mono-, myceloconidium, myxo-, nimbo-, oidium, oo-, papulo-, part -, partheno-, peri-, phialoconidium (under phialidic), phragmo-, placodiomorph, plasmagamo-, polarilocular-, poroconidium, poro-, primo-, promycelial -, protero-, protoconidium, proto-, pseudoidium, pseudo-, pycnidio-, pycnio-, pycno-, radula -, ramoconidium, repeating -, resting -, scoleco-, secondary -, seio-, sicyo-, simblo-, slime -, smut -, spiculo-, sporangio-, sporidesm, sporidiole, sporidium, stalagmo-, statismo-, stauro-, stylo-, summer -, sympodioconidium, synchrono-, teleutosporodesm, telio-, terminus -, tetra-, texo-, thallo-, theca-, tretoconidium (under tretic), tricho-, ustilo-, usto-, winter -, xeno-, zoo-, zygo-.

Spore wall. Conventional or electron microscopy shows the spore wall to be layered. The terminology of these layers by different authors is somewhat confused (see the comparison by Payak, 1964: 33). Five layers (the spore wall proper; **eusporium**) which have been distinguished are, from within outwards:

(1) **endosporium** (endospore, corium), which is usually thin and is the last to develop during sporogenesis; (2) **episporium**, the thick, fundamental layer which determines the shape of the spore; (3) **exosporium** (exospore, epitunica, trachytectum, tunica), a layer derived from (2) but chemically distinct and frequently responsible for the ornamentation; (4) **perisporium** (= mucostratum, myxosporium), a layer, frequently fugacious, enveloping the whole spore and limited by (5), the hardly visible **ectosporium** (sporothecium). On this disappearance of (4) and (5) (3) is the outer spore layer. (1)-(3) are thus the spore wall proper; (4) and (5) of extrasporal origin. See Heim (*Rev. Mycol.* **27**: 199, 1962), Payak (*in* Nair (Ed.), *Recent advances in palynology*, 1964), Pyatt (*TBMS* **52**: 167, 1969; lichens), Pegler & Young (*TBMS* **72**: 356, 1979; basidiospores). See Fig. 5; cf. Cell wall chemistry.

Sporendocladia G. Arnaud ex Nag Raj & W.B. Kendr. (1975), anamorphic *Ceratocystidaceae*, Hso.0eH.22. 7, widespread. See Wingfield *et al.* (*TBMS* **89**: 609, 1987; separation from *Phialocephala*), Crous & Wingfield (*Sydowia* **46**: 193, 1994; Switzerland), Onofri *et al.* (*MR* **98**: 745, 1994; key), Jacobs *et al.* (*Mycol.* **95**: 637, 2003; phylogeny).

Sporendonema Desm. (1827), anamorphic *Pezizomycotina*, Hso.0eP.40. 3, widespread. See Sigler & Carmichael (*Mycotaxon* **4**: 376, 1976).

Sporhaplus H.B.P. Upadhyay (1964), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1 (lichenicolous), Brazil. See Hawksworth (*Bull. Br. Mus. nat. Hist.* Bot. **9**: 1, 1981), Matzer (*Mycol. Pap.* **171**: 202 pp., 1996).

Sporhelminthium Speg. (1918) = Clasterosporium fide Hughes (*CJB* **36**: 727, 1958).

Sporichthya M.P. Lechev., H. Lechev. & Holbert (1968), Actinobacteria. q.v.

sporidesm (sporodesm), a compound spore or spore-ball, the components of which are merispores. See teleutosporodesm.

Sporidesmiella P.M. Kirk (1982), anamorphic *Melanommataceae*, Hso.1-≡ eP.19. 18, widespread. See Zhang *et al.* (*Mycotaxon* **18**: 243, 1983; conidiogenesis), Kuthubutheen & Nawawi (*MR* **97**: 1305, 1993; review), Castañeda Ruíz *et al.* (*MR* **102**: 548, 1998), Wu & Zhuang (*Fungal Diversity Res. Ser.* **15**, 2005), Shenoy *et al.* (*MR* **110**: 916, 2006; phylogeny).

sporidesmin (and **sporodesmolides**), toxins (oligopeptides) of *Pithomyces chartarum* (teleomorph *Leptosphaerulina chartarum*); the cause of facial eczema in sheep and cattle, esp. in NZ.

Sporidesmina Subram. & Bhat (1989), Xylariales. See Sutton (*in litt.*), Shenoy *et al.* (*MR* **110**: 916, 2006; phylogeny).

Sporidesmiopsis Subram. & Bhat (1989) = Brachysporiella fide Sutton (*in litt.*), Wu & Zhuang (*Fungal Diversity Res. Ser.* **15**, 2005; China).

Sporidesmium Link (1809), anamorphic *Pleosporales*, Hso.≡ -#eP.19. 113, widespread. See Ellis (*Mycol. Pap.* **70**, 1958; key), Hughes (*CJB* **36**: 807, 1958), Moore (*Mycol.* **50**: 681, 1958), Bullock *et al.* (*CJB* **67**: 313, 1989; morphology, histochem. and germination of *S. sclerotivorum*), Subramanian (*Proc. Indian natn Sci. Acad.* Part B. Biol. Sci. **58**: 179, 1992; segregation), Réblová (*Mycotaxon* **71**: 13, 1999), Wu & Zhuang (*Fungal Diversity Res. Ser.* **15**, 2005; China), Shenoy *et al.* (*MR* **110**: 916, 2006; phylogeny, polyphyly).

Sporidiaceae R.T. Moore (1980) = Sporidiobolaceae R.T. Moore.

Sporidiales R.T. Moore (1980), see *Sporidiobolales*.

Sporidiobolaceae Kobayasi (1961) nom. inval. = Sporidiobolaceae R.T. Moore.

Sporidiobolaceae R.T. Moore (1980), Sporidiobolales. 3 gen., 10 spp.

Lit.: Boekhout & Nakase *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 828, 1998), Fell & Statzell-Tallman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 678, 1998), Kurtzman & Fell (*Yeasts, a taxonomic study* 4th edn, 1998; taxonomy), Statzell-Tallman & Fell *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 693, 1998), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Hamamoto & Nakase (*Int. J. Syst. Evol. Microbiol.* **50**: 1373, 2000), Biswas *et al.* (*Int. J. Syst. Evol. Microbiol.* **51**: 1191, 2001), Nagahama *et al.* (*Antonie van Leeuwenhoek* **80**: 101, 2001), Bai *et al.* (*Int. J. Syst. Evol. Microbiol.* **52**: 2309, 2002), Fell *et al.* (*FEMS Yeast Res.* **1**: 265, 2002), Scorzetti *et al.* (*FEMS Yeast Res.* **2**: 495, 2002), Libkind *et al.* (*Antonie van Leeuwenhoek* **84**: 313, 2003), Sampaio *et al.* (*Mycol. Progr.* **2**: 63, 2003), Wang & Bai (*FEMS Yeast Res.* **4**: 579, 2004).

Sporidiobolales Doweld (2001). Microbotryomycetes. 1 fam., 7 gen., 83 spp. Fam.:

Sporidiobolaceae

Lit.: Moore (1980), Boekhout *et al.* (*Can. J. Microb.* **39**: 276, 1993), Swann & Taylor (*Stud. Mycol.* **38**: 147, 1995; mol. phylogeny, taxonomy). See also *Lit.* for Yeast.

Sporidiobolus Nyland (1950), Sporidiobolaceae R.T. Moore. Anamorphs *Rhodomyces*, *Sporobolomyces*. 7, widespread. See Bandoni *et al.* (*CJB* **49**: 683, 1971).

sporidiolae, spore-like bodies produced inside **sporidiomata**, perithecium-like structures, in *Kathistes* (Malloch & Blackwell, *CJB* **68**: 1712, 1990).

sporidiole, a small spore.

Sporidiomycetes. Class used by Moore (1980) for *Sporidiales*, q.v.

sporidium (pl. **sporidia**), (1) a basidiospore of the *Pucciniales* and *Ustilaginales* or, in the latter, any spore other than an ustilospore; (2) ascospore (obsol.).

Sporisorium Ehrenb. ex Link (1825), Ustilaginaceae. *c.* 320 (on *Poaceae*), widespread. *S. sorghi* and *S. cruentum* (covered and loose smuts of sorghum); *S. reilianum* (head smut of maize (*Zea*) and sorghum). Many graminicolous smuts originally described as *Sorosporium*, *Sphacelotheca* or *Ustilago* belong here. See Langdon & Fullerton (*Mycotaxon* **6**: 421, 1978), Vánky (*Europ. Smut Fungi*: 570 pp., 1994), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002; New Zealand), Vánky (*Mycotaxon* **2**: 169, 2005; Europe).

Sporoacania A. Massal. (1855) ? = Lecidea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sporoblastia Trevis. (1851) = Cliostomum fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sporobolomyces Kluyver & C.B. Niel (1924), anamorphic *Sporidiobolus*. *c.* 25, widespread. See Fell *et al.* (*Stud. Mycol.* **38**: 129, 1995; mol. phylogeny, 2000; mol. phylogeny), Nakase *et al.* (*Stud. Mycol.* **38**: 163, 1995; mol. phylogeny), Swann & Taylor (*Stud. Mycol.* **38**: 147, 1995; mol. phylogeny), Takashima & Nakase (*Mycoscience* **41**: 357, 2000; Thai-

land), Bai *et al.* (*International Journal of Systematic and Evolutionary Microbiology* **52**: 2309, 2002), Sampaio (*Frontiers in Basidiomycote Mycology*: 49, 2004), Libkind *et al.* (*International Journal of Systematic and Evolutionary Microbiology* **55**: 503, 2005; Argentina), Nagahama (*Journal of General and Applied Microbiology, Tokyo* **52**: 37, 2006), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Sporobolomycetales (mirror or shadow yeasts), anamorphic yeasts with basidiomycetous affinities characteristically producing ballistospores following multiplication by budding (e.g. *Bullera*, *Itersonilia*, *Sporobolomyces*, *Tilletiopsis*). Accepted in *Basidioblastomycetes* by Moore (1980). See Yeast for *Lit.*, also Martin (*Univ. Iowa Stud. nat. Hist.* **19**(3), 1952).

Sporocadaceae Corda (1842) = Amphisphaeriaceae.

Sporocadus Corda (1839), anamorphic *Amphisphaeriaceae*. 1, widespread. See Shoemaker & Müller (*CJB* **42**: 403, 1964), Brockmann (*Sydowia* **28**: 275, 1976), Morelet (*Ann. Soc. Sci. nat. Arch. Toulon & Var* **37**: 233, 1985), Sergeeva *et al.* (*Australas. Pl. Path.* **34**: 255, 2005).

sporocarp, a general term for spore-bearing organs; fruit-body (q.v.). Used esp. of *Acrasiomycota*, *Mycetozoa* and *Endogonaceae*.

Sporocarpon Will. (1878), Fossil Fungi ? Ascomycota. 5 (Carboniferous), Europe; USA. See Hutchinson (*Ann. Bot.* **19**: 428, 1955), Baxter (*Paleont. Contrib. Univ. Kansas* **77**, 1975), Pirozynski (*Ann. Rev. Phytopath.* **14**: 237, 1976).

Sporocephalium Chevall. (1826) = Acladium fide Hughes (*CJB* **36**: 727, 1958).

Sporocephalum Arnaud (1952) ? = Oedocephalum fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Sporochytriaceae A. Fisch. (1892) = Rhizophydiaceae.

Sporocladium Chevall. (1826) ≡ Cladosporium fide Hughes (*CJB* **36**: 727, 1958).

sporocladium, a special sporogenous branch in the *Kickxellaceae*.

Sporoclema Tiesenh. (1912) nom. dub., Fungi. 'phycomycetes'. See Kendrick & Carmichael *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 323, 1973).

Sporoctomorpha J.V. Almeida & Sousa da Câmara (1903), Pezizomycotina. 1, Europe.

Sporocybe Fr. (1825) = Periconia fide Mason & Ellis (*Mycol. Pap.* **56**, 1953), Carmarán & Novas (*Fungal Diversity* **14**: 67, 2003).

Sporocybomyces H. Maia (1967) = Echinoplaca fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

sporocyst, a cyst producing asexual spores.

Sporocystis Morgan (1902), anamorphic *Pezizomycotina*, Hsp.#eH.?. 2, N. America; Sri Lanka.

Sporoderma Mont. (1856) = Trichoderma Pers. (1794) fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **119**: 671, 1910).

Sporodesmium, see *Sporidesmium*.

Sporodictyon A. Massal. (1852), Verrucariaceae (L). 3, Europe.

Sporodinia Link (1824) ≡ Syzygites.

Sporodiniella Boedijn (1959), Mucoraceae. 1 (on eggs, larvae & imago of *Membracidae* (*Diptera*, *Homoptera*, *Hymenoptera* & *Lepidoptera*; apparently parasitic), pantropical. See Evans & Samson (*CJB* **55**: 2981, 1977), Gbaja & Young (*Microbios* **42**: 263, 1985; ultrastr.), Chien & Hwang (*Mycoscience* **38**: 343, 1997), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Ali-Shtayeh *et al.* (*Mycopathologia* **156**: 235, 2002; Palestine).

Sporodiniopsis Höhn. (1903) nom. dub., anamorphic *Pezizomycotina*. See Hawksworth (*Mycol. Pap.* **126**, 1971).

sporodochium, conidioma, typical of the *Tuberculariaceae* (q.v.) in which the spore mass is supported by a superficial cushion-like (pulvinate) mass of short conidiophores and pseudoparenchyma; **pionnote** - (**pseudopionnotes**, Sherbakoff, 1915) (of *Fusarium*), minute sporodochia near the surface of the substrate having no stroma, the spores forming a continuous slimy layer. Cf. acervulus, pionnotes.

Sporodum Corda (1837) = Periconia fide Mason & Ellis (*Mycol. Pap.* **56**, 1953).

sporogenesis, spore development.

sporogenous, producing, having or supporting spores; cf. conidiogenous.

Sporoglena Sacc. (1894), anamorphic *Pezizomycotina*, Hsy.0eP.?. 1, Papua New Guinea.

sporograph, the straight-line graph obtained by plotting the ratio (E) of the length (D) to width (d) against the length of the basidiospores of a species of agaric (Corner, *New Phytol.* **46**: 196, 1947). Cf. Q.

sporoma (pl. **-omata**), a multicellular structure specially developed to produce spores.

Sporomega Corda (1842), Rhytismataceae. 1, Europe; N. America. See Eriksson (*Symb. bot. upsal.* **19** no. 4, 1970).

Sporonema Desm. (1847), anamorphic *Godronia*, St.0eH.15. 15, widespread (north temperate). See Limber (*Mycol.* **47**: 389, 1955), Sutton (*The Coelomycetes*, 1980).

Sporonites R. Potonié (1931), Fossil Fungi ? Fungi. 1.

sporont, a thallus on which spores will be produced.

Sporopachydermia Rodr. Mir. (1978), Saccharomycetales. Anamorph *Candida*. 3, widespread. See Yamada *et al.* (*J. gen. appl. Microbiol.* Tokyo **38**: 179, 1992), Lachance & Phaff *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 395, 1998), Lachance *et al.* (*Int. J. Syst. Evol. Microbiol.* **51**: 237, 2001; phylogeny, species concepts), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Sporophaga Harkn. (1899) nom. dub., ? Fungi.

Sporophagomyces K. Põldmaa & Samuels (1999), Hypocreaceae. 3 (fungicolous), widespread. See Põldmaa *et al.* (*CJB* **77**: 1765, 1999), Põldmaa & Samuels (*Sydowia* **56**: 79, 2004; Thailand).

sporophagous, feeding on spores, as in certain thrips species on fungus spores (Ananthakrishnan *et al.*, *Proc. Ind. Acad. Sci.* Anim. Ser. **92**: 95, 1983), where the dimensions of the mouth parts are related to the sizes of the spores eaten (Ananthakrishnan & Dhileepan, *Proc. Ind. Acad. Sci.* Anim. Ser. **93**: 243, 1984); species lists (Ananthakrishnan *et al.*, 1984).

Sporophiala P. Rag. Rao (1970), anamorphic *Pezizomycotina*, Hso.≡ eP.3. 3, India; USA. See Rao (*Mycopathologia* **41**: 317, 1970).

Sporophleum Nees ex Link (1824) = Arthrinium fide Hughes (*CJB* **36**: 727, 1958).

Sporophlyctidium Sparrow (1933), Chytridiaceae. 2, USA; North Africa.

Sporophlyctis Serbinow (1907), ? Chytridiaceae. 2 (on *Draparnaldia* and *Chaetophora*), widespread.

Sporophora Luteraan (1952), anamorphic *Pezizomycotina*, Hso.0eH.3. 1, France. See Luteraan (*Rev. Biol. gen. theor. appl.* **2**: 2, 1952).

sporophore (1) a spore-producing or -supporting structure, esp. a conidiophore; (2) (of macrofungi), ascoma, basidioma (see Fig. 4); cf. hymenophore; a basidium (sensu Berkeley).

Sporophormis Malloch & Cain (1973) ≡ Warcupiella.

Sporophysa (Sacc.) Vain. (1921) = Verrucaria Schrad. fide Keissler (*Rabenh. Krypt.-Fl.* **8**: 446, 1930).

Sporophyta, see *Cryptogamia*.

sporophyte, the diploid or asexual phase in the life-cycle of a plant; diplont; diplophase. Cf. gametophyte.

sporoplasm, the spore-producing protoplasm within the epiplasm in a sporangium or ascus (Guilliermond).

Sporopodiopsis Sérus. (1997), Ectolechiaceae (L). 2, S.E. Asia. See Sérusiaux (*Abstracta Botanica* **21**: 145, 1997).

Sporopodium Mont. (1851), Ectolechiaceae (L). 24, widespread (tropical). See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952), Hafellner (*Beih. Nova Hedwigia* **79**: 241, 1984), Elix *et al.* (*Biblthca Lichenol.* **58**: 81, 1995; chemistry), Lücking & Lumbsch (*Mycotaxon* **78**: 23, 2001; chemistry), Sérusiaux *et al.* (*Mycotaxon* **103**: 255, 2008; key, chemistry).

Sporormia De Not. (1845), Sporormiaceae. 3 (coprophilous or on wood), widespread. See Ahmed & Cain (*CJB* **50**: 419, 1972), Dissing (*Persoonia* Suppl. **14**: 389, 1992), Berbee (*Mol. Biol. Evol.* **13**: 462, 1996; DNA), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny).

Sporormiaceae Munk (1957), Pleosporales. 10 gen. (+ 7 syn.), 143 spp.

Lit.: von Arx & van der Aa (*TBMS* **89**: 117, 1987; key 6 gen.), Dissing (*Persoonia* Suppl. **14**: 389, 1992), Berbee (*Mol. Biol. Evol.* **13**: 462, 1996; DNA), Hyde & Steinke (*Mycoscience* **37**: 99, 1996), Guarro *et al.* (*MR* **101**: 305, 1997), Silva-Hanlin & Hanlin (*MR* **103**: 153, 1999), Barr (*Mycotaxon* **76**: 105, 2000; keys, *Delitschiaceae*), Liew *et al.* (*Mol. Phylogen. Evol.* **16**: 392, 2000), Arenal *et al.* (*Mycotaxon* **89**: 137, 2004), Kruys *et al.* (*MR* **110**: 527, 2006), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Wang *et al.* (*MR* **111**: 1268, 2007; phylogeny).

Sporormiella Ellis & Everh. (1892), Sporormiaceae. *c.* 80 (mainly coprophilous), widespread. Used as indicators of megafauna in Quaternary lake deposits. See also *Preussia*. See Ahmed & Cain (*CJB* **50**: 419, 1972), Davis (*Quatern. Res.* **28**: 290, 1987), Barr (*N. Amer. Fl.* ser. 2 **13**: 129 pp., 1990), Eriksson & Hawksworth (*SA* **10**: 144, 1991), Berbee (*Mol. Biol. Evol.* **13**: 462, 1996; DNA), Lumbsch & Lindemuth (*MR* **105**: 901, 2001; phylogeny), Burney *et al.* (*Proc. natn Acad. Sci. U.S.A.* **100**: 10800, 2003; Holocene extinctions in Madagascar), Prokhorov & Armenskaya (*Mikol. Fitopatol.* **37**: 27, 2003; Russia), Arenal *et al.* (*Mycotaxon* **89**: 137, 2004; biometrics), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Spororminula Arx & Aa (1987), Sporormiaceae. 1 (coprophilous), Canary Islands. See von Arx & van der Aa (*TBMS* **89**: 117, 1987), Barr (*Mycotaxon* **76**: 105, 2000).

Sporormiopsis Breton & Faurel (1964) = Sporormiella fide von Arx (*Persoonia* **7**: 367, 1973), Barr (*Mycotaxon* **76**: 105, 2000).

Sporoschisma Berk. & Broome (1847), anamorphic *Melanochaeta*, Hsy.≡ eP.22. 10, widespread. See Nag Raj & Kendrick (*Monogr. Chalara Allied Genera*, 1975), Goh *et al.* (*MR* **101**: 1295, 1997; key), Ho *et al.* (*CJB* **76**: 1614, 1998), Sivichai *et al.* (*MR* **104**: 478, 2000; Thailand).

Sporoschismataceae Nann. (1934) = Chaetosphaeriaceae.

Sporoschismatites Babajan & Tasl. (1977), Fossil Fungi. 1 (Tertiary), former USSR.

Sporoschismopsis Hol.-Jech. & Hennebert (1972), anamorphic *Porosphaerellopsis*, Hso.≡ eP.22. 5, Europe; N. America. See Goh *et al.* (*MR* **101**: 1295, 1997; key).

Sporoschizon Riedl (1960), ? Naetrocymbaceae (L). 1, Austria. See Harris (*More Florida Lichens*, 1995; ? synonym of *Naetrocymbe*).

Sporostachys Sacc. (1919) = Melanographium fide Saccardo (*Syll. fung.* **25**: 936, 1931), Somrithipol & Jones (*Fungal Diversity* **19**: 137, 2005).

sporostasis (adj. **sporostatic**), inhibition of spore germination; cf. mycostasis; sporostatic products of fungi, see Robinson *et al.* (*TBMS* **51**: 113, 1968).

Sporostigma Grube (2001), Arthoniaceae (L). 1, USA. See Grube (*Lichenologist* **33**: 388, 2001).

sporothallus, a thallus producing spores; cf. gametothallus.

Sporotheca Corda (1829) ? = Melanconis fide Mussat (*Syll. fung.* **15**: 398, 1901).

sporothecium (1) the tip of a basidium bearing basidiospores when the basidiospores are sessile (Clémençon, *Z. Pilzk.* **36**: 113, 1970); (2) see spore wall.

Sporothrichum, see *Sporotrichum*.

Sporothrix Hektoen & C.F. Perkins (1901), anamorphic *Ophiostoma*. *c.* 40, widespread. *S. schenckii*, from humans. See Thibaut (*Annls Parasit. hum. comp.* **46**: 93, 1971; *S. schenckii*, see sporotrichosis), De Hoog (*Stud. Mycol.* **7**, 1974), Kreisel & Schauer (*J. Basic Mycol.* **25**: 653, 1985; use of C sources), Findlay & Vismer (*Mycopathologia* **96**: 115, 1986; SEM of morphology), Smith & Batenburg-van der Vegte (*J. gen. appl. Microbiol.* Tokyo **32**: 549, 1986; ultrastr. septa), Takeda *et al.* (*Mycopathologia* **116**: 9, 1991; phylogeny, molecular epidemiology), de Hoog *in* Wingfield *et al.* (Eds) (*Ceratocystis* and *Ophiostoma* Taxonomy, Ecology and Pathogenicity: 53, 1993; anamorphs of *Ophiostoma*), Benade *et al.* (*MR* **101**: 1108, 1997; conidiogenesis), Okada *et al.* (*CJB* **76**: 1495, 1998; phylogeny), Ishizaki *et al.* (*Medical Mycology* **38**: 433, 2000; DNA, Africa, Australia), Lin *et al.* (*Mycopathologia* **148**: 69, 1999; DNA, China), Mesa-Arango *et al.* (*J. Clin. Microbiol.* **40**: 3004, 2002; from human, genetic diversity), de Beer *et al.* (*Mycol.* **95**: 434, 2003; clinical spp., phylogeny), Halmschlager & Kowalski (*Mycol. Progr.* **2**: 259, 2003; on *Quercus* roots), Hu *et al.* (*J. Clin. Microbiol.* **41**: 1414, 2003; molecular detection), Marimon *et al.* (*J. Clin. Microbiol.* **44**: 3251, 2006; phylogeny), Marimon *et al.* (*J. Clin. Microbiol.* **45**: 3198, 2007; new clinical spp.).

Sporotrichella P. Karst. (1887) = Fusarium fide Hughes (*CJB* **36**: 727, 1958).

Sporotrichites Göpp. & Berendt (1945), Fossil Fungi. 4 (Oligocene, Miocene), Baltic.

Sporotrichopsis Guég. (1911) nom. inval. = Sporothrix.

Sporotrichopsis Stalpers (2000), anamorphic *Abortiporus*. 1, widespread.

sporotrichosis, a lymphatic disease in humans and animals caused by *Sporothrix schenckii*. See de Beurmann & Gougerot (*Les Sporotrichoses*, 1912), Norden (*Acta Path. Microbiol. Scand., Suppl.* **84**,

1951).

Sporotrichum Link (1809), anamorphic *Laetiporus, Phanerochaete, Pycnoporellus*, Hso.0eH.10. 3, widespread. See von Arx (*Persoonia* **6**: 179, 1971), Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974), Stalpers (*Stud. Mycol.* **24**: 15, 1984; list 339 epithets) = Poria (Polyp.) fide.

spot anthracnose, see anthracnose.

Spraguea Weissenberg (1976), Microsporidia. 1.

Spragueola Massee (1896) = Neolecta fide Korf (*Phytologia* **21**: 201, 1971).

Spumatoria Massee & E.S. Salmon (1901), ? Ophiostomataceae. 1, Europe. See Malloch & Blackwell (*CJB* **68**: 1712, 1990).

Spumula Mains (1935), Raveneliaceae. 6 (on *Leguminosae*, mainly *Mimosoideae*), America (tropical); Africa; Indonesia; Philippines. See Berndt (*Pl. Syst. Evol.* **200**: 79, 1996).

spunk, see touchwood, amadou.

Squamacidia Brako (1989), Ramalinaceae (L). 1, widespread (tropical). See Brako (*Mycotaxon* **35**: 6, 1989), Okamoto & Iwatsuki (*J. Jap. Bot.* **66**: 292, 1991; Japan), Ekman (*Op. bot.* **127**: 148 pp., 1996; N America).

Squamanita Imbach (1946), Tricholomataceae. 10, widespread. See Bas (*Persoonia* **3**: 331, 1965; key), Harmaja (*Karstenia* **27**: 71, 1987), Læssøe & Rosendahl (*MR* **98**: 88, 1994; mycoparasitism), Redhead *et al.* (*CJB* **72**: 1812, 1994), Vizzini & Girlanda (*Allionia* **35**, 1997; mycoparasitism), Mondiet *et al.* (*MR* **111**: 599, 2007; mycoparasitism).

Squamaphlegma Locq. (1979) = Cortinarius fide Kuyper (*in litt.*).

Squamaria Hoffm. (1789) [non *Squamaria* Ludw. 1757, *Orobanchaceae*] = Cetraria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Squamarina Poelt (1958), Stereocaulaceae (L). 28, widespread. See Poelt & Krüger (*Feddes Repert.* **81**: 187, 1970), Stenroos & DePriest (*Am. J. Bot.* **85**: 1548, 1998; DNA), Peršoh *et al.* (*Mycol. Progr.* **3**: 103, 2004; asci, photobionts), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Squamarinaceae Hafellner (1984) = Stereocaulaceae.

Squamariomyces E.A. Thomas (1939) nom. inval. = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Squamella S. Hammer (2001), Cladoniaceae (L). 1, Australia. See Hammer (*Bryologist* **104**: 561, 2001).

Squammaria DC. (1805) = Squamarina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

squamose, having scales.

Squamotubera Henn. (1903) ? = Sarcoxylon fide Rogers (*Mycol.* **73**: 28, 1981).

squamule, a small scale.

squamulose (1) having small scales; (2) growth form of a lichen thallus (Fig. 21C).

squarrose, rough with scales.

St Anthony's Fire, see ergot.

St George's mushroom, Basidioma of the edible *Calocybe gambosum*.

stachel, bullet-like structure in the rohr with its pointed end orientated towards the appressorium and the host cell wall in plasmodiophorids. See also rohr and schlauch.

Stachybotryella Ellis & Barthol. (1902), anamorphic *Pezizomycotina*, Hso.0eP.?. 2, N. America.

Stachybotryna Tubaki & T. Yokoy. (1971), anamorphic *Pezizomycotina*, Hso.0eH.15. 3, widespread. See Tubaki & Yokoyama (*TMSJ* **12**: 18, 1971), Calduch *et al.* (*Mycol.* **94**: 355, 2002; Spain, key).

stachybotryotoxin, a mycotoxin produced by *Stachybotrys* growing on hay; implicated in serious poisoning of horses (stachyobotrytoxicosis).

Stachybotrys Corda (1837), anamorphic *Hypocreales*, Hsy.0eP.15. *c.* 44, widespread. Toxin-producing spp. are frequently encountered in environmental surveys of damp buildings. See Barron (*CJB* **39**: 1566, 1961), Verona & Mazzucchetti (*Microfunghi della cellulosa e della carta* □ *I generi Stachybotrys e Memnoniella*, 1968), Jong & Davis (*Mycotaxon* **3**: 409, 1976; spp. in cult.), McKenzie (*Mycotaxon* **41**: 179, 1991; spp. from *Freycinetia*), Haugland *et al.* (*Mycol.* **93**: 54, 2001; phylogeny), Andersen *et al.* (*Mycol.* **94**: 392, 2002; from water-damaged buildings), Andersen *et al.* (*Mycol.* **95**: 1227, 2003; chemotypes), Koster *et al.* (*CJB* **81**: 633, 2003; phylogeny), Taylor *et al.* (*Can. J. Pl. Path.* **25**: 49, 2003; molecular detection), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny), Pinruan *et al.* (*Fungal Diversity* **17**: 145, 2004; key), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Stachycoremium Seifert (1986), anamorphic *Pezizomycotina*, Hsy.1eH.16. 1, USA; E Asia. See Okada (*Microbiol. Culture Coll.* **12**: 17, 1996; conidiogenesis).

Stachylidium Link (1809), anamorphic *Pezizomycotina*, Hso.0eP.15. 2, widespread. See Hughes (*TBMS* **34**: 551, 1951).

Stachylina L. Léger & M. Gauthier (1932), Harpellaceae. 29 (in *Diptera*), widespread. See Lichtwardt (*Mycol* **64**: 167, 1972), Moss (*Mycol.* **66**: 173, 1974; cytology), Moss *in* Fuller & Lovelock (Eds) (*Microbial ultrastructure*: 279, 1976; ultrastr.), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), Lichtwardt *et al.* (*TMSJ* **28**: 376, 1987), Lichtwardt & Williams (*Mycol.* **80**: 400, 1988; zygospores), Lichtwardt & Williams (*CJB* **68**: 1057, 1990), Williams & Lichtwardt (*CJB* **68**: 1045, 1990), White & Lichtwardt (*Mycol.* **96**: 891, 2004; Norway), White (*MR* **110**: 1011, 2006; phylogeny), White *et al.* (*Mycol.* **98**: 333, 2006; USA), Valle (*Mycol.* **99**: 442, 2007; Spain).

Stachylinoides Lichtw. & López-Lastra (1999), Harpellaceae. 1 (in *Diptera*), S. America. See Lichtwardt *et al.* (*Mycol.* **91**: 1069, 1999).

Stachyomphalina H.E. Bigelow (1979) = Gamundia fide Kuyper (*in litt.*).

stage, a phase of the life cycle (q.v.). See States of fungi.

Staginospora Trivedi & C.L. Verma (1971), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Tertiary), India.

Stagnicola Redhead & A.H. Sm. (1986), Strophariaceae. 1, widespread (north temperate). See Redhead & Smith (*CJB* **64**: 645, 1986).

Stagonopatella Petr. (1927), anamorphic *Pezizomycotina*, St.0fH.?. 1, Europe.

Stagonopsis Sacc. (1884), anamorphic *Pezizomycotina*, Cpd.≡ eH.?. 4, widespread (temperate). See Petrak (*Sydowia* **3**: 139, 1949).

Stagonospora (Sacc.) Sacc. (1884) nom. cons., anamorphic *Phaeosphaeria*, Cpd.≡ eH.1. *c.* 209, widespread. *S. nodorum* and *S. avenae*, important cereal pathogens. The genus is poylphyletic as currently circumscribed, and often confused with *Septoria* (q.v.). See Castellani & Germano (*Ann. Fac. Sci. Agric. Univ. Torino* **10**: 1, 1977; 77 graminicolous spp.),

Philipson (*New Phytol.* **113**: 127, 1989; ultrastr.), Crane & Shearer (*Bull. Ill. St. nat. Hist. Stagonosporella Tassi (1902) = Stagonospora fide Saccardo (*Syll. fung.* **18**, 1906).

Stagonosporina Tassi (1902), anamorphic *Pezizomycotina*, Cpd.≡ eH.?. 1, widespread.

Stagonosporites Babajan & Tasl. (1970), Fossil Fungi. 1 (Tertiary), former USSR.

Stagonosporopsis Died. (1912) = Ascochyta fide Petrak (*Annls mycol.* **23**: 5, 1925), Boerema *et al.* (*Phoma Identification Manual* Differentiation of Specific and Infra-Specific Taxa in Culture: 470 pp., 2004).

Stagonostroma Died. (1914) = Fusarium fide Sutton (*Mycol. Pap.* **141**, 1977).

Stagonostromella Petr. & Syd. (1927), anamorphic *Pezizomycotina*, St.≡ eH.?. 1, Brazil.

Staheliella Emden (1974), anamorphic *Pezizomycotina*, Hso.0eP.39. 1, Surinam. See Emden (*Acta Bot. Neerl.* **23**: 251, 1974).

Staheliomyces E. Fisch. (1921), Phallaceae. 1, C. & S. America.

Staibia Bat. & Peres (1966), Leptopeltidaceae. 1, Brazil. See Batista & Peres (*Atas Inst. Micol. Univ. Pernambuco* **3**: 142, 1966).

Stains. See also mounting media. Stains are used to highlight fungal structures for viewing with the compound light microscope. Cotton blue (also known as aniline blue) is the most popular stain for the microscopic examination of most groups of fungi and is frequently used at 0.1% with lactic acid or (formerly, but now not recommended) lactophenol to produce permanent mounts. Acid fuchsin, a red stain, is combined with lactic acid to produce lactofuchsin. This gives excellent clarity and is also suitable for permanent preparations for most groups of fungi (Carmichael, *Mycol.* **47**: 611, 1955). Erythrosin B in aqueous ammonia gives good differentiation between cell walls and cytoplasm (ideal for elucidating conidial ontogeny) but crystallizes rapidly and is therefore only suitable in temporary mounts. Useful red stains for fungi also include congo red (Gurr, *Encyclopaedia of microscopic stains*, 1960), orseillin BB (Alcorn & Yeager, *Stain Technology* **12**: 158, 1937) and rosazurin (Locquin & Langeron, Handbook of microscopy, 1983). Diazonium blue B is used for staining yeasts (Kurtzman & Fell, The Yeasts, a taxonomic study, edn 4, 1998) but has also been used as a stain for filamentous fungi (Hopsu-Havu *et al.*, *Mykosen* **10**: 23, 1967), Summerbell (*Mycol.* **77**: 587, 1985). Use of trypan blue as a stain for fungi was described by Boedijn (*Stain Technology* **31**: 115, 1965). Cresyl blue is used for staining spore-walls of basidiomycetes (Locquin, *BSMF* **68**: 170, 1952). For use of toluidine blue O in polychromatic staining of fungal structures, see Ghemawat (*Physiol. Plant Path.* **11**: 251, 1977). Safranin O is frequently used as a counter-stain but can also be used as a rapid nuclear stain for fungi (Bandoni, *Mycol.* **71**: 873, 1979). Black stains include chlorazole-black (Armitage, *TBMS* **27**: 131, 1944) and nigrosin, which can be used in combination with picric acid (picro-nigrosin) to stain fungal structures (Fleming & Smith, *TBMS* **27**: 13, 1944). Nigrosin is also useful as a negative stain for examining mucilaginous material on the surface of spores and hyphae.

Staining methods for differentiation of fungi in plant tissues include the use of Bruzzese and Hasan's technique (Brusseze & Hasan, *Plant Path.* **32**: 335, 1983), periodic acid-Schiff's technique (Dring, *New Phytol.* **54**: 277, 1955) and thionin and orange G (Stoughton, *Ann. Appl. Biol.* **17**: 162, 1930). For further details of staining methods for fungi in plant tissues see Tuite (*Plant pathological methods. Fungi and bacteria*, 1969) and Fox (*Principles of diagnostic techniques in plant pathology*, 1993).

To differentiate fungi in animal tissues, good results are obtained with the periodic acid-Schiff stain (Kligman & Mescon, *J. Bact.* **60**: 415, 1950), Gridley's technique (Gridley, *Am. J. Clin. Path.* **23**: 303, 1953), Grocott's modification of the Gomori methenamine silver stain (Grocott, *Am. J. Clin. Path.* **25**: 975, 1955) and the standard haematoxylin-eosin stain. Brown and Brenn's modification of Gram's stain is used for examination of *Actinomyces* and *Nocardia* (Brown & Brenn, *Bull. Johns Hopkins Hosp.* **48**: 69, 1931). *Cryptococcus* is differentiated using Mayer's mucicarmine stain see Mallory (*Pathological techniques*, 1942). For further details of staining methods in medical fungi see Kwon-Chung & Bennett (*Medical mycology*, edn 4, 1992) and Rippon (*Medical mycology: the pathogenic fungi and the pathogenic actinomycetes*, 1982).

For nuclear staining of fungi, the Giemsa stain is frequently used (Hrushovetz, *CJB* **34**: 321, 1956), Duncan & Galbraith (*Stain Technology* **48**: 107, 1973). Techniques using carmine as a nuclear stain include the Feulgen-carmine technique (McIntosh, *Stain Technology* **29**: 29, 1954) and the propiono-carmine squash technique (Lu, *CJB* **40**: 843, 1962). A rapid nuclear stain for studying ascocarp development in *Lophodermium* and *Rhytisma* was described by Hulton & Morgan-Jones (*Mycol.* **66**: 881, 1974).

For testing the amyloid reaction in basidiomycetes and both lichenized and non-lichenized ascomycetes, Melzer's and Lugol's iodine are used (see mounting fluids). For discussion see Kohn & Korf (*Mycotaxon* **3**: 165, 1975 and Baral (*Mycotaxon* **29**: 399, 1987).

Stakman (Elvin Charles; 1885-1979; USA). Student,

University of Minnesota (1902-1906); school teacher (1906-1909); Assistant (1909-1913) then Section Head (1913-1940) then Head (1940-1953), Department of Vegetable [later Plant] Pathology, University of Minnesota; also for many years Director of the Federal Rust Laboratory, St Paul, Minnesota. Stakman is noted for his work on cereal rusts and their physiologic races (stemming from his doctoral thesis) and, in particular, for leading the campaign to eradicate barberry, the alternate host of black-stem rust, from major wheat-growing areas of the USA. A cultured and versatile man, author of more than 300 papers and co-author of two books. *Publs.* A study in cereal rusts. Physiological races. *Minnesota Agricultural Experiment Station Bulletin* **138** (1914); (with J.G. Harrar) *Principles of Plant Pathology* (1957). *Biogs, obits etc.* Anon. *Aurora Sporalis. E.C. Stakman Day issue 17 May 1979*, 1979) [Department of Plant Pathology, University of Minnesota]; Christensen (*Phytopathology* **69**: 195, 1979) [portrait]; Christensen (*E.C. Stakman, Statesman of Science*, 1984) [bibliography, biography, portrait]; Stafleu & Cowan (*TL-2* **5**: 830, 1985); Wilcoxson & Kommedahl (*Review of Tropical Plant Pathology* **7**: 223, 1993).

Stakmania Kamat & Sathe (1968) = Phakopsora fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Stalactocolumella S. Imai (1950) nom. nud. ≡ Circulocolumella.

Stalagmites Theiss. & Syd. (1914), Nectriaceae. 1 (branches), Brazil. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Stalagmochaetia Cif. & Bat. (1963), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, USA. See Ciferri & Batista (*Quad. Lab. crittogam., Pavia* **31**: 187, 1963).

stalagmoid (of spores, **stalagmospores**), like a long tear or drop.

staling substances, substances produced by an organism which slow up or stop its growth (iso-antagonism) (see Brown, *Ann. Bot., Lond.* **37**: 106, 1923); **inhibitory substances** are similar substances which retard or inhibit the growth of *other* organisms (e.g. penicillin) (hetero-antagonism; cf. antibiotic substances). See Porter & Carter (*Bot. Rev.* **4**: 165, 1938).

Starbaeckiella (Sacc. & P. Syd.) Syd. & P. Syd. (1919) = Pyrenula Ach. (1809) fide Harris (*Mem. N. Y. bot. Gdn* **49**, 1989).

Starkeyomyces Agnihothr. (1956) = Myrothecium fide Tulloch (*Mycol. Pap.* **130**, 1972).

Starmera Y. Yamada, Higashi, S. Ando & Mikata (1997), ? Phaffomycetaceae. 3, widespread. See Yamada *et al.* (*Biosc., Biotechn., Biochem.* **63**: 827, 1999), Starmer *et al.* (*FEMS Yeast Res.* **3**: 441, 2003), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Starmerella C.A. Rosa & Lachance (1998), Saccharomycetales. Anamorph *Candida*. 1, Canada. See Rosa & Lachance (*Int. J. Syst. Bacteriol.* **48**: 1413, 1998), Teixeira *et al.* (*Int. J. Syst. Evol. Microbiol.* **53**: 339, 2003), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

starters, the pure cultures or mixtures of fungi and bacteria used for starting fermenting processes. Pure culture starters are used in beer making, etc., and frequently in butter and cheese making. Examples of the more complex type are ragi (q.v.) used for Javanese arak (an alcoholic drink from rice starch), Chinese rice (Mingen or Men) (*Rhizopus oryzae*) the starter for rice wine, the Japanese Koji (preparations of *Aspergillus* used in soy and other fermenting processes), and kephir grains, a mixture of yeasts and bacteria which is the starter for kephir. See Fermented foods and beverages.

States of fungi. Since publication of the Tulasnes' *Selecta carpologia fungorum* (1861-1865), it has been accepted that many fungi are pleomorphic, that is, one fungus may produce several sorts of spores which may or may not be coincident in time and may or may not be produced after a nuclear fusion followed by meiosis, a sequence that may be interpreted as sexual. The state characterized by sexual spores (ascospores, basidiospores, etc.) has traditionally been designated the **'perfect' state** (or stage), that characterized by asexual spores (conidia) or the absence of spores the **'imperfect' state** (or stage). Under the code governing scientific names of fungi it is permissible to treat both 'perfect' and 'imperfect' states as species designated by latinized binomials, but when a 'perfect' and 'imperfect' species have been established to be different states of the same fungus the binomial applied to the 'perfect' state also covers that of the 'imperfect' and takes precedence. To increase precision in terminology for states of pleomorphic fungi, Hennebert & Weresub (*Mycotaxon* **6**: 207, 1977) introduced new nouns and adjectives: **holomorph**, for the whole fungus in all its morphs, phases, stages or states; **teleomorph**, for the

sexual ('perfect') state (e.g. that characterized by ascomata or basidiomata); and **anamorph**, for the asexual ('imperfect') state (e.g. that characterized only by presence or absence of conidia). **Synanamorph** is applied to any one of two or more anamorphs which have the same teleomorph (Gams, *Mycotaxon* **15**: 459, 1982). A holomorph includes a teleomorph and frequently one, or rarely more anamorphs. The term **ana-holomorph** has been used for an 'imperfect' fungus (anamorphic fungus) which appears to lack a 'perfect' state (teleomorph). A name applied under the Code to both perfect and imperfect states of a fungus is a **nomen holomorphosis**; that to the imperfect state a **nomen anamorphosis**. It has also been suggested that **anamorph-genus** and **anamorph-species** should replace the terms 'form genus' and 'form species'.

The morph terminology (which has been adopted for pleomorphic fungi in this *Dictionary*) is discussed in detail in Kendrick (Ed.) (*The whole fungus*, 2 vols, 1979) which also includes a reprint of Hennebert & Weresub's paper. A more recent discussion of the issues is presented in Seifert *et al.* (*Stud. Mycol.* **45**, 2000). See Nomenclature.

statismospore, a spore not forcibly discharged. Cf. ballistospore.

Statistical methods and design of experiments, see Johnston & Booth (Eds) (*Plant pathologist's pocketbook*: 353 edn 2, 1983).

statolon, an antiviral substance (which induces interferon formation) from *Penicillium stoloniferum*; the active principle of which is considered to be RNA of viral origin (Banks *et al.*, *Nature* **218**: 542, 1968).

Stauriella Sivichai & E.B.G. Jones (2004), anamorphic *Pezizomycotina*. 1, Thailand. See Sivichai & Jones (*Sydowia* **56**: 132, 2004).

Staurochaeta Sacc. (1875) ? = Staurophoma fide Sutton (*Mycol. Pap.* **141**, 1977).

Staurolemma Körb. (1867), Collemataceae (L). 3, widespread. See Jørgensen & Henssen (*Graphis Scripta* **5**: 12, 1993), Henssen (*Nova Hedwigia* **68**: 117, 1999; Australia), Jørgensen & Henssen (*Bryologist* **102**: 22, 1999), Jørgensen (*Bryologist* **107**: 392, 2004; N America).

Stauronema (Sacc.) Syd., P. Syd. & E.J. Butler (1916), anamorphic *Pezizomycotina*, Ccu.0eH.19. 6, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Abbas *et al.* (*Pakist. J. Bot.* **34**: 117, 2002).

Stauronematopsis Abbas, B. Sutton & Ghaffar (2002), anamorphic *Pezizomycotina*, C?.?.?. 1, USA. See Abbas *et al.* (*Pakist. J. Bot.* **34**: 118, 2002).

Staurophallus Mont. (1845) nom. dub., Phallaceae.

Staurophoma Höhn. (1907), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1, S. America; Hong Kong. See Morgan-Jones *et al.* (*Univ. Waterloo Biol. Ser.* **4**, 1972), Yanna *et al.* (*Sydowia* **50**: 139, 1998).

Staurosphaeria Rabenh. (1858) = Karstenula fide Saccardo (*Syll. fung.* **3**, 1883).

staurospore (stauroconidium), a non-septate or septate spore with more than one axis; axes not curved through more than 180° (cf. helicospore); protuberances present and ›$^1/_4$ spore body length (cf. amerospore). See Anamorphic fungi.

Staurothele Norman (1852) nom. cons., Verrucariales (L). *c.* 72, widespread. See Swinscow (*Lichenologist* **2**: 152, 1963; Brit. spp.), Thomson (*Bryologist* **94**: 351, 1991; key 17 spp., N. Am.), Harada (*Nat. Hist. Res.* **2**: 39, 1992; Japan), McCarthy (*Muelleria* **8**: 275, 1995; Australia), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Harada & Wang (*Lichenology* **5**: 13, 2006; China), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny), Lumbsch *et al.* (*MR* **111**: 257, 2007; phylogeny).

Stegasphaeria Syd. & P. Syd. (1916), Mesnieraceae. 2 (from living leaves), Philippines; Africa. See Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Stegasphaeriaceae Syd. & P. Syd. (1916) = Mesnieraceae.

Stegastroma Syd. & P. Syd. (1916) = Anisomyces Theiss. & Syd. fide Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973).

Stegia Fr. (1818) [non *Stegia* DC. 1805, *Malvaceae*] ≡ Stegilla.

Stegiacantha Maas Geest. (1966), ? Meruliaceae. 1, Madagascar. See Maas Geesteranus (*Proc. K. ned. Akad. Wet.* C **69**: 317, 1966).

Stegilla Rchb. (1828) nom. dub., Fungi. See Sutton & Pirozynski (*TBMS* **46**: 517, 1964).

Stegites Mesch. (1892), Fossil Fungi. 2 (Tertiary), Europe.

Stegobolus Mont. (1845), Thelotremataceae (L). 1, pantropical. See Hale (*Bull. Br. Mus. nat. hist.* Bot. **8**: 227, 1981), Frisch & Kalb (*Biblthca Lichenol.* **92**: 371, 2006; revision).

Stegocintractia M. Piepenbr., Begerow & Oberw. (1999), Anthracoideaceae. 5 (on *Juncaceae*). See Piepenbring (*Bot. Jb.* **24**: 241, 2003).

Stegolerium Strobel, W.M. Hess & E. Ford (2001), anamorphic *Pezizomycotina*. 1, Venezuela. See Strobel *et al.* (*Mycotaxon* **78**: 356, 2001).

Stegonsporiopsis Van Warmelo & B. Sutton (1981), anamorphic *Pezizomycotina*, St.#eP.15. 1, N. America. See van Warmelo & Sutton (*Mycol. Pap.* **145**: 17, 1981).

Stegonsporium Corda (1827), anamorphic *Splanchnonema*, Cac.#eP.19. 3, widespread. See van Warmelo & Sutton (*Mycol. Pap.* **145**, 1981).

Stegopeziza Höhn. (1917) = Hysterostegiella fide Hein (*Nova Hedwigia* **38**: 669, 1983).

Stegopezizella Syd. (1924) = Sarcotrochila fide Korf (*Mycol.* **54**: 12, 1962).

Stegophora Syd. & P. Syd. (1916), Sydowiellaceae. Anamorph *Cylindrosporella*. 1 (on *Ulmus*), N. America. See Petrak (*Annls mycol.* **38**: 267, 1940), McGranahan & Smalley (*Phytopathology* **74**: 1300, 1984; culture), European and Mediterranean Plant Protection Organization (*Bulletin OEPP* EPPO Bulletin **35**: 416, 2005), Rossman *et al.* (*Mycoscience*

48: 135, 2007; review).

Stegophorella Petr. (1947), Pezizomycotina. 1, Ecuador.

Stegothyrium Höhn. (1918), ? Microthyriaceae. 1, Europe.

Steinera Zahlbr. (1906), Coccocarpiaceae (L). 4, Australasia. See Henssen & James (*Bull. Br. Mus. nat. hist.* Bot. **10**: 227, 1982), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **31**: 822, 2004; phylogeny), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny).

Steiner's stable PD solution, *p*-phenylenediamine, 1 g; sodium sulphite (Na_2SO_3), 10 g liquid detergent, *c.* 10 drops; water, 100 ml. Stable for at least 6 months; see Scott (*Lichenologist* **1**: 88, 1958). See also Metabolic products.

Steinhausia Sprague, Ormières & Manier (1972), Microsporidia. 2.

Steinia Körb. (1873), Aphanopsidaceae (L). 2, Europe; Australia. See Faurel & Schotter (*Bull. Soc. Hist. nat. Afr. Noire* **25**: 126, 1954), Hafellner (*Cryptog. Bot.* **5**: 99, 1995), Printzen & Rambold (*Lichenologist* **27**: 91, 1995), Kantvilas & McCarthy (*Lichenologist* **31**: 555, 1999).

Steirochaete A. Braun & Casp. (1853) = Colletotrichum fide Southworth (*J. Mycol.* **6**: 115, 1890).

Stelechotrichum Ritgen (1831) nom. inval. ≡ Cephalotrichum Link.

steliogen, the structure which gives rise to the sporocarp stalk in protostelids.

Stella Massee (1889) [non *Stella* Medik. 1787, *Leguminosae*] = Scleroderma fide Demoulin (*in litt.*).

Stellasclerotes Beneš (1959), Fossil Fungi. 1 (Carboniferous), former Czechoslovakia.

stellate, like a star in form; **- seta**, a compound seta having several radiating arms; asterophysis.

Stellatospora Tad. Ito & Nakagiri (1994), Chaetomiaceae. 1, Japan. See Ito & Nakagiri (*Mycoscience* **35**: 413, 1994).

Stellatostroma, see *Asterostroma*.

Stellifera Léman (1824) nom. dub., anamorphic *Agaricaceae*.

Stellifraga Alstrup & Olech (1993), Pezizomycotina. 1 (on lichens, esp. *Cladonia*), Spitsbergen. See Alstrup & Olech (*Polish Polar Research* **14**: 39, 1993).

Stelligera R. Heim ex Doty (1948) = Lachnocladium fide Corner (*Ann. Bot. Mem.* [A monograph of Clavaria and allied genera] **1**, 1950).

Stellomyces Morgan-Jones, R.C. Sinclair & Eicker (1987), anamorphic *Pezizomycotina*, Hso.0eH.6. 1, S. Africa; India. See Morgan-Jones *et al.* (*Mycotaxon* **28**: 447, 1987), Keshavaprasad & Bhat (*Mycotaxon* **84**: 61, 2002).

Stellopeltis Bat. & A.F. Vital (1959), anamorphic *Pezizomycotina*, Cpt.0eH.?. 2, Brazil. See Batista & Vital (*Mycopath. Mycol. appl.* **11**: 88, 1959).

Stellosetifera Matsush. (1996), Pseudoperisporiaceae. Anamorph *Penicillifer*. 1, Malaysia. Possibly related to *Wentiomyces*. See Matsushima (*Mycol. Mem.* **9**, 1996).

Stellospora Alcorn & B. Sutton (1984), anamorphic *Pezizomycotina*, Hso.0eH.15. 1 (on *Appendiculella*), Australia; Philippines. See Alcorn & Sutton (*Mycotaxon* **20**: 45, 1984).

Stellothyriella Bat. & Cif. (1959), anamorphic *Pezizomycotina*, Cpt.1eH.?. 1, USA. See Batista & Ciferri (*Mycopath. Mycol. appl.* **11**: 62, 1959).

Stemastrum Raf. (1808) nom. dub., Agaricales. 'gasteromycetes'.

Stemmaria Preuss (1851) nom. dub. ? = Mycosylva fide Seifert (*Sydowia* **45**: 103, 1993).

Stemmatomyces Thaxt. (1931), Laboulbeniaceae. 3, widespread. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Stempellia L. Léger & E. Hesse (1910), Microsporidia. 4.

Stemphyliites Babajan & Tasl. (1973), Fossil Fungi. 1 (Neogene), former USSR.

Stemphyliomma Sacc. & Traverso (1911) = Pithomyces fide Kirk (*TBMS* **80**: 449, 1983).

Stemphyliopsis A.L. Sm. (1901) = Stemphylium. An albino mutant. fide Petch (*TBMS* **23**: 146, 1939), Barron & Onions (*CJB* **44**: 861, 1966).

Stemphyliopsis Speg. (1910) [non *Stemphyliopsis* A.L. Sm. 1910] ≡ Stemphyliomma.

Stemphylium Wallr. (1833), anamorphic *Pleospora*, Hso.#eP.19. 43, widespread. See Wiltshire (*TBMS* **21**: 211, 1938), Simmons (*Mycol.* **61**: 1, 1969), Simmons (*Sydowia* **38**: 284, 1986), Simmons (*Mem. N. Y. bot. Gdn* **49**: 305, 1989), Basallote-Ureba *et al.* (*Pl. Stenellopsis B. Huguenin (1966), anamorphic *Mycosphaerellaceae*, Hsp.≡ eP.10. 5, New Caledonia. See Huguenin (*BSMF* **81**: 695, 1965), Crous *et al.* (*Mycol.* **93**: 1081, 2001), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Stenellopsis Morgan-Jones (1980) [non *Stenellopsis* B. Huguenin 1966] ≡ Parastenella.

Stenhammara A. Massal. ex Zahlbr. (1924) = Lecidea fide Hertel (*Beih. Nova Hedwigia* **24**, 1967).

Stenhammara Flot. ex Körb. (1855) ≡ Stenhammarella.

Stenhammarella Hertel (1967), Porpidiaceae (L). 1, Europe; central Asia. See Hertel (*Nova Hedwigia* Beih. **24**: 124, 1967), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004; phylogeny).

Stenocarpella Syd. & P. Syd. (1917), anamorphic *Diaporthales*, Cpd.1-≡ eP.15. 2, widespread (tropical). See Sutton (*The Coelomycetes*, 1980), Dorrance *et al.* (*Pl. Dis.* **83**: 675, 1999; culture, isozymes), Xia & Achar (*J. Phytopath.* **149**: 35, 2001; molecular detection), Crous *et al.* (*Stud. Mycol.* **55**: 235, 2006; phylogeny).

Stenocephalopsis Chamuris & C.J.K. Wang (1998), anamorphic *Pezizomycotina*, Hso.?.?. 1, widespread. See Chamuris & Wang (*Mycol.* **90**: 464, 1998).

Stenocephalum Chamuris & C.J.K. Wang (1990), anamorphic *Pezizomycotina*, Hso.0eH/1eP.10. 1, widespread. See Chamuris & Wang (*Mycol.* **82**: 530, 1990), Chamuris & Wang (*Mycol.* **90**: 464, 1998).

Stenocladiella Marvanová & Descals (1987), anamorphic *Pezizomycotina*, Hso.1bH.10. 2 (aquatic), Europe. See Marvanová & Descals (*TBMS* **89**: 507, 1987).

Stenocybe Nyl. ex Körb. (1855), Mycocaliciaceae. *c.* 14, widespread. See Tschermak-Woess (*Lichenologist* **10**: 69, 1978; biology), Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Peterson & Rikkinen (*Mycol.* **90**: 1087, 1998), Tibell & Wedin (*Mycol.* **92**: 577, 2000), Titov *et al.* (*Botanicheskiĭ Zhurnal* **87**: 60, 2002), Döbbeler & Feuerer (*Biblthca Lichenol.* **88**: 91, 2004; on liverwort), Tibell & Vinuesa (*Taxon* **54**: 427, 2005; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny).

Stenocybella Vain. (1927) = Calicium fide Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984).

Stenographa Mudd (1861) = Thalloloma fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stenospora Deighton (1969), anamorphic *Pezizomycotina*, Hso.0fH.10. 1 (on *Puccinia*), Sierra Leone. See Deighton (*Mycol. Pap.* **118**: 22, 1969).

Stephanoascus M.T. Sm., Van der Walt & Johannsen (1976) = Trichomonascus fide Traquair *et al.* (*CJB* **66**: 926, 1988), Giménez-Jurado *et al.* (*Syst. Appl. Microbiol.* **17**: 237, 1994), Smith & Hoog *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 400, 1998), Ueda-Nishimura & Mikata (*Int. J. Syst. Evol. Microbiol.* **52**: 463, 2002), Kurtzman & Robnett (*FEMS Yeast Res.* **7**: 141, 2007).

Stephanocyclos Hertel (1983), Porpidiaceae (L). 1, Antarctica. See Hertel (*Lecideaceae exsiccatae* Fascicle V: no. 96, 1983), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004; phylogeny).

stephanocyst, a structure, typically bicellular (basal cell cup-like, terminal cell globose), found in certain basidiomycetes. See Burdsall (*Mycol.* **61**: 915, 1969).

Stephanoma Wallr. (1833), anamorphic *Hypomyces*, Hso.0bP.1. 3, widespread. See Butler & McCain (*Mycol.* **60**: 955, 1968), Põldmaa (*Stud. Mycol.* **45**: 83, 2000), Samuels *et al.* (*CBS Diversity Ser.* **4**, 2006; USA).

Stephanomyces Speg. (1917) = Cucujomyces fide Thaxter (*Memoirs of the American Academy of Arts and Sciences* **16**: 1, 1931).

Stephanonectria Schroers & Samuels (1999), Bionectriaceae. 1, British Isles. See Schroers *et al.* (*Sydowia* **51**: 116, 1999), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny).

Stephanophallus MacOwan [not traced] = Anthurus fide Saccardo (*Syll. fung.* **7**: 23, 1888).

Stephanophoron Nádv. (1942) = Nadvornikia fide Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984).

Stephanophorus Flot. (1843) = Leptogium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stephanopus M.M. Moser & E. Horak (1975), Cortinariaceae. 5, S. America. See Moser & Horak (*Beih. Nova Hedwigia* **52**: 608, 1975; key).

Stephanospora Pat. (1914), Stephanosporaceae. 4, Eurasia; New Zealand. See Oberwinkler & Horak (*Pl. Syst. Evol.* **131**: 157, 1979), Martín *et al.* (*Mycotaxon* **90**: 133, 2004; relationship with *Lindtneria trachyspora*), Larsson (*MR* **111**: 1040, 2007), Lawrey *et al.* (*Mol. Phylog. Evol.* **44**: 778, 2007).

Stephanosporaceae Oberw. & E. Horak (1979), Agaricales. 5 gen. (+ 3 syn.), 21 spp.

Lit.: Oberwinkler & Horak (*Pl. Syst. Evol.* **131**: 157, 1979), Pegler & Young (*TBMS* **72**: 353, 1979), Beaton *et al.* (*Kew Bull.* **40**: 573, 1985), Lebel & Castellano (*Mycol.* **94**: 327, 2002), Martín *et al.* (*Mycotaxon* **90**: 133, 2004).

Stephanosporium Dal Vesco (1961), anamorphic *Pezizomycotina*, Hso.0eP.39. 1, widespread. See Dal Vesco (*Allionia* **7**: 182, 1961).

Stephanotheca Syd. & P. Syd. (1914), Elsinoaceae. 2, Philippines.

Stephanothecaceae Petr. (1931) = Elsinoaceae.

Stephembruneria R.F. Castañeda (1988), anamorphic *Pezizomycotina*, Hso.≡ eP.15. 1, Cuba. See Castañeda (*Fungi Cubenses* **3**: 14, 1988).

Stephensia Tul. (1845), Pyronemataceae. 7 (hypogeous), widespread. See de Vries (*Coolia* **28**: 96, 1985), Fontana & Giovannetti (*Mycotaxon* **29**: 37, 1987; anamorph), Trappe *et al.* (*Mycotaxon* **64**: 431, 1997), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Stephosia Bat. & H. Maia (1967) = Porina Müll. Arg. fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Sterbeeckia Dumort. (1822) ≡ Craterellus.

Stercum, see *Stereum*.

Stereaceae Pilát (1930), Russulales. 22 gen. (+ 3 syn.), 125 spp.

Lit.: Donk (*Persoonia* **3**: 199, 1964), Reid (*Beih. Nova Hedwigia* **18**: 484 pp., 1965; stipitate steroid spp.), Jahn (*Westfäl. Stereocaulum Clem. (1909) = Pertusaria fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stereochlamydomyces Cif. & Tomas. (1953) ≡ Stereochlamys.

Stereochlamys Müll. Arg. (1885) = Trichothelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stereocladium Nyl. (1875) = Stereocaulon Hoffm. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stereoclamydomyces, see *Stereochlamydomyces*.

Stereocrea Syd. & P. Syd. (1917), Clavicipitaceae. 1 (on grasses), widespread (paleotropics). See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Bischoff & White (*Mycology Series* **19**: 125, 2003).

Stereofomes Rick (1928), Lachnocladiaceae. 5, S. America; Japan. See Donk (*Taxon* **6**: 114, 1957; a nom. dub.), Boidin & Lanquetin (*Biblthca Mycol.* **114**, 1987).

Stereogloeocystidium Rick (1940) = Podoscypha fide Boidin (*Revue Mycol.* Paris **24**: 197, 1959).

Stereolachnea Höhn. (1917) = Scutellinia fide Denison (*Mycol.* **51**: 605, 1959).

stereome (of lichens), a scleroplectenchyma which forms the main supporting tissue of the thallus, as in *Alectoria*, *Bryoria*, and *Cladonia*.

Stereonema Kütz. (1836) = Lecidea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stereopeltis Franzoni & De Not. (1861) = Sarcogyne Flot. (1851) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stereophyllum P. Karst. (1889) [non *Stereophyllum* Mitt. 1859, *Musci*] ≡ Cyphellostereum.

Stereopodium Earle (1909) ≡ Mycena.

Stereopsis D.A. Reid (1965), Meruliaceae. 13, widespread (esp. tropical). See Boidin *et al.* (*BSMF* **66**: 445, 1998; sub *Phanerochaetaceae*), Douanla-Meli & Langer (*Mycotaxon* **90**: 323, 2004).

Stereosorus Sawada (1943) = Burrillia fide Ling (*Mycol.* **41**: 252, 1949).

Stereosphaeria Kirschst. (1939), Clypeosphaeriaceae. 1 (bark etc.), widespread (temperate). See Barr (*Sydowia* **41**, 1989), Hyde *et al.* (*Sydowia* **50**: 21, 1998), Kang *et al.* (*Mycoscience* **40**: 151, 1999).

Stereostratum Magnus (1899), Pucciniaceae. 2 (on *Bambusoideae* (*Poaceae*)), China; Japan. See Thirumalachar (*Mycol.* **52**: 690, 1961).

Stereum Hill ex Pers. (1794), Stereaceae. 27, widespread. *S. purpureum* is included in *Chondrostereum*. See Talbot (*Bothalia* **6**: 303, 1954; S. Afr.), Boidin (*Rev. Mycol.* **23**: 318, 1958), Boidin (*Rev. Mycol.* **24**: 197, 1959), Boidin (*Bull. Soc. linn. Lyon* **28**: 205, 1959), Boidin (*Bull. Jard. bot. Brux.* **30**: 51, 1960; Congo), Boidin (*Bull. Jard. bot. Brux.* **30**: 283, 1960; Congo), Welden (*Mycol.* **63**: 796, 1971; key genus s.s.), Chamuris (*Mycotaxon* **22**: 105, 1985; key N. Am. spp.), Eicker & Louw (*South African Journal of Botany* **64**: 30, 1998; S. Afr.).

Stericium Raf. (1819) nom. dub., Fungi. No spp. included.

sterigma (pl. **-ata**), (1) (of a basidium, q.v.), an extension of the metabasidium composed of a basal filamentous or inflated part (the **proto-**; epibasidium) and an apical spore-bearing projection (the **spiculum**) (Fig. 8F); (2) (of *Aspergillus*, etc.) [a usage not recommended], phialide (**secondary -**); prophialide (**primary -**); metula; (3) (of lichens), a spermatiophore (Nylander).

Sterigmatobotrys Oudem. (1886), anamorphic *Pezizomycotina*, Hso.≡ eH.10. 3, widespread (esp. north temperate). See Ellis (*Dematiaceous Hyphomycetes*, 1971), Jong & Davies (*Norw. Jl Bot.* **18**: 177, 1971), Sutton (*Mycol. Pap.* **132**, 1973), Chang. (*MR* **95**: 1142, 1991).

sterigmatocystin, a carcinogenic hepatotoxin (xanthone derivative) from *Aspergillus versicolor* (Van der Walt & Purchase, *Brit. J. exp. Path.* **51**: 183, 1970); precursor of aflatoxin B1 (Singh & Hsich, *Appl. environ. Microbiol.* **31**: 743, 1976).

Sterigmatocystis C.E. Cramer (1859) = Aspergillus fide Raper & Fennell (*The genus Aspergillus*, 1965).

Sterigmatomyces Fell (1966), anamorphic *Agaricostilbaceae*, Hso.0eH.10. 2, Atlantic Ocean; Indian Ocean. See Lodder (*Yeasts, a taxonomic study* 2nd edn: 1229, 1970), Yamada *et al.* (*J. gen. appl. Microbiol.* Tokyo **32**: 157, 1986; enzyme systems), van der Walt *et al.* (*Antonie van Leeuwenhoek* **53**: 137, 1987; key to 3 spp.), Yamada *et al.* (*Agric. Biol. Chem.* **53**: 2993, 1989; phylogeny), Guého *et al.* (*Int. J. Syst. Bacteriol.* **40**: 60, 1990; partial rRNA sequences), Kurtzman (*Int. J. Syst. Bacteriol.* **40**: 56, 1990; DNA relatedness), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny).

Sterigmatosporidium G. Kraep. & U. Schulze (1983), Cuniculitremaceae. 1, Germany. See Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny).

sterile (1) not producing spores or a sporocarp; (2) free from living microorganisms; sterilized.

Sterilization. Making free from living microorganisms, may be done by chemical (see Fungicides) or physical methods. Heat is the most widely used physical agent. Dry heat may be used for glass and other materials; death of even the most resistant bacterial spores takes place within an hour in a hot air oven at 160°C. A flame may frequently be used for the surface sterilization of instruments. Moist heat, especially if the pressure is increased, is even better. Most media may be made sterile by autoclaving for 15 min at 121°C, but when such severe heating is not possible 'discontinuous steaming' (steaming at atmospheric pressure for 20 min every day for 3 days)

is frequently used. In addition, steam is of use for the 'sterilization' (partial (or incomplete) sterilization) of soil for controlling soil-living pathogens, and hot water (about 50°C) has an important application for the control of diseases such as loose smut of wheat (*Ustilago tritici*) in which the pathogen is inside the seed. Though cold will not let growth take place, even great cold may not be lethal to micro-organisms.

Among other physical agents are ultra-violet light (to which the sterilizing effect to sunlight is due) but certain fluorescent dyes, such as eosin, are able to make bacteria sensitive to light of longer wave lengths (Blum, *Physiol. Rev.* **12**: 23, 1932), electricity (the effect of low frequency currents being possibly that of the heat or the nascent oxygen (O) or chlorine (Cl) produced), X-rays, radium emanation, and supersonic waves. Desiccation (drying) is frequently lethal, specially to the vegetative phase, but some fungal and bacterial spores are very resistant. It is sometimes possible to make a liquid sterile by filtering out the micro-organisms with a filter of unglazed porcelain. See Rahn (*Bact. Rev.* **9**: 1, 1945; physical methods), Russell *et al.* (*Principles and practice of disinfection, preservation and sterilization*, 688 pp., 2004), Sykes (*Disinfection and sterilization. Theory and practice*, 1958, *in* Norris & Ribbons (Eds), *Methods in microbiology* **1**: 77, 1969).

Sterrebekia Link (1816) [non *Sterbeckia* Schreb. 1789, *Papilionaceae*] = Scleroderma fide Stalpers (*in litt.*).

Stevensea Trotter (1926) = Diplotheca Starbäck fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Stevensiella Trotter (1928) ≡ Diatractium.

Stevensomyces E.F. Morris & Finley (1965), anamorphic *Pezizomycotina*, Hsy.0eH.?. 1, Panama. See Morris & Finley (*Mycol.* **57**: 483, 1965).

Stevensonula Petr. (1952), anamorphic *Pezizomycotina*, Ccu.1eP.1. 1, USA; New Caledonia. See Sutton (*Nova Hedwigia* **26**: 1, 1975).

Stevensula Speg. (1924) = Leptomeliola fide Hughes (*Mycol. Pap.* **166**, 1993).

Steyaertia Bat. & H. Maia (1960) = Asterolibertia fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Sthughesia M.E. Barr (1987), Capnodiales. See Eriksson & Hawksworth (*SA* **7**: 91, 1988), Winton *et al.* (*Mycol.* **99**: 240, 2007; phylogeny).

stichobasidium, see basidium.

Stichoclavaria Ulbr. (1928) ≡ Holocoryne fide Pine *et al.* (*Mycol.* **91**: 994, 1999; considered the correct name for *Multiclavula*).

Stichoclavariaceae Ulbr. (1928) = Clavariaceae.

Stichodothis Petr. (1927) = Auerswaldiella fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

Stichomyces Thaxt. (1901), Laboulbeniaceae. 7, widespread. See Santamaria i del Campo (*L'ordre Laboulbenials (Fungi, Ascomycotina) a la Peninsula Ibèrica i Illes Ballears [Thesis]*: 669 pp., 1990).

Stichophoma Kleb. (1933) ? = Sclerophoma fide Sutton (*Mycol. Pap.* **141**, 1977).

Stichopsora Dietel (1899) = Coleosporium fide Sydow & Sydow (*Monographia Uredinearum seu Specierum Omnium ad hunc usque Diem Descriptio et Adumbratio Systematica* **3**, 1915).

Stichoramaria Ulbr. (1928) ≡ Clavulina.

Stichospora Petr. (1927), anamorphic *Pezizomycotina*, St.0eH/1eP.?. 1, Europe.

Stichus D.E. Ether. (1904), Fossil Fungi (mycel.) ? Fungi. 1 (Cretaceous), Australia.

Sticta (Schreb.) Ach. (1803), Lobariaceae (L). *c.* 114, widespread (esp. tropical). See Joshi & Awasthi (*Biol. Mem.* **7**: 165, 1982; key 13 spp., India), Galloway (*Lichenologist* **26**: 223, 1994; key 12 spp. S. Am.), Galloway (*Lichenologist* **29**: 105, 1997; NZ), Galloway (*Trop. Bryol.* **15**: 117, 1998; Australia), Piovano *et al.* (*Biochemical Systematics and Ecology* **28**: 589, 2000; chemistry), Thomas *et al.* (*Biblthca Lichenol.* **82**: 123, 2001; phylogeny), Tønsberg & Goward (*Bryologist* **104**: 12, 2001; N America), McDonald *et al.* (*Bryologist* **106**: 61, 2003; USA), Wiklund & Wedin (*Cladistics* **19**: 419, 2003; phylogeny), Miądlikowska & Lutzoni (*Am. J. Bot.* **91**: 449, 2004; phylogeny), Takahashi *et al.* (*Lichenology* **2**: 174, 2004; China), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Stictaceae Stizenb. (1862) = Lobariaceae.

Stictidaceae Fr. (1849), Ostropales. 20 gen. (+ 22 syn.), 156 spp.

Lit.: Sherwood (*Mycotaxon* **5**: 1, 1977; monogr., keys), Johnston (*Mycotaxon* **24**: 349, 1985), Winka *et al.* (*Lichenologist* **30**: 455, 1998; DNA), Lücking *et al.* (*Mycol.* **96**: 283, 2004), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **31**: 822, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Wedin *et al.* (*MR* **110**: 773, 2006), Hofstetter *et al.* (*Mol. Phylogen. Evol.* **44**: 412, 2007; phylogeny).

Stictina Nyl. (1860) nom. rej. = Pseudocyphellaria fide Galloway (*Bull. Br. Mus. nat. hist.* Bot. **17**, 1988).

Stictis Pers. (1800), Stictidaceae. Anamorph *Stictospora*. *c.* 68, widespread. See Sherwood (*Mycotaxon* **5**: 1, 1977; key), Sherwood (*Mycotaxon* **6**: 215, 1977), Winka *et al.* (*Lichenologist* **30**: 455, 1998; DNA), Lumbsch *et al.* (*Organ. Divers. Evol.* **1**: 99, 2001; phylogeny), Kauff & Lutzoni (*Mol. Phylogen. Evol.* **25**: 138, 2002; phylogeny), Wedin *et al.* (*New Phytol.* **164**: 459, 2004; ecology, phylogeny), Wedin *et al.* (*Lichenologist* **37**: 67, 2005; phylogeny, lichen status), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Wedin *et al.* (*MR* **110**: 773, 2006; Scandinavia).

Stictochorella Höhn. (1917) = Asteromella fide Clements & Shear (*Gen. Fung.*, 1931).

Stictochorellina Petr. (1922) = Asteromella fide Sutton (*Mycol. Pap.* **141**, 1977).

Stictoclypeolum Rehm (1904) = Asterothyrium Müll. Arg. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stictographa Mudd (1861) = Melaspilea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stictomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Lobaria.

Stictopatella Höhn. (1918), anamorphic *Pezizomycotina*, Ccu.0eH.?. 1, Europe.

Stictophacidium Rehm (1888), ? Stictidaceae. Anamorphs *Ebollia*, *Coleophoma*-like. 1, Europe. See Sherwood (*Mycotaxon* **5**: 1, 1977).

Stictosepta Petr. (1964), anamorphic *Pezizomycotina*, St.0fH.10. 1, former Czechoslovakia. See Petrak (*Sydowia* **17**: 230, 1964), Treigiene (*Botanica Lithuanica* **12**: 131, 2006).

Stictosphaeria Tul. & C. Tul. (1863) = Diatrype fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stictospora Cif. (1957), anamorphic *Stictis*, St.0eH.?. 1, Europe. See Ciferri (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **14**: 276, 1957).

Stictostroma Höhn. (1917) ? = Placuntium fide Sherwood (*Mycotaxon* **5**: 1, 1977).
Stigeosporium C. West (1916) ? = Glomus fide Gerdemann & Trappe (*Mycol. Mem.* **5**, 1974).
Stigmagora Trevis. (1853) = Ocellularia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Stigmastoma Bat. & H. Maia (1960) = Pycnothyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Stigmatea Fr. (1849) ≡ Stigmea Fr.
Stigmateacites S.L. Zheng & W. Zhang (1986), Fossil Fungi. 2, China.
Stigmatella Berk. & M.A. Curtis (1857) ? = Chondromyces fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Stigmatella Mudd (1861) = Sclerophyton fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Stigmatellina Bat. & H. Maia (1960), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Belgium. See Batista & Maia (*Nova Hedwigia* **2**: 474, 1960).
Stigmateopsis Bat. (1960) = Placonema fide Sutton (*Kew Bull.* **31**: 461, 1977), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).
Stigmatidium G. Mey. (1825) = Enterographa fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Stigmatisphaera Dumort. (1822) nom. dub., Pezizomycotina. Used for diverse perithecioid fungi.
Stigmatochroma Marbach (2000), Caliciaceae (L). 7, widespread. See Marbach (*Biblthca Lichenol.* **74**: 304, 2000).
stigmatocyst, see hyphopodium.
Stigmatodothis Syd. & P. Syd. (1914), Micropeltidaceae. 1, Philippines; Australia. See Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; Australia).
Stigmatolemma Kalchbr. (1882) = Resupinatus fide Thorn *et al.* (*Mycol.* **97**: 1140, 2005).
Stigmatomassaria Munk (1953) = Splanchnonema fide Barr (*Mycotaxon* **15**: 349, 1982), Barr (*Mycotaxon* **46**, 1993).
Stigmatomma Körb. (1855) = Staurothele fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Stigmatomyces H. Karst. (1869), Laboulbeniaceae. 135 (on *Diptera*), widespread. See Santamaría & Rossi (*An. Jard. bot. Madr.* **51**: 33, 1993; Iberian spp.), Hedström (*MR* **98**: 403, 1994; neotropics), Weir & Rossi (*MR* **99**: 841, 1995; key Brit. spp.), Weir & Blackwell (*MR* **105**: 1182, 2001; phylogeny), Hughes *et al.* (*Mycol.* **96**: 834, 2004; New Zealand, New Caledonia), Rossi *et al.* (*MR* **109**: 271, 2005; in amber), Rossi & Weir (*Mycol.* **99**: 139, 2007).
stigmatomycosis (of cotton (*Gossypium*) bolls, *Phaseolus*, and other plants), damage caused by insect-inoculated fungi such as *Nematospora gossypii* and *N. coryli*. See Leach (*Insect transmission of plant diseases*, 1940), Frazer (*Ann. appl. Biol.* **31**: 271, 1944).
Stigmatopeltis Doidge (1927) = Vizella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).
Stigmatophragmia Tehon & G.L. Stout (1929), Micropeltidaceae. 1, N. America.
stigmatopodium (stigmopodium), see hyphopodium.
Stigmatopsis Traverso (1906) = Cryptosphaeria Ces. & De Not. fide Barr (*Mycol. Mem.* **7**, 1978).
Stigmatoscolia Bat. & Peres (1960) = Lophodermium fide von Arx (*in litt.*).
Stigmatula (Sacc.) Syd. & P. Syd. (1901), Phyllachoraceae. Anamorph *Rhodosticta*. 10 (on *Leguminosae*), widespread (temperate). See Cannon (*Mycol. Pap.* **163**, 1991), Cannon *in* McKey, D. & Sprent, J. (Eds) (*The Nitrogen Factor. Advances in Legume Systematics* **5**: 179, 1994; coevolution), Cannon (*Mycopathologia* **135**: 37, 1996).
Stigme Syd. & P. Syd. (1917) = Dimerina fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).
Stigmea Bonord. (1864) = Dothiora Fr. (1849) fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Stigmea Fr. (1836), Dothideomycetes. 20, widespread.
Stigmella Lév. (1842), anamorphic *Pezizomycotina*, Cpd.#eP.1. 27, widespread. See Hughes (*Mycol. Pap.* **49**, 1952).
Stigmidium Trevis. (1860), Mycosphaerellaceae. *c.* 75 (on lichens), widespread. See David & Hawksworth (*SA* **5**: 158, 1986; posn), Roux & Triebel (*Bull. Soc. linn. Provence* **45**: 451, 1994; key 17 spp.), Calatayud & Triebel (*Nova Hedwigia* **69**: 439, 1999; Spain), Calatayud & Triebel (*Biblthca Lichenol.* **78**: 27, 2001), Calatayud & Triebel (*Lichenologist* **35**: 103, 2003), Roux & Triebel (*Mycotaxon* **91**: 133, 2005; anatomy), Crous *et al.* (*Stud. Mycol.* **58**: 1, 2007).
Stigmina Sacc. (1880) = Pseudocercospora. Polyphyletic, with species linked to diverse *Dothideomycetes*. See Philipson (*New Phytol.* **113**: 127, 1989; ultrastr.), Sutton & Pascoe (*MR* **92**: 210, 1989; taxonomic re-evaluation), Sutton (*Arnoldia* **14**: 33, 1997), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003), Braun & Crous (*Taxon* **55**: 803, 2006; nomencl.).
Stigmochora Theiss. & Syd. (1914), Phyllachoraceae. 2 or 9 (living legume leaves), S. America. African species are not congeneric. See Cannon (*Mycol. Pap* **163**, 1991), Cannon (*Mycopathologia* **120**: 61, 1992).
Stigmopeltella Syd. (1927) = Stigmopeltis fide Clements & Shear (*Gen. Fung.*, 1931).
Stigmopeltis Syd. (1927), anamorphic *Pezizomycotina*, Cpt.0fH.?. 2, C. America.
Stigmopeltopsis Peres (1961) = Myxothyriopsis fide von Arx (*in litt.*).
Stigmopsis Bubák (1914) = Cheiromyces fide Moore (*Mycol.* **50**: 681, 1959).
Stigonema C. Agardh ex Bornet & Flahault (1887), Algae. Algae.
stilbaceous (obsol.), having synnemata; synnematous (q.v.).
Stilbechrysomyxa M.M. Chen (1984), Coleosporiaceae. 3 (on *Rhododendron* (II, III) (*Ericaceae*)), Asia. See Chen (*Forest Fungi Phytogeography, Forest Fungi Phytogeography of China, North America, and Siberia and International Quarantine of Tree Pathogens*: 495 pp., 2003) Probably belonging to *Chrysomyxa*.
Stilbella Lindau (1900) nom. cons., anamorphic *Hypocreales*, Hsy.0eH.15. *c.* 44 (from soil, coprophilous, on *Insecta*), widespread. See Morris (*Western Ill. Univ. Ser biol. Sci.* **3**, 1963), Benjamin (*Taxon* **17**: 521, 1968), Sutton (*Mycol. Pap.* **132**: 18, 1973), Seifert (*Stud. Mycol.* **27**: 1, 1985; key), Seifert & Samuels (*Mycol.* **89**: 512, 1997), Bischoff *et al.* (*Mycotaxon* **86**: 433, 2003).
Stilbellula Boedijn (1951), anamorphic *Pezizomycotina*, Hsy.0eH.?. 1, Java. See Boedijn (*Sydowia* **5**: 227, 1951), Seifert (*Mem. N. Y. bot. Gdn* **59**: 109, 1990).

Stilbochalara Ferd. & Winge (1910) = Chalara fide Nag Raj & Kendrick (*Monogr. Chalara Allied Genera*, 1975).

Stilbocrea Pat. (1900), Bionectriaceae. Anamorphs *Stilbella*-like, *Acremonium*-like. 6 (dead plant tissues and fungal stromata), widespread. See Seifert (*Stud. Mycol.* **27**, 1985), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Castlebury *et al.* (*MR* **108**: 864, 2004; phylogeny).

Stilbodendron Syd. & P. Syd. (1916), anamorphic *Penicilliopsis*, Hsy.0eP.38. 1, Africa. See Hsieh & Ju (*Mycol.* **94**: 539, 2002).

Stilbodendrum Bonord. (1851) = Syzygites fide Kirk (*in litt.*).

Stilbohypoxylon Henn. (1902), Xylariaceae. 10, widespread (esp. subtropical). See Læssøe (*SA* **13**: 43, 1994; ? synonym of *Xylaria*), Rogers & Ju (*MR* **101**: 135, 1997), Hladki & Romero (*Sydowia* **55**: 65, 2003), Petrini (*Sydowia* **56**: 51, 2004; revision), Ju *et al.* (*Mycol.* **99**: 612, 2007; phylogeny).

stilboid, a sterile, basidioma-like structure (as in *Mycena citricolor* and other agarics) which functions as a propagule (Singer, 1962: 25); gemma (Buller). Cf. carpophoroid.

Stilbomyces Ellis & Everh. (1895) nom. dub., anamorphic *Pezizomycotina*. Based on hyphophores of a lichen. See Seifert (*Sydowia* **45**: 103, 1993).

Stilbonectria P. Karst. (1889) = Nectria fide Rossman (*Mycol. Pap.* **150**, 1983), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Stilbopeziza Speg. (1908), ? Helotiales (?L). 1, S. America.

Stilbophoma Petr. (1942), anamorphic *Pezizomycotina*, St.0eH.15. 2, India; Africa. See Sutton (*The Coelomycetes*, 1980).

Stilbospora Pers. (1794), anamorphic *Pezizomycotina*, Cpd/Cac.≡ eP.19. 16, widespread.

Stilbothamnium Henn. (1896), anamorphic *Trichocomaceae*. See Thom & Raper (*Manual of the Aspergilli*, 1945), Roquebert & Nicot (*Advances in Penicillium and Aspergillus Systematics* **102**: 221, 1985), Wicklow *et al.* (*Mycotaxon* **34**: 249, 1989), Dupont *et al.* (*Modern Concepts in Penicillium and Aspergillus Classification* [NATO ASI Series A: Life Sciences] **185**: 335, 1990), Hsieh & Ju (*Mycol.* **94**: 539, 2002).

Stilbotulasnella Oberw. & Bandoni (1982), Cantharellales. 1, Hawaii. See Bandoni & Oberwinkler (*CJB* **60**: 1875, 1982).

Stilbum Tode (1790), Chionosphaeraceae. *c.* 10, widespread (temperate). See Donk (*Taxon* **7**: 236, 1958; typification), McLaughlin *et al.* (*Am. J. Bot.* **91**: 808, 2004; phylogeny; cf. *Bensingtonia*).

stilbum, the erect synnema (q.v.) of *Stilbella* with its head of slime spores.

stink horns, basidiomata of certain *Phallales*.

Stioclettia Dennis (1975), Diaporthales. 1 (on *Luzula*), British Isles. See Dennis (*Kew Bull.* **30**: 362, 1975).

stipe, a stalk (Fig. 4D, F-H).

Stipella L. Léger & M. Gauthier (1932), Legeriomycetaceae. 2 (in *Diptera*), Europe. See Moss (*TBMS* **54**: 1, 1970), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986), Nelder *et al.* (*Fungal Diversity* **22**: 121, 2006; ecology and taxonomy), Valle (*Mycol.* **99**: 442, 2007; Spain).

Stipinella, see *Stypinella*.

stipitate, stalked.

Stipitochaete Ryvarden (1985) = Hymenochaete fide Léger (*Biblthca Mycol.* **171**: 1, 1998).

Stipitocyphella G. Kost (1998), Marasmiaceae. 1, Kenya. See Kost (*MR* **102**: 505, 1998).

Stipiza Raf. (1815) nom. nud., Fungi. See Merrill (*Index Rafinesq.*, 1949).

Stiptophyllum Ryvarden (1973), Polyporaceae. 1, Brazil. See Ryvarden (*Norw. Jl Bot.* **20**: 4, 1973).

Stirtonia A.L. Sm. (1926), Arthoniaceae (L). *c.* 16, widespread (tropical). See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952), Makhija & Patwardhan (*Mycotaxon* **67**: 287, 1998).

Stirtoniella D.J. Galloway, Hafellner & Elix (2005), Ramalinaceae (L). 1, Australasia. See Galloway *et al.* (*Lichenologist* **37**: 263, 2005).

Stirtoniopsis Groenh. (1938) nom. inval., Arthoniales (L). 2, Java; Morocco.

stock (of basidiomycetes), a dikaryotic mycelium (fide Raper, 1966). Cf. strain.

stolon, a 'runner', as in *Rhizopus*.

Stomatisora J.M. Yen (1971) = Chrysocelis fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Stomatogene Theiss. (1917), Parodiopsidaceae. 2, N. America. See Farr (*Mem. N. Y. bot. Gdn* **49**: 70, 1989).

Stomatogenella Petr. (1955), Pezizomycotina. 1, Australia. See Petrak (*Sydowia* **9**: 507, 1955).

stomatopodium (stomopodium), a hyphal branch (an appressorium; cf. hyphopodium) or 'plug' above or in a stoma.

Stomiopeltella Theiss. (1914) = Stomiopeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Reynolds & Gilbert (*Cryptog. Mycol.* **27**: 249, 2006).

Stomiopeltina Bat. (1963) = Metathyriella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Stomiopeltis Theiss. (1914), Micropeltidaceae. Anamorph *Sirothyriella*. 25, widespread. See Batista (*Publções Inst. Micol. Recife* **56**, 1959), Ellis (*TBMS* **68**: 157, 1977; key Brit. spp.), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005; Australia), Batzer *et al.* (*Mycol.* **97**: 1268, 2005; phylogeny).

Stomiopeltites Alvin & M.D. Muir (1970), Fossil Fungi. 1 (Cretaceous), British Isles.

Stomiopeltopsis Bat. & Cavalc. (1963), Micropeltidaceae. 1, Brazil. See Batista & Cavalcanti (*Publções Inst. Micol. Recife* **392**: 30, 1963), Ramaley (*Mycotaxon* **83**: 327, 2002).

Stomiotheca Bat. (1959), Micropeltidaceae. 1, Brazil. See Batista (*Publções Inst. Micol. Recife* **56**: 453, 1959).

stone rag (stone raw), *Parmelia saxatilis*.

stone-fungus, the hard pseudosclerotium of *Polyporus tuberaster*; Pietraia fungaia. On being watered, an edible basidioma is produced. The Canadian tuckahoe is the same species (Vanterpool & Macrae, *CJB* **29**: 147, 1951).

stopper, the *Neurospora* phenotype characterized by irregular cycles of cessation and renewal of growth.

Straggaria Reinsch (1888) nom. dub., ? Fungi.

strain (1) a group of clonally related individuals or cells. See Yoder *et al.* (*Phytopath.* **76**: 383, 1986); (2) a homokaryotic mycelium (fide Raper, 1966), cf. stock.

Straminella M. Choisy (1929) = Lecanora fide Brodo & Elix (*Biblthca Lichenol.* **53**: 19, 1993).

straminipile (straminopile), colloquial noun for an organism bearing tripartite tubular hairs (Patterson, 1989).

straminipilous (straminopilous), bearing tripartite

tubular hairs; applicable to flagella and/or cells, whether uniflagellate, multiflagellate or non-flagellate (the auxiliary cyst of *Saprolegnia* which bears a tuft of tripartite tubular hairs would be a straminipilous cyst), cf. flimmergeissel; - **fungi**, see *Chromista*, *Straminipila*.

strand plectenchyma, plectenchyma in strands forming supporting tissues in a lichen thallus.

strangle fungus, *Epichloë typhina*; see choke.

Strangospora Körb. (1860), Lecanorales (L). *c.* 10, widespread (north temperate). See Harris *et al.* (*Evansia* **5**: 26, 1988; posn), Hafellner (*Cryptog. bot.* **5**: 99, 1995), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Strangulidium Pouzar (1967) = Oligoporus fide Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 1, 1974).

Strasseria Bres. & Sacc. (1902), anamorphic *Pezizomycotina*, St.0eH.15. 1, widespread. *S. geniculata* (black rot of apple). See Dennis (*Gdnrs' Chron.* **114**: 221, 1943), Parmelee & Cauchon (*CJB* **57**: 1660, 1979), Sutton (*The Coelomycetes*, 1980).

Strasseriopsis B. Sutton & Tak. Kobay. (1970), anamorphic *Pezizomycotina*, St.1eH.15. 1, Japan. See Sutton & Kobayashi (*Mycol.* **61**: 1068, 1969).

Stratiphoromyces Goh & K.D. Hyde (1998), anamorphic *Pezizomycotina*, Hso.?.?. 2, Brunei; Andaman Islands. See Goh & Hyde (*MR* **102**: 1149, 1998).

Stratisporella Hafellner (1979), ? Patellariaceae. 1 (on lichens, *Tremotylium*), Angola. See Kutorga & Hawksworth (*SA* **15**: 1, 1997).

stratose thallus, a lichen thallus having the tissue in horizontal layers.

Strattonia Cif. (1954), Lasiosphaeriaceae. 9 (coprophilous), widespread. See Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972; key), Barr (*Mycotaxon* **39**: 43, 1990; posn), Abdullah *et al.* (*Nova Hedwigia* **69**: 211, 1999), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005; phylogeny), Cai *et al.* (*MR* **110**: 359, 2006; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

straw mushrooms (paddy straw or Chinese mushroom), the edible *Volvariella volvacea* and *V. diplasia*. These agarics are widely used in the tropics. In Myanmar, where *V. diplasia* is cultured, wet rice ('paddy') straw is made into a bed about 1 × 1 × 5 m which is inoculated with 'pure culture' spawn (cf. mushroom culture), and kept wet. Mushrooms are first seen after 2-3 weeks; 4 kg or so being obtained from one bed. An air temperature of at least 21°C is necessary. See Thet & Seth (*Indian Fmg* **1**: 332, 1940), Chang (*Econ. Bot.* **31**: 374, 1977), Sukara *et al.* (*Bull. BMS* **19**: 129, 1985), Edible fungi.

Streblema Chevall. (1826) nom. dub., anamorphic *Xylariaceae*. 1, France. Composed only of stroma zone lines.

Streblocaulium Chevall. (1837) = Conoplea fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 390, 1973).

Streblomyces Thaxt. (1920) = Nycteromyces fide Tavares (*Mycol. Mem.* **9**, 1985).

Streimannia G. Thor (1991), Roccellaceae (L). 1, Australia. See Thor (*Op. bot.* **103**: 84, 1991), Grube (*Bryologist* **101**: 377, 1998).

Strelitziana Arzanlou & Crous (2006), anamorphic *Chaetothyriales*. 1, S. Africa. See Arzanlou & Crous (*Fungal Planet* **no. 8**: [1], 2006).

Streptobotrys Hennebert (1973), anamorphic *Streptotinia*, Hso.0eH.7. 3, N. America. See Hennebert (*Persoonia* **7**: 191, 1973), Hong *et al.* (*Pl. Path. J.* **20**: 192, 2004).

Streptomyces Waksman & Henrici (1943), Actinobacteria. q.v.

streptomycin, a broad spectrum aminoglycoside antibiotic produced by *Streptomyces griseus*. Active against *Mycobacterium tuberculosis*, staphylococci, some gram-negative bacteria, and inhibiting vegetative growth of some fungi.

Streptopodium R.Y. Zheng & G.Q. Chen (1978), anamorphic *Pleochaeta*, Hso.0eH.1. 5, widespread. See Zheng & Chen (*Acta Microbiol. Sin.* **18**: 183, 1978), Saenz (*McIlvainea* **13**: 33, 1998; phylogeny), Liberato *et al.* (*MR* **108**: 1185, 2004; on *Carica*), Kiss *et al.* (*MR* **110**: 1301, 2006).

Streptosporangium Couch (1955), Actinobacteria. q.v.

Streptotheca Vuill. (1887) = Ascozonus fide Bergman & Shanor (*Mycol.* **49**: 879, 1957), Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Streptothrix Corda (1839) = Conoplea fide Hughes (*CJB* **36**: 727, 1958).

Streptotinia Whetzel (1945), Sclerotiniaceae. Anamorph *Streptobotrys*. 2, USA.

Streptotrichites Mesch. (1892), Fossil Fungi. 1 (Oligocene), Baltic.

Streptoverticillium E. Bald. (1958), Actinobacteria. q.v.

Striadiporites C.P. Varma & Rawat (1963), Fossil Fungi. 3 (Tertiary), India; USA.

Striadyadosporites Dueñas (1979), Fossil Fungi. 2 (Pleistocene), Colombia.

Striainaperturites Y.K. Mathur (1966), Fossil Fungi. 1.

Striatasclerotes Stach & Pickh. (1957), Fossil Fungi. 1 (Carboniferous), Germany. See Stach & Pickhardt (*Palaeontologische Zeitschrift* **31**: 140, 1957).

striate, marked with delicate lines, grooves or ridges (Fig. 20.13).

Striatodecospora D.Q. Zhou, K.D. Hyde & B.S. Lu (2000), Xylariaceae. 1, Hong Kong. See Zhou *et al.* (*Mycotaxon* **76**: 141, 2000).

Striatosphaeria Samuels & E. Müll. (1979), Chaetosphaeriaceae. Anamorph *Dictyochaeta*. 1 (from dead wood), C. & S. America. See Samuels & Müller (*Sydowia* **31**: 126, 1978), Réblová *et al.* (*Sydowia* **51**: 49, 1999), Réblová (*Stud. Mycol.* **45**: 149, 2000; review), Réblová & Winka (*Mycol.* **92**: 939, 2000; phylogeny), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny), Fernández *et al.* (*Mycol.* **98**: 121, 2006; phylogeny).

Striatospora I.V. Issi & Voronin (1986), Microsporidia. 1.

Strickeria Körb. (1865), Pezizomycotina. *c.* 9, widespread. See Wakefield (*TBMS* **24**: 282, 1940), Eriksson (*SA* **10**: 144, 1991).

Stridiporosporites Ke & Shi (1978), Fossil Fungi. 6 (Oligocene, Tertiary), China.

Striglia Adans. (1763) = Daedalea fide Donk (*Persoonia* **1**: 284, 1960).

Strigopodia Bat. (1957), Euantennariaceae. Anamorphs *Antennatula*, *Capnophialophora*, *Hyphosoma*, *Racodium*. 3, widespread (temperate-boreal). See Hughes (*CJB* **46**: 1009, 1968), Reynolds (*Mycotaxon* **27**: 377, 1986).

strigose, rough with sharp-pointed hairs; hispid.

Strigula Fr. (1823), Strigulaceae (L). Anamorph *Dis-*

cosiella. *c*. 118 (many foliicolous), widespread (esp. tropical). See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952; foliicolous spp.), Margot (*Lichenologist* **9**: 51, 1977; host relationship), Nag Raj (*CJB* **59**: 2519, 1981; asci, pycnidia), Hawksworth (*Taxon* **35**: 787, 1986; nomencl.), McCarthy *et al.* (*Lichenologist* **28**: 239, 1996), McCarthy (*Lichenologist* **29**: 513, 1997), Sérusiaux (*Bryologist* **101**: 147, 1998), Aptroot & Lücking (*MR* **105**: 510, 2001; on ferns), Roux *et al.* (*Biblthca Lichenol.* **90**: 96 pp., 2004), Schmitt *et al.* (*Mycol.* **97**: 362, 2005; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Tretiach & Rinino (*Nova Hedwigia* **83**: 451, 2006), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Strigulaceae Zahlbr. (1898), Chaetothyriomycetidae (inc. sed.) (L). 4 gen. (+ 22 syn.), 123 spp.

Lit.: Lücking (*Nova Hedwigia* **52**: 267, 1991), Lücking & Lücking (*Herzogia* **11**: 143, 1995), Huhndorf & Harris (*Brittonia* **48**: 551, 1996), McCarthy *et al.* (*Lichenologist* **28**: 239, 1996), Lücking *et al.* (*Lichenologist* **30**: 121, 1998), Sérusiaux (*Bryologist* **101**: 147, 1998), Roux *et al.* (*Biblthca Lichenol.* **90**: 96 pp., 2004), Schmitt *et al.* (*Mycol.* **97**: 362, 2005).

Strigulomyces Cif. & Tomas. (1953) = Strigula fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Strilia Gray (1821) = Coltricia fide Parmasto (*in litt.*) See, Donk (*Verh. K. ned. Akad. Wet.* tweede sect. **62**: 49, 1974).

Striodiplodia Zambett. (1955) nom. inval. = Lasiodiplodia fide Sutton (*Mycol. Pap.* **141**, 1977), Verkley & Aa (*Mycotaxon* **65**: 113, 1997).

Strionemadiplodia Zambett. (1955) nom. inval., anamorphic *Pezizomycotina*, Cpd.1eP.?. 3, widespread. See Zambettakis (*BSMF* **70**: 233, 1954), Verkley & Aa (*Mycotaxon* **65**: 113, 1997).

Striosphaeropsis Verkley & Aa (1997), anamorphic *Pezizomycotina*, Cpd.?.?. 1, Papua New Guinea. See Verkley & Aa (*Mycotaxon* **65**: 115, 1997).

strobiliform, like a fir-cone in form.

Strobilofungus Lloyd (1915) = Boletellus fide Singer (*Farlowia* **2**: 223, 1945).

Strobilomyces Berk. (1851), Boletaceae. *c*. 20, cosmopolitan. See Ying & Ma (*Acta Mycol. Sin.* **4**: 95, 1985; China), Lakhanpal & Sharma (*Kavaka* **16**: 27, 1988; NW Himalaya), Watling *et al.* (*British Fungus Flora. Agarics and Boleti* Rev. & Enl. Edn **1**: 173 pp., 2005; Brit. sp.).

Strobilomycetaceae E.-J. Gilbert (1931) = Boletaceae.

Strobiloscypha N.S. Weber & Denison (1995), Pezizales. 1, USA. Perhaps a member of the *Sarcosomataceae*, but molecular data do not clearly support this. See Weber & Denison (*Mycotaxon* **54**: 129, 1995), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).

Strobilurus Singer (1962), Physalacriaceae. 10, widespread (temperate). See Redhead (*CJB* **58**: 68, 1980).

stroma (pl. **stromata**), a mass or matrix of vegetative hyphae, with or without tissue of the host or substrate, sometimes sclerotium-like in form, in or on which spores or fruit bodies bearing spores are produced. Many ascomycetes (esp. *Xylariales*) and anamorphic fungi have stromata; a few *Pucciniales* and other fungi. **ecto-** **(epi-**, Fuisting), a -, normally conidial, formed in the periderm and frequently breaking through the bark; **endo-** **(ento-)** **(hypho-**, Fuisting), a perithecial - formed under the **ecto-**; **eu-**, one of fungal tissue only (Fig. 10P-R); **pseudo-** see under pseudostroma. Ruhland's name for the ostiolar disc is **placodium**, forms (as in *Diatrype*) from the **endo-** being **ento-placodial**, those (at least in part) from the **ecto-** being **ecto-placodial**. A species having ecto- and endo- is **diplostromatic**; one with only one **haplostromatic**. See Miller (*Mycol.* **20**: 188, 1928). Cf. sclerotium.

Stromaster Höhn. (1930), Phyllachoraceae. 1, S. America. Affinities are uncertain. See Petrak (*Sydowia* **5**: 354, 1951).

Stromatella Henssen (1989), Lichinaceae (L). 1, Bermuda. See Henssen (*Lichenologist* **21**: 111, 1989), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Stromateria Corda (1837) = Tubercularia Tode fide Saccardo (*Syll. fung.* **4**: 646, 1886).

Stromatinia (Boud.) Boud. (1907), Sclerotiniaceae. Anamorph *Sclerotium*. 7, Europe; N. America. See Schumacher (*Agarica* **5**: 111, 1984), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny).

Stromatocrea W.B. Cooke (1952), anamorphic *Hypocreopsis*, Hsp.0eH.15. 1, USA. See Petrak (*Sydowia* **6**: 336, 1952), Cauchon & Quellette (*Mycol.* **56**: 453, 1964).

Stromatocyphella W.B. Cooke (1961), Marasmiaceae. 3, N. America. See Cooke (*Beih. Sydowia* **4**: 104, 1961).

Stromatographium Höhn. (1907), anamorphic *Fluviostroma*, Hsy.0eP.15. 1, widespread (tropical). The genus is polyphyletic; some species are referable to the *Diaporthales*. See Seifert (*CJB* **65**: 2196, 1987), Okada *et al.* (*CJB* **76**: 1495, 1998; 18S rDNA), Verkley (*Mycol.* **93**: 205, 2001), Decock *et al.* (*Antonie van Leeuwenhoek* **88**: 231, 2005; phylogeny).

stromatolites (lichen), laminar calcretes formed abiotically in rock and sometimes wrongly interpreted as fossils (Klappa, *Sediment. Petrol.* **49**: 387, 1979).

Stromatoneurospora S.C. Jong & E.E. Davis (1973), Xylariaceae. 2, widespread (tropical). See Dennis (*Revista Biol.* **1**: 175, 1958), Jong & Davis (*Mycol.* **65**: 458, 1973), Rogers *et al.* (*Mycol.* **84**: 166, 1992).

Stromatopogon Zahlbr. (1897), anamorphic *Pezizomycotina*, Cpd.#eH.?15. 3 (on lichens, *Usnea*), Australia. See Diederich (*Lichenologist* **24**: 371, 1992; redescr.), Diederich & Sérusiaux (*Biblthca Lichenol.* **86**: 103, 2003), Etayo & Breuss (*Öst. Z. Pilzk.* **13**: 277, 2004).

Stromatopycnis A.F. Vital (1956), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Brazil. See Vital (*Publções Inst. Micol. Recife* **15**: 5, 1956).

Stromatoscypha Donk (1951) ≡ Porotheleum.

Stromatoscyphaceae Jülich (1982) nom. illegit. = Schizophyllaceae.

Stromatosphaeria Grev. (1824) nom. rej. ≡ Daldinia.

Stromatostilbella Samuels & E. Müll. (1980) ≡ Stromatographium fide Seifert (*CJB* **65**: 2196, 1987).

Stromatostysanus Höhn. (1919), anamorphic *Pezizomycotina*, Hsy.0eH.?. 1, Europe. See Braun (*Sydowia* **45**: 81, 1993).

Stromatothecia D.E. Shaw & D. Hawksw. (1971), Odontotremataceae. 1 (on *Nothofagus*), Papua New Guinea. See Shaw & Hawksworth (*Proc. Papua New Guinea Sci. Soc.* **22**: 24, 1971), Sherwood-Pike (*Mycotaxon* **28**: 137, 1987).

Stromatothelium Trevis. (1861), ? Pyrenulales (L). 4, widespread (tropical).

Stromne Clem. (1909) ≡ Engleromyces.

Strongwellsea A. Batko & Weiser (1965), Entomophthoraceae. 2, USA. See Batko & Weiser (*J. Invert. Path.* **7**: 455, 1965), Weiser & Batko (*Folia Parasit.* **13**: 144, 1966), Humber (*Mycol.* **68**: 1042, 1976; emend., key), Remaudière & Keller (*Mycotaxon* **11**: 323, 1980; syn. of *Erynia*), Humber (*Mycotaxon* **15**: 167, 1982), Eilenberg *et al.* (*Entomophaga* **37**: 65, 1992; isolation), Eilenberg & Michelsen (*J. Invert. Path.* **73**: 189, 1999; host range), Keller & Petrini (*Sydowia* **57**: 23, 2005; key), Keller (*Sydowia* **59**: 75, 2007; Switzerland, n.sp.).

Strongyleuma Vain. (1927) = Chaenothecopsis fide Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984).

Strongylium (Ach.) Gray (1821) = Calicium fide Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984).

Strongylopsis Vain. (1927) = Microcalicium fide Tibell (*Bot. Notiser* **131**: 229, 1978).

Strongylothallus Bat. & Cif. (1959), anamorphic *Pezizomycotina*, Cpt.-.-. 1, Brazil. See Batista & Ciferri (*Mycopath. Mycol. appl.* **11**: 97, 1959).

Stropharia (Fr.) Quél. (1872) = Psilocybe (Fr.) P. Kumm. fide Kuyper (*in litt.*).

Strophariaceae Singer & A.H. Sm. (1946), Agaricales. 18 gen. (+ 46 syn.), 1316 spp.

Lit.: Fogel (*Mycol.* **77**: 72, 1985), Pegler & Young (*Notes R. bot. Gdn Edinb.* **44**: 437, 1987), Watling & Gregory (*British Fungus Flora* **5**, 1987), Jacobsson (*Windahlia* **19**: 1, 1990), Bougher & Castellano (*Mycol.* **85**: 285, 1993), Johnston & Buchanan (*N.Z. Jl Bot.* **33**: 379, 1995), Holec (*Mykol. Listy* **57**: 1, 1996), Bresinsky & Binder (*Z. Mykol.* **64**: 79, 1998), Kytövuori (*Karstenia* **39**: 11, 1999), Reijnders (*MR* **104**: 900, 2000), Bougher & Lebel (*Aust. Syst. Bot.* **14**: 439, 2001), Peintner *et al.* (*Am. J. Evol.* **23**: 357, 2002), Bon & Roux (*Docums Mycol.* **33**: 3, 2003), Clémençon & Roffler (*Mycol. Progr.* **2**: 235, 2003), Matsumoto *et al.* (*Mycoscience* **44**: 197, 2003), Francis & Bougher (*Australasian Mycologist* **23**: 1, 2004), Guzmán & Kasuya (*Mycoscience* **45**: 295, 2004), Peintner *et al.* (*Mycol.* **96**: 1042, 2004), Walther *et al.* (*MR* **109**: 525, 2005), Matheny *et al.* (*Mycol.* **98**: 982, 2006; phylogeny), Moreau *et al.* (*Mol. Phylogen. Evol.* **38**: 794, 2006).

Stropholoma (Singer) Balletto (1989) nom. inval. = Psilocybe (Fr.) P. Kumm. fide Kuyper (*in litt.*).

Strossmayeria Schulzer (1881), Helotiaceae. Anamorph *Pseudospiropes*. 16, widespread. See Iturriaga & Korf (*Mycotaxon* **36**: 119, 1990; monogr.), Hosoya (*Memoirs of the National Science Museum* Tokyo **34**: 241, 2000; Japan).

Strumella Fr. (1849), anamorphic *Urnula*, Hsp.0eP.?. 8, widespread. *S. coryneoidea*, canker of oak (*Quercus*) and sometimes of other trees. See Wolf (*Mycol.* **50**: 837, 1959).

Strumellopsis Höhn. (1909), anamorphic *Pezizomycotina*, St.0eP.?. 2, Java.

Stuartella Fabre (1879), Dothideomycetes. Anamorph *Bactrodesmium*. 3, Europe; N. America. See LaFlamme & Müller (*Sydowia* **29**: 278, 1977), Funk & Shoemaker (*CJB* **61**: 2277, 1983).

stuffed (of a stipe), having the inside of a different structure from that of the outer layer (Fig. 4F).

stupose, of tissue formed from hyphae which are not gelatinized.

Stygiomyces Coppins & S.Y. Kondr. (1995), anamorphic *Pezizomycotina*, Cpd.0fH.15. 1 (on *Pseudocyphellaria*), Tasmania. See Coppins & Kondratyuk (*Edinb. J. Bot.* **52**: 229, 1995).

Stylaspergillus B. Sutton, Alcorn & P.J. Fisher (1982), anamorphic *Pezizomycotina*, Hso.0fH.15. 1, widespread. Synanamorph *Parasympodiella*. See Tokumasu (*TMSJ* **28**: 19, 1987).

Stylina Syd. (1921), Graphiolaceae. 1 (on *Livistona*), China.

Stylobates Fr. (1837) nom. dub., Agaricales.

Stylodothis Arx & E. Müll. (1975), Dothideaceae. 2, widespread. See von Arx & Müller (*Stud. Mycol.* **9**: 11, 1975), Lumbsch & Lindemuth (*MR* **105**: 901, 2001; phylogeny), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **34**: 512, 2005; phylogeny), Prado *et al.* (*MR* **110**: 511, 2006; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Styloletendraea Weese (1924) nom. nud. = Nectria. Anamorph name. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Stylonectria Höhn. (1915) = Cosmospora fide Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Stylonectriella Höhn. (1915) ? = Nectriella Nitschke ex Fuckel fide Sutton (*Mycol. Pap.* **141**, 1977).

Stylopage Drechsler (1935), Zoopagaceae. 17, widespread. See Drechsler (*Mycol.* **27**: 197, 1935), Drechsler (*Mycol.* **27**: 206, 1935), Drechsler (*Mycol.* **28**: 241, 1936), Drechsler (*Mycol.* **30**: 137, 1938), Drechsler (*Mycol.* **31**: 388, 1939), Drechsler (*Mycol.* **37**: 1, 1945), Drechsler (*Mycol.* **40**: 85, 1948), Duddington (*Ann. Bot.* Lond. **17**: 127, 1953), Duddington (*Mycol.* **47**: 245, 1955), Peach & Juniper (*TBMS* **38**: 431, 1955), Dyal (*Sydowia* **27**: 293, 1976; keys parasites of nematodes and amoebae, bibliogr.), Wood (*TBMS* **80**: 368, 1983), Saikawa (*Mycol.* **78**: 309, 1986; ultrastr.), Blackwell & Malloch (*Mycol.* **83**: 360, 1991; life history), Mo & Bi (*Mycosystema* **20**: 129, 2001; China).

stylospore (1) a spore on a pedicel or hypha, esp. a urediniospore (obsol.); (2) an elongated pycnidiospore (obsol.); (3) the sporangiolum (the 'Stielgemmen' of Linnemann, 1941) of *Mortierella*.

Stypella Möller (1895), Auriculariales. 4, widespread. See Martin (*Stud. nat. Hist. Univ. Iowa* **16**: 143, 1934), Donk (*Persoonia* **4**: 241, 1966), Roberts (*Mycotaxon* **69**: 209, 1998; key), Weiss & Oberwinkler (*MR* **105**: 403, 2001; phylogeny).

Stypinella J. Schröt. (1888) ≡ Helicobasidium.

Stysanopsis Ferraris (1909) = Cephalotrichum Link fide Hughes (*CJB* **36**: 727, 1958).

Stysanus Corda (1837) = Cephalotrichum Link fide Hughes (*CJB* **36**: 727, 1958).

suaveolent, having a sweet smell.

sub- (prefix), under; below; frequently in the sense of approximating to the condition qualified, slightly, somewhat.

Subbaromyces Hesselt. (1953), ? Pleosporales. Anamorph *Hyalobelemnospora*. 2 (on filter beds), N. America; India. See Cole *et al.* (*CJB* **52**: 2453, 1974; development, ultrastr.), Malloch & Blackwell (*CJB* **68**: 1712, 1990), Blackwell *et al.* (*Mycol.* **95**: 987, 2003; phylogeny).

subcentric, see centric.

subcutis, see cutis.

subglobose, not quite spherical (Fig. 23.1).

subhymenium, generative tissue below the hymenium; sometimes used as equivalent to medullary exciple or hypothecium.

Subhysteropycnis Wedin & Hafellner (1998), anamorphic *Arthonia*, Cpd.?.? (L). 1, Chile. See Wedin & Hafellner (*Lichenologist* **30**: 69, 1998).

Subicularium M.L. Farr & Goos (1989), anamorphic *Pezizomycotina*, Hsp.#eP.1. 1, Venezuela. See Eriksson (*SA* **8**: 77, 1989).

Subiculicola Speg. (1924) = Melioliphila fide Rossman (*Mycol. Pap.* **157**, 1987).

subiculum (subicule), a net-, wool-, or crust-like growth of mycelium under fruit-bodies.

Submersisphaeria K.D. Hyde (1996), Annulatascaceae. 5 (submerged wood), Australia. See Hyde (*Nova Hedwigia* **62**: 171, 1996), Wong *et al.* (*SA* **16**: 17, 1998), Campbell *et al.* (*Mycol.* **95**: 41, 2003; phylogeny), Pinnoi *et al.* (*Sydowia* **56**: 72, 2004; key).

suboperculate, see ascus.

Subramanella H.C. Srivast. (1962) = Phomopsis (Sacc.) Bubák. fide Sutton (*Mycol. Pap.* **141**, 1977).

Subramania D. Rao & P. Rag. Rao (1964), anamorphic *Pezizomycotina*, Hso.0eP.3. 1, India. See Rao & Rao (*Trans. Am. microsc. Soc.* **83**: 403, 1964).

Subramanianospora Narayanan, J.K. Sharma & Minter (2003), anamorphic *Pezizomycotina*. 1, India. See Narayanan *et al.* (*Indian Phytopath.* **56**: 160, 2003).

Subramaniomyces Varghese & V.G. Rao (1980), anamorphic *Pezizomycotina*, Hso.0eP.3. 3, India. See Varghese & Rao (*Kavaka* **7**: 83, 1979), Crous *et al.* (*MR* **110**: 264, 2006).

Subramaniula Arx (1985), Chaetomiaceae. 2, S. Africa; India. See von Arx (*Proc. Indian Acad. Sci.* Pl. Sci. **94**: 341, 1985), Cannon (*TBMS* **86**: 56, 1986; key), von Arx *et al.* (*Beih. Nova Hedwigia* **94**, 1988).

substrate (substratum), although these two terms are frequently treated as synonyms by mycologists both have useful special senses: (1) **substrate**: (in enzymology) is applied to the substance on which an enzyme acts and in microbiology to the substances (e.g. culture medium constituents) utilized by a microorganism for growth in distinction to the material; (2) **substratum** (pl. **substrata**): (in ecology), the material on which an organism is growing or to which it is attached.

substroma, pseudostroma (q.v.) in which the vegetative hyphae of the host predominate (Johnston, *Ann. Mo. bot. Gdn* **27**: 31, 1940).

Subulariella Höhn. (1915) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

subulate, slender and tapering to a point; awl-shaped (Fig. 23.34).

Subulicium Hjortstam & Ryvarden (1979), Hymenochaetales. 3, widespread (north temperate). See Hjortstam & Ryvarden (*Mycotaxon* **9**: 511, 1979).

Subulicystidiaceae Jülich (1982) = Hyphodermataceae.

Subulicystidium Parmasto (1968), Hydnodontaceae. Anamorph *Aegeritina*. 7, widespread. See Jülich (*Persoonia* **8**: 187, 1975), Duhem & Michel (*Cryptog. Mycol.* **22**: 163, 2001).

Subulispora Tubaki (1971), anamorphic *Pezizomycotina*, Hso.0fH.10. 12, widespread (north temperate). See Sutton (*TBMS* **71**: 167, 1978), de Hoog (*Stud. Mycol.* **26**: 54, 1985; key), Castañeda Ruíz *et al.* (*Mycotaxon* **67**: 9, 1998), Marvanová & Laichmanová (*Fungal Diversity* **26**: 241, 2007; key).

subuniversal veil, see protoblem.

Sucinaria Syd. (1925) = Coccodiella fide Müller & von Arx *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 87, 1973).

Sufa Adans. (1763) = Lycoperdon Pers. fide Mussat (*Syll. fung.* **15**: 408, 1901).

sufu (Chinese cheese), an oriental food composed of *Actinomucor* or *Mucor* fermented soybeans (Hesseltine, *Mycol.* **57**: 164, 1965, *Mycologist* **5**: 162, 1991); see Fermented food and drinks.

sugar fungus, a fungus attacking decaying substances and only able to utilize simple sugars, amino acids, and other relatively simple organic compounds (Thom & Morrow, *J. Bact.* **33**: 77, 1937).

Sugiyamaella Kurtzman & Robnett (2007), Trichomonascaceae. 1. See Kurtzman (*FEMS Yeast Res.* **7**: 1046, 2007; from forests), Kurtzman & Robnett (*FEMS Yeast Res.* **7**: 141, 2007).

Sugiyamaemyces I.I. Tav. & Balazuc (1989), Laboulbeniaceae. 1, Borneo. See Tavares & Balazuc (*Mycotaxon* **34**: 566, 1989).

Suillaceae Besl & Bresinsky (1997), Boletales. 3 gen. (+ 15 syn.), 54 spp.

Lit.: Samson & Fortin (*Mycol.* **80**: 382, 1988), Baura *et al.* (*Mycol.* **84**: 592, 1992), Bruns *et al.* (*Mol. Ecol.* **7**: 257, 1998), Dahlberg & Finlay (*Ectomycorrhizal Fungi*: 33, 1999), Noordeloos (*Coolia* **43**: 1, 2000), Noordeloos (*Coolia* **43**: 75, 2000), Manian *et al.* (*FEMS Microbiol. Lett.* **204**: 117, 2001), Binder & Hibbett (*Mol. Phylogen. Evol.* **22**: 76, 2002), Moncalvo *et al.* (*Mol. Phylogen. Evol.* **23**: 357, 2002), Ding & Wen (*Nova Hedwigia* **76**: 459, 2003), Muller *et al.* (*Mol. Ecol.* **16**: 165, 2006).

Suillellus Murrill (1909) = Boletus Fr. fide Singer (*Farlowia* **2**: 223, 1945).

Suillosporium Pouzar (1958), Botryobasidiaceae. 2, Europe; N. America. See Eriksson *et al.* (*Cortic. N. Europ.* **7**, 1984), Langer & Langer (*Frontiers in Basidiomycote Mycology*: 303, 2004; Ecuador).

Suillus (Haller) Kuntze (1898) = Boletus Fr. fide Stalpers (*in litt.*).

Suillus Gray (1821), Suillaceae. 50 (associated with conifers), widespread (north temperate; introduced in southern hemisphere). See Pantidou & Groves (*CJB* **44**: 1371, 1966; cultural studies), Thiers (*Beih. Nova Hedwigia* **51**, 1975; key N. Am. spp.), Bruns & Palmer (*J. Mol. Evol.* **28**: 349, 1989; evolution), Baura *et al.* (*Mycol.* **84**: 592, 1992; gastroid form), Engel (*Schmier- und Filzröhrlinge s.l. in Europe*, 1996; key Eur. spp.), Kretzer *et al.* (*Mycol.* **88**: 776, 1996; taxonomy, phylogeny), Kretzer & Bruns (*Mycol.* **89**: 586, 1997; gastroid form), Dahlberg & Finlay (*Suillus – Ectomycorrhizal fungi, key genera in profile*, 1999; ecology), Wu *et al.* (*Mol. Phylog. Evol.* **17**: 37, 2000; phylogeny, biogeography), Consiglio (*Rivista di Micologia* **44**: 99, 2001), Estades & Lannoy (*Bulletin Mycologique et Botanique Dauphiné-Savoie* **44**: 3, 2004; European spp.), Šutara (*Czech Mycol.* **57**: 1, 2005; Central European genera), Watling *et al.* (*British Fungus Flora. Agarics and Boleti* Rev. & Enl. Edn **1**: 173 pp., 2005; British spp.).

Suillus P. Karst. (1882) ≡ Gyroporus.

Suillus P. Micheli ex Adans. (1763) = Boletus Fr. fide Donk (*Persoonia* **8**: 279, 1975).

Sulcaria Bystrek (1971), Parmeliaceae (L). 3, Asia; USA. See Brodo & Hawksworth (*Op. bot. Soc. bot. Lund* **42**, 1977), Awasthi & Awasthi (*Candollea* **40**: 305, 1985; India, Nepal), Brodo (*Mycotaxon* **27**: 113, 1986; USA), Peterson *et al.* (*Bryologist* **101**: 112, 1998; USA), Obermayer & Elix (*Biblthca Lichenol.*

86: 33, 2003; Tibet, chemistry).

sulcate, grooved.

Sulcatisclerotes Beneš (1959), Fossil Fungi. 2 (Carboniferous), former Czechoslovakia.

Sulcatistroma A.W. Ramaley (2005), Calosphaeriales. 1, USA. See Ramaley (*Mycotaxon* **93**: 140, 2005).

Sulcispora, see *Sulcospora*.

Sulcospora Shoemaker & C.E. Babc. (1989), Phaeosphaeriaceae. 1, Europe. See Shoemaker & Babcock (*CJB* **67**: 1500, 1989).

Sulcopyrenula H. Harada (1999), Pyrenulaceae. 4, widespread. See Harada (*Lichenologist* **31**: 567, 1999).

Sulcospora Kohlm. & Volkm.-Kohlm. (1993) ≡ Aropsiclus.

sulcus, a furrow or groove.

sulphur polypore (**sulphur shelf-mushroom**), basidioma of the edible *Laetiporus sulphureus*.

Sulphurina Pilát (1953) = Lindtneria fide Hjortstam (*in litt.*).

summer spore, a spore germinating without resting, frequently living only a short time; cf. resting spore.

Sungaiicola Fryar & K.D. Hyde (2004), Sordariomycetes. 1, Brunei. See Fryar & Hyde (*Cryptog. Mycol.* **25**: 250, 2004).

super- (prefix), above; used in combination with the names of taxonomic categories to give additional ranks in (e.g. superfamily); only recently permitted under the botanical Code.

superficial, on the surface of the substratum.

superior (of an annulus), near the top of the stipe.

supine (of fructifications), closely applied to the substratum.

supra- (prefix), above; **-generic**, all taxonomic ranks above that of genus; **-specific**, all taxonomic ranks above that of species; also used at other ranks of the hierarchy; cf. infra-.

suprahilar plage (of basidiospores, esp. of *Lactarius* and *Russula*), the area above the hilar appendage on which the eusporial ornamentation is lacking or reduced (Kühner, 1926).

surculicolous (of *Exobasidium* infections), monocarpic (q.v.) and systemic in annual shoots (Nannfeldt, 1981).

Surculiseries Okane, Nakagiri & Tad. Ito (2001), anamorphic *Pezizomycotina*. 1, Japan. See Okane *et al.* (*Mycoscience* **42**: 116, 2001).

surfactant, an agent which reduces the surface tension of a liquid, e.g. detergent.

suscept, a living organism which is **susceptible** to (able to be attacked by; non-immune to) a given disease, pathogen, or toxin.

suspensor, a hypha supporting a gamete, gametangium, or esp. a zygospore (Fig. 27C).

Sutravarana Subram. & Chandrash. (1977), anamorphic *Pezizomycotina*, Hsy.0eH.10. 1, India. See Subramanian & Chandrashekara (*CJB* **55**: 251, 1977).

Suttonia S. Ahmad (1961) [non *Suttonia* A. Rich. 1832, *Myrsinaceae*] ≡ Suttoniella.

Suttoniella S. Ahmad (1961), anamorphic *Pezizomycotina*, St.1bH.16. 3, Asia; Australia. See Sutton (*TBMS* **59**: 285, 1972), Punithalingam (*MR* **107**: 917, 2003; cytology), Hoyo & Gómez-Bolea (*Mycotaxon* **89**: 39, 2004).

Suttonina H.C. Evans (1984), anamorphic *Pezizomycotina*, Cac.1-≡ eP.38. 1, Guatemala. See Evans (*Mycol. Pap.* **153**: 92, 1984).

Svrcekia Kubička (1960) = Boudiera Cooke fide Dissing (*SA* **6**: 153, 1987).

Svrcekomyces J. Moravec (1976) = Pseudombrophila fide van Brummelen (*Libri Botanici* **14**: 1, 1995).

Swampomyces Kohlm. & Volkm.-Kohlm. (1987), Hypocreomycetidae. 2, pantropical. See Hyde & Nakagiri (*Sydowia* **44**: 122, 1992), Read *et al.* (*MR* **99**: 1465, 1995; ultrastr.), Abdel-Wahab *et al.* (*Fungal Diversity* **8**: 35, 2001; Egypt), Sakayaroj *et al.* (*Bot. Mar.* **48**: 395, 2005; phylogeny), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny).

swarm-cell (of *Mycetozoa* and some *Chytridiales*), a motile cell acting, before or after division, as an isogamete.

swarm-spore (**swarmer**), see zoospore.

Syamithabeeja Subram. & Natarajan (1976), anamorphic *Pezizomycotina*, Hso.0eH.18. 1, India. See Subramanian & Natarajan (*Mycol.* **67**: 1213, 1975).

Sychnoblastia Vain. (1921) = Thelopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sychnogonia Körb. (1855) nom. rej. = Muellerella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sychnogonia Trevis. (1860) [non *Sychnogonia* Körb. 1855] = Thelopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

sycosis, a fungus disease of the hair follicles; esp. of the face; ringworm of the beard.

Sydow (Hans; 1879-1946; Germany). Son of P. Sydow (q.v.); employed at the Dresden Bank, Berlin (1904-1937); collected in Costa Rica (1924-1925), Venezuela (1927-1928) and Ecuador (1937-1938). An amateur; founder and Editor *Annales Mycologici* (1903-1944); in addition to works produced with his father, contributed greatly to development of mycotas particularly in Central and South America. *Publs.* (with P. Sydow) *Mycotheca Germanica* (1903-1942) [exsiccati, nos 1-550 issued jointly with P. Sydow]; *Monographia Uredinearum* (1902-1924). *Biogs, obits etc.* Grummann (1974: 49); Petrak (*Sydowia* **2**: 1, 1948 [portrait]); Stafleu & Cowan (*TL-2* **6**: 129, 1986).

Sydow (Paul; 1851-1925; Germany). Schoolmaster, Berlin; father of H. Sydow (q.v.). Major contributions to information handling in mycology through indexes and catalogues; with his son, the author of many works describing new species of ascomycetes, rusts and smuts. *Publs. Die Flechten Deutschlands* (1887); Index vols (**12-13**) to Saccardo's *Sylloge*; (with Lindau) *Thesaurus Literaturae Mycologicae* (1908-1918); *Uredineen* (1888-1924) [exsiccati]; *Ustilagineen* (1894-1915) [exsiccati]; (with H. Sydow, q.v.) *Monographia Uredinearum* (1902-1924). *Biogs, obits etc.* Stafleu & Cowan (*TL-2* **6**: 132, 1986).

Sydowia Bres. (1895), Dothioraceae. Anamorphs *Dothichiza*, *Sclerophoma*, *Hormonema*-like. 10, Europe; N. America. See Barr (*Contr. Univ. Mich. Herb.* **9**: 523, 1972), Froidevaux (*Nova Hedwigia* **23**: 679, 1973), Funk & Finck (*CJB* **66**: 212, 1988), Yurlova *et al.* (*Stud. Mycol.* **43**: 63, 1999; DNA), Barr (*Harvard Pap. Bot.* **6**: 25, 2001), Goodwin *et al.* (*Phytopathology* **91**: 648, 2001; phylogeny), Tsuneda *et al.* (*Mycol.* **96**: 1128, 2004; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Sydowiella Petr. (1923), Sydowiellaceae. 3 (from bark), Europe; N. America. See Barr (*Mycotaxon* **41**: 287, 1991), Rossman *et al.* (*Mycoscience* **48**: 135,

2007; review).

Sydowiellaceae Lar.N. Vassiljeva (1987), Diaporthales. 7 gen., 17 spp. Further research is needed on the circumscription of this fam. fide Vasilyeva (*Mycoscience* **42**: 401, 2001), Rossman *et al.* (*Mycoscience* **48**: 135, 2007; phylogeny).

Sydowiellina Bat. & I.H. Lima (1959) = Myriangiella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Sydowina Petr. (1923) = Lojkania fide Barr (*Mycotaxon* **20**, 1984).

Sydowinula Petr. (1923) = Acanthonitschkea fide Nannfeldt (*Svensk bot. Tidskr.* **69**: 49, 1975).

Sylviacollaea Cif. (1963), anamorphic *Pezizomycotina*, St.0eH.15. 1 (on termites), Dominican Republic. See Ciferri (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **20**: 246, 1963).

sym-, see **syn-**.

Symbiosis. Associations between unlike organisms, generally ones persisting for long periods (relative to the generation time of the interacting organisms); apparently first used by the lichenologist A.B. Frank in 1877 (often credited to de Bary, 1879) who later coined the word mycorrhiza (q.v.). At times equated with mutualism (q.v.), but correctly also covering parasitic (harmful) and commensalistic (unharmful) associations (Ahmadjian & Paracer, 1987).

Symbioses involving fungi are frequent, abundant and widespread. Mutualistic symbioses include endophytes, lichens, mycorrhizas and rumen fungi, as well as cultivation of fungi by ambrosial insects, ants, humans and termites. Parasitic symbioses include fungal diseases of animals, other fungi and plants, but also parasitism of fungi by plants such as orchids, and consumption of fungi by various types of animal.

In mutualistic lichen symbioses, there has been debate as to which partner might be regarded as host (e.g. de Bary regarded the algae in lichens as the host, and Douglas, 1994, the fungus as host to the algae); to circumvent this controversy, Law & Lewis (1983) used the neutral terms **exhabitant** (the organism forming the outer tissues) and **inhabitant** (the enclosed organism).

In lichens, Poelt (*Abstr. IMC2*, 1977) recognized: **two-membered -**, one alga + one fungus, **three-membered -**, one alga + two fungi (lichenicolous fungi; q.v.), or two algae + one fungus (cephalodium; q.v.); and **four-membered -**, two algae + two fungi (lichenicolous lichens); Hawksworth (*Bot. J. Linn. Soc.* **96**: 3, 1988) used **'-biont'** (q.v.) instead and discussed further fungal/algal interactions (see also Rambold & Triebel, *Bibl. Lich.* **48**, 1992).

Lit.: Ahmadjian & Paracer (*Symbiosis, an introduction to biological associations*, 1986), Carroll (*in* Carroll & Wicklow, *The fungal community*, edn 2 : 327, 1992; fungal mutualisms), Cook *et al.* (Eds) (*Symp. Soc. exp. Biol.* **29**, 1975), Cooke (*The biology of symbiotic fungi*, 1977), Cook *et al.* (Eds) (*Cellular interactions in symbiosis and parasitism*, 1980), Douglas (*Symbiotic interactions*, 1994), Law & Lewis (*Biol. J. Linn. Soc.* **20**: 249, 1983), Lewis (*Biol. Rev.* **48**: 261, 1973; *in* Rayner *et al.* (Eds), *Evolutionary biology of the fungi*: 161, 1987), Margulis & Fester (Eds) (*Symbiosis as a source of evolutionary innovation*, 1991), Sapp (*Evolution by association: a history of symbiosis*, 1984). See Antagonism, Coevolution, Endophyte, Lichens, Mycorrhiza.

Symbiotaphrina Kühlw. & Jurzitza ex W. Gams & Arx (1980), anamorphic *Pezizomycotina*, Hso.0eH.?. 2 (beetle mycetomas), Germany. See Jones *et al.* (*MR* **103**: 542, 1999; syst. posn), Schweigkofler *et al.* (*Organ. Divers. Evol.* **2**: 1, 2002; phylogeny), Lopandic *et al.* (*Mycol. Progr.* **4**: 205, 2005; phylogeny).

sympatric, occurring in the same geographical region. Cf. allopatric.

Symperidium Klotzsch (1843) = Aecidium fide Saccardo (*Syll. fung.* **18**: 829, 1906).

Symphaeophyma Speg. (1912), Parmulariaceae. 1, S. America. See Inácio & Cannon (*MR* **107**: 82, 2003).

Symphaster Theiss. & Syd. (1915), Asterinaceae. 2, S. America; S. Africa. See Hosagoudar *et al.* (*Journal of Mycopathological Research* **39**: 61, 2001).

symphogenous, see meristogenous.

Symphyosira Preuss (1853), anamorphic *Symphyosirinia*, Hsy.≡ eH.39. 4, Europe.

Symphyosirinia E.A. Ellis (1956), Helotiaceae. Anamorph *Symphyosira*. 4, Europe; N. America. See Baral (*SA* **13**: 113, 1994; posn), Baral (*Z. Mykol.* **60**: 211, 1994; key).

Symphysos Bat. & Cavalc. (1967), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Batista & Cavalcanti (*Atas Inst. Micol. Univ. Pernambuco* **5**: 202, 1967).

symplastic, entering living cells; cf. apoplastic.

Symplectromyces Thaxt. (1908), Laboulbeniaceae. 1, widespread. See Benjamin (*Aliso* **10**: 345, 1983), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

symplesiomorphy (-ies), see Cladistics.

Symplocia A. Massal. (1854) nom. rej. ≡ Crocynia.

Sympodia (R. Heim) W.B. Cooke (1952) nom. inval. = Marasmius fide Kirk (*in litt.*).

sympodial (of conidiogenous cells), characterized by continued growth, after the main axis has produced a terminal spore, by the development of a succession of apices each of which originates below and to one side of the previous apex.

Sympodiella W.B. Kendr. (1958), anamorphic *Pezizomycotina*, Hso.0eH.39. 3, Europe; Cuba. See Kendrick (*TBMS* **41**: 519, 1958).

Sympodina Subram. & Lodha (1964) = Veronaea fide von Arx (*Gen. Fungi Sporul. Cult.*, 1970).

Sympodiocladium Descals (1982), anamorphic *Pezizomycotina*, Hso.0eH.1. 1 (aquatic), British Isles. See Descals (*TBMS* **78**: 427, 1982).

Sympodioclathra Voglmayr (1997), anamorphic *Pezizomycotina*, Hso.?.?. 1, USA. See Voglmayr & Krisai-Greilhuber (*Mycol.* **89**: 945, 1997).

sympodioconidium (sympodulospore), a spore produced on a sympodula.

Sympodiomyces Fell & Statzell (1971) = Blastobotrys fide Statzell-Tallman & Fell *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 603, 1998), Carreiro *et al.* (*Int. J. Syst. Evol. Microbiol.* **54**: 1891, 2004), Kurtzman & Robnett (*FEMS Yeast Res.* **7**: 141, 2007).

Sympodiomycopsis Sugiy., Tokuoka & Komag. (1991), anamorphic *Microstromataceae*. 1 (from nectar), Japan. See Begerow *et al.* (*MR* **104**: 53, 2000; mol. phylogeny).

Sympodiophora G.R.W. Arnold (1970) = Pseudohansfordia G.R.W. Arnold fide de Hoog (*Persoonia* **10**: 67, 1978), Arnold (*Abstracts, XI Congress of European Mycologists* Kew, England, 7-11 September 1992: 3, 1992).

Sympodioplanus R.C. Sinclair & Boshoff (1997), anamorphic *Pezizomycotina*, Hso.?.?. 1, S. Africa; S.

America. See Sinclair *et al.* (*Mycotaxon* **64**: 366, 1997).

Sympodomyces R.K. Benj. (1973), Laboulbeniaceae. 1, Papua New Guinea. See Benjamin (*Aliso* **8**: 1, 1973), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

sympodula, a sympodial conidiogenous cell.

Sympoventuria Crous & Seifert (2007), ? Venturiaceae. Anamorph *Sympodiella*-like. 1, S. Africa. See Crous *et al.* (*Fungal Diversity* **25**: 19, 2007), Crous *et al.* (*Stud. Mycol.* **58**: 185, 2007; phylogeny).

syn- (sym-) (in compounds), growing together; adhesion; aggregation.

Synalissa Fr. (1825), Lichinaceae (L). 5, Europe; N. America. See Moreno & Egea (*Acta Bot. Barcinon.* **41**: 1, 1992), Schultz & Büdel (*Mycotaxon* **84**: 21, 2002), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Synalissina Nyl. (1885) = Lempholemma fide Zahlbruckner (*Nat. Pflanzenfam.* **8**: 167, 1926).

Synallisopsis Nyl. ex Stizenb. (1882) nom. inval. = Pyrenopsis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

synanamorph, see States of fungi.

Synandromyces Thaxt. (1912), Laboulbeniaceae. 10, widespread. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Synaphia Nees & T. Nees ex Rchb. (1841) nom. dub., Fungi.

synapomorphy (-ies), see Cladistics.

Synaptomyces Thaxt. (1912), Ceratomycetaceae. 1, S. America.

synaptonemal complex, proteinaceous, longitudinally aligned structure which usually unites homologous chromosomes during the prophase of meiosis.

Synaptospora Cain (1957), ? Coniochaetaceae. 4, Europe. See Barr (*Mycotaxon* **39**: 43, 1990; posn), Matzer (*Cryptog. Mycol.* **14**: 11, 1993), Huhndorf *et al.* (*Sydowia* **51**: 176, 1999), Réblová (*Sydowia* **54**: 248, 2002), García *et al.* (*MR* **110**: 1271, 2006).

Synárthonia Müll. Arg. (1891), Arthoniales (L). 1, C. America.

Synarthoniomyces Cif. & Tomas. (1953) ≡ Synarthonia.

Synascomycetes. Class (Gäumann, *Die Pilze*, 1949) for *Ascomycota* with spores formed in a spore sac ('synascus', q.v.), interpreted as a group of fused asci; included fungi now in *Ascosphaerales* and *Protomycetales* (here included in *Taphrinales*).

synascus, the gametangium of *Ascosphaera* (Varitchak, 1933).

Syncarpella Theiss. & Syd. (1915), Cucurbitariaceae. Anamorph *Syntholus*. 7, widespread. See Barr & Boise (*Mem. N. Y. bot. Gdn* **49**: 298, 1989), Ramaley & Barr (*Mycotaxon* **65**: 499, 1997).

Syncephalastraceae Naumov ex R.K. Benj. (1959), Mucorales. 8 gen. (+ 1 syn.), 22 spp.

Lit.: Benjamin (*Aliso* **4**: 321, 1959), Zheng *et al.* (*Mycosystema* **1**: 35, 1988).

Syncephalastrum J. Schröt. (1886), Syncephalastraceae. 2, widespread. See Benjamin (*Aliso* **4**: 321, 1959), Misra (*Mycotaxon* **3**: 51, 1975), Hobot & Gull (*Protoplasma* **107**: 339, 1981; germination), Schipper & Stalpers (*Persoonia* **12**: 81, 1983), Chen & Huang (*Mycosystema* **1**: 53, 1988; electrophoresis), Zheng *et al.* (*Mycosystema* **1**: 39, 1988; key), Benny *et al. in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **7A**: 113, 2001), O'Donnell *et al.* (*Mycol.* **93**: 286, 2001; phylogeny), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Nyilasi *et al.* (*Clin. Microbiol. Infect.* **14**: 393, 2008; molecular identification).

Syncephalidium Badura (1963) = Syncephalis fide Benjamin (*Mycol.* **48**: 1, 1966).

Syncephalis Tiegh. & G. Le Monn. (1873), Piptocephalidaceae. *c.* 45 (mycoparasites of *Mucorales*), widespread. See Benjamin (*Aliso* **4**: 321, 1959), Zycha *et al.* (*Mucorales*, 1969; key), Kuzuha (*TMSJ* **14**: 237, 1973), Hunter & Butler (*Mycol.* **67**: 863, 1975), Baker *et al.* (*Mycol.* **69**: 1008, 1977; host range & culture), Kuzuha (*J. Jap. Bot.* **55**: 343, 1980; zygospore formation), Bawcutt (*TBMS* **80**: 219, 1983), Benjamin (*Aliso* **11**: 1, 1985), Can *et al.* (*Nova Hedwigia* **49**: 427, 1989), Ginman & Young (*Mycologist* **5**: 19, 1991; ultrastr.), Gruhn & Petzold (*Can. J. Microbiol.* **37**: 355, 1991), Patil & Patil (*Indian Phytopath.* **43**: 217, 1994), Ho (*Taiwania* **48**: 53, 2003; Taiwan), Tanabe *et al.* (*J. gen. appl. Microbiol.* Tokyo **51**: 267, 2005; phylogeny), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny), Ho & Benny (*Botanical Studies* **48**: 319, 2007; n.sp., Taiwan), Ho & Benny (*Botanical Studies* **49**: 45, 2008; n.sp., Taiwan).

Syncephalopsis Boedijn (1959) = Syncephalis fide Benjamin (*Mycol.* **48**: 1, 1966).

Syncesia Taylor (1836), Roccellaceae (L). 17, widespread (esp. S. America). See Tehler (*Cryptog. Bot.* **3**: 139, 1993), Tehler (*Fl. Neotrop.* **75**, 1997), Myllys *et al.* (*Bryologist* **101**: 70, 1998; morphology, phylogeny), Myllys *et al.* (*Lichenologist* **31**: 461, 1999; phylogeny), Tehler & Irestedt (*Cladistics* **23**: 432, 2007).

Synchaetomella Decock & Seifert (2005), anamorphic *Diaporthales*. 1, Singapore. See Decock *et al.* (*Antonie van Leeuwenhoek* **88**: 234, 2005).

synchronized culture, a culture manipulated so that division of all the component cells is simultaneous; see Williamson & Scopes (*Symp. Soc. gen. Microbiol.* **11**: 217, 1961; *Saccharomyces cerevisiae*).

Synchronoblastia Uecker & F.L. Caruso (1988), anamorphic *Pezizomycotina*, Cpd.0eH.6. 1, USA. See Uecker & Caruso (*Mycol.* **80**: 345, 1988).

synchronospore, a spore produced simultaneously with other neighbouring spores.

Synchytriaceae J. Schröt. (1892), Chytridiales. 5 gen. (+ 5 syn.), 136 spp.

Lit.: Percival (*Zentbl. Bakt. ParasitKde* Abt. II **25**: 440, 1910), Karling (*Synchytrium*: 470 pp., 1964), Barr (*Geobios* New Rep., 1980; emmend.), Raghavendra & Pavgi (*Indian Phytopath.* **46**: 36, 1993), Hampson *et al.* (*Mycol.* **86**: 733, 1994), Barr *in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **7A**: 93, 2001).

Synchytrium de Bary & Woronin (1863), Synchytriaceae. *c.* 120 (plant parasites), widespread. *S. aureum* reported from 198 host spp. (123 gen., 34 fam.); Karling experimentally infected 1465 spp. in more than 918 gen. of 176 fam. with *S. macrosporum*, *S. endobioticum* (potato wart disease). See Karling (*Synchytrium*, 1964; keys), Karling (*Adv. Frontier Pl. Sci.* **29**: 1, 1972), Raghavendra & Pavgi (*Indian Phytopath.* **46**: 36, 1993; on *Cucurbitaceae*), Hampson *et al.* (*Mycol.* **86**: 733, 1994; Ultrastr. *S. endobioticum*), Niepold & Stachewicz (*Zeitschrift für Pflanzenkrankheiten und Pflanzenschutz* **111**: 313, 2004; PCR-detection of *S. endobioticum*).

Syncladium Rabenh. (1859), anamorphic *Pezizomycotina*, Cpd.?.?. 1, widespread. See Hughes (*Mycol.* **68**: 693, 1976).
Syncleistostroma Subram. (1972) nom. conf. = Petromyces fide Malloch & Cain (*CJB* **51**: 1647, 1973).
Syncoelium Wallr. (1833), ? Algae. See Hughes (*CJB* **36**: 747, 1958).
Syncollesia Nees (1823) ? = Fumago fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Syncomista Nieuwl. (1916) ≡ Toninia.
syncytium, see coenocyte.
Syndiplodia Peyronel (1915) = Microdiplodia Allesch. fide Sutton (*Mycol. Pap.* **141**, 1977).
syndrome, a complex of symptoms, especially that which constitutes the picture of a disease.
Synechoblastus Trevis. (1853) = Collema F.H. Wigg. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
synecology, ecology of communities.
synergism, two organisms or environmental factors acting simultaneously to effect a change greater than either could alone; e.g. the increase of fungicidal value in certain mixtures of fungicides, fungicides and non-toxic materials, or of air pollutants. Cf. metabiosis.
syngamy, fertilization; the fusion of male and female cells to form a zygote.
Syngenosorus Trevis. (1860) = Tomasellia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Syngliocladium Petch (1932), anamorphic *Ophiocordyceps*, Hsy.0eH.?. 5, widespread (north temperate). See Petch (*TBMS* **25**: 262, 1942), Pendland & Boucias (*Mycopathologia* **99**: 25, 1987), Hodge *et al.* (*Mycol.* **90**: 743, 1998), Evans & Shah (*MR* **106**: 737, 2002).
Synglonium Penz. & Sacc. (1897) ? = Nymanomyces fide Höhnel (*Annls mycol.* **16**: 154, 1918).
synisonym, one of two or more names having the same basionym (Donk, *Persoonia* **1**: 175, 1960).
synkaryon, a diploid zygote nucleus.
synkaryotic (of a nucleus), having *2n* chromosomes.
synnema (pl. **synnemata**), a conidioma composed of a more or less compacted group of erect and sometimes fused conidiophores bearing conidia at the apex only or on both apex and sides. Seifert (*Stud. Mycol.* **27**: 1, 1985) distinguished 3 types: **determinate -**, with a terminal, non-elongated conidiogenous zone, growth ceasing after sporulation has begun, e.g. *Stilbella*; **indeterminate -**, with an elongated fertile zone, sometimes covering the whole conidioma, growth continuing after sporulation, e.g. *Doratomyces*; **compound -**, branched in which determinate or indeterminate branches are formed on a branched or unbranched axis, e.g. *Tilachlidiopsis*. Anatomical stipe types found in the three groups include **parallel -**, of primarily parallel hyphae; **intricate -**, of primarily or entirely textura intricata; **basistromatic -**, with well-defined basal stromata; **amphistromatic -**, well-defined basal stroma, stipe of parallel hyphae and an apical dome of textura angularis to globulosa with conidiogenous cells; **cupulate -**, conidiogenous zone concave. See Fig. 38.
synnema coremium, sometimes used for synnemata with looser fascicles as in 'coremioid' spp. of *Penicillium* and *Aspergillus* (obsol.).
Synnemadiplodia Zambett. (1955) = Botryodiplodia fide Petrak (*Sydowia* **16**: 353, 1963).
Synnemapestaloides T. Handa & Y. Harada (2004), anamorphic *Amphisphaeriaceae*. 1, Japan. See Handa *et al.* (*Mycoscience* **45**: 138, 2004).
Synnemaseimatoides K. Matsush. & Matsush. (1996), anamorphic *Pezizomycotina*, Hso.?.?. 1, Japan. See Matsushima & Matsushima (*Matsush. Mycol. Mem.* **9**: 38, 1996).
Synnematium Speare (1920) = Hirsutella fide Evans & Samson (*TBMS* **79**: 431, 1982).
Synnematomyces Kobayasi (1981), anamorphic *Pezizomycotina*, Hsy.0eH.?. 1, Japan. See Kobayasi (*J. Jap. Bot.* **56**: 287, 1981).
Synnematomycetes, anamorphic fungi having synnemata (Höhnel, 1923); *Coremiales* (Potebnia, 1909), (obsol.).
synnematous (synnematogenous), having synnemata. See Seifert (*Stud. Mycol.* **27**: 1, 1985, *Stilbella* and allies, *Mem. N.Y. bot. Gdn* **59**: 109, 1990, keys).
Synnemellisia N.K. Rao, Manohar. & Goos (1989), anamorphic *Pezizomycotina*, Hsy.0eH.15. 1, India. See Rao *et al.* (*Mycol.* **80**: 896, 1988).
Synnmukerjiomyces Aneja & R. Kumar (1999), anamorphic *Pezizomycotina*, H?.?.?. 1, India. See Aneja & Kumar (*Advances in Microbial Biotechnology*: 1, 1999).
Synomyces Arthur (1924) = Coleosporium fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).
synonym, another name for a species or group, esp. a later or illegitimate name not currently employed for the taxon. If two or more names are based on the same type they are **homotypic (nomenclatural**, 'obligate', ≡) synonyms, if on different types they may be **heterotypic (taxonomic**, 'facultative', =) synonyms. See Nomenclature, and cf. basionym, homonym, orthographic synisonym, variant.
Synostomella Syd. (1927) = Cyclotheca fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).
Synostomina Petr. (1949), anamorphic *Pezizomycotina*, St.0eH.?. 1, S. America.
Synpeltis Syd. & P. Syd. (1917) = Cyclotheca fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).
Synpenicillium Costantin (1888) = Doratomyces fide Morton & Smith (*Mycol. Pap.* **86**, 1963).
Synphragmidium F. Strauss (1853) = Speira fide Saccardo (*Syll. fung.* **4**: 514, 1886).
Synsphaeria Bonord. (1851), Pezizomycotina. 1, Europe.
Synsphaeridium G. Playford (1981), Fossil Fungi. 1, Western Australia.
Synsporium Preuss (1849) = Stachybotrys fide Hughes (*CJB* **36**: 727, 1958).
Synsterigmatocystis Costantin (1888) nom. inval. = Gibellula fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Syntexis Theiss. (1916) ? = Mollisia fide Petrak (*Annls mycol.* **26**: 399, 1928).
Synthetospora Morgan (1892) = Stephanoma fide Mattirolo (*Annals R. Accad. Agric. Torino* **79**: 190, 1936).
Syntholus A.W. Ramaley & M.E. Barr (1997), anamorphic *Syncarpella*, Cpd.?.?. 1, USA. See Ramaley & Barr (*Mycotaxon* **65**: 501, 1997).
syntype, see type.
synzoospore, multinucleate zoospore with many sets of flagella.
Syphosphaera Dumort. (1822), Pezizomycotina. 1, Europe.
Syrigosis Neck. ex Kremp. (1869) = Sphaerophorus

fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Syringospora Quinq. (1868) nom. rej. = Candida fide van der Walt (*Mycopathologia* **40**: 231, 1970), von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977).

Syrropeltis Bat., J.L. Bezerra & Matta (1964), ? Dothideales. 1 (on *Xylopia*), Brazil. See Batista *et al.* (*Portugaliae Acta Biologica* Série B **7**: 376, 1964).

syrrotium (pl. **-ia**), term coined by Falk (1912) for the mycelial cord of *Merulius*. See Thompson (*in* Jennings & Rayner (Eds), *The ecology and physiology of the fungal mycelium*: 185, 1984).

Syspastospora P.F. Cannon & D. Hawksw. (1982), Ceratostomataceae. 2 (saprobic and/or fungicolous), widespread. See Horie *et al.* (*Mycotaxon* **25**: 229, 1986), García *et al.* (*Mycol.* **94**: 862, 2002).

Systematics. also **Biosystematics** (q.v.). The study of the relationships and classification of organisms and the processes by which they have evolved and are maintained (includes the subdisciplines of nomenclature and taxonomy), see Hawksworth (Ed.) (*Prospects in systematics*, 1988), Minelli (*Biological systematics: the state of the art*, 1993), Ross (*Biological systematics*, 1974), Stevens (*The development of biological systematics*, 1995). The word also has other uses outside biology. See also Classification, Nomenclature, Phylogenetic analysis.

systemic (1) (of a parasite), spreading throughout the host; (2) (of a fungicide), absorbed, esp. by the roots, and translocated to other parts of the plant.

Systenostrema E.I. Hazard & Oldacre (1975), Microsporidia. 3.

Systremma Theiss. & Syd. (1915), Dothideaceae. 1, widespread. See von Arx & Müller (*Stud. Mycol.* **9**, 1975), Gams (*Taxon* **54**: 520, 2005; nomencl.).

Systremmopsis Petr. (1923), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe. See Hoog & McGinnis (*Stud. Mycol.* **30**: 187, 1987).

Syzygites Ehrenb. (1818), Mucoraceae. 1 (on decaying *Boletaceae* (esp. *Boletus*), widespread (north temperate). See Hesseltine (*Lloydia* **20**: 228, 1957), Ekpo & Young (*Microbios* **10**: 63, 1979; ultrastr.), Kaplan & Goos (*Mycol.* **74**: 684, 1982; zygospore formation), Kovacs (*Syzygites megalocarpus (Mucoraceae, Mucorales, Zygomycetes) and its host-parasite association in the contiguous United States*, 1995), Weete *et al.* (*J. Am. Oil Chem. Soc.* **75**: 1367, 1998; fatty acids), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Syzygospora G.W. Martin (1937), Carcinomycetaceae. 16, widespread. If the type species is anamorphic, then the remaining species belong in *Carcinomyces* or *Christiansenia*. See Donk (*Taxon* **11**: 101, 1962; ? nom. anam.), Ginns (*Mycol.* **78**: 619, 1986; key), Diederich (*Biblthca Mycol.* **61**: 29., 1996), Hauerslev (*Mycotaxon* **72**: 465, 1999), Harmaja (*Memoranda Societatis pro Fauna et Flora Fennica* **79**: 73, 2003; Finland), Kotiranta & Miettinen (*Acta Mycologica* Warszawa **41**: 21, 2006; Finland n.sp.).

Syzygosporaceae Jülich (1982) = Carcinomycetaceae.

Szczawinskia A. Funk (1984), anamorphic *Pilocarpaceae*, St.0fH.15 (L). 1, N. America; Papua New Guinea. See Aptroot *et al.* (*Biblthca Lichenol.* **64**, 1997), Holien & Tønsberg (*Lichenologist* **34**: 369, 2002), Andersen & Ekman (*MR* **109**: 21, 2005).

T, see RIEC.

T-2 toxin, a mycotoxin of the trichothecene group (q.v.) produced by some *Fusarium* spp., causing alimentary toxic aleukia.

Tabanispora H.I. Bykova, Y.Y. Sokolova & I.V. Issi (1987), Microsporidia. 2.

Tabanomyces Couch, R.V. Andrejeva, Laird & Nolan (1979) = Meristacrum fide Tucker (*Mycotaxon* **13**: 481, 1981).

Tachaphantium Bref. (1888) = Platygloea fide Bandoni (*Mycol.* **48**: 821, 1956).

Taeniola Bonord. (1851) nom. illegit. = Hormiscium fide Saccardo (*Syll. fung.* **4**: 263, 1886), Hughes (*CJB* **36**: 727, 1958).

Taeniolella S. Hughes (1958), anamorphic *Glyphium*, Hso.≡ eP.3/4. *c.* 48, widespread. See Sutton (*TBMS* **54**: 255, 1970; teleomorphs), Ellis (*More Dematiaceous Hyphomycetes*, 1976), Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **6**: 183, 1979; on lichens), Zhurbenko (*Folia Cryptog. Estonica* **32**: 153, 1998), Gulis & Marvanová (*Mycotaxon* **72**: 237, 1999), Diederich & Zhurbenko (*Graphis Scripta* **12**: 37, 2001; nomencl.), Jones & Eaton (*Mycoscience* **43**: 201, 2002).

Taeniolina M.B. Ellis (1976), anamorphic *Pezizomycotina*, Hso.≡ eP.3. 1, Europe; Cuba. See Ellis (*More Dematiaceous Hyphomycetes*: 61, 1976).

Taeniophora P. Karst. (1886) = Phragmotrichum fide Sutton & Pirozynski (*TBMS* **48**: 349, 1965).

Taeniospora Marvanová (1977), anamorphic *Fibulomyces*, Hso.1bH.1. 2 (with clamp connexions), Czech Republic. See Marvanová & Stalpers (*TBMS* **89**: 489, 1987; key, teleomorphs).

Tainosphaeria F.A. Fernández & Huhndorf (2005), Chaetosphaeriaceae. 1, Puerto Rico. See Fernández & Huhndorf (*Fungal Diversity* **18**: 44, 2005), Fernández *et al.* (*Mycol.* **98**: 121, 2006; phylogeny).

Taiwanascaceae Sivan. & H.S. Chang (1997) = Niessliaceae.

Taiwanascus Sivan. & H.S. Chang (1997), Niessliaceae. 1 (from dead wood), Taiwan. See Samuels & Barr (*CJB* **75**: 2165, 1997), Sivanesan & Chang (*MR* **101**: 176, 1997).

Taiwanoporia T.T. Chang & W.N. Chou (2003), Agaricomycetidae. 1, Taiwan. See Chang & Chou (*Mycol.* **95**: 1215, 2003).

take-all, a cereal disease (*Gaeumannomyces graminis*).

Talaromyces C.R. Benj. (1955), Trichocomaceae. Anamorphs *Penicillium*, *Geosmithia*-like, *Merimbla*. 42, widespread. See Pitt (*The genus Penicillium and its teleomorphic states Eupenicillium and Talaromyces*, 1979; keys), Frisvad *et al.* (*Antonie van Leeuwenhoek* **57**: 179, 1990; chemotaxonomy), Prieto *et al.* (*MR* **99**: 69, 1995; polysaccharides), Yaguchi *et al.* (*Mycoscience* **37**: 55, 1996; ubiquinones), Ogawa *et al.* (*Mycol.* **89**: 756, 1997; DNA), Ogawa & Sugiyama (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 149, 2000; phylogeny), Pitt *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 9, 2000; accepted names), Heredia *et al.* (*Mycol.* **93**: 528, 2001; Mexico), Yaguchi *et al.* (*Cryptog. Mycol.* **26**: 133, 2005), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny).

Talbotiomyces Vánky, R. Bauer & Begerow (2007), Entorrhizaceae. 1 (galls on roots of dicots), S. Africa. See Vánky *et al.* (*Mycol. Balcanica* **4**: 11, 2007).

Talekpea Lunghini & Rambelli (1979), anamorphic *Pezizomycotina*, Hso.1eP.19. 1, Ivory Coast. See Lunghini & Rambelli (*Micol. Ital.* **8**: 23, 1979).

Talpapellis Alstrup & M. Cole (1998), anamorphic

Pezizomycotina, Hso.?.?. 1, Canada. See Alstrup & Cole (*Bryologist* **10**: 227, 1998).

Tamnidium, see *Thamnidium Link*.

Tamsiniella S.W. Wong, K.D. Hyde, W.H. Ho & S.J. Stanley (1998), Dothideomycetes. 1, Australia. See Wong *et al.* (*CJB* **76**: 334, 1998).

Tandonea, see *Tandonia*.

Tandonella S.S. Prasad & R.A.B. Verma (1970) = Passalora fide Sutton & Pascoe (*Aust. J. Bot.* **35**: 183, 1987; on *Olearia*), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Tandonia M.D. Mehrotra (1991), anamorphic *Pezizomycotina*, St.0eH.15. 1, India. See Mehrotra (*MR* **95**: 1074, 1991).

Tanglella Höhn. (1918), ? Helotiales. 1, Europe.

Tania Egea, Torrente & Sipman (1995), Arthoniaceae (L). 1, Malaysia. See Egea *et al.* (*Lichenologist* **27**: 352, 1995), Grube (*Bryologist* **101**: 377, 1998), Harada & Yamamoto (*Lichenology* **5**: 89, 2006).

tao-cho (tao-si), see hamanatto.

tapé, an Indonesian fermented food prepared by the action of *Rhizopus oryzae* and *Endomyces chodatii* on rice (Swan Djien Ko, *Appl. Microbiol.* **23**: 976, 1972); - **ketala** (peuyeum), a Javanese food obtained by the fermentation of cassava tubers with *Mucor javanicus* (Hedger, *Bull. BMS* **12**: 54, 1978). See also Fermented food and drinks.

Tapeinosporium Bonord. (1853) = Septocylindrium fide Saccardo (*Syll. fung.* **4**: 226, 1886).

Tapellaria Müll. Arg. (1890), ? Ectolechiaceae (L). 12, widespread (tropical). See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952), Lücking (*Phyton* Horn **39**: 131, 1999; Costa Rica), Lücking (*Willdenowia* **29**: 299, 1999; Ecuador).

Tapellariopsis Lücking (1999), Ectolechiaceae (L). 1, Costa Rica. See Lücking (*Phyton* Horn **104**: 148, 1992).

Tapesia (Pers.) Fuckel (1870) nom. rej., Helotiales. *c.* 25, widespread. Species associated with cereal disease are now separated as *Oculimacula*. Often synonymized with *Mollisia*. See Baral & Krieglsteiner (*Beih. Z. Mykol.* **6**, 1985; synonymy with *Mollisia*), Gamundí (*Fl. criptog. Tierra del Fuego* **10**: 126 pp., 1986; Argentina), Gminder (*Z. Mykol.* **62**: 181, 1996), Harrington & McNew (*Mycotaxon* **87**: 141, 2003), Gminder (*Czech Mycol.* **58**: 125, 2006).

Tapesina Lambotte (1887), Hyaloscyphaceae. Anamorph *Chalara*-like. 1, Europe. See Svrček (*Česká Mykol.* **41**: 193, 1987), Baral (*Z. Mykol.* **68**: 117, 2002).

Taphria Fr. (1821) = Taphrina fide Fries (*Syst. mycol.* **3**: 520, 1832).

Taphridium Lagerh. & Juel (1902), Protomycetaceae. 2, widespread. See Reddy (*Mycotaxon* **3**: 1, 1975; key).

Taphrina Fr. (1815), Taphrinaceae. Anamorph *Lalaria*. 95 (biotrophic on plants), widespread. *T. populina* (poplar leaf blister), *T. betulina* (witches' broom of birch, *T. bullata* (pear leaf blister), *T. cerasi* (witches' broom of cherry), *T. caerulascens* (oak leaf curl), *T. deformans* (peach leaf curl), *T. insititiae* (witches' broom of plum), *T. minor* (cherry leaf curl), *T. pruni* (pocket plums). See Mix (*Kansas Univ. Sci. Bull.* **33**: 1, 1949), Kramer (*Mycol.* **52**: 295, 1960; dev. and nuclear behaviour), Snider & Kramer (*Mycol.* **66**: 743, 754, 1974; 754, 1974; numerical taxonomy), Bacigálová (*Czech Mycol.* **50**: 107, 1997; spp. on *Betula*), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997; phylogeny), Sugiyama (*Mycoscience* **39**: 487, 1998; phylogeny), Schweigkofler *et al.* (*Organ. Divers. Evol.* **2**: 1, 2002; phylogeny), Bacigálová *et al.* (*Mycol. Progr.* **2**: 179, 2003; on *Alnus*), Karatygin (*Mikol. Fitopatol.* **37**: 26, 2003; key), Rodrigues & Fonseca (*Int. J. Syst. Evol. Microbiol.* **53**: 607, 2003; phylogeny), Inácio *et al.* (*FEMS Yeast Res.* **4**: 541, 2004; anamorphs, Portugal), Tavares *et al.* (*Eur. J. Pl. Path.* **110**: 973, 2004; molecular detection), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny), Hansen *et al.* (*MR* **111**: 592, 2007; on *Nothofagus*).

Taphrinaceae Gäum. (1928) nom. cons., Taphrinales. 2 gen. (+ 7 syn.), 118 spp.

Lit.: Kramer (*Stud. Mycol.* **30**: 151, 1987), Nishida & Sugiyama (*Mol. Biol. Evol.* **10**: 431, 1993), Bacigálová (*Czech Mycol.* **50**: 107, 1997), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997), Moore *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 582, 1998), Sugiyama (*Mycoscience* **39**: 487, 1998), Rodrigues & Fonseca (*Int. J. Syst. Evol. Microbiol.* **53**: 607, 2003), Inácio *et al.* (*FEMS Yeast Res.* **4**: 541, 2004), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny).

Taphrinales Gäum. & C.W. Dodge (1928). Taphrinomycetidae. 2 fam., 8 gen., 140 spp. Mycelium subcuticular or subepidermal, composed of dikaryotic ascogenous cells, sometimes forming thick-walled smooth or ornamented resting spores, vegetative tissue ± lacking; ascomata absent; interascal tissue absent; asci formed either directly from ascogenous cells or with a separating stalk cell, forming internally or in a palisade on the surface of the host tissue, ± cylindrical, the end often truncate, ± persistent, usually 8-spored, the ascospores discharged simultaneously; ascospores hyaline, aseptate, globose or ellipsoidal, sometimes discharged in a single mass. Anamorph yeast-like, monokaryotic, formed from budding ascospores. Biotrophic on plants, usually causing hyperplasia (galls, witches' brooms) or lesions. Fams:

(1) **Protomycetaceae**
(2) **Taphrinaceae**

Cell walls are two-layered and conidiogenesis (ascospore budding) is basidiomycete-like. Has similarities with the red yeasts, *Exobasidiales* and *Ustilaginales*, but are now accepted as an ancestral lineage of the *Ascomycota*.

Lit.: Kramer (*in* Ainsworth *et al.* (Eds), *The Fungi* **4A**: 33, 1973; keys gen., *Stud. Mycol.* **30**: 151, 1987), von Arx *et al.* (1982; relationships, ultrastr., wall chemistry), Sugiyama (*Mycoscience* **39**: 487, 1998; phylogeny), Sugiyama *et al.* (*Mycol.* **98**: 996, 2006; phylogeny), Sjamsuridzal *et al.* (*Mycoscience* **38**: 267, 1997; phylogeny), Swann *et al.* (*Mycol.* **91**: 51, 1999; contrast with *Basidiomycota*).

Taphrinomycetes O.E. Erikss. & Winka (1997). Taphrinomycotina. 1 ord., 2 fam., 8 gen., 140 spp. Subcl.:
Taphrinomycetidae

For *Lit.* see ord. and fam.

Taphrinomycetidae, see *Taphrinomycetes*.

Taphrinomycotina O.E. Erikss. & Winka (1997), Taphrinomycetes. Ord.:
Taphrinales

Bresadola'* **42**: 7, 1999; Italy), Wu & Kimbrough (*Int. J. Pl. Sci.* **162**: 1075, 2001; ontogeny), Yao & Spooner (*MR* **106**: 1243, 2002; UK (as *Tazzetta*)), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Liu & Zhuang (*Mycosystema* **25**: 546, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Tasmidella Kantvilas, Hafellner & Elix (1999), Megalariaceae (L). 1, Tasmania. See Kantvilas *et al.* (*Lichenologist* **31**: 213, 1999).

Tassia Syd. & P. Syd. (1919), anamorphic *Pezizomycotina*, Cpt.0eH.?. 2, Brazil; Europe.

Taste. Five basic tastes are now generally recognized: bitter, salty, sour, sweet and savoury. Of these, savoury (also known by the Japanese word umami) is most important in mycology. This is the taste contributed by glutamates and characteristic of fermented foods, many of which are produced using fungi (see Fermented food and drinks). Tastes in fungi combine with smells (q.v.) to produce flavours which are significant in edible fungi, and as an aid to identification. Fresh basidiomata of some agarics have characteristic flavours (e.g. acrid, or apricot or garlic, peppery, etc.), often described as tastes, which are sometimes used to aid identification; see Gilbert (*Méthode de mycologie descriptive*, 1934), Josserand (1952: 68), Locquin (*Petite flore des champignons de France*, 1956: 100). Tasting unknown fungi should be practised with caution.

Tatraea Svrček (1993), Helotiaceae. 1, Europe. See Baral *et al.* (*Öst. Z. Pilzk.* **8**: 71, 1999).

Tauromyces Cavalc. & A.A. Silva (1972) = Gyalectidium fide Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Tausonia Babeva (1998), anamorphic *Cystofilobasidiaceae*. 1, Tadzhikistan. See Bab'eva (*Mikrobiologiya* **67**: 231, 1998).

Tavaresiella T. Majewski (1980), ? Laboulbeniaceae. 4, widespread. See Benjamin (*Aliso* **13**: 559, 1993).

Tawdiella K.B. Deshp. & K.S. Deshp. (1966), anamorphic *Pezizomycotina*, Hso.#eP.?. 1, India. See Deshpande & Deshpande (*Mycopathologia* **28**: 207, 1966).

tawny grisette, basidioma of the edible *Amanita fulva*.

taxis (frequently a suffix), a movement of a plasmodium or zoospore as a reaction to a one-sided stimulus; + (positive) when the movement is in the direction of the stimulus, – (negative) when away from the stimulus. The following tactic movements of zoospores have been described; (1) **chemotaxis**, in response to root exudates (*Pythium* spp.) and amino acids (*Allomyces* spp.); (2) **gravitaxis** (*Phytophthora palmivora*); (3) **electrotaxis** (*Phytophthora palmivora*; Morris *et al.*, *Plant Cell & Environment* **15**: 645, 1992).

taxol, an antitumor diterpenoid used in treatment of some cancers originally obtained from bark of Pacific yew (*Taxus brevifolia*), but also produced by the endophytic fungus *Taxomyces andreanae* (Stierle *et al.*, *Science* **260**: 214, 1993).

Taxomyces Strobel, A. Stierle, D. Stierle & W.M. Hess (1993), anamorphic *Pezizomycotina*, Hso.1bH.1. 1 (endophytic), USA. See Strobel *et al.* (*Mycotaxon* **47**: 73, 1993).

taxon (pl. **taxa**, **taxons**), a taxonomic group of any rank (Code, Art. 1). See Lam (*Taxon* **6**: 213, 1957; history and usage). See Classification.

taxonomy, the science of classification, in biology the arrangment of organisms into a classification; **idio-**, of organisms; **syn-**, of communities. See Classification, Nomenclature, systematics.

Tazzetta, see *Tarzetta*.

TDP, thermal death point; generally used for a 10 min. application of heat.

tea fungus, a symbiotic association of yeasts (*Saccharomycodes ludwigii*) and bacteria (esp. *Acetobacter xylinum*). See Stadelmann (*Sydowia* **11**: 380, 1958; bibliogr., *Zbl. Bakt.* Abt. I **180**: 401, 1961), Kappel & Anken (*The Mycologist* **7**: 12, 1993; analysis); cf. teekwass, tibi, ginger beer plant.

Teberdinia Sogonov, W. Gams, Summerbell & Schroers (2005), anamorphic *Pseudeurotium*, H?.?.?. 1, Karacheyevo-Cherkessiya. See Sogonov *et al.* (*Mycol.* **97**: 698, 2005).

Tectacervulus A.W. Ramaley (1992), anamorphic *Pezizomycotina*, Cac.0eH.15. 1, USA. See Ramaley (*Mycotaxon* **43**: 438, 1992).

Tectella Earle (1909), ? Mycenaceae. 3, widespread (north temperate). See Cavet (*Bull. Trimestr. Féd. Mycol. Dauphiné-Savoie* **34**: 32, 1994), Jin *et al.* (*Mycotaxon* **79**: 7, 2001; phylogeny).

Tectimyces L.G. Valle & Santam. (2002), Legeriomycetaceae. 2 (in *Habroleptoides*), Spain. See Valle & Santamaria (*MR* **106**: 842, 2002).

teekwass, a Russian drink obtained by fermenting tea with a symbiotic mixture of *Acetobacter xylinum* and *Schizosaccharomyces pombe*. Cf. ginger beer plant, tea fungus, tibi.

Tegillum Mains (1940) = Olivea fide Ono & Hennen (*TMSJ* **24**: 369, 1978).

Tegoa Bat. & Fonseca (1961) nom. inval.; nom. dub., anamorphic *Pezizomycotina*. See Lücking *et al.* (*Lichenologist* **30**: 121, 1998).

Teichospora Fuckel (1870), ? Dacampiaceae. *c.* 23 (on wood), widespread. See Yuan & Barr (*Mycotaxon* **54**: 111, 1995), Barr (*Mycotaxon* **82**: 373, 2002).

Teichosporaceae M.E. Barr (2002) ? = Dacampiaceae. Described to contain non-lichenicolous taxa of the *Dacampiaceae*, but is almost certainly polyphyletic in its original circumscription. Molecular data are lacking.

Lit.: Barr (*Mycotaxon* **82**: 373, 2002).

Teichosporella (Sacc.) Sacc. (1895), Dothideomycetes. 1 or 2, widespread (temperate). See Kutorga & Hawksworth (*SA* **15**: 1, 1997).

Teichosporina (G. Arnaud) Cif. & Bat. (1962) = Limacinula Höhn. fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Telamonia (Fr.) Wünsche (1877) nom. cons. = Cortinarius fide Kauffman (*N. Amer. Fl.* **10**, 1932).

teleblem (teleoblema), see universal veil.

Telebolus Lindau (1905) = Thelebolus fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Telemeniella Bat. (1955) = Phyllachora Nitschke ex Fuckel (1870) fide Hyde & Cannon (*Mycol. Pap.* **175**, 1999).

teleomorph, see States of fungi.

teleutosorus, see telium.

Teleutospora Arthur & Bisby (1921) = Uromyces fide Arthur (*Manual Rusts US & Canada*, 1934).

teleutospore, see teliospore.

Teleutosporites Mesch. (1902), Fossil Fungi ? Pucciniales. 4 (Carboniferous, Tertiary), France; Malaysia. But see Pirozynski (*Biol. Mem.* **1**: 104, 1976).

teleutosporodesm, Donk's (*Proc. Kon. Nederl. Akad. Wetensch.* C **75**: 385, 1972) term for teliospore (obsol.).

Telimena Racib. (1900), Phyllachoraceae. 11 (from living leaves), widespread. See Müller (*Sydowia* **27**: 74, 1975), Sivanesan (*TBMS* **88**: 473, 1987).

Telimenella Petr. (1940), Phyllachoraceae. 2 (from living leaves), widespread (temperate). See Barr (*Mycol.* **69**: 952, 1977), Sivanesan (*TBMS* **88**: 473, 1987).

Telimeniella, see *Telemeniella.*

Telimenochora Sivan. (1987), Phyllachoraceae. 1 (from living leaves), Mexico; Puerto Rico. See Sivanesan (*TBMS* **88**: 473, 1987).

Telimenopsis Petr. (1950) = Telimena fide Sivanesan (*TBMS* **88**: 473, 1987).

Telioclipeum Viégas (1962), Pezizomycotina. 1 (on *Aspidiosperma*), Brazil. See Viégas (*Bragantia* **21**: 260, 1962).

Teliomycetes, see *Pucciniomycetes.*

teliospore (teleutospore; teleutosporidesm, Donk (1973)), the spore (commonly a winter or resting spore) of the *Pucciniales* (or *Ustilaginales*) from which the basidium is produced (Fig. 8H).

Teliosporeae. A subclass (Bessey, 1935) for *Pucciniomycetes* and *Ustilaginomycetes.*

telium, a sorus producing teliospores.

Telligia Hendr. (1948), anamorphic *Pezizomycotina*, Hso.#eP.?. 1, Congo.

Teloconia Syd. (1921) = Phragmidium fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Telogalla Nik. Hoffm. & Hafellner (2000), Verrucariaceae. 1 (lichenicolous), Europe. See Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000).

Telomapea G.F. Laundon (1967) = Maravalia fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Telomyxa L. Léger & E. Hesse (1910), Microsporidia. 1.

Teloschistaceae Zahlbr. (1898), Teloschistales (L). 12 gen. (+ 41 syn.), 644 spp.

Evol.* **44**: 412, 2007; phylogeny), Gaya *et al.* (*MR* **112**: 528, 2008; phylogeny).

Teloschistales D. Hawksw. & O.E. Erikss. (1986), (L). Lecanoromycetidae. 5 fam., 66 gen., 1954 spp. Thallus varied, usually foliose or fruticose, often brightly coloured. Ascomata apothecial, usually strongly concave, usually orange or reddish, usually with a well-developed thalline margin, often with anthraquinone pigments (K+ crimson). Interascal tissue of usually unbranched paraphyses, the apices often capitate. Asci cylindrical, persistent, the apex strongly thickened, without separable wall layers, with a conspicuous outer J+ layer, sometimes also with an internal J+ structure, releasing ascospores through an apical split. Ascospores mostly hyaline, often with very thick septa, reduced lumina, and polarilocular. Anamorphs pycnidial. Lichenized with green algae, cosmop., esp. on nutrient-rich or basic substrata.

Pycnidia with numerous small locules lined by ± doliiform conidiogenous cells support the separation from *Lecanorales* as well as characters of the ascomata and chemistry. Fams:

(1) **Caliciaceae** (syn. *Buelliaceae*, *Pyxinaceae*)
(2) **Letrouitiaceae**
(3) **Megalosporaceae**
(4) **Physciaceae**
(5) **Teloschistaceae** (syn. *Caloplacaceae*)

Two suborders have been suggested, the *Teloschistineae* which corresponds to the traditionally circumscribed order, and the *Physciineae* which contains the *Caliciaceae* and *Physciaceae*. *Lit.*: Kärnefelt

(*Crypt. Bot.* **1**: 147, 1989; gen. names, phylogeny), Miądlikowska *et al* (*Mycol.* **98**: 1088, 2006).

Teloschistes Norman (1853), Teloschistaceae (L). *c.* 33, widespread. See Thomson (*Am. midl. Nat.* **41**: 706, 1949; N. Am.), Filson (*Muelleria* **2**: 65, 1969; Australia), Almborn (*Nordic Jl Bot.* **8**: 521, 1989; key 9 spp., C. & S. Afr.), Stenroos & DePriest (*Am. J. Teloschistomyces Cif. & E.A. Thomas (1953) = Teloschistes.

Telospora Arthur (1906) = Uromyces fide Arthur (*Manual Rusts US & Canada*, 1934).

TEM, transmission electron microscope. See ultrastructure.

Temerariomyces B. Sutton (1993), anamorphic *Pezizomycotina*, Hso.0eP.?3. 1, Malawi. See Sutton (*Mycol. Pap.* **167**: 62, 1993).

Temnospora A. Massal. (1860) = Chrysothrix fide Laundon (*Lichenologist* **13**: 101, 1981).

tempeh (tempé), an oriental food composed of *Rhizopus oligosporus* fermented soybeans (Hesseltine, *Mycol.* **57**: 154, 1965).

tempeh-bongrek, an oriental food composed of *Rhizopus* and manioc prepared in Malaysia.

tenacle, see haerangium.

Teng (Shu-chun; 1902-1970; China). Student, Cornell University, New York, USA (1923-1928); Lecturer, Lingnan University (1928-1933); Lecturer, Jinling University and Nanking University (1930s); surveying to establish forest stations around the upper Yellow River to control erosion (early 1940s); member of staff, Research Institute of Biology, Academia Sinica (late 1940s). Member, Academia Sinica (1948); establishing Agricultural Colleges, northeast China (1950-1955); Member, Chinese Academy of Sciences (1955); Director, Mycology Section, Microbiology Institute (*c.* 1955 onwards); a victim of the 'cultural revolution', denounced as a 'counter-revolutionary academic authority', imprisoned and tortured (1966-1970). Produced the first major treatment of the fungi of China available in English; he studied Chinese native lore on fungi but his research, which pre-dated ethnomycology (q.v.) elsewhere, including the manuscript of a book of 400,000 words and 600 colour paintings was confiscated during the cultural revolution and, having not re-appeared when he was 'rehabilitated' (1978), must be presumed destroyed. *Publs. Chung-kuo Ti Chen-chun* [*Fungi of China*] (1963) [Chinese translation; original English version, Mycotaxon Ltd, 1996]. *Biogs, obits etc.* Zhuang Deng (Foreword, in *Fungi of China* ix-xiii, 1996) [biography written by Teng's daughter].

Tengiomyces Réblová (1999), Helminthosphaeriaceae. Anamorph *Spadicoides*. 1 (from wood), India; China. See Réblová (*Mycotaxon* **70**: 387, 1999), Réblová (*Sydowia* **51**: 223, 1999).

Terfeziopsis Harkn. (1899) = Tuber fide Fischer (*Nat. Pflanzenfam.* **5b**: viii, 1938), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

terminus (phialo) spore, a phialospore of a 1-spored phialide, i.e. one terminating the growth of the phialide (Mason, 1933).

Termitaria Thaxt. (1920), anamorphic *Kathistaceae*, St.0eH.15. 2 or 3, America; Sardinia. See Khan & Kimbrough (*Am. J. Bot.* **61**: 395, 1974), Blackwell *et al.* (*Mycol.* **95**: 987, 2003; phylogeny), Ensaf *et al.* (*Cryptog. Mycol.* **27**: 219, 2006).

Termitariaceae Cif. (1963) = Kathistaceae.

Termitariopsis M. Blackw., Samson & Kimbr. (1980), anamorphic *Kathistaceae*, Hsp.≡ eH.?. 1 (on termites), USA. See Blackwell *et al.* (*Mycotaxon* **12**: 98, 1980), Blackwell *et al.* (*Mycol.* **95**: 987, 2003).

Termite fungi. Species of *Termitomyces* coexist in a mutualistic relationship with termite ants. Traditionally this has been described in terms of the termite cultivating fungi in their nests as food (Heim, *Termites et champignons*, 1977), but it may be more accurate to say that the fungus modifies cellulosic materials gathered by the ants making them more digestible for the ants; this has been described as an extracorporeal digestive system to which the ants have 'outsourced' cellulose digestion; the alternative view that the fungus is employing termites to provide it with a suitable environment and eliminate competitors has also been put forward (Turner, *Natural History* **111**: 62, 2002). In Africa, fruitbodies of *Termitomyces* are prized as food (see Edible fungi). Termites are also attacked by fungi, see Blackwell & Kimbrough (*Mycol.* **70**: 1279, 1979; key gen. termite-infesting fungi). See also: Ochiel *et al.* (*Mycologist* **11**: 7, 1997; ecology, pathogens), Suh *et al.* (*Mycol.* **90**: 611, 1998; pathogens, taxonomy), Thomas (*TBMS* **84**: 519, 1985; isolation medium); Van der Westhuizen & Eicker (*MR* **94**: 923, 1991; key S. Afr. spp.), Zobel & Grace (*Mycol.* **82**: 289, 1990; on *Reticulitermes*).

Termiticola E. Horak (1979), Agaricaceae. 1 (on termite nests), Papua New Guinea. See Horak (*Beih. Sydowia* **8**: 207, 1979), Vellinga (*MR* **108**: 354, 2004; phylogeny; clades with *Leucocoprinus*).

Termitomyces R. Heim (1942), Lyophyllaceae. Anamorph *Termitosphaera*. *c.* 30 (in nests of *Macrotermitinae*), Africa; S.E. Asia. See Heim (*Termites et champignons*, 1977), Pegler (*Kew Bull.* Addit. Ser. **6**, 1977; key), Jing & Ma (*Acta Mycol. Sin.* **4**: 103, 1985; key Chinese spp.), Aanen *et al.* (*PNAS* **99**: 1487, 2002; coevolution with termites), Rouland-Lefevre *et al.* (*Mol. Phylog. Evol.* **22**: 423, 2002; phylogeny), Frøslev *et al.* (*MR* **107**: 1277, 2003; phylogeny), Mossebo *et al.* (*Bull. Soc. Mycol. Tetranacrium H.J. Huds. & B. Sutton (1964), anamorphic *Pezizomycotina*, St.1bH.1. 1, West Indies; India. See Hudson & Sutton (*TBMS* **47**: 202, 1964), Punithalingam (*MR* **107**: 917, 2003; cytology).

Tetrandromyces Thaxt. (1912), Laboulbeniaceae. 6, widespread. See Rossi & Santamaria (*Mycol.* **92**: 786, 2000).

Tetrapisispora Ued.-Nishim. & Mikata (1999), Saccharomycetaceae. 6, widespread. See Ueda-Nishimura & Mikata (*Int. J. Syst. Bacteriol.* **49**: 1915, 1999), Kurtzman *et al.* (*Stud. Mycol.* **50**: 397, 2004), Sumpradit *et al.* (*Int. J. Syst. Evol. Microbiol.* **55**: 1735, 2005), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Tetraploa Berk. & Broome (1850), anamorphic *Massarina*, Hso.#eP.1. 9, widespread. See Ellis (*TBMS* **32**: 246, 1949), Rifai *et al.* (*Reinwardtia* **10**: 419, 1988; Javan spp.), Scheuer (*MR* **95**: 126, 1991; teleomorph), Hatakeyama *et al.* (*Mycoscience* **46**: 196, 2005; Japan).

Tetraposporium S. Hughes (1951), anamorphic *Pezizomycotina*, Hso.0bP.1. 2, Africa; USA. See Hughes (*Mycol. Pap.* **46**: 25, 1951).

Tetrapyrgos E. Horak (1987), Marasmiaceae. 16, widespread (tropical). See Horak (*Sydowia* **39**: 101, 1986), Bulakh (*Mikol. Fitopatol.* **37**: 23, 2003; Russian Far East), Wilson & Desjardin (*Mycol.* **97**: 667, 2005; phylogeny).

Tettigomyces Thaxt. (1915), Ceratomycetaceae. 16, widespread. See Ye & Shen (*Acta Mycol. Sin.* **11**: 285, 1992; key 10 spp. China).

Tettigorhyza G. Bertol. (1875) ? = Cordyceps fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

texospore, ascospore coated with a layer of cells of paraphysal origin, as in *Texosporium* (Tibell & Hofsten, *Mycol.* **60**: 557, 1968).

Texosporium Nádv. ex Tibell & Hofsten (1968), Caliciaceae (L). 1, USA. See Tibell & Hofsten (*Mycol.* **60**: 557, 1968), Wedin *et al.* (*Taxon* **51**: 655, 2002), Tibell (*J. Hattori bot. Lab.* **100**: 809, 2006).

Textotheca Matsush. (1996), anamorphic *Pezizomycotina*, Cpd.?.?. 1, Cape Province. See Matsushima (*Matsush. Mycol. Mem.* **9**: 28, 1996).

textura, see tissue types.

Thaelaephora, see *Thelephora*.

Thailandia Vardhan. (1959) = Candida fide Orr & Kuehn (*Mycol.* **63**: 191, 1971).

Thailandiomyces Pinruan, Sakay., K.D. Hyde & E.B.G. Jones (2008), Diaporthales. Anamorph *Craspedodidymum*. 1, Thailand. See Pinruan *et al.* (*Fungal Diversity* **29**: 89, 2008).

thalamium, asci + hamathecium (obsol.).

thalassiomycetes, fungi living in marine environments; see Marine fungi.

Thalassoascus Ollivier (1926), Dothideomycetes. 3 (on *Algae*), widespread. See Kohlmeyer (*Mycol.* **73**: 833, 1981).

Thalassochytrium Nyvall, Pedersén & Longcore (1999), Chytridiomycota. 1 (on marine red alga), China. See Nyvall *et al.* (*Journal of Phycology* **35**: 176, 1999).

Thalassogena Kohlm. & Volkm.-Kohlm. (1987), Halosphaeriaceae. 1 (marine), Belize. See Kohlmeyer & Volkmann-Kohlmeyer (*SA* **6**: 223, 1987), Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991).

Thalespora Chatmala & E.B.G. Jones (2006), Halosphaeriaceae. 1, Thailand. See Chatmala & Jones (*Nova Hedwigia* **83**: 228, 2006).

thallic (of conidiogenesis), one of the two basic sorts (cf. blastic) in which any enlargement of the recognizable conidial initial occurs *after* the initial has been delimited by one or more septa. The conidium is differentiated from a *whole* cell. **entero-**, thallic conidiogenesis in which the outer wall of the sporogenous cell is not involved in the formation of the spore wall (as for sporangiospores).

thalline exciple (margin) (margin), see excipulum thallinum.

Thallinocarpon Å.E. Dahl (1950) ? = Lichinella fide Henssen (*Ber. dt. bot. Ges.* **92**: 483, 1980).

Thallisphaera Dumort. (1822) nom. dub., Pezizomycotina. Used for diverse perithecioid fungi.

Thallochaete Theiss. (1913) = Aphanopeltis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

thalloconidium, a propagule produced and seceded directly from the lower cortex and(or) rhizines of certain *Umbilicaria* spp.; similar structures arise from the prothallus in *Protoparmelia*, *Rhizoplaca* and *Sporastatia* (Poelt & Obermayer, *Herzogia* **8**: 273, 1990); thalloconidia are dark brown, smooth to rugged, with 2-3 wall layers, and consist of one to 2500 cells. See Hestmark (*Nord. Jl Bot.* **9**: 547, 1990; ultrastr., occurrence); see also thallyles.

thallodic, of, pertaining to, or belonging to a thallus (Weresub & LeClair, *CJB* **49**: 2203, 1971).

Thalloedematomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Thalloidima.

Thalloidima A. Massal. (1852) nom. rej. = Toninia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Thalloidimatomyces, see *Thalloedematomyces*.

Thalloloma Trevis. (1853), Graphidaceae (L). 1, widespread. See Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Staiger (*Biblthca Lichenol.* **85**, 2002), Kalb *et al.* (*Symb. bot. upsal.* **34** no. 1: 133, 2004), Archer (*Biblthca Lichenol.* **94**, 2006; Australia), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is).

Thallomicrosporon Benedek (1964) = Microsporum fide Ajello (*Sabouraudia* **6**: 153, 1968).

Thallomyces H.J. Swart (1975), Parmulariaceae. 1, Australia. See Swart (*TBMS* **65**: 84, 1975).

Thallophyta, see *Fungi*; **thallophyte**, one of the *Thallophyta*.

Thallospora L.S. Olive (1948), anamorphic *Pezizomycotina*, Hso.1bH.1. 1, USA.

thallospore (1) an asexual spore having neither conidiophore nor conidiogenous cell, or one which is not separated from the hypha or conidiogenous cell producing it; i.e. an arthrospore, blastospore, or chlamydospore (and aleuriospore) (after Vuillemin; see Mason, 1933); (2) a thalloconidium (q.v.).

thallus, the vegetative body of a thallophyte; for thallus types in lichens see Lichens; **heteromerous-**, a layered thallus; **homoiomerous-**, an unlayered thallus.

thallyles, minute thallus-like propagules produced on the underside of certain *Umbilicaria* thalli (Krog & Swinscow, *Nordic Jl Bot.* **6**: 75, 1986); see also thalloconidia.

Thamnidiaceae Fitzp. (1930) = Mucoraceae.
Lit.: Kirk (*in litt.*).

Thamnidium Link (1809), Mucoraceae. 1, widespread. See Benny (*Mycol.* **84**: 834, 1992), Roux & Botha (*Proc. Elect. Microsc. Soc. S. Afr.* **24**: 64, 1994; ultrastr.), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Ho (*Fungal Science* Taipei **17**: 87, 2002; Taiwan).

Thamnidium Tuck. ex Schwend. (1860) = Lichina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

thamniscophagous, see ptyophagous.

Thamnium Vent. (1799) nom. rej. = Roccella fide Ahti (*Taxon* **33**: 330, 1984).

Thamnocephalis Blakeslee (1905), Sigmoideomycetaceae. 3, N. America; India. See Mehrotra (*Zbl. Bakt.* Abt. II **117**: 425, 1964), Benny *et al.* (*Mycol.* **84**: 635, 1992; key), Tanabe *et al.* (*Mol. Phylogen. Evol.* **16**: 253, 2000; phylogeny).

Thamnochrolechia Aptroot & Sipman (1991), Agyriaceae (L). 1, Papua New Guinea. See Lumbsch *et al.* (*Biblthca Lichenol.* **57**: 355, 1995), Schmitt *et al.* (*Biblthca Lichenol.* **86**: 147, 2003; phylogeny).

Thamnogalla D. Hawksw. (1980), Pezizomycotina. 1 (on *Thamnolia*), widespread (northern hemisphere). See Hafellner & Sancho (*Herzogia* **8**: 363, 1990; posn), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000).

Thamnolecania (Vain.) Gyeln. (1933), Lecanorales (L). 5, widespread (sub-Antarctic). Perhaps allied to *Crocyniaceae*. See Ekman (*MR* **105**: 783, 2001; phylogeny).

Thamnolia Ach. ex Schaer. (1850) nom. cons., Icmadophilaceae (L). 4, widespread (montane). Sterile. See Ihlen (*Graphis Scripta* **7**: 17, 1995; Norway), Kärnefelt & Thell (*Biblthca Lichenol.* **58**: 213, 1995;

genetic variation), Ekman & Tønsberg (*MR* **106**: 1262, 2002; phylogeny), Santesson (*Symb. bot. upsal.* **34**: 393, 2004), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Thamnoliaceae Zahlbr. (1898) = Icmadophilaceae.

Thamnoma, see *Thamnonoma*.

Thamnomyces Ehrenb. (1820), Xylariaceae. Anamorph *Nodulisporium*. 4 or 5, widespread (esp. tropical). See Dennis (*Kew Bull.* **12**: 297, 1957), Dennis (*Bull. Jard. bot. Brux.* **31**: 150, 1961), Samuels & Müller (*Sydowia* **33**: 274, 1980; relationships), San Martín & Rogers (*Mycotaxon* **53**: 115, 1995; Mexico), Stadler *et al.* (*MR* **108**: 239, 2004; chemistry), Stadler & Fournier (*Revta Iberoamer. Micol.* **23**: 160, 2006).

Thamnonoma (Tuck.) Gyeln. (1933) = Caloplaca fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Thamnostylum Arx & H.P. Upadhyay (1970), Syncephalastraceae. 4, widespread (esp. warmer areas). See Benny & Benjamin (*Aliso* **8**: 301, 1975; key), Botha *et al.* (*S. Afr. J. Bot.* **63**: 104, 1997), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Ho (*Fungal Science* Taipei **17**: 87, 2002; Taiwan).

Thanatephorus Donk (1956), Ceratobasidiaceae. Anamorph *Rhizoctonia*. 12, widespread. *T. cucumeris* (stat. mycel. *Rhizoctonia solani*) is now used to replace *Corticium solani*. See Talbot (*Persoonia* **3**: 371, 1965), Currah & Zelmer (*Rep. Tottori mycol. Inst.* **40**: 43, 1992; 4 spp. with orchids), Roberts (*Rhizoctonia-forming fungi*, 1999), Elbakali *et al.* (*Phytopath. Mediterr.* **42**: 167, 2003; on potato), Toda *et al.* (*J. Gen. Pl. Path.* **70**: 270, 2004; *Rhizoctonia solani* ITS), Ciampi *et al.* (*Eur. J. Pl. Path.* **113**: 183, 2005; *Rhizoctonia solani* intraspecific evolution).

Thanatophytum Nees (1816), anamorphic *Helicobasidium*. 1, widespread. *T. crocorum* (a pathogen of *Crocus*; mort de saffran). See Lutz *et al.* (*MR* **108**: 227, 2004).

Thaptospora B. Sutton & Pascoe (1987), anamorphic *Pezizomycotina*, Ccu.0eH.15. 1, Australia. See Sutton & Pascoe (*TBMS* **88**: 174, 1987).

Tharoopama Subram. (1956), anamorphic *Pezizomycotina*, Hsy.0eP.10. 2, India; Panama. See Subramanian (*J. Indian bot. Soc.* **35**: 84, 1956), Sureshkumar *et al.* (*Journal of Mycology and Plant Pathology* **36**: 8, 2006).

Thaumasiomyces Thaxt. (1931), Ceratomycetaceae. 3, W. Africa; Borneo. See Zhou *et al.* (*MR* **105**: 919, 2001; DNA).

Thaxter (Roland; 1858-1932; USA). Assistant Professor (1891) then Professor of Cryptogamic Botany (1901-1919), Harvard University; Honorary Curator of the Farlow Herbarium (1919 onwards). His great contribution was the detailed and meticulous study of the *Laboulbeniales* (q.v.), previously almost completely overlooked. *Publs.* Contribution towards a monograph of the Laboulbeniaceae I-V. *Memoirs of the American Academy of Arts and Sciences* (1896-1931). *Biogs, obits etc.* Grummann (1974: 197); Pfister (*Mycotaxon* **20**: 225, 1984; index to non-*Laboulbeniales* names); Stafleu & Cowan (*TL-2* **6**: 231, 1986); Weston (*Mycol.* **25**: 69, 1933) [bibliography, portrait]; Weston (*Phytopathology* **23**: 565, 1933).

Thaxteria Giard (1892) = Laboulbenia fide Thaxter (*Proc. Amer. Acad. Arts & Sci.* **30**: 471, 1895).

Thaxteria Sacc. (1891), Nitschkiaceae. 2, widespread. See Booth & Müller (*TBMS* **58**: 73, 1972), Nannfeldt (*Svensk bot. Tidskr.* **69**: 204, 1975; posn), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004), Huhndorf *et al.* (*MR* **108**: 1384, 2004).

Thaxteriella Petr. (1924), Tubeufiaceae. 11, widespread. See Rossman (*Mycol. Pap.* **157**, 1987), Crane *et al.* (*CJB* **76**: 602, 1998), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006), Spatafora *et al.* (*Mycol.* **98**: 1018, 2006; phylogeny), Tsui *et al.* (*Mycol.* **98**: 94, 2006).

Thaxteriellopsis Sivan., Panwar & S.J. Kaur (1977) = Chaetosphaerulina fide Crane *et al.* (*CJB* **76**: 602, 1998).

Thaxterina Sivan., R.C. Rajak & R.C. Gupta (1988), Tubeufiaceae. 1, India. See Sivanesan *et al.* (*TBMS* **90**: 662, 1988), Crane *et al.* (*CJB* **76**: 602, 1998), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006).

Thaxteriola Speg. (1918), anamorphic *Pyxidiophora*. 1, widespread. See Blackwell *et al.* (*Mycol.* **78**: 605, 1986), Blackwell *et al.* (*Science* N.Y. **232**: 993, 1986), Simpson & Stone (*Mycotaxon* **30**: 1, 1987), Blackwell & Malloch (*Mem. N. Y. bot. Gdn* **49**: 23, 1989), Blackwell *et al.* (*MR* **92**: 397, 1989), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Thaxterogaster Singer (1951) = Cortinarius. Formerly recognized as an independent sequestrate genus. fide Peintner *et al.* (*Mycotaxon* **81**: 177, 2002).

Thaxterogastraceae Singer (1962) = Cortinariaceae.

Thaxterosporium Ben Ze'ev & R.G. Kenneth (1987), Neozygitaceae. 1, widespread. See Ben-Ze'ev *et al.* (*Mycotaxon* **28**: 323, 1987) = Neozygites (Entomophthor.) fide, Keller (*Sydowia* **43**: 39, 1991).

theca, see ascus (obsol.).

Thecamycetes, see *Ascomycota* (Marchand, 1896).

Thecaphora Fingerh. (1836) nom. cons., Glomosporiaceae. Anamorphs *Thecaphorella*, *Rhombiella*. 57 (on *Leguminosae*, *Compositae*, *Convolvulaceae*, etc.), widespread. *T. solani*, potato (*Solanum*) smut; *T. frezzii*, peanut (*Arachis*) smut. Frequently has an anamorph. See Zambettakis & Joly (*BSMF* **91**: 71, 1975; numerical taxonomy), Durán (*CJB* **60**: 1512, 1982), Vánky (*Illustrated genera of smut fungi*, 1987), Vánky (*Cryptog. Stud.* **1**: 159 pp., 1987), Mordue (*Mycopathologia* **103**: 177, 1988), Vánky (*TBMS* **32**: 148, 1991), Vánky (*Taxon* **47**: 153, 1998), Vánky (*Fungal Diversity* **6**: 131, 2001; as *Glomosporium*), Piątek (*Mycotaxon* **92**: 33, 2005; as *Kochmania*), Vánky *et al.* (*Mycol. Progr.*: [in press], 2008).

Thecaphorella H. Scholz & I. Scholz (1988), anamorphic *Thecaphora*. 1. See Vánky (*Europ. Smut Fungi*: 228, 1994).

Thecaria Fée (1824), Graphidaceae (L). 1, pantropical. See Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995), Staiger (*Biblthca Lichenol.* **85**, 2002), Archer (*Biblthca Lichenol.* **94**, 2006), Archer (*Systematics & Biodiversity* **5**: 9, 2007; Solomon Is).

thecaspore, see ascospore (obsol.).

Theciopeltis F. Stevens & Manter (1925) = Micropeltis fide Clements & Shear (*Gen. Fung.*, 1931).

thecium, the part of an apothecium containing the asci between the epithecium and hypothecium; sometimes used for the whole sporocarp or as equivalent to hymenium.

Theclospora Harkn. (1884) = Emericella fide Peek & Solheim (*Mycol.* **50**: 844, 1958).

Thecographa A. Massal. (1860), Graphidaceae. 1,

paleotropical. See Lücking *et al.* (*Taxon* **56**: 1296, 2007; nomencl.).

Thecopsora, see *Thekopsora*.

Thecostroma Clem. (1909) = Bloxamia fide Clements & Shear (*Gen. Fung.*, 1931).

Thecotheus Boud. (1869), ? Ascobolaceae. 17, widespread (esp. temperate). See Kimbrough (*Mycol.* **61**: 107, 1969; key), Krug & Khan (*Mycol.* **79**: 200, 1987; key 10 spp.), Aas (*A World-Monograph of the Genus Thecotheus*, 1992), Kimbrough *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 398, 1994; posn), Prokhorov (*Mikol. Fitopatol.* **31**: 27, 1997), Landvik *et al.* (*Mycoscience* **39**: 49, 1998; phylogeny), Yao & Spooner (*Kew Bull.* **55**: 451, 2000; UK), Nagao *et al.* (*Mycol.* **95**: 688, 2003; Australia), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).

Thedgonia B. Sutton (1973), anamorphic *Helotiales*, Hsp.1-≡ eH.39. 3, widespread (north temperate). See Yoshikawa & Yokoyama (*TMSJ* **33**: 177, 1992), Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **1**: 211, 1995; key), Crous *et al.* (*Mycol.* **93**: 1081, 2001; phylogeny), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003), Crous *et al.* (*Stud. Mycol.* **58**: 33, 2007; phylogeny).

Theissen (Ferdinand; 1877-1919; Germany, later Brazil). Stationed in São Leopoldo, Brazil (1902-1908); studied theology and became priest, Valkenburg and Innsbruck (1909-1912); schoolmaster, Feldkirch (1914-1919); died as a result of a climbing accident in the Voralberg Alps while collecting. With Rick (q.v.) he made significant contributions to tropical mycology, particularly for ascomycetes of Brazil. *Publs. Die Gattung Asterina* (1913); (with H. Sydow, q.v.) Die Dothideales. *Annales Mycologici* (1915). *Biogs, obits etc.* Sydow (*Annales Mycologici* **17**: 134, 1919, bibliography); Stafleu & Cowan (*TL-2* **6**: 239, 1986).

Theissenia Maubl. (1914), Xylariaceae. Anamorph *Nodulisporium*. 4, pantropical. See Dennis (*Bull. Jard. bot. Brux.* **34**: 231, 1961), Ju *et al.* (*Mycol.* **95**: 109, 2003; monogr.), Ju *et al.* (*Mycol.* **99**: 612, 2007; phylogeny).

Theissenula Syd. & P. Syd. (1914) nom. dub., Fungi. See Hansford (*Mycol. Pap.* **15**, 1946).

Thekopsora Magnus (1875), Pucciniastraceae. Anamorph *Pomatomyces*. *c*. 11 (on *Picea*, *Tsuga* (0, I) (*Pinaceae*; on dicots (II, III)), widespread (north temperate). See Hiratsuka (*Revision of taxonomy of the Pucciniastreae*, 1958), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983; as *Pucciniastrum*), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; accepted).

Thelactis Mart. (1821) = Mucor Fresen. fide Fries (*Syst. mycol.* **3**, 1832).

Thelebolaceae Eckblad (1968), Thelebolales. 9 gen. (+ 9 syn.), 46 spp.

Lit.: Kimbrough (*CJB* **44**: 685, 1966), Kimbrough & Korf (*Am. J. Bot.* **54**: 9, 1967), Moravec (*Česká Mykol.* **25**: 150, 1971), Czymmek & Klomparens (*CJB* **70**: 1669, 1992), Momol *et al.* (*SA* **14**: 91, 1996), Brummelin (*Persoonia* **16**: 425, 1998), Brummelin & Kristiansen (*Persoonia* **17**: 119, 1998), Landvik *et al.* (*Mycoscience* **39**: 49, 1998; phylogeny), Prokhorov (*Mikol. Fitopatol.* **32**: 40, 1998), van Brummelen (*Persoonia* **16**: 425, 1998; ultrastr.) and under *Thelebolus*, Wang (*Bull. natn. Mus. Nat. Sci. Taiwan* **12**: 49, 1999), Stchigel *et al.* (*MR* **105**: 377, 2001).

Thelebolales P.F. Cannon (2001), ? Leotiomycetes. 1 fam., 9 gen., 46 spp. Stromata absent. Ascomata minute, ± globose or pulvinate, at least initially cleistothecial, the excipulum hyaline, poorly developed, ± glabrous. Interascal tissue poorly developed, composed of simple paraphyses. Asci ± ellipsoidal, often multispored, ± persistent, opening with a rather irregular vertical split. Ascospores usually small, hyaline, smooth or with ornamentation formed as an elaboration of an initially homogeneous secondary wall layer. Anamorphs unknown. Saprobic, usually coprophilous, widespr. Fam.:

Thelebolaceae

For *Lit.* see under fam.

Thelebolus Tode (1790), Thelebolaceae. 10 (psychrophilic, coprophilous), widespread (north temperate). See Cooke & Barr (*Mycol.* **56**: 763, 1964; asci and *Erysiphaceae*), Wicklow & Malloch (*Mycol.* **63**: 118, 1971), Kimbrough (*Mycol.* **73**: 1, 1981; ascus structure), Czymmek & Klomparens (*CJB* **70**: 1669, 1992; ascospores), Momol & Kimbrough (*SA* **13**: 1, 1994; posn), Momol *et al.* (*SA* **14**: 91, 1996; posn), Landvik *et al.* (*Mycoscience* **39**: 49, 1998), Gernandt *et al.* (*Mycol.* **93**: 915, 2001; phylogeny), Stchigel *et al.* (*MR* **105**: 377, 2001; phylogeny), Hoog *et al.* (*Stud. Mycol.* **51**: 33, 2005; phylogeny, ecology), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny).

Thelenella Nyl. (1855), Thelenellaceae (L). 33, widespread. See Mayrhofer (*Biblthca Lichenol.* **26**, 1987; key), Mayrhofer & McCarthy (*Muelleria* **7**: 333, 1991; key 12 saxicolous spp.), Harris (*More Florida Lichens*, 1995), Aptroot (*Fungal Diversity* **2**: 43, 1999), Fryday & Coppins (*Lichenologist* **36**: 89, 2004), Lücking *et al.* (*Lichenologist* **39**: 187, 2007).

Thelenellaceae O.E. Erikss. ex H. Mayrhofer (1987), Pezizomycotina (inc. sed.) (±L). 2 gen. (+ 10 syn.), 51 spp.

Lit.: Mayrhofer & Poelt (*Herzogia* **7**: 13, 1985), Barr (*Sydowia* **38**: 11, 1985), Mayrhofer (*Biblthca Lichenol.* **26**: 106 pp., 1987), Mayrhofer (*Biblthca Lichenol.* **26**, 1987), Kalb (*Flechten Follmann* Contributions to Lichenology in Honour of Gerhard Follmann: 249, 1995), Harada (*J. Nat. Hist. Mus. Inst.* Chiba **5**: 91, 1999), Hyde & Wong (*MR* **103**: 347, 1999), Schmitt *et al.* (*Mycol.* **97**: 362, 2005).

Thelenidia Nyl. (1886), ? Dothideomycetes (L). 1, Greenland; Switzerland. See Topham & Swinscow (*Lichenologist* **4**: 294, 1970).

Thelenidiomyces Cif. & Tomas. (1953) ≡ Thelenidia.

Thelephora Ehrh. ex Willd. (1787), Thelephoraceae. *c*. 50, widespread. See Corner (*Beih. Nova Hedwigia* **27**, 1968; monogr.), Stalpers (*Stud. Mycol.* **35**: 168 pp., 1993; key), Zecchin (*Rivista di Micologia* **48**: 243, 2005).

Thelephoraceae Chevall. (1826), Thelephorales. 12 gen. (+ 20 syn.), 171 spp.

Lit.: Svrček (*Sydowia* **14**: 170, 1960; subfam. *Tomentelloideae*, keys), Cunningham (*The Thelephoraceae of Australia and New Zealand* [*Bull. DSIR N.Z.* **145**], 1963; Cuba), Reid (*Beih. Nova Hedwigia* **18**: 1090, 1965; stipitate steroid spp.), Corner (*Beih. Nova Hedwigia* **27**, 1968), Jülich & Stalpers (*Verh. Kon. Ned. Akad. Wetensch.* Afd. Natuurk. sect. 2 **74**, 1980; N. Hemisph.), Stalpers (*Stud. Mycol.* **35**: 168 pp., 1993), Kõljalg (*Syn. Fung.* **9**: 213 pp., 1996).

Thelephorales Corner ex Oberw. (1976). Agaricomycetes. 2 fam., 18 gen., 269 spp. Fams:
(1) **Bankeraceae**
(2) **Thelephoraceae**
For *Lit.* see under fam.

Thelephorella P. Karst. (1889) nom. dub., Thelephorales. See Donk (*Taxon* **6**: 17, 1957).

Theleporus Fr. (1847), Grammotheleaceae. 3, widespread (tropical). See Ryvarden (*TBMS* **73**: 9, 1979), Roberts & Ryvarden (*Kew Bull.* **61**: 55, 2006; Cameroon).

Thelidea Hue (1902) = Knightiella fide Rambold *et al.* (*Biblthca Lichenol.* **53**: 217, 1993).

Thelidiaceae Walt. Watson (1929) = Verrucariaceae.

Thelidiella Fink (1933), Pezizomycotina. 1 (on lichens), N. America.

Thelidiola C.W. Dodge (1968) = Muellerella fide Castello & Nimis (*Biblthca Lichenol.* **57**: 71, 1995).

Thelidiomyces Cif. & Tomas. (1953) ≡ Thelidium.

Thelidiopsis Vain. (1921), Verrucariaceae (L). 1, Europe; Asia.

Thelidium A. Massal. (1855), Verrucariaceae (L). *c.* 111, widespread. See Servít (*Československé lišejníky čeledi Verrucariaceae*, 1954), Harada (*Hikobia* **12**: 133, 1996; Japan), Harada (*Hikobia* **12**: 289, 1998), Grube (*Nova Hedwigia* **68**: 241, 1999; asci), Harada & Wang (*Lichenology* **3**: 47, 2004), Harada & Wang (*Lichenology* **5**: 23, 2006), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

Thelignya A. Massal. (1855), Lichinaceae (L). 1, Europe. See Henssen (*Symb. bot. upsal.* **18** no. 1, 1963), Jørgensen & Henssen (*Taxon* **39**: 343, 1990), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Thelis Clem. (1931) ≡ Hanseniaspora.

Thelocarpaceae Zukal (1893), Pezizomycotina (inc. sed.). 3 gen. (+ 12 syn.), 25 spp. See Salisbury (*Lichenologist* **3**: 175, 1966), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny).

Thelocarpella Nav.-Ros. & Cl. Roux (1999), Acarosporaceae. 1, France. See Navarro-Rosinés *et al.* (*CJB* **77**: 835, 1999), Lutzoni *et al.* (*Am. J. Bot.* **91**: 1446, 2004; phylogeny), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny), Wedin *et al.* (*MR* **109**: 159, 2005; phylogeny).

Thelocarpon Nyl. (1853), Thelocarpaceae (±L). 23, Europe; N. America. See Salisbury (*Lichenologist* **3**: 175, 1966), Poelt & Hafellner (*Phyton* Horn **17**: 67, 1975), Kocourková-Horáková (*Czech Mycol.* **50**: 271, 1998), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Aptroot & Sparrius (*Lichenologist* **32**: 513, 2000), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny).

Thelocarponomyces Cif. & Tomas. (1953) ≡ Thelocarpon.

Thelocarpum Clem. (1909) ≡ Thelocarpon.

Thelochroa A. Massal. (1855) = Pyrenocarpon fide Jorgensen & Henssen (*Taxon* **39**: 343, 1990).

Thelococcum Nyl. ex Hue (1888) = Thelocarpon fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Thelographis Nyl. (1857) nom. nud. = Graphis fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Thelohania Henneguy (1892), Microsporidia. 23.

Thelomma A. Massal. (1860), Caliciaceae (L). 7, widespread. See Tibell (*Bot. Notiser* **129**: 221, 1976), Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Wedin & Tibell (*CJB* **75**: 1236, 1997), Ekman & Wedin (*Pl. Biol.* **2**: 350, 2000; phylogeny), Andersen & Ekman (*Lichenologist* **36**: 27, 2004; phylogeny).

Thelomphale Flot. (1863) = Thelocarpon fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Thelophora Clem. (1902) ≡ Thelephora.

Thelopsidomyces Cif. & Tomas. (1953) ≡ Thelopsis.

Thelopsis Nyl. (1855) nom. cons., Ostropales (L). 9, Europe; N. America. See Vězda (*Folia geobot. phytotax.* **4**: 363, 1968), Sherwood (*Mycotaxon* **5**: 1, 1977), McCarthy (*Muelleria* **7**: 313, 1991; Australia), Renobales *et al.* (*Lichenologist* **28**: 105, 1996; Spain), Breuss & Schultz (*Lichenologist* **39**: 35, 2007; Socotra, key).

Theloschisma Trevis. (1860) = Phaeographis fide Staiger (*Biblthca Lichenol.* **85**, 2002).

Theloschistes Th. Fr. (1861) ≡ Teloschistes.

Theloschistomyces Cif. & Tomas. (1953) ≡ Theloschistes.

Thelospora, see *Theclospora*.

Thelotrema Ach. (1803), Thelotremataceae (L). *c.* 126, widespread (esp. tropical). See Salisbury (*Lichenologist* **5**: 262, 1972; *lepadinum*-group), Hale (*Smithson. Contr. bot.* **16**, 1974; Dominican Republic), Salisbury (*Lichenologist* **7**: 59, 1975; gen. concept), Hale (*Smithson. Contr. bot.* **38**, 1978; Panama), Hale (*Smithson. Contr. bot.* **40**, 1980; limits), Hale (*Bull. Br. Mus. nat. hist.* Bot. **8**: 227, 1981; Sri Lanka), Purvis *et al.* (*Biblthca Lichenol.* **58**: 335, 1995; Eur.), Matsumoto & Deguchi (*Bryologist* **102**: 86, 1999; anamorph), Matsumoto (*J. Hattori bot. Lab.* **88**: 1, 2000; Japan), Galloway (*Australasian Lichenology* **49**: 16, 2001), Homchantara & Coppins (*Lichenologist* **34**: 113, 2002; SE Asia), Lücking *et al.* (*Mycol.* **96**: 283, 2004; phylogeny), Frisch (*Biblthca Lichenol.* **92**: 3, 2006; Africa), Frisch *et al.* (*Biblthca Lichenol.* **92**: 517, 2006; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Mangold *et al.* (*Biblthca Lichenol.* **95**: 459, 2007; Australia), Mangold *et al.* (*Lichenologist* **40**: 39, 2008; phylogeny).

Thelotremataceae Stizenb. (1862), Ostropales (L). 21 gen. (+ 37 syn.), 660 spp.
Lit.: Hale (*Mycotaxon* **11**: 130, 1980), Hale (*Bull. Br. Mus. nat. Hist.* Bot. **8**: 227, 1981; gen. concepts), Lumbsch (*Nova Hedwigia* **56**: 227, 1993), Lumbsch & Tehler (*Bryologist* **101**: 398, 1998), Matsumoto & Deguchi (*Bryologist* **102**: 86, 1999; anams), Kantvilas & Vězda (*Lichenologist* **32**: 325, 2000; Tasmania), Kantvilas & Vězda (*Lichenologist* **32**: 343, 2000), Matsumoto (*J. Hattori bot. Lab.* **88**: 1, 2000), Kauff & Lutzoni (*Mol. Phylogen. Evol.* **25**: 138, 2002), Martín *et al.* (*Lichenologist* **35**: 27, 2003), Kalb *et al.* (*Symb. bot. upsal.* **34** no. 1: 133, 2004), Lumbsch *et al.* (*Mol. Phylogen. Thelotrematomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Thelotrema.

Themisia Velen. (1939), ? Helotiales. 1, former Czechoslovakia.

Thermoactinomyces Tsikl. (1899), Bacteria. q.v.

Thermoascaceae Apinis (1967), Eurotiales. 2 gen., 8 spp. See Hambleton *et al.* (*Stud. Mycol.* **53**: 29, 2005; phylogeny).

Thermoascus Miehe (1907), Thermoascaceae. Anamorph *Polypaecilum*. 5, widespread. See also *Coonemeria*. See Apinis (*TBMS* **50**: 573, 1967), Ellis (*TBMS* **76**: 457, 1981; ultrastr.), Ellis (*TBMS* **76**: 467, 1981; ultrastr.), Malloch *in* Samson & Pitt (Eds) (*Advances in Penicillium and Aspergillus systematics* **102**: 365, 1985), Landvik *et al.* (*Mycoscience* **37**: 237, 1997; DNA), Mouchacca (*Cryptog. Mycol.* **18**: 19, 1997; review), Luangsa-ard *et al.* (*Mycol.* **96**: 773, 2004; phylogeny), Hambleton *et al.* (*Stud. Mycol.* **53**: 29, 2005; phylogeny).

thermodury, withstanding high temperature, esp. when in a dormant state, e.g. as spores. Cf. thermophily.

Thermoidium Miehe (1907) = Malbranchea fide Sigler & Carmichael (*Mycotaxon* **4**: 441, 1976).

Thermomonospora Henssen (1957), Actinobacteria. q.v.

Thermomucor Subraham., B.S. Mehrotra & Thirum. (1977), Mucoraceae. 1, India. See Subrahamanyam *et al.* (*Georgia J. Sci.* **35**: 1, 1977), Schipper (*Antonie van Leeuwenhoek* **45**: 275, 1979), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Thermomyces Tsikl. (1899), anamorphic *Eurotiales*, Hso.0eP.1. 4 (from soil), widespread. See Pugh *et al.* (*TBMS* **47**: 115, 1964), Jensen *et al.* (*MR* **97**: 665, 1993; growth kinetics), Mouchacca (*Cryptog. Mycol.* **18**: 19, 1997; review), Hambleton *et al.* (*Stud. Mycol.* **53**: 29, 2005; phylogeny).

thermophily, making active growth at high temperature. Cf. thermodury. Fungi may be classified as **thermophiles** (adj. **-ilic**), growth at 20-50+°C (opt. 40-50+°C). See Cooney & Emerson (*Thermophilic fungi*, 1964; descriptions), Emerson (*in* Ainsworth & Sussman (Eds), *The Fungi* **3**: 105, 1968), Crisan (*Mycol.* **65**: 1170, 1973; concepts), Bilaĭ & Zakharchenko (*Opredelitel' Termofill'nykh Gribov*, 1987; keys, illustr. 38 spp.); **thermotolerant fungi**, e.g. *Aspergillus fumigatus*, *Absidia ramosa*, max. *c.* 50°C, min. well below 20°C; **mesophiles** (adj. **-ilic**), growth 10-40°C (opt. 20-35°C); **psychrophiles** (adj. **-ilic**), growth below 10°C (opt. below 20°C).

Thermophymatospora Udagawa, Awao & Abdullah (1986), anamorphic *Ganoderma*. 1 (with clamp connexions, from soil), Iraq. See Udagawa *et al.* (*Mycotaxon* **27**: 100, 1986).

Thermutis Fr. (1825), Lichinaceae (L). 1, Europe. See Henssen (*Symb. bot. upsal.* **18** no. 1, 1963), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Thermutomyces Cif. & Tomas. (1953) ≡ Thermutis.

Thermutopsis Henssen (1990), Lichinaceae (L). 1, Antigua. See Henssen (*Lichenologist* **22**: 254, 1990), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key).

Therrya Sacc. (1882), Rhytismataceae. 7, widespread. See Reid & Cain (*CJB* **39**: 1117, 1961), Yuan & Mohammed (*Mycotaxon* **64**: 173, 1997), Johnston (*Aust. Syst. Bot.* **14**: 377, 2001).

Thielavia Zopf (1876), Chaetomiaceae. 31, widespread. See Malloch & Cain (*Mycol.* **65**: 1055, 1973), von Arx (*Stud. Mycol.* **8**, 1975), von Arx *et al.* (*Biblthca Mycol.* **94**, 1988), Mouchacca (*Cryptog. Mycol.* **18**: 19, 1997; thermophilic spp.), Lee & Hanlin (*Mycol.* **91**: 434, 1999; DNA), Stchigel *et al.* (*MR* **106**: 975, 2002; phylogeny), Stchigel *et al.* (*Mycol.* **95**: 1218, 2003; Antarctica), Sun *et al.* (*Mycosystema* **24**: 318, 2005; China), Cai *et al.* (*MR* **110**: 137, 2006; phylogeny).

Thielaviella Arx & T. Mahmood (1968) = Boothiella fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Thielaviopsis Went (1893), anamorphic *Ceratocystis*, Hso.0eP.38. 12, widespread. *T. basicola* (root rot of tobacco and other plants). See Johnson (*J. agric. Res.* **7**: 289, 1916; hosts), Rawlings (*Ann. Mo. bot. Gdn* **27**: 561, 1940; culture), Punja & Sun (*CJB* **77**: 1801, 1999), Paulin & Harrington (*Stud. Mycol.* **45**: 209, 2000; phylogeny), Paulin-Mahady *et al.* (*Mycol.* **94**: 62, 2002; phylogeny), Geldenhuis *et al.* (*MR* **110**: 306, 2006; phylogeography).

Thind (Kartar Singh; 1917-1991; India). PhD, University of Wisconsin, Madison, USA (1948); Senior Lecturer (1949-1957) then Reader (1957-1962) then Professor (1962-1967) then Senior Professor (1967-1977) in Botany (Mycology and Plant Pathology) and Head of the Botany Department (1976-1977) then Professor (1977-1980) then Emeritus Professor (1980 onwards), Panjab University, Chandigarh. Explored the mycota of the northwest Himalaya over many years, leading a team of younger mycologists, organizing broad coverage of all taxonomic groups and ensuring a continuous output of papers reporting discoveries. *Publs. Clavariaceae of India* (1961); *Myxomycetes of India* (1977). *Biogs, obits etc.* Subramanian (*Current Science* **63**: 151, 1992).

Thindia Korf & Waraitch (1971), Sarcoscyphaceae. 1 (on *Cupressus*), India. See Cabello (*Boln Soc. argent. Bot.* **25**: 395, 1988; numerical taxonomy).

Thindiomyces Arendh. & R. Sharma (1983), Helotiaceae. 1, Bhutan. See Arambarri & Sharma (*Mycotaxon* **17**: 486, 1983).

Thirumalacharia Rathaiah (1981), anamorphic *Pezizomycotina*, Hso.1eP.10. 1, India. See Rathaiah (*Mycol.* **72**: 1210, 1980).

Thirumalachariella Sathe (1975) = Phragmidiella fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Tholomyces Matsush. (2003), anamorphic *Pezizomycotina*, Cpd.?.?. 1, Honshu. See Matsushima (*Matsush. Mycol. Mem.* **10**: 94, 2001).

Tholurna Norman (1861) nom. cons., Caliciaceae (L). 1, Europe; N. America. See Tibell (*MR* **107**: 1403, 2003; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Tholurnaceae Elenkin (1929) = Caliciaceae.

Tholurnomyces Cif. & Tomas. (1953) ≡ Tholurna.

tholus, see ascus.

Thom (Charles; 1872-1956; USA). PhD, University of Missouri (1899); Mycologist at the Storrs (Connecticut) Experiment Station (1904-1913); Mycologist in Charge, Microbiological Laboratory (1913-1927) then Head, Division of Soil Microbiology (1927-1934), Bureau of Chemistry, then Head, Bureau of Plant Industry (1934-1942), US Department of Agriculture, Washington. Noted for his studies on fungi in dairy products and the soil, particularly *Penicillium* and *Aspergillus* (q.v.); his work influenced the establishment of standards for food handling and processing in the USA; he played an important role in development of penicillin during World War II. *Publs. The Penicillia* (1930); (with M.B. Church) *The Aspergilli* (1926); (with K.B. Raper) *A Manual of the Aspergilli* (1945); (with K.B. Raper) *A Manual of the Penicillia* (1949). *Biogs, obits etc.* Raper (*Mycol.* **49**: 134, 1957) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **6**: 268, 1986).

Thomiella C.W. Dodge (1935) = Gonatobotryum fide Kendrick & Carmichae *in* Ainsworth *et al.* (Eds)

(*The Fungi* **4A**: 390, 1973).

Thoracella Oudem. (1900), anamorphic *Pezizomycotina*, St.0eH.10. 1, Europe.

Thozetella Kuntze (1891), anamorphic *Chaetosphaeriaceae*, Hsp.0eH.15. 12, widespread. See Pirozynski & Hodges (*CJB* **51**: 157, 1973), Sutton & Cole (*TBMS* **81**: 97, 1983), Waipara *et al.* (*N.Z. Jl Bot.* **34**: 517, 1996), Markovskaja & Treigiene (*Botanica Lithuanica* **7**: 93, 2001; Lithuania), Allegrucci *et al.* (*Mycotaxon* **90**: 275, 2004; Argentina), Paulus *et al.* (*Mycol.* **96**: 1074, 2004; Australia, phylogeny, key).

Thozetellopsis˜ Agnihothr. (1958) = Thozetella fide Pirozynski & Hodges (*CJB* **51**: 157, 1973).

Thozetia Berk. & F. Muell. (1881) [non *Thozetia* F. Muell. ex Benth. 1868, *Asclepiadaceae*] ≡ Thozetella.

Thrauste Theiss. (1916), Englerulaceae. 1 or 2, Java; Philippines.

thread blight (1) a disease caused by species of *Corticium* and *Marasmius* having mycelium running as well-marked threads over the leaves and stems of tropical plants; (2) a fungus causing - -; see Petch (*Ann. R. bot. Gdns Peradeniya* **9**: 1-43, 1924). Cf. horse-hair blight fungi.

Thrinacospora Petr. (1948), anamorphic *Pezizomycotina*, St.≡ eH.1. 1, Ecuador.

Thripomyces Speg. (1915), Ceratomycetaceae. 1, Italy. See Nannfeldt (*Svensk bot. Tidskr* **43**: 468, 1949).

Thrombiaceae Poelt & Vězda ex J.C. David & D. Hawksw. (1991), Pezizomycotina (inc. sed.) (L). 1 gen. (+ 4 syn.), 1 spp.

Lit.: Schmitt *et al.* (*Mycol.* **97**: 362, 2005).

Thrombium Wallr. (1831), Thrombiaceae (L). 1, Europe; N. America. See Swinscow (*Lichenologist* **2**: 276, 1964), Schmitt *et al.* (*Mycol.* **97**: 362, 2005; phylogeny).

Thrombocytozoons Tchacarof (1963) = Candida fide Desser & Barta (*Can. J. Microbiol.* **34**: 1096, 1988).

thrush, a throat and genital disease of humans caused by *Candida albicans*.

thryptogen (thryptophyte), an organism increasing the sensitivity of a suscept to outside factors, e.g. to cold (Langer, 1936).

Thryptospora Petr. (1947), Dothideomycetes. 1, Syria.

Thuchomyces Hallbauer & Jahns (1977), Fossil Fungi ? Fungi (L). 1 (Precambrian), S. Africa. Formed abiotically fide Cloud (*Palaeobiology* **2**: 351, 1976). See also Klappa (*Sediment. Petrol.* **49**: 387, 1979).

Thuemenella Penz. & Sacc. (1898), Xylariaceae. Anamorph *Nodulisporium*. 1, widespread. See Corlett (*Mycol.* **77**: 272, 1985), Samuels & Rossman (*Mycol.* **84**: 26, 1992), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Thuemenia Rehm (1878) = Botryosphaeria fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Thuemenidium Kuntze (1891) = Geoglossum fide Eckblad (*Nytt Mag. Bot.* **10**: 137, 1963), Gamundí (*Kew Bull.* **31**: 731, 1976), Benkert (*Delitschia* **10**: 141, 1983; key), Nitare (*Windahlia* **14**: 37, 1984), Spooner (*Biblthca Mycol.* **116**: 1, 1987).

Thujacorticium Ginns (1988), Cyphellaceae. 1, Canada. See Ginns (*Mycol.* **80**: 69, 1988).

Thwaitesiella Massee (1892) = Lopharia fide Donk (*Taxon* **6**: 17, 1957).

Thyrea A. Massal. (1856), Lichinaceae (L). *c.* 23, widespread. See Henssen (*Ber dt. bot. Ges.* **81**: 176, 1968), Yoshimura (*J. Jap. Bot.* **43**: 354, 1968), Yoshimura (*J. Jap. Bot.* **43**: 500, 1968), Asahina (*J. Jap. Bot.* **45**: 65, 1970), Moreno & Egea (*Lichenologist* **24**: 215, 1992), Moreno & Egea (*Acta Bot. Barcinon.* **41**: 1, 1992; Eur. N. Afr.), Schultz *et al.* (*Lichenologist* **33**: 211, 2001; S America), Schultz *et al.* (*Pl. Biol.* **3**: 116, 2001; phylogeny), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key), Schultz & Büdel (*Lichenologist* **35**: 151, 2003).

Thyriascus Schulzer (1877) nom. dub., Fungi.

Thyridaria Sacc. (1875), Dothideomycetes. Anamorph *Cyclothyrium*. 23, widespread. See Wehmeyer (*Lloydia* **4**: 241, 1941), Barr (*Mycotaxon* **88**: 271, 2003; placement in *Didymosphaeriaceae*).

Thyridella (Sacc.) Sacc. (1895), Pezizomycotina. 3, widespread.

Thyridiaceae J.Z. Yue & O.E. Erikss. (1987), Sordariomycetidae (inc. sed.). 5 gen. (+ 5 syn.), 22 spp.

Lit.: Leuchtmann & Müller (*Bot. Helv.* **96**: 283, 1986), Eriksson & Yue (*SA* **8**: 9, 1989), Samuels & Rogerson (*Stud. Mycol.* **31**: 145, 1989), Eriksson & Yue (*SA* **10**: 57, 1990), Taylor *et al.* (*Sydowia* **49**: 94, 1997), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005).

Thyridium Fuckel (1870) [non *Thyridium* Mitt. 1868, *Musci*] ≡ Mycothyridium E. Müll.

Thyridium Nitschke (1867), Thyridiaceae. Anamorph *Pleurocytospora*. 17, widespread. See Esfandiari & Petrak (*Sydowia* **4**: 11, 1950), Leuchtmann & Müller (*Bot. Helv.* **96**: 283, 1986), Eriksson & Yue (*SA* **8**: 9, 1989).

Thyrinula Petr. & Syd. (1924), anamorphic *Aulographina*, Cpt.0fH.15. 1, S. Africa; Australia. See Swart (*TBMS* **90**: 286, 1988).

Thyriochaetum Frolov (1968) ? = Amerosporium fide Sutton & Sarbhoy (*TBMS* **66**: 297, 1976).

Thyriodictyella Cif. (1962), Micropeltidaceae. 1, Dominican Republic. See Ciferri (*Atti Ist. bot. Univ. Lab. crittog. Pavia* sér. 5 **19**: 129, 1962).

Thyriopsis Theiss. & Syd. (1915), Asterinaceae. 1, widespread. See Câmara & Dianese (*Fitopatol. Brasil* **18** (Supl.): 346, 1993).

Thyriostroma Died. (1913) = Leptostroma fide Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **124**: 49, 1915).

Thyriostromella Bat. & C.A.A. Costa (1959), anamorphic *Pezizomycotina*, Cpt.1eH.?. 1, Malaysia. See Batista & Costa (*Mycopath. Mycol. appl.* **11**: 15, 1959).

thyriothecium, an inverted flattened ascoma, having the wall ('scutellum', 'placodium') more or less radial in structure, and lacking a basal plate, e.g. *Microthyrium*; cf. catathecium.

Thyrococcum (Sacc.) Sacc. (1913) nom. dub., anamorphic *Pezizomycotina*. See von Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **124**: 49, 1915).

Thyrodochium Werderm. (1924) = Stemphylium fide Wiltshire (*TBMS* **21**: 211, 1938).

Thyronectria Sacc. (1875) nom. dub., ? Sordariomycetes. 1, Italy. See Rossman (*Mem. N. Y. bot. Gdn* **49**: 253, 1989).

Thyronectroidea Seaver (1909), Thyridiaceae. 1 (from bark), USA. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Thyrosoma Syd. (1921) = Cyclotheca fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Thyrospora Kirschst. (1938), Dothideales. 1, Germany.

Thyrospora Tehon & E.Y. Daniels (1925) = Stemphylium fide Wiltshire (*TBMS* **21**: 211, 1938), Simmons (*Mycotaxon* **88**: 163, 2003).

Thyrostroma Höhn. (1911), anamorphic *Dothidotthia*, Hsp.≡ -#eP.19. 19, widespread. See Sutton & Pascoe (*MR* **92**: 210, 1989; relationship with *Stigmina*), Yuan & Old (*MR* **94**: 573, 1990; *T. eucalypti* on *Eucalyptus*), Sutton (*Arnoldia* **14**: 33, 1997), Ramaley (*Mycotaxon* **94**: 127, 2005; teleomorph).

Thyrostromella Höhn. (1919), anamorphic *Pezizomycotina*, Hsp.#eP.10. 2, Australia; Europe.

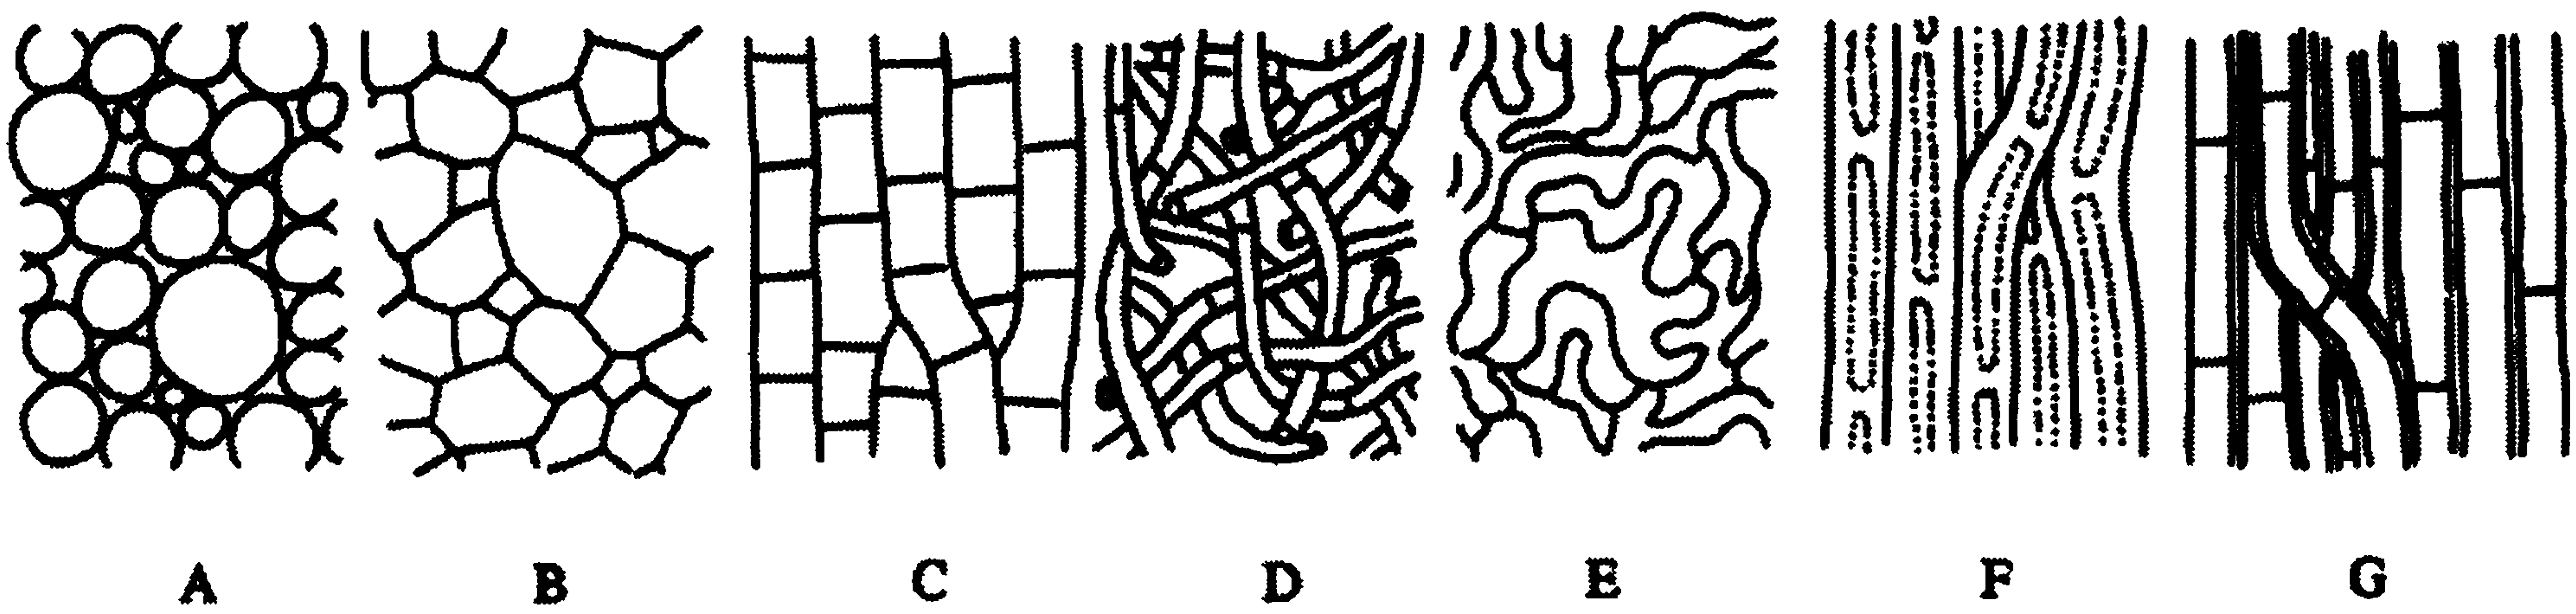

Fig. 24. Hyphal tissue (textura) types (Korf, 1958). A, textura globulosa; B, textura angularis; C, textura prismatica; D, textura intricata; E, textura epidermoidea; F, textura oblita; G, textura porrecta.

Thyrostromella Syd. (1924) [non *Thyrostromella* Höhn. 1919] = Thyrostroma fide Ellis (*Dematiaceous Hyphomycetes*, 1971), Sutton & Pascoe (*MR* **92**: 212, 1989).

Thyrotheca Kirschst. (1944), Pezizomycotina. 1, N. America.

Thyrsidiella Höhn. ex Höhn. (1909), anamorphic *Pezizomycotina*. 2, Europe.

Thyrsidina Höhn. (1905), anamorphic *Pezizomycotina*, Cac.#eH.1. 1, Europe.

Thyrsidium Mont. (1849) ≡ Myriocephalum.

thyrsus (pl. **thyrsi**), (1) a type of inflorescence (Bot.); (2) the densely branched apices of some lichens, e.g. *Cladonia stellaris*.

thysanoblastic (of conidiogenesis), when 'the whole of the upper surface of the conidiogenous cell takes part in the process of conidium formation and secession, and both schizolysis and rhexolysis occur alternately in successively seceding conidia' (Roux & van Warmelo, *MR* **92**: 225, 1989).

Thysanophora W.B. Kendr. (1961), anamorphic *Trichocomaceae*, Hso.0eP.15. 9, Europe; N. America. See Stolk & Hennebert (*Persoonia* **5**: 189, 1968), Iwamoto *et al.* (*Mycoscience* **43**: 169, 2002; phylogeny), Peterson & Sigler (*MR* **106**: 1109, 2002), Iwamoto *et al.* (*Mycol.* **97**: 1238, 2005; evolution).

Thysanophoron Stirt. (1883) = Sphaerophorus fide Wedin (*Pl. Syst. Evol.* **187**: 213, 1993).

Thysanopyxis Rabenh. ex Bonord. (1864) = Volutella fide Saccardo (*Syll. fung.* **4**: 684, 1886).

Thysanorea Arzanlou, W. Gams & Crous (2007), anamorphic *Herpotrichiellaceae*. 1, Papua New Guinea. See Arzanlou *et al.* (*Stud. Mycol.* **58**: 57, 2007).

Thysanothecium Mont. & Berk. (1846), Cladoniaceae (L). 2, Australasia; Asia. See Galloway (*Nova Hedwigia* **28**: 499, 1977), Stenroos (*Ann. bot. fenn.* **25**: 207, 1988; Melanesia), Ahti (*Regnum veg.* **128**: 58, 1993), Wei *et al.* (*Mycosystema* **7**: 23, 1994; China), Hammer (*Biblthca Lichenol.* **78**: 75, 2001; ontogeny).

Tiarospora Sacc. & Marchal (1885), anamorphic *Phaeosphaeriaceae*, Cpd.1eH.1. 3, Europe.

Tiarosporella Höhn. (1924), anamorphic *Darkera*, Cpd.0eH.1. 10, Europe; N. America. See Sutton (*The Coelomycetes*, 1980), Roux *et al.* (*MR* **94**: 254, 1990; conidiomatal and conidial ontogeny), Hyde (*Aust. Syst. Bot.* **6**: 169, 1993), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993), Kohlmeyer & Volkmann-Kohlmeyer (*Mycotaxon* **59**: 79, 1996), Karadžic (*Eur. J. For. Path.* **28**: 145, 1998), Müller & Hantula (*MR* **102**: 1163, 1998; diversity).

Tiarosporellivora Punith. (1981), anamorphic *Pezizomycotina*, Cpd.0eH.15. 1 (in *Tiarosporella*), Germany. See Punithalingam (*Nova Hedwigia* **35**: 26, 1981).

Tibellia Vězda & Hafellner (1992), Ramalinaceae (L). 1, Australia. See Hafellner & Vezda (*Nova Hedwigia* **55**: 186, 1992), Ekman (*Op. bot.* **127**: 148 pp., 1996).

tibi, Swiss drink derived from a 15% sucrose sol. (+ other ingredients) by fermentation with 'Tibi grains', a symbiotic association of *Betabacterium vermiforme* and *Saccharomyces intermedius*. Cf. gingerbeer plant, tea fungus, teekwass.

Tichodea Körb. (1848) = Collema F.H. Wigg. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Tichospora A. Massal. ex Horw. (1912) nom. inval. ? = Psorotichia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Tichothecium Flot. (1850) = Verrucaria Schrad. fide Hawksworth (*Bot. Notiser* **132**: 283, 1979).

tichus, peripheral layer of cells of perithecial walls forming a dark protective layer as in *Pleospora herbarum* (Groenhart, *Persoonia* **4**: 11, 1965).

Ticogloea G. Weber, Spaaij & W. Gams (1994), anamorphic *Pezizomycotina*, Hso.0eP.10. 1, widespread. See Weber *et al.* (*MR* **98**: 663, 1994), Halmschlager & Kowalski (*Öst. Z. Pilzk.* **9**: 67, 2000).

Ticomyces Toro (1952), Meliolaceae. 1 (from leaves), C. America. See Toro (*J. Agric. Univ. Puerto Rico* **36**: 48, 1952).

Ticonectria Döbbeler (1998), ? Nectriaceae. 1 (liverworts), Costa Rica. See Döbbeler (*Nova Hedwigia* **66**: 325, 1998).

Tieghemella Berl. & De Toni (1888) = Absidia fide Hesseltine (*Mycol.* **47**: 344, 1955).

Tieghemiomyces R.K. Benj. (1959), Dimargaritaceae. 2 (mycoparasites of *Mucorales*), India; Poland; USA. See Benjamin (*Aliso* **5**: 11, 1961; key), Misra & Gupta (*Mycotaxon* **7**: 204, 1978; India), Beblowska (*Acta Mycologica* Warszawa **27**: 271, 1991; Poland).

tiger's milk, *Polyporus sacer*; used as a medicine in Malaysia.

Tigria Trevis. (1853) = Erysiphe fide Braun (*SA* **7**: 57, 1988).

Tilachlidiopsis Keissl. (1924), anamorphic *Dendrocollybia*, Hsy.0eH.41. 1 (with clamp connexions), widespread (north temperate). See Mains (*Bull. Torrey bot. Club* **78**: 122, 1951), Stalpers *et al.* (*CJB* **69**: 6, 1991; gen. revision).

Tilachlidium Preuss (1851), anamorphic *Hypocreales*, Hsp.0eH.15. 1, widespread. See Gams (*Cephalosporium-artige Schimmelpilze*, 1971).

Tilakidium Vaidya, C.D. Naik & Rathod (1986), ? Hypocreaceae. 1, India. Affinities uncertain, the description is inadequate for proper characterization.

Tilakiella Srinivas. (1973), Dothideomycetes. 1, India. See Srinivasalu (*Indian Phytopath.* **25**: 292, 1972).

Tilakiopsis V.G. Rao (1994), anamorphic *Pezizomycotina*, Hso.?.?. 1, India. See Rao (*Advances in Mycology and Aerobiology* (Dr S.T. Tilak Commemoration Volume). *Current Trends in Life Sciences* **20**: 132, 1994).

Tilakomyces Sathe & Vaidya (1979) = Eutypella fide Rappaz (*Mycol. Helv.* **3**:: 281, 1989).

Tilletia Tul. & C. Tul. (1847), Tilletiaceae. Anamorph *Tilletiella*. *c.* 175 (on *Poaceae*), widespread. Basidiospores produced at the apex of an aseptate basidium; few to many in number, when 1-nucleate, often conjugating with one another, giving rise to ballistosporic 'secondary conidia', but in some spp. basidiospores are multinucleate and do not conjugate. Species delimited on morphological characters do not always fit with those based on molecular data, which are also not unanimous. *T. caries* (syn. *T. tritici*) and *T. laevis* (syn. *T. foetida*) (wheat bunt); *T. controversa* (dwarf bunt of wheat, barley, rye and several grasses); *T. horrida* (syn. *Neovossia horrida*) (rice smut); *T. indica* (syn. *N. indica*) (kernal bunt of wheat). See Buller & Vanterpool Buller (*Researches on Fungi* **5**, 1933), Holton & Heald (*Bunt or stinking smut of wheat*, 1941), Durán & Fischer (*The genus Tilletia*, 1961; keys, species delimited on morphological characters), Kollmorgen *et al.* (*TBMS* **75**: 461, 1980), Durán (*Ustilaginales of Mexico*: 331 pp., 1987; basidiospores), Ingold (*TBMS* **88**: 75, 1987), Russell & Mills (*Phytopath.* **84**: 576, 1994), Shi *et al.* (*Phytopath.* **86**: 311, 1996), Pimentel *et al.* (*Mycol.* **90**: 1017, 1998), Pimentel *et al.* (*Phytopath.* **90**: 376, 1998), Pimentel *et al.* (*Mycol.* **92**: 411, 2000).

Tilletiaceae J. Schröt. (1887), Tilletiales. 6 gen. (+ 1 syn.), 186 spp.

Lit.: Kollmagen *et al.* (*TBMS* **75**: 461, 1980), Durán (*Ustilaginales of Mexico. Taxonomy, Symptomatology, Spore Germination and Basidial Cytology*: 331 pp., 1987), Ingold (*TBMS* **88**: 75, 1987), Buller & Vanterpool *in* Buller (*Mycol.* **82**: 276, 1990), Begerow *et al.* (*CJB* **75**: 2045, 1998), Palm (*Mycol.* **91**: 1, 1999), McDonald *et al.* (*Pl. Dis.* **84**: 1121, 2000), Pimentel *et al.* (*Phytopathology* **90**: 376, 2000), Pimentel *et al.* (*Mycol.* **92**: 411, 2000), Levy *et al.* (*Phytopathology* **91**: 935, 2001), Josefsen & Christiansen (*MR* **106**: 1287, 2002), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002), Chesmore *et al.* (*Bulletin OEPP* EPPO Bulletin **33**: 495, 2003), Anon. (*Bulletin OEPP* EPPO Bulletin **34**: 219, 2004), Cunnington & Shivas (*Australas. Mycol.* **22**: 53, 2004), Vánky (*Mycol. Balcanica* **1**: 175, 2004), Castlebury *et al.* (*Mycol.* **97**: 888, 2005), Tan & Murray (*MR* **110**: 203, 2006).

Tilletiales Kreisel ex R. Bauer & Oberw. (1997). Exobasidiomycetes. 1 fam., 6 gen., 186 spp. Fam.:
Tilletiaceae

For *Lit.* see under fam.

Tilletiaria Bandoni & B.N. Johri (1972), Tilletiariaceae. 1 (saprobic), Canada. See Begerow *et al.* (*MR* **104**: 53, 2000; mol. phylogeny).

Tilletiariaceae R.T. Moore (1980), Georgefischeriales. 3 gen., 7 spp.

Lit.: Vánky (*Cryptog. Stud.* **1**: 159 pp., 1987), Ingold (*MR* **96**: 987, 1992), Takashima & Nakase (*J. gen. appl. Microbiol.* Tokyo **42**: 421, 1996), Bauer *et al.* (*CJB* **75**: 1273, 1997), Begerow *et al.* (*CJB* **75**: 2045, 1998), Boekhout *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 703, 1998), Begerow *et al.* (*MR* **104**: 53, 2000; mol. phylogeny), Bauer *et al.* (*MR* **105**: 423, 2001).

Tilletiella Zambett. (1970) nom. inval. = Tilletia.

Tilletiopsis Derx (1948), anamorphic *Entyloma, Melanotaenium*. 7, widespread. See Boekhout (*Stud. Mycol.* **33**: 1, 1991; species revision).

Tilotus Kalchbr. (1881) nom. dub. ? = Phyllotopsis fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

Timdalia Hafellner (2001), Lecanoromycetes (L). 1. See Hafellner & Türk (*Stapfia* **76**: 158, 2001), Reeb *et al.* (*Mol. Phylogen. Evol.* **32**: 1036, 2004; phylogeny), Crewe *et al.* (*MR* **110**: 521, 2006; phylogeny).

Timgrovea Bougher & Castellano (1993), Agaricomycetes. 5, Australasia; China. See Bougher & Castellano (*Mycol.* **85**: 288, 1993), Francis & Bougher (*Australasian Mycologist* **21**: 81, 2002).

Tinctoporellus Ryvarden (1979), Polyporaceae. 2, widespread (pantropical). See Ryvarden (*TBMS* **73**: 18, 1979), Ryvarden & Iturriaga (*Mycol.* **95**: 1066, 2003; Venezuela).

Tinctoporia Murrill (1907) = Porogramme fide Ryvarden (*TBMS* **73**: 1, 1979).

tinder fungus, *Fomes fomentarius*; **false - -**, *Phellinus igniarius*. Cf. amadou.

tinea, ringworm or other skin diseases in humans or animals caused by various parasitic fungi (esp. dermatophytes). **- barbae** (- sycosis), beard ringworm; **- capitis** (- tonsurans), head ringworm; **- corporus** (**- circinata**), body ringworm; **- cruris**, groin ringworm; **- favosa** = favus (q.v.); **- imbricata** (Tokelau) (*Trichophyton concentricum*); **- nigra**, pigmented cutaceous infection caused by a dematiaceous fungus; **- nodosa** = piedra (q.v.); **- pedis**, 'athlete's foot', foot ringworm; **- unguium**, ringworm of the nails; **- versicolor** = pityriasis versicolor (q.v.).

Tingiopsidium Werner (1939) = Koerberia fide Henssen (*Symb. bot. upsal.* **18** no. 1, 1963).

tinophyses (Groenhart, *Persoonia* **4**: 11, 1965), paraphysoids; see hamathecium.

Tirispora E.B.G. Jones & Vrijmoed (1994), Halosphaeriaceae. 2 (marine), Hong Kong; India. See Jones *et al.* (*CJB* **72**: 1373, 1994), Sarma & Hyde (*Australas. Mycol.* **19**: 52, 2000; India), Pang *et al.* (*Nova Hedwigia* **77**: 1, 2003; phylogeny).

Tirisporella E.B.G. Jones, K.D. Hyde & Alias (1996), Dothideomycetes. Anamorph *Phialophora*-like. 1, widespread. See Jones *et al.* (*CJB* **74**: 1489, 1996).

Tirmania Chatin (1892), Pezizaceae. 3 (hypogeous, mycorrhizal), widespread. See Trappe (*TBMS* **57**: 185, 1971), Malençon (*Persoonia* **7**: 261, 1973), Alsheikh & Trappe (*TBMS* **81**: 83, 1983), Moreno *et al.* (*MR* **104**: 378, 2000), Díez *et al.* (*Mycol.* **94**: 247, 2002; phylogeny), Hansen *et al.* (*Mol. Phylogen. Evol.* **36**: 1, 2005; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

tissue types, Korf distinguished the types of hyphal tissues in discomycetes as different **textura**'s and this is now applied to all ascomycetes and coelomycetes. Tissue (textura) types (from Korf, *Sci. Rep. Yokohama nat. Univ.* II **7**: 13, 1958; which is derived from Starbäck, 1895). See also Dargan (*Nova Hedw.* **44**: 489, 1987; *Xylariaceae*), plectenchyma. See Fig. 24.

Titaea Sacc. (1876), anamorphic *Paranectriella*, Hso.1bH.10. 9 (on fungi), widespread. See Sutton (*TBMS* **83**: 399, 1984; key), Pelaez *et al.* (*Mycotaxon* **70**: 55, 1999; Spain), Kirschner & Piepenbring (*Fungal Diversity* **21**: 93, 2006).

Titaeella G. Arnaud ex K. Ando & Tubaki (1985), anamorphic *Agaricomycetes*, Hso.1bH.1. 1 (with clamp connexions, aquatic), Europe; Japan. See Ando & Tubaki (*TMSJ* **26**: 151, 1985).

Titaeopsis B. Sutton & Deighton (1984), anamorphic *Pezizomycotina*, Hso.1bH.10. 1 (on leaf ascomycetes), Uganda. See Sutton & Deighton (*TBMS* **83**: 409, 1984).

Titaeospora Bubák (1916), anamorphic *Pezizomycotina*, Cac.1eH.15. 2, widespread (temperate).

Titaeosporina Luijk (1920) = Asteroma fide Sutton (*Mycol. Pap.* **141**, 1977).

Titanella Syd. & P. Syd. (1919) = Pyrenula Ach. (1809) fide Barr (*Mycotaxon* **9**: 17, 1979), Harris (*Mem. N. Y. bot. Gdn* **49**, 1989), Checa & Blanco (*Mycotaxon* **91**: 353, 2005).

Titania Berl. (1891) [non *Titania* Endl. 1833, *Orchidaceae*] ≡ Fremineavia.

Tjibodasia Holterm. (1898) = Platygloea fide Martin (*Lloydia* **11**: 119, 1948).

toadstool, a basidioma, esp. an inedible one, of an agaric or a bolete; there is no unequivocal definition and the term is best avoided; in 1959 there was a controversial court case as to whether soup made from *Boletus edulis* should be referred to as 'toadstool soup' (Small, *Pl. Sci. Bull.* **21**(3): 34, 1975). Cf. mushroom.

Tode (Heinrich Julius; 1733-1797; Germany). President of the Synod of Wittenburg. An early mycologist who gave names to such common ascomycete genera as *Acrospermum*, *Hysterium*, *Myrothecium*, *Stilbum*, *Sphaerobolus*, and *Volutella* and gave accounts of 54 species. of *Sphaeria*. *Publs. Fungi Mecklenburgenses Selecti* (1790-1791). *Biogs, obits etc.* Grummann (1974: 50); Stafleu & Cowan (*TL-2* **6**: 382, 1986).

Tofispora G. Langer (1994) = Thanatephorus fide Roberts (*Rhizoctonia-forming fungi*, 1999).

tofu, see sufu.

Togaria W.G. Sm. (1908) = Agrocybe fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

Togninia Berl. (1900), Togniniaceae. Anamorph *Phaeoacremonium*. 11, widespread. See Barr *et al.* (*Mycotaxon* **48**: 529, 1993), Mostert *et al.* (*Mycol.* **95**: 646, 2003; anamorph), Pascoe *et al.* (*Phytopath. Mediterr.* **43**: 51, 2004; Australia), Réblová *et al.* (*Stud. Mycol.* **50**: 533, 2004), Rooney-Latham *et al.* (*Pl. Dis.* **89**: 177, 2005; USA), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006; revision), Mostert *et al.* (*Phytopath. Mediterr.* **45** Suppl.: S12, 2006), Réblová & Mostert (*MR* **111**: 299, 2007; phylogeny).

Togniniaceae Réblová, L. Mostert, W. Gams & Crous (2004), ? Diaporthales. 2 gen. (+ 2 syn.), 25 spp.

Lit.: Barr (*Mycol.* **77**: 549, 1985), Mostert *et al.* (*Mycol.* **95**: 646, 2003), Pascoe *et al.* (*Phytopath. Mediterr.* **43**: 51, 2004), Réblová *et al.* (*Stud. Mycol.* **50**: 533, 2004), Vijaykrishna *et al.* (*Stud. Mycol.* **50**: 387, 2004), Fischer *et al.* (*Mycotaxon* **92**: 85, 2005), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006), Rossman *et al.* (*Mycoscience* **48**: 135, 2007; phylogeny).

Togniniella Réblová, L. Mostert, W. Gams & Crous (2004), Calosphaeriaceae. Anamorph *Phaeocrella*. 1, New Zealand. See Réblová *et al.* (*Stud. Mycol.* **50**: 543, 2004), Mostert *et al.* (*Stud. Mycol.* **54**: 115 pp., 2006).

Tolediella Viégas (1943) = Phyllachora Nitschke ex Fuckel (1870) fide Petrak (*Sydowia* **5**: 340, 1951).

tolerant (of an organism), giving little reaction to infection by a pathogen or to the effect of other factors (e.g. tolerant of heat, of a virus).

Tolypocladium W. Gams (1971), anamorphic *Elaphocordyceps*, Hso.0eH.15. 11, widespread. See also cyclosporin. See Riba *et al.* (*J. Invert. Path.* **48**: 362, 1986; isozyme analysis), von Arx (*Mycotaxon* **25**: 153, 1986), Holubová-Jechová (*Mykol. Listy* **31**: 8, 1988; key), von Arx (*Persoonia* **13**: 467, 1988), Aarnio & Agathos (*Appl. Microbiol. Biotechn.* **33**: 435, 1990; pigmented variants in *T. inflatum*), Rakotonirainy (*J. Invert. Path.* **57**: 17, 1991; rRNA sequence comparison with *Beauveria*), Stimberg *et al.* (*Appl. Microbiol. Biotechn.* **37**: 485, 1992; electrophoretic karyotyping), Dreyfuss & Gams (*Taxon* **43**: 660, 1994; nomencl.), Doggett & Porter (*Mycol.* **88**: 720, 1996; teleomorph), Fang *et al.* (*Mycosystema* **17**: 40, 1998), Stensrud *et al.* (*MR* **109**: 41, 2005; phylogeny), Sung *et al.* (*Stud. Mycol.* **57**, 2007).

Tolypoderma Thirum. & M.J. O'Brien (1978) nom. inval. = Moesziomyces fide Vánky (*Europ. Smut Fungi*: 163, 1994).

Tolypomyria Preuss (1852) = Trichoderma Pers. (1794) fide Hughes (*Friesia* **9**: 64, 1969).

tolypophagous, see ptyophagous.

Tolyposporella G.F. Atk. (1897), Tilletiariaceae. 5 (on *Poaceae*), N. & S. America; Africa; Asia. See Thirumalachar *et al.* (*Mycol.* **59**: 389, 1967).

Tolyposporidium Thirum. & Neerg. (1978) = Moesziomyces fide Vánky (*Carpathian Ustilaginales*, 1985).

Tolyposporium Woronin ex J. Schröt. (1887), Anthracoideaceae. 2 (on *Cyperaceae*, *Juncaceae*), Europe; New Zealand; N. America. See Vánky (*Bot. Notiser* **130**: 131, 1977), Vánky (*Mycotaxon* **74**: 344, 2000).

Tomasellia A. Massal. (1856), ? Naetrocymbaceae (±L). *c.* 50, widespread (esp. tropical). See Keissler (*Rabenh. Krypt.-Fl.* **9**, 1937), Harris (*More Florida Lichens*, 1995; delimitation).

Tomaselliella Cif. (1952) = Arthonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Tomaselliellomyces Cif. (1953) ≡ Tomaselliella.

Tomaselliomyces Cif. & Tomas. (1953) ≡ Tomasellia.

Tomelin (Boris Anatol'evich; 1928-2008; Russia). Graduate, Kharkiv State University, Ukraine (1953); student, then laborant, then mycologist, then Head of the Laboratory of Applied Mycology, then Head of

the Department of Ecology of Fungi, then Professor of Mycology, V.I. Komarov Botanical Institute (1954-2005), St Petersburg. Carried out pioneering mycological exploration of boreal and oriental Russia (the Amur valley, Komi, the Taimyr peninsula, the northern Urals, Yakutia and the Russian Far East) described in a series of papers in various Russian language journals; known for work on *Mycosphaerella*; also studied diseases of cotton in Kazakhstan (1960s). *Publs.* [*Identification Book of the Genus Mycosphaerella Johans.*] (1979) [in Russian]. *Biogs, obits etc.* Karatygin, Dudka, Andrianova & Lebedeva ([*Mikologiya i Fitopatologiya*] **32**: 89, 1998) [portrait, in Russian].

Tomentella Johan-Olsen (1888) [non *Tomentella* Pat. 1887, nom. cons.] = Tomentella Pat. fide Donk (*Taxon* **6**: 119, 1957).

Tomentella P. Karst. (1889) [non *Tomentella* Pat. 1887, nom. cons.] = Trechispora fide Stalpers (*in litt.*; or = *Phlebiella*).

Tomentella Pers. ex Pat. (1887) nom. cons., Thelephoraceae. 80 (ectomycorrhizal), widespread. See Wakefield (*TBMS* **53**: 161, 1969; key 40 Br. spp.), Larsen (*Mycol. Mem.* **4**, 1974; key 72 spp.), Stalpers (*Stud. Mycol.* **35**: 168 pp., 1993; key), Kõljalg (*Syn. Fung.* **9**: 213 pp., 1996; key), Jakucs *et al.* (*Mycorrhiza* **Mycorrhiza**: 247, 2005).

Tomentellaceae Warm. (1890) = Thelephoraceae.

Tomentellago Hjortstam & Ryvarden (1988) = Amaurodon fide Kõljalg (*Syn. Fung.* **9**, 1996).

Tomentellastrum Svrček (1958) = Tomentella Pat. fide Donk (*Taxon* **12**: 113, 1963).

Tomentelleopsis Orlova (1959) ? = Chromelosporium fide Sutton (*in litt.*).

Tomentellina Höhn. & Litsch. (1906) = Tomentella Pat. fide Kõljalg (*Syn. Fung.* **9**, 1996).

Tomentellopsis Hjortstam (1970), Thelephoraceae. 7, widespread. See Hjortstam (*Svensk bot. Tidskr.* **68**: 51, 1974), Kõljalg (*Syn. Fung.* **9**, 1996; key), Kõljalg *et al.* (*Mycol. Progr.* **1**: 81, 2002; phylogeny).

Tomenticola Deighton (1969), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 1, Africa (tropical). See Deighton (*Mycol. Pap.* **117**: 20, 1969).

Tomentifolium Murrill (1903) ≡ Phyllotopsis.

Tomentoporus Ryvarden (1973) = Microporus fide Reid (*Microscopy* **32**: 448, 1975).

tomentose, having a covering of soft, matted hairs (a **tomentum**; downy.

Tomeoa I. Hino (1954), Dothideomycetes. 1, Japan. See Hino (*Bulletin of the Faculty of Agriculture, Yamaguchi University* **5**: 241, 1954).

Tomophagus Murrill (1905) = Ganoderma fide Furtado (*Mycol.* **57**: 599, 1965).

Tompetchia Subram. (1985), anamorphic *Pezizomycotina*, Hso.#eP.1. 1 (on scale insects), widespread. See Subramanian (*Kavaka* **12**: 66, 1984).

Tonduzia F. Stevens (1927) [non *Tonduzia* Pittier 1908, *Apocynaceae*] ≡ Dontuzia.

Toninia A. Massal. (1852) nom. cons., Catillariaceae (±L). 82 (a few on lichens), widespread. Perhaps better subsumed within the *Ramalinaceae*. See Timdal (*Op. Bot.* **110**, 1991; key), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **31**: 822, 2004; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Toniniopsis Frey (1926), Ramalinaceae (L). 1, Europe.

tonophily (adj. **-ilic**, **-ilous**), the ability to grow under conditions of high osmotic pressure.

Topelia P.M. Jørg. & Vězda (1984), ? Stictidaceae (L). 6, Europe; N. America. See Jørgensen & Vězda (*Nova Hedwigia* Beih. **79**: 502, 1984), Tretiach & Vezda (*Lichenologist* **24**: 107, 1992; Italy).

Topeliopsis Kantvilas & Vězda (2000), Thelotremataceae (L). 8, widespread. See Kantvilas & Vězda (*Lichenologist* **32**: 347, 2000), Kalb (*Mycotaxon* **79**: 319, 2001; Australia), Frisch (*Biblthca Lichenol.* **92**: 3, 2006; Africa), Frisch & Kalb (*Lichenologist* **38**: 37, 2006), Frisch *et al.* (*Biblthca Lichenol.* **92**: 517, 2006; phylogeny), Mangold *et al.* (*Lichenologist* **40**: 39, 2008; phylogeny).

Tophora Fr. (1825) ≡ Byssus.

Topospora Fr. (1836), anamorphic *Godronia*, St.≡ eH.15. 6, widespread. See Verkley (*Nova Hedwigia* **75**: 433, 2002; phylogeny).

Tormentella H.D. Pflug (1966), Fossil Fungi. 1, USA.

Tornabea Østh. (1980), Physciaceae (L). 2, widespread. See Kurokawa (*J. Jap. Bot.* **37**: 289, 1962), Nimis & Tretiach (*Bryologist* **100**: 217, 1997; revision), Nordin & Mattsson (*Lichenologist* **33**: 3, 2001; phylogeny), Scheidegger *et al.* (*Lichenologist* **33**: 25, 2001; evolution), Helms *et al.* (*Mycol.* **95**: 1078, 2003; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Tornabenia A. Massal. (1853) [non *Tornabenea* Parl. 1850, *Umbelliferae*] = Anaptychia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Tornabenia Trevis. (1853) [non *Tornabenea* Parl. 1850, *Umbelliferae*] ≡ Tornabea.

Tornabeniopsis Follmann (1980) nom. inval. ≡ Tornabea.

Toroa Syd. (1926), Pseudoperisporiaceae. 2, widespread (tropical). See Hansford (*Mycol. Pap.* **15**, 1946).

Torpedospora Meyers (1957), Hypocreomycetidae. 2 (marine), widespread. See Meyers (*Mycol.* **49**: 496, 1957), Sakayaroj *et al.* (*Bot. Mar.* **48**: 395, 2005; revision, phylogeny), Schoch *et al.* (*MR* **111**: 154, 2007; phylogeny).

Torrendia Bres. (1902) = Amanita Pers. fide Kuyper (*in litt.*); basidioma gasteroid.

Torrendiaceae Jülich (1982) = Amanitaceae.

Torrendiella Boud. & Torrend (1911), Sclerotiniaceae. 12, widespread. See Spooner (*Biblthca Mycol.* **116**, 1987), Galán *et al.* (*Mycotaxon* **48**: 229, 1993; posn), Zhuang (*Mycotaxon* **72**: 325, 1999), Johnston & Gamundí (*N.Z. Jl Bot.* **38**: 493, 2000; 6 spp. on *Nothofagus*), Malaval (*Bulletin Semestriel de la Fédération des Associations Mycologiques Méditerranéennes* **28**: 41, 2005; France).

Torrentispora K.D. Hyde, W.H. Ho, E.B.G. Jones, K.M. Tsui & S.W. Wong (2000), Annulatascaceae. 3 (from wood, aquatic), Hong Kong. See Hyde *et al.* (*MR* **104**: 1399, 2000), Lee *et al.* (*Fungal Diversity* **16**: 87, 2004; ultrastr.).

Torrubia Lév. (1863) ≡ Cordyceps.

Torrubiella Boud. (1885), Cordycipitaceae. Anamorphs *Akanthomyces*, *Gibellula*, *Lecanicillium*, *Simplicillium*. 70 (on *Arachnida* and *Coccida*), widespread (tropical). See Petch (*TBMS* **27**: 81, 1944), Samson *et al.* (*Atlas of Entomopathogenic Fungi*, 1988), Hywel-Jones (*MR* **99**: 330, 1995; Thailand), Hywel-Jones (*MR* **101**: 143, 1997; Thailand), Hywel-Jones *et al.* (*MR* **101**: 1242, 1997; anamorphs), Tzean *et al.* (*MR* **102**: 1350, 1998; Taiwan), Zare & Gams (*Nova Hedwigia* **73**: 1, 2001; anamorph), Bischoff & White (*Stud. Mycol.* **50**: 89, 2004), Sung *et al.* (*Stud. Mycol.* **57**, 2007).

Torsellia Fr. (1849) = Cytospora fide Défago (*Phytopath. Z.* **14**: 103, 1944).

torsive, spirally twisted.

Torula Pers. (1794), anamorphic *Pezizomycotina*, Hso.0eP.3. 7, widespread. *T. ligniperda* causes stain in hardwoods. See Rao & de Hoog (*Persoonia* **8**: 201, 1975; key), Crane & Schoknecht (*Mycol.* **78**: 86, 1986), Casares-Porcel *et al.* (*Lichenologist* **28**: 37, 1996; spp. on gypsum), Crane (*Mycotaxon* **80**: 109, 2001; nomenclator), Hughes & Crane (*Mycol.* **98**: 141, 2006).

Torulaspora Lindner (1904), Saccharomycetaceae. 3, widespread. See van der Walt & Johansen (*CSIR Res. Rept.* **325**, 1975), Kreger-van Rij (Ed.) (*Yeasts, a taxonomic study* 3rd edn, 1984), Yamada *et al.* (*J. gen. appl. Microbiol.* Tokyo **37**: 503, 1991; molec. relations), Oda & Tonomura (*Lett. Appl. Microbiol.* **21**: 190, 1995; karyotypes), James *et al.* (*Int. J. Syst. Bacteriol.* **46**: 189, 1996; ITS), Smole Možina *et al.* (*Lett. Appl. Microbiol.* **24**: 311, 1997; PCR), Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 404, 1998), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Torulella Gyeln. (1939) nom. dub., anamorphic *Pezizomycotina*. See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **6**: 181, 1979).

Torulina Sacc. & D. Sacc. (1906) = Gliomastix fide Dickinson (*Mycol. Pap.* **115**, 1968).

Torulites Grüss (1927), Fossil Fungi. 1 (Tertiary), Europe.

Torulites Pia (1927), Fossil Fungi. 1 (Oligocene), Europe.

Toruloidea Sumst. (1913) = Oospora fide Clements & Shear (*Gen. Fung.*, 1931).

Torulomyces Delitsch (1943), anamorphic *Trichocomaceae*, Hso.0eH.15. 6, Europe; N. America. See Barron (*Mycol.* **59**: 716, 1967), Ando *et al.* (*Mycoscience* **39**: 313, 1998; key).

Torulopsidosira Geitler (1955), ? Algae. See Batra *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 187, 1978; an achlorotic alga).

Torulopsiella Bender (1932), anamorphic *Pezizomycotina*, Hso.0eP.38. 2, S. America. See Hughes (*N.Z. Jl Bot.* **10**: 232, 1972).

Torulopsis Berl. (1894) = Candida fide van der Walt & Johannsen (*Antonie van Leeuwenhoek* **40**: 281, 1974), Yarrow & Meyer (*Int. J. Syst. Bacteriol.* **28**: 611, 1978), Odds *et al.* (*J. gen. Microbiol.* **136**: 761, 1990; synonymy with *Candida*).

Torulopsis Oudem. (1903) = Gliomastix fide Sutton (*in litt.*).

Torulopsis Speg. (1918) ≡ Torulopsiella.

torulose (torulous), cylindrical but having swellings at intervals; moniliform.

torulosis, see cryptococcosis.

Tothia Bat. (1960), ? Microthyriaceae. 1, Hungary. See Batista (*Annls hist.-nat. Mus. natn. hung.* **52**: 105, 1960).

Tothiella Vánky (1999) = Thecaphora fide Vánky (*Mycotaxon* **89**: 55, 2004).

totipotent, bisexual.

touchwood (1) wood rotted by fungi (esp. *Polyporus squamosus*); (2) *Fomes fomentarius* or *Phellinus igniarius* basidiomata or the tinder ('amadou', q.v.) made from them.

Tovariella Syd. (1930), Helotiales. 1, S. America.

toxic, of, caused by, or acting as, poison; **-ity**, the power of acting as a poison.

Toxicocladosporium Crous & U. Braun (2007), anamorphic *Capnodiales*. 1, Surinam. See Crous *et al.* (*Stud. Mycol.* **58**: 33, 2007).

toxigenic, toxin producing.

toxin, a non-enzymic metabolite of one organism which is injurious to another (cf. antibiotic); **myco-**, a toxin produced by a fungus, esp. one affecting humans or animals (see Mycetisms, Mycotoxicoses, Phytotoxic mycotoxins); **patho-** (Wheeler & Luke, *Ann. Rev. Phytopath.* **17**: 223, 1963), see vivotoxin; **phyto-**, (1) a toxin produced by a plant (cf. phytoalexins); (2) (frequently, but better avoided), a toxin injurious to plants (see Phytotoxic mycotoxins); **vivo-**, a toxin 'produced in the infected host by the pathogen and/or its host, which functions in the production of disease, but is not itself the initial inciting agent' (Dimond & Waggoner, *Phytopath.* **43**: 229, 1953); pathotoxin.

toxiphilous, favouring a polluted habitat (e.g. *Lecanora conizaeoides* in area of high sulphur dioxide pollution), cf. poleophilous; **toxiphobous**, not tolerating such a habitat, e.g. *Usnea* spp.); **toxitolerant**, tolerant of toxins. See Air pollution.

Toxoglugea L. Léger & E. Hesse (1924), Microsporidia. 3.

Toxonema Léger & Hesse (1922), Microsporidia. 1.

Toxospora Kudo (1925), Microsporidia. 1.

Toxospora Voronin (1993), Microsporidia. 1.

Toxosporiella B. Sutton (1986), anamorphic *Pezizomycotina*, Cpd.≡ eP.1. 1, Australia. See Sutton (*TBMS* **86**: 16, 1986).

Toxosporiopsis B. Sutton & Sellar (1966), anamorphic *Pezizomycotina*, St.≡ eP.1. 3, widespread. See Sutton & Dyko (*MR* **93**: 476, 1989), Wu (*Acta Mycol. Sin.* **12**: 205, 1993; n.sp.).

Toxosporium Vuill. (1896), anamorphic *Pezizomycotina*, Hsp.≡ eP.1. 2, widespread. See Sutton (*Mycol. Pap.* **138**, 1975).

Toxotrichum G.F. Orr & Kuehn (1964) = Myxotrichum fide Apinis (*Mycol. Pap.* **96**, 1964).

trabecula (pl. **-ae**; adj. **-ate**), (1) a lamella primordium; (2) (of *Gymnoglossum* and other gasteromycetes), plates of undifferentiated primordial tissue in the developing gleba forming a branch of a dendroid columella; (3) (of pseudoparaphyses), paraphysoids, tinophyses, see hamathecium.

Trabecularia Bonord. (1857) = Merulius Fr. fide Donk (*Reinwardtia* **1**: 199, 1951).

Trabutia Sacc. & Roum. (1881), ? Phyllachoraceae. Anamorph *Baeumleria*. 1, widespread. See Barr (*Mycol.* **79**: 188, 1987; key 3 N. Am. spp.), von Arx (*SA* **6**: 213, 1987), Cannon (*Mycopathologia* **135**: 37, 1996).

Trabutiella F. Stevens (1920) ≡ Diatractium.

Trabutiella Theiss. & Syd. (1914) = Phyllachora Nitschke ex Fuckel (1870) fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

trace elements, see nutrition of fungi.

tracheomycosis, see hadromycosis.

Trachipleistophora W.S. Hollister, E.U. Canning, E. Weidner, A.S. Field, J. Kench & D.J. Marriott (1996), Microsporidia. 2.

Trachyderma (Imazeki) Imazeki (1952) = Ganoderma fide Donk (*Persoonia* **1**: 173, 1960).

Trachyderma Norman (1853) = Pannaria fide Jørgensen (*Op. Bot.* **45**, 1978).

Trachylia Fr. (1817) = Arthonia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Trachylia Tuck. (1848) = Cyphelium Ach. fide Tibell (*Symb. bot. upsal.* **27** no. 1: 279 pp., 1987), Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Trachypus Bataille (1908) [non *Trachypus* Reinw. & Hornsch. 1826, *Musci*] ≡ Leccinum.

Trachyspora Fuckel (1861), Phragmidiaceae. 6 (on *Alchemilla* (*Rosaceae*)), widespread (esp. north temperate; Africa; Java). See Gäumann (*Boissiera* **7**: 105, 1943), Gjaerum & Cummins (*Mycotaxon* **15**: 420, 1982), Helfer (*Nova Hedwigia* **81**: 325, 2005; Europ. spp.).

Trachysporella Syd. (1921) = Trachyspora fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

trachytectum, see exosporium; Spore wall.

Trachythyriolum Speg. (1919) nom. conf., anamorphic *Pezizomycotina*. See Petrak & Sydow (*Annls mycol.* **33**: 157, 1935).

Trachyxylaria Möller (1901) = Xylobotryum fide Clements & Shear (*Gen. Fung.*, 1931).

Tracya Syd. & P. Syd. (1901), Doassansiaceae. Anamorph *Tracyella*. 2 (on aquatic plants), widespread (northern hemisphere). See Spooner & Legon (*Mycologist* **20**: 90, 2006; British sp.).

Tracyella Zambett. (1970) nom. inval. = Tracya fide Vánky (*in litt.*).

Tracylla (Sacc.) Tassi (1904), anamorphic *Pezizomycotina*, Cpt.0eH.15/16. 2, widespread. See Petrak (*Sydowia* **1**: 202, 1947), Sutton (*Sydowia* **43**: 264, 1991), Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Trailia G.K. Sutherl. (1915), ? Halosphaeriaceae. 1 (on marine *Ascophyllum*), British Isles. See Christensen (*Mycol.* **74**: 226, 1982; synoptic keys *A. ochraceus* and *A. nidulans* groups).

Trailia Syd. (1922) [non *Trailia* G.K. Sutherl. 1915] = Puccinia fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

trama, the layer of hyphae in the central part of a lamella of an agaric, a spine of *Hydnaceae*, or the dissepiment between pores in a polypore. Cf. context.

Trametaceae Boidin, Mugnier & Canales (1998) = Polyporaceae.

Trametella Pinto-Lopes (1952) = Coriolopsis fide Ryvarden (*Syn. Fung.* **5**, 1991).

Trametes Fr. (1836), Polyporaceae. *c.* 50 (on wood), widespread. Living trees attacked by *T. pini* and others. See Haddow (*TBMS* **22**: 182, 1938; *T. pini*), Ryvarden (*Polyp. N. Eur.* **2**: 421, 1978; key 8 Eur. spp.), Ryvarden & Johansen (*Prelim. Polyp. Fl. E. Afr.*: 555, 1980; key 20 Afr. spp. s.lat.), Tomšovský & Homolka (*Nova Hedwigia* **79**: 425, 2004; Mating tests in *Trametes versicolor*), Tomšovský *et al.* (*Nova Hedwigia* **82**: 269, 2006; Molecular phylogeny European spp.), Zhang *et al.* (*Mycosystema* **25**: 23, 2006; molecular taxonomy based on ITS sequences).

Trametites Mesch. (1892), Fossil Fungi. 3 (Cretaceous, Pliocene), Europe.

Transeptaesporites V.S. Ediger (1981), Fossil Fungi. 5 (upper Oligocene), Turkey; USA.

transformations, in fungi; see Biotechnology, Genetic engineering.

trans-septum, see septum.

Tranzschel (Woldemar Andrejevich; 1868-1942; Russia). Assistant, Forestry Institute, St Petersburg; Assystent for Systematic Botany, University of Warsaw (1898); Curator, Department of Cryptogams, St Petersburg Botanical Museum (1900); Professor, Institute for Applied Zoology and Plant Pathology, Leningrad. Noted for his work on rusts of Russia and adjacent countries [formerly the Soviet Union]. *Publs. Conspectus Uredinalium URSS* (1939). *Biogs, obits etc.* Azbukina ([*Mikologiya i Fitopatologiya*] **27**: 91, 1993) [in Russian]; Stafleu & Cowan (*TL-2* **6**: 433, 1986).

Tranzschelia Arthur (1906), Uropyxidaceae. 12 (heteroecious on *Ranunculaceae* (0, I); on *Prunus* (II, III) (*Rosaceae*), or autoecious on *Ranunculaceae*), widespread (esp. north temperate). *T. discolor*, *T. pruni-spinosae* (esp. on cultivated *Prunus*). See Blumer (*Phytopath. Z.* **38**: 355, 1960), Bennell & Henderson (*TBMS* **71**: 271, 1978; spore devel.), López-Franco & Hennen (*System. Bot.* **15**: 560, 1990; American spp.), Helfer (*Nova Hedwigia* **81**: 325, 2005; Europ. spp.).

Tranzscheliella Lavrov (1936), ? Ustilaginaceae. 16 (on *Poaceae* (esp. *Stipa*)), widespread. See Gutner (*Golovnevye griby*, 1941; ? = *Ustilago*), Vánky (*Mycotaxon* **89**: 55, 2004).

Tranzschel's Law. This states in essence that the telia of microcyclic rust species adopt the habit of the parent macrocyclic species and occur on the aecial host plants of the latter. There are no proven exceptions, the only one firmly suspected (*Chrysomyxa arctostaphyli*) having been disproved (Peterson, *Science, N.Y.* **134**: 468, 1961). The significance of haustorial type in relation to this law has been investigated (Quilliam & Shattock, *Plant pathology* **52**: 104, 2003).

Trapelia M. Choisy (1929) nom. cons., Trapeliaceae (L). 12, widespread (temperate). See Hertel (*Herzogia* **1**: 111, 1968), Hertel (*Vortr. bot. Ges.* n.f. **4**: 171, 1970), Honegger (*Lichenologist* **14**: 205, 1982; asci), Coppins & James (*Lichenologist* **16**: 241, 1984), Lumbsch (*J. Hattori bot. Lab.* **83**: 1, 1997), Lumbsch *et al.* (*MR* **105**: 16, 2001; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Trapeliaceae M. Choisy ex Hertel (1970), Baeomycetales. 9 gen. (+ 13 syn.), 103 spp. Contains most lichenized species formerly placed in the *Agyriaceae*.

Lit.: Lumbsch *et al.* (*MR* **105**: 265, 2001), Lumbsch *et al.* (*MR* **111**: 1133, 2007).

Trapelina Motyka (1996) nom. inval. ≡ Trapelia.

Trapeliopsis Hertel & Gotth. Schneid. (1980), Agyriaceae (L). 17, widespread (esp. temperate). See Coppins & James (*Lichenologist* **16**: 241, 1984), Coppins (*SA* **7**: 93, 1988), Lumbsch (*J. Hattori bot. Lab.* **83**: 1, 1997), Lumbsch *et al.* (*MR* **105**: 16, 2001; phylogeny), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Traponora Aptroot (1997), Lecanoraceae (L). 1, Papua New Guinea. See Aptroot *et al.* (*Biblthca Lichenol* **64**: 199, 1997).

Trappea Castellano (1990), Trappeaceae. 3, China; Europe; N. America. See Xu & Luo (*Mycosystema* **22**: 191, 2003; China).

Trappeaceae P.M. Kirk (2008), Hysterangiales. 2 gen., 4 spp.

Traquairia Carruth. (1873), Fossil Fungi, Ascomycota. 2, USA. See Smith (*Am. J. Bot.* **70**: 387, 1983).

Traversoa Sacc. & Syd. (1913) = Lasiodiplodia fide Sutton (*Mycol. Pap.* **141**, 1977).

Trechinothus E.C. Martini & Trichies (2004), Agaricomycetes. 1, Europe. See Martini & Trichiès (*Mycotaxon* **90**: 262, 2004).

Trechispora P. Karst. (1890), Hydnodontaceae. 46, widespread. See Liberta (*CJB* **51**: 1871, 1973), Larsson (*The Genus Trechispora (Corticiaceae, Basidio-*

mycetes) Dissertation. Universität Göteborg, 1992).

Trechisporales K.H. Larss. (2007). Agaricomycetes. 1 fam., 15 gen., 105 spp. Fam.:

Hydnodontaceae

For *Lit.* see under fam.

tree hair (1) lichens, esp. fruticose spp. (*Bryoria*, *Usnea*), etc. growing on tree trunks (obsol.); (2) the lichen *Pseudevernia furfuracea* (mousse d'arbre); a source of perfume. Cf. oak-moss.

trehalose, a reserve disaccharide (α-D-glucopyanosyl-α-D-glucopyanoside) of fungi (esp. yeasts) and lichens which is hydrolyzed by the enzyme **trehalase**; mycose.

Treleasia Speg. (1896) = Pyxidiophora fide Petch (*Annls mycol.* **34**: 74, 1936), Sutton (*Mycol. Pap.* **141**, 1977), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Treleasiella Speg. (1896) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

trellis rust, on pear (*Gymnosporangium fuscum*); on juniper (*G. sabinae*).

Tremateia Kohlm., Volkm.-Kohlm. & O.E. Erikss. (1995), ? Pleosporaceae. Anamorph *Phoma*-like. 1 (on *Juncus*), USA. See Kohlmeyer *et al.* (*Bot. Mar.* **38**: 165, 1995).

Trematomyces Schrantz (1961) = Requienella fide Boise (*Mycol.* **78**, 1986).

Trematophlyctis Pat. (1918), ? Chytridiales. 1 (on *Leptodesmia* (legume)), Madagascar.

Trematophoma Petr. (1924), anamorphic *Pezizomycotina*, Cpd.0eH.19. 1, Austria.

Trematophora Eisenack (1965), Fossil Fungi ? Fungi. 1, Sweden.

Trematosphaerella Kirschst. (1906) ? = Phaeosphaeria fide Holm (*Symb. bot. upsal.* **14** no. 3: 1, 1957), Hara (*Monogr. Rice Diseases*, 1959), Shoemaker & Babcock (*CJB* **67**: 1500, 1989).

Trematosphaeria Fuckel (1870), ? Pleomassariaceae. Anamorph *Zalerion*-like. 15, widespread. See Boise (*Mycol.* **77**: 230, 1985; key), Fisher & Webster (*Nova Hedwigia* **54**: 77, 1992; anamorph), Lumbsch & Lindemuth (*MR* **105**: 901, 2001; phylogeny), McKeown *et al.* (*MR* **105**: 615, 2001; ultrastr.), Tanaka *et al.* (*Fungal Diversity* **19**: 145, 2005; revision, Japan), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny, polyphyly).

Trematosphaeriopsis Elenkin (1901), Pleosporales. 1 (lichenicolous). See Theissen & Sydow (*Annls mycol.* **13**: 603, 1915), Hafellner (*Mycotaxon* **80**: 381, 2001).

Trematosphaeris Clem. & Shear (1931) ≡ Trematosphaeriopsis.

Trematosphaerites Grüss (1924), Fossil Fungi ? Fungi. 1 (Devonian), Spitzbergen.

Trematosphaerites Mesch. (1892), Fossil Fungi. 1 (Tertiary), Europe. See Bužek & Holy (*Sbor. geol. ved.* **4**: 108, 1964).

Trematostoma (Sacc.) Shear (1942) = Exarmidium fide Barr & Boise (*Mycotaxon* **23**, 1985), Aptroot (*Nova Hedwigia* **66**: 89, 1998).

Trematovalsa Jacobesco (1906), ? Diaporthales. 1, France.

trembling fungi, the *Tremellales*.

Tremella Dill. ex L. (1753) nom. inval., Cyanophyta.

Tremella Pers. (1794) nom. cons., Tremellaceae. *c.* 90 (parasites on other fungi), widespread. The edible *T. fuciformis* ('Silver ear') is cultivated in China. See Donk (*Persoonia* **4**: 179, 1966; regional lists), Bandoni & Bisalputra (*CJB* **49**: 27, 1971; ultrastr. of haplonts), Barnett *et al.* (*Yeasts: Characteristics and Identification* 2nd edn, 1990; yeast states 10 spp.), Diederich & Christiansen (*Lichenologist* **26**: 47, 1994; on lichens), Roberts (*Mycologist* **15**: 146, 2001; British spp.), Roberts (*Kew Bulletin* **58**: 763, 2003; Cameroon), Diederich (*Opuscula Philolichenum* **4**: 11, 2007; on lichens).

Tremellacantha Jülich (1980) = Protohydnum fide Hjortstam *et al.* (*Kew Bull.* **45**: 319, 1990).

Tremellaceae Fr. (1821), Tremellales. 17 gen. (+ 14 syn.), 238 spp.

Lit.: Bandoni (*Stud. Mycol.* **30**: 87, 1987), Barnett *et al.* (*Yeasts: Characteristics and Identification* 2nd edn, 1990; yeast states), Zugmaier *et al.* (*Mycol.* **86**: 49, 1994), Bandoni & Boekhout *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 705, 1998), Banno & Yamada *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 768, 1998), Boekhout & Nakase *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 731, 1998), Chen (*Biblthca Mycol.* **174**: 225 pp., 1998), Bandoni & Ginns (*CJB* **76**: 1544, 1998), Chen *et al.* (*Mycoscience* **40**: 137, 1999), Chen *et al.* (*Mycotaxon* **77**: 215, 2001), Weiss & Oberwinkler (*MR* **105**: 403, 2001), Sampaio *et al.* (*Mycol.* **94**: 874, 2002), Scorzetti *et al.* (*FEMS Yeast Res.* **2**: 495, 2002), Yan *et al.* (*Mycosystema* **21**: 47, 2002).

Tremellales Fr. (1821). Tremellomycetes. 9 fam., 38 gen., 341 spp. Mycoparasites. Fams:

(1) **Carcinomycetaceae**
(2) **Cuniculitremaceae**
(3) **Hyaloriaceae**
(4) **Phragmoxenidiaceae**
(5) **Rhynchogastremataceae**
(6) **Sirobasidiaceae**
(7) **Tetragoniomycetaceae**
(8) **Tremellaceae**
(9) **Trichosporonaceae**

Lit.: Martin (1952), Donk (1951-1963; VIII, 1966: 218), Lowy (*Fl. Neotrop.* **6**, 1971; *Nova Hedw.* **19**: 407, 1971; key neotrop. spp.), Raitviir (*in* Parmasto, *Zhivaya priroda Dal'nego Vostoka*: 84, 1971; E. former USSR), McNabb (*in* Ainsworth *et al.* (Eds), *The Fungi* **4B**, 1973), Bandoni (*Trans. Tremellastrum Clem. (1909) ≡ Crepidotus.

Tremellidium Petr. (1927), anamorphic *Pezizomycotina*, St.0eH.?. 1, Europe.

Tremellina Bandoni (1986), anamorphic *Tremellales*. 1, USA. See Bandoni (*Windahlia* **16**: 53, 1986).

Tremellochaete Raitv. (1964) = Exidia fide Donk (*Persoonia* **4**: 166, 1966).

Tremellodendron G.F. Atk. (1902), Sebacinaceae. *c.* 10, N. America; S. America; Europe. See Bodman (*Am. midl. Nat.* **27**: 203, 1942), Walker & Parrent (*Memoirs of the New York Botanical Garden* **89**: 291, 2004; mycorrhizal).

Tremellodendropsidaceae Jülich (1982) = Auriculariales.

Tremellodendropsis (Corner) D.A. Crawford (1954), Auriculariales. 7, widespread. See Petersen (*Mycotaxon* **29**: 45, 1987), Wendland (*Boletus* **18**: 102, 1994), Weiss & Oberwinkler (*MR* **105**: 403, 2001).

Tremellodiscus Lloyd (1925) nom. nud. ≡ Ruhlandiella fide Dissing & Korf (*Mycotaxon* **12**: 290, 1980).

Tremellodon (Pers.) Fr. (1874) ≡ Pseudohydnum P. Karst.

Tremellogaster E. Fisch. (1924), Diplocystidiaceae. 1, Surinam; Guyana. See Linder (*Mycol.* **22**: 265, 1930).

Tremellogastraceae Zeller (1948) = Diplocystidiaceae.

tremelloid (1) like jelly or wet gelatin; gelatinous; (2) *Tremella*-like.

Tremellomycetes Hibbett, Matheny & Manfr. Binder (2007), Agaricomycotina. 3 ord., 11 fam., 50 gen., 377 spp. Ords:
(1) **Cystofilobasidiales**
(2) **Filobasidiales**
(3) **Tremellales**
Lit.: Hibbett *et al.* (*MR* **111**: 509, 2007).

Tremellomycetidae, see *Tremellomycetes*.

Tremellopsis Pat. (1903) = Crepidotus fide Singer (*Lilloa* **13**: 59, 1947).

Tremelloscypha D.A. Reid (1979), Sebacinaceae. 2, Australia; Jamaica; USA. See Reid (*Beih. Sydowia* **8**: 332, 1979), Weiss & Oberwinkler (*Mycol.* **74**: 325, 1982), Weiss & Oberwinkler (*MR* **105**: 403, 2001; posn, phylogeny).

Tremellostereum Ryvarden (1986), Sebacinaceae. 1, Caribbean. See Ryvarden (*Mycotaxon* **27**: 321, 1986).

Tremiscus (Pers.) Lév. (1846) = Guepinia Fr. fide Legon *et al.* (*Checklist of the British & Irish Basidiomycota*, 2005).

Tremolecia M. Choisy (1953), Lecanorales (L). 5, widespread. See Hertel (*Ergebn. Forsch Unternehmens Nepal Himalaya* **6**: 150, 1977), Makarova (*Nov. sist. Niz. Rast.* **27**: 107, 1990; Russia), Buschbom & Mueller (*Mol. Phylogen. Evol.* **32**: 66, 2004; phylogeny), Türk & Uhl (*Biblthca Lichenol.* **88**: 691, 2004; Austria), Wedin *et al.* (*MR* **109**: 159, 2005; phylogeny).

tremorgen, a mycotoxin inducing a neurotoxicosis (tremor) in humans and higher animals, e.g. fumitremorgin, verruculotoxin.

Tremotyliomyces Cif. & Tomas. (1953) = Thelotrema.

Tremotylium Nyl. (1865), Thelotremataceae (L). 6, widespread. See Redinger (*Ark. Bot.* **28A** no. 8: 1, 1936).

Trenomyces Chatton & F. Picard (1908), Laboulbeniaceae. 11, widespread. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Trentepohlia Mart. (1817), Algae. Algae.

Tretendophragmia Subram. (1994) = Diplococcium fide Sutton (*in litt.*).

tretic (of conidiogenesis), the sort of conidiogenesis in which each conidium (**tretoconidium**, tretic conidium, poroconidium, porospore) is delimited by an extension of the inner wall of the conidiogenous cell. Tretoconidia are solitary or in acropetal chains (cf. phialidic). **mono-**, **poly-**, (of conidiogenous cells), producing tretoconidia by the extrusion of the inner wall through one or several channels, respectively.

Tretocephala Subram. (1995), anamorphic *Pezizomycotina*, Hso.0eP.24. 1, Singapore. See Subramanian (*Cryptog. Mycol* **13**: 65, 1992), Subramanian (*Kavaka* **20/21**: 57, 1992/1993).

Tretophragmia Subram. & Natarajan (1974), anamorphic *Pezizomycotina*, Hsy.≡ eP.24. 2, India. See Subramanian & Natarajan (*Proc. Natl. Inst. Sci. India* B, Biol. Sci. **39**: 550, 1973), Holubová-Jechová & Mercado Sierra (*Česká Mykol.* **40**: 142, 1986).

Tretopileus B.O. Dodge (1946), anamorphic *Corticiaceae*, Hsy.#eP.42. 3, USA; Africa. See Deighton (*Mycol. Pap.* **78**, 1960), Okada *et al.* (*Asian Network on Microbial Researches. Proceedings of International Conference on Asian Network on Microbial Researches* NATO ASI Series vol. 269: 537, 1998), Okada *et al.* (*Mycoscience* **39**: 21, 1998; phylogeny), Lawrey *et al.* (*Amer. J. Bot.* **95**: 816, 2008).

Tretospeira Piroz. (1972), anamorphic *Pezizomycotina*, Hso.#eP.24. 1, Uganda. See Pirozynski (*Mycol. Pap.* **129**: 58, 1972).

Tretospora M.B. Ellis (1976), anamorphic *Balladynopsis*, Hso.≡ eP.24. 7, widespread. See Khan *et al.* (*Mycotaxon* **49**: 477, 1993; key), Chaudhary *et al.* (*Mycotaxon* **57**: 201, 1996), Hosagoudar *et al.* (*Zoos' Print Journal* **18**: 967, 2003).

Tretovularia Deighton (1984), anamorphic *Pezizomycotina*, Hso.0eH.15. 1, widespread (northern Europe). See Braun (*Monogr. Cercosporella, Ramularia Allied Genera (Phytopath. Hyphom.)* **2**, 1998).

Treubiomyces Höhn. (1909), Chaetothyriaceae. 2, widespread. See Pohlad & Reynolds (*Mycol.* **66**: 521, 1974), Pohlad (*CJB* **67**: 40, 1989), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Trevisan (Vittore, Earl of San Leon; 1818-1897; Italy). Born of a wealthy family in Padova; Professor of Natural History and Popular Physics in Padova (1851-1853); from 1853 onwards worked from his estate in Mason, then moved to Monza and Milan where he died. Trevisan devoted much of his time to advancing study of a wide range of cryptogams, including plant pathogens and lichen-forming fungi; he was especially concerned in using new microscopic features, introducing 75 generic names for lichen-forming taxa and making numerous critical and nomenclatural remarks on the works of Körber (q.v.) and especially Massalongo (q.v.). His collections were transferred to the University of Genoa, but all destroyed in World War II. *Biogs, obits etc.* Lazzarin [ed.] (*L' Opera Lichenologica di Vittore Trevisan*, 1994) [reprint collected works, including biography]; Grummann (1974: 524); Stafleu & Cowan (*TL-2* **6**: 480, 1986).

tri- (in combination), three, triple.

Triactella Syd. (1921) = Hapalophragmium fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983) See, Lohsomboon *et al.* (*MR* **96**: 461, 1992), Hennen *et al.* (*Mycol.* **92**: 312, 2000).

Triacutus G.L. Barron & Tzean (1981), anamorphic *Pezizomycotina*, Hso.1bH.1. 1 (on bdelloid rotifer), Canada. See Barron & Tzean (*CJB* **59**: 1207, 1981).

Triadelphia Shearer & J.L. Crane (1971), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 13 (aquatic and terrestrial), widespread. See Constantinescu & Samson (*Mycotaxon* **15**: 472, 1982; key), von Arx (*TBMS* **85**: 566, 1985; related genera), Révay (*Acta Bot. Hung.* **33**: 67, 1987), Tzean & Chen (*Mycol.* **81**: 626, 1989; synoptic key).

Triainomyces W. Rossi & A. Weir (1998), Laboulbeniaceae. 1 (on pill-millipedes), New Zealand. See Rossi & Weir (*Mycol.* **90**: 282, 1998).

Triandromyces Thaxt. (1931) = Tetrandromyces fide Tavares (*Mycol. Mem.* **9**, 1985).

Triangularia Boedijn (1934), Lasiosphaeriaceae. 6, widespread. See Cain & Farrow (*CJB* **34**: 689, 1956; key), von Arx & Hennebert (*BSMF* **84**: 423, 1969), Guarro & Cano (*TBMS* **91**: 587, 1988; key 5 spp.), Guarro *et al.* (*SA* Reprint of Volumes 1-4 (1982-1985) **10**: 79, 1991), Huhndorf *et al.* (*Mycol.* **96**: 368,

2004; phylogeny), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005; phylogeny), Cai *et al.* (*MR* **110**: 359, 2006; phylogeny).

Triblidiaceae Rehm (1888), Triblidiales. 3 gen. (+ 5 syn.), 11 spp.
Lit.: Eriksson (*SA* **11**: 1, 1992), Magnes (*Biblthca Mycol.* **165**: 177 pp., 1997).

Triblidiales O.E. Erikss. (1992). Pezizomycotina. 1 fam., 3 gen., 11 spp. Fam.:
Triblidiaceae
Lit.: Eriksson (*SA* **11**: 1, 1992), Magnes (*Bibl. Mycol.* **165**, 1997).

Tribolites W.H. Bradley ex Janson. & Hills (1976), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Eocene), USA.

Tribolospora D.A. Reid (1966), anamorphic *Pezizomycotina*, St.0eH.15. 1, Australia. See Reid (*Aust. J. Bot.* **14**: 31, 1966).

Tribulatia Joanne E. Taylor, K.D. Hyde, E.B.G. Jones (2003), Sordariomycetes. 1, Queensland. See Taylor & Hyde (*Fungal Diversity Res. Ser.* **12**: 189, 2003).

Tricella Long (1912) = Phragmopyxis fide Dietel (*Nat. Pflanzenfam.* **6**, 1928).

Tricellaesporonites Sheffy & Dilcher (1971), Fossil Fungi. 2 (Eocene), USA.

Tricellula Beverw. (1954), anamorphic *Pezizomycotina*, Hsy.≡ eH.10. 4, Europe; USA. See Haskins (*Can. J. Microbiol.* **4**: 279, 1958), Petersen (*Bull. Torrey bot. Club* **89**: 287, 1962).

Tricellulortus Matsush. (1995) = Minimedusa fide Diederich & Lawrey (*Mycol. Progr.* **6**: 61, 2007).

Triceromyces T. Majewski (1980), Laboulbeniaceae. 5, widespread. See Tavares (*Mycol. Mem.* **9**: 627 pp., 1985), Benjamin (*Aliso* **11**: 245, 1986; key 6 spp.), Benjamin (*Aliso* **17**: 1, 1998).

Trichaegum Corda (1837), anamorphic *Pezizomycotina*, Hso.#eP.?. 3, Europe; N. America.

Trichaleurina Rehm (1903) = Scutellinia fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Trichaleuris Clem. (1909) = Scutellinia fide Eckblad (*Nytt Mag. Bot.* **15**: 1, 1968).

Trichamelia Bat. (1960), Asterinaceae. 1, Brazil. See Batista (*Publções Inst. Micol. Recife* **295**: 9, 1960), Hosagoudar *et al.* (*Journal of Mycopathological Research* **39**: 61, 2001).

Trichangium Kirschst. (1935), Helotiales. 1, Europe.

Trichaptum Murrill (1904), Polyporaceae. 20, widespread (pantropical). See Macrae (*CJB* **45**: 1371, 1966), Corner (*Beih. Nova Hedwigia* **86**: 197, 1987; key), Hattori (*Mycoscience* **46**: 303, 2005; type studies Corner species).

Tricharia Boud. (1885) ≡ Tricharina.

Tricharia Fée (1825), Gomphillaceae (L). 69, widespread (tropical). See Sérusiaux (*Mycol.* **76**: 108, 1984; key), Vězda & Poelt (*Folia geobot. phytotax.* **22**: 179, 1987), Lücking (*Biblthca Lichenol.* **65**: 1, 1997), Ferraro (*Fungal Diversity* **15**: 153, 2004; hypophores), Lücking *et al.* (*Mycol.* **96**: 283, 2004; phylogeny), Lücking *et al.* (*Lichenologist* **37**: 123, 2005; phylogeny).

Tricharina Eckblad (1968), Pyronemataceae. Anamorph *Ascorhizoctonia*. 13, widespread (temperate). See Yang & Korf (*Mycotaxon* **24**: 467, 1985; key), Yang & Kristiansen (*Mycotaxon* **35**: 313, 1989; anamorph), Egger (*CJB* **74**: 773, 1996; DNA), Barrera & Romero (*Mycotaxon* **77**: 31, 2001; Argentina), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Liu & Zhuang (*Mycosystema* **25**: 546, 2006; phylogeny), Tedersoo *et al.* (*New Phytol.* **170**: 581, 2006; mycorrhiza), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Trichaster Czern. (1845) = Geastrum fide Staněk *in* Pilát (Ed.) (*Fl. ČSR* **B**, **1**: 480, 1958).

Trichasterina G. Arnaud (1918), Asterinaceae. 9, widespread (tropical). See Song *et al.* (*Mycosystema* **21**: 309, 2002; China).

trichidium, see sterigma.

Trichobacidia Vain. (1921) nom. dub., Fungi. See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952).

Trichobasis Lév. (1849) = Uredo fide Saccardo (*Syll. fung.* **7**: 838, 1887) See, Laundon (*Mycotaxon* **3**: 133, 1975).

Trichobelonium (Sacc.) Rehm (1896) = Belonopsis fide Aebi (*Nova Hedwigia* **23**: 49, 1972), Nannfeldt (*Sydowia* **38**: 194, 1985).

Trichobolbus Bat. (1964), anamorphic *Pezizomycotina*, Cpd.0eP.?. 1, Brazil. See Batista (*Riv. Patol. veg., Pavia* sér. 3 **4**: 559, 1964).

Trichobolus (Sacc.) Kimbr. & Cain (1967), Pezizales. 4, Europe; N. America. Perhaps close to *Lasiobolus*. See Krug (*CJB* **51**: 1497, 1973), Samuelson & Kimbrough (*Mycol.* **70**: 1191, 1978), Olsen (*Blyttia* **45**: 117, 1987; Norway), Brummelin (*Persoonia* **16**: 425, 1998), Prokhorov (*Mikol. Fitopatol.* **32**: 40, 1998; Russia).

Trichobotrys Penz. & Sacc. (1901), anamorphic *Pezizomycotina*, Hso.0eP.3. 3, Asia (tropical). See Morgan-Jones *et al.* (*Mycotaxon* **30**: 345, 1987), D'Souza & Bhat (*Mycotaxon* **80**: 105, 2001).

Trichocarpus P. Karst. (1889) [non *Trichocarpus* Schreb. 1789, *Tiliaceae*] = Amylostereum fide Donk (*Persoonia* **3**: 199, 1964).

Trichocephalum Costantin (1888) = Periconia fide Mason & Ellis (*Mycol. Pap.* **56**, 1953).

Trichoceridium R.A. Poiss. (1932) ? = Smittium fide Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986).

Trichochora Theiss. & Syd. (1915) nom. dub., Fungi. See Petrak (*Annls mycol.* **27**: 324, 1929).

Trichocicinnus (Sacc.) Höhn. (1926) = Chaetosticta fide Sutton (*Mycol. Pap.* **141**, 1977).

Trichocintractia M. Piepenbr. (1995), Anthracoideaceae. 1 (on *Rhynchospora* (*Cyperaceae*)), widespread (tropical). See Piepenbring (*CJB* **73**: 1089, 1995), Piepenbring (*Revta Biol. trop.* **49**: 411, 2001; Panama), Pérez & Minter (*IMI Descr. Fungi Bact.* **164**, 2005).

Trichocladia (de Bary) Neger (1901) = Erysiphe fide Braun & Takamatsu (*Schlechtendalia* **4**: 3, 2000).

Trichocladia Stirt. (1882) [non *Trichocladia* Harv. 1836, *Algae*] = Heterodea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Trichocladium Harz (1871), anamorphic *Chaetomiaceae*, Hso.≡ eP.1. 24, widespread. The genus is highly polyphyletic. See Hughes (*TBMS* **35**: 152, 1952), Hughes (*N.Z. Jl Bot.* **7**: 153, 1969), Pidoplichko & Kirilenko (*Mikol. Fitopatol.* **6**: 510, 1972; key), Kohlmeyer & Volkmann-Kohlmeyer (*Mycotaxon* **53**: 349, 1995; key 7 aquatic spp.), Goh & Hyde (*Fungal Diversity* **2**: 101, 1999; synopsis), Chang (*Fungal Science* Taipei **16**: 35, 2001; teleomorph), Jones *et al.* (*Fungal Diversity* **7**: 49, 2001), Chatmala *et al.* (*Fungal Diversity Res. Ser.* **7**: 59,

2002), Mantle *et al.* (*MR* **110**: 1371, 2006; phylogeny).

Trichocollonema Höhn. (1902) = Zignoëlla fide von Höhnel (*Annls mycol.* **15**, 1917).

Trichocoma Jungh. (1838), Trichocomaceae. Anamorph *Penicillium*. 1, widespread (subtropical). See Martin (*Mycol.* **29**: 620, 1937), Kuraishi *et al.* (*MR* **95**: 705, 1991; ubiquinones), Ogawa & Sugiyama (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 149, 2000; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny).

Trichocomaceae E. Fisch. (1897), Eurotiales. 39 gen. (+ 45 syn.), 881 spp.

Lit.: Raper & Fennell (*The genus Aspergillus*, 1965), Malloch & Cain (*CJB* **50**: 2613, 1972), Malloch & Cain (*CJB* **51**: 1647, 1973; gen. names), Weijman (*Antonie van Leeuwenhoek* **42**: 315, 1976), Pitt (*The genus Penicillium and its teleomorphic states Eupenicillium and Talaromyces*, 1979), Malloch *in* Arai (Ed.) (*Filamentous micro-organisms*: 37, 1985; key gen.), Malloch *in* Samson & Pitt (Eds) (*Advances in Penicillium and Aspergillus Systematics* **102**: 365, 1985), Malloch (*Advances in Penicillium and Aspergillus Systematics* **102**: 365, 1985), Pitt & Samson (*Regnum veg.* **128**: 13, 1993; names in use), Pitt (*CJB* **73** Suppl. 1: S768, 1995), Horie *et al.* (*Mycoscience* **37**: 323, 1996), Landvik *et al.* (*Mycoscience* **37**: 237, 1996), Ogawa *et al.* (*Mycol.* **89**: 756, 1997), Frısvad *et al.* (*Chemical Fungal Taxonomy*: 289, 1998), Geiser *et al.* (*Mycol.* **90**: 831, 1998), Domenech *et al.* (*Microbiology* Reading **145**: 2789, 1999), Skouboe *et al.* (*MR* **103**: 873, 1999), Frisvad & Samson (*Stud. Mycol.* **45**: 201, 2000), Frisvad *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 265, 2000), Kuraishi *et al.* (*Antonie van Leeuwenhoek* **77**: 179, 2000), Ogawa & Sugiyama (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 149, 2000), Peterson (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 163, 2000), Peterson (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 323, 2000), Pitt *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 9, 2000), Tamura *et al.* (*Integration of Modern Taxonomic Methods for Penicillium and Aspergillus Classification*: 357, 2000), Klich (*Identification of Common Aspergillus Species*: 116 pp., 2002), Klich *et al.* (*Mycol.* **95**: 1252, 2003), Samson *et al.* (*Stud. Mycol.* **49**: 175, 2004), Scott *et al* (*Mycol.* **96**: 1095, 2004), Hong *et al.* (*Mycol.* **97**: 1316, 2005), Peterson (*Mycol.* **100**: 205, 2008; 4-locus phylogeny).

Trichoconiella B.L. Jain (1976) = Alternaria fide Sutton (*in litt.*).

Trichoconis Clem. (1909), anamorphic *Pezizomycotina*, Hso.≡ eH.1. 15 (on fungi), widespread. See Deighton & Pirozynski (*Mycol. Pap.* **128**, 1972; keys), Baker *et al.* (*Mycotaxon* **79**: 361, 2001).

Trichoconium Corda (1837) = Melanconium fide Saccardo (*Syll. fung.* **3**: 1, 1884).

Trichocrea Marchal (1891) nom. dub., anamorphic *Pezizomycotina*. See Minter & Caine (*TBMS* **74**: 434, 1980).

Trichoctosporea J.I.R. Larsson (1994), Microsporidia. 1. See Larsson (*Arch. Protistenk.* **144**: 147, 1994).

trichocyst, a subpellicular organelle of many ciliates and dinoflagellates; sometimes an offensive weapon able to disable prey, sometimes an anchoring device.

Trichodelitschia Munk (1953), Phaeotrichaceae. 4, widespread. See Lundqvist (*Svensk bot. Tidskr.* **58**: 267, 1964), Barr (*Prodr. Cl. Loculoasc.*, 1987; posn), Eriksson (*SA* **7**: 93, 1988), Ebersohn & Eicker (*S. Afr. J. Bot.* **58**: 145, 1992), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny).

trichoderm (of basidiomata), an outer layer composed of hair-like elements projecting from the surface (Furtado, *Mycol.* **57**: 599, 1965). See derm.

Trichoderma Pers. (1794), anamorphic *Hypocrea*, Hso.0eH.15. 102 (esp. in soil), widespread. See Rifai (*Mycol. Pap.* **116**, 1969; key), Doi *et al.* (*Bull. natn Sci. Mus.* Tokyo, B **10**: 73, 1984), Barak *et al.* (*Can. J. Microbiol.* **31**: 810, 1985; antigens), Eveleigh (*Biology of Industrial Microorganisms*: 487, 1985; review), Min *et al.* (*Korean J. Mycol.* **13**: 221, 1985; chromosomes), Doi & Doi (*Bull. natn. Sci. Mus.* Tokyo, B **12**: 1, 1986; nomenclator), Doi *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **13**: 1, 1987), Elad *et al.* (*TBMS* **88**: 259, 1987; ultrastr.), Doi *et al.* (*Bull. natn. Sci. Mus.* Tokyo, B **15**: 27, 1989; conidium ornamentation), Meyer & Plaskowitz (*Mycol.* **81**: 312, 1989; SEM), Stasz *et al.* (*Mycol.* **81**: 391, 1989; cladistics), Toyama & Toyama (*Agric. Biol. Chem.* **54**: 2331, 1990; genetics), Meyer (*Phytopathology* **81**: 1240, 1991), Meyer (*Appl. Environm. Microbiol.* **57**: 2269, 1991; DNA), Nevalainen *et al.* (*Molecular Industrial Mycology: Systems and Applications for Filamentous Fungi* Mycology Series **8**: 129, 1991; gene expression), Samuels *et al.* (*Petria* **1**: 121, 1991; teleomorph), Bissett (*CJB* **69**: 2357, 1991), Bissett (*CJB* **69**: 2418, 1991), Bissett (*CJB* **70**: 639, 1992), Bissett (*CJB* **69**: 2373, 1991), Zimand *et al.* (*Phytoparasitica* **21**: 166, 1993; RAPDs), García *et al.* (*Revta Iberoamer. Micol.* **11**: S48, 1994; numerical taxonomy), Mills & Muthumeenakshi (*Ecology of Plant Pathogens*: 135, 1994; from mushroom compost), Samuels *et al.* (*Mycol.* **86**: 421, 1994), Tschen & Li (*Mycoscience* **35**: 257, 1994; protoplast generation), Zimand *et al.* (*MR* **98**: 531, 1994; RAPDs), Leuchtmann *et al.* (*Mycol.* **88**: 384, 1996; isozymes), Samuels (*MR* **100**: 923, 1996; review), Samuels & Lodge (*Mycol.* **88**: 302, 1996), Gómez *et al.* (*Molecular & General Genetics* **256**: 127, 1997; genetic diversity), Grondona *et al.* (*Appl. Trichoderma Pers. (1801) nom. conf., Fungi.

Trichodermia Hoffm. (1795) = Trichothecium fide Saccardo (*Syll. fung.* **4**: 178, 1886).

Trichodesmium Chevall. (1826) nom. rej. prop. ≡ Graphiola.

Trichodiscula Vouaux (1910), anamorphic *Pezizomycotina*. 1 (on cardboard), France.

Trichodiscus Kirschst. (1924) [non *Trichodiscus* Welsford 1912, *Algae*] ≡ Dennisiodiscus.

Trichodochium Syd. (1927), anamorphic *Pezizomycotina*, Hsp.1eP.19. 2, C. America; India. See Ellis (*Mycol. Pap.* **111**, 1967).

Trichodothella Petr. (1946), Venturiaceae. 1, Europe.

Trichodothis Theiss. & Syd. (1914), Venturiaceae. 3, N. America; Africa. See Barr (*Sydowia* **41**: 25, 1989).

Trichoduboscqia L. Léger (1926), Microsporidia. 1.

Trichodytes Kleb. (1898) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Trichofusarium Bubák (1906) = Fusarium fide Booth (*The genus Fusarium*, 1971).

Trichoglossum Boud. (1885), Geoglossaceae. 20, widespread (esp. temperate). See Mains (*Mycol.* **46**: 61, 1954; key N. Am. spp.), Rifai (*Lloydia* **28**: 113, 1965; key Javanese spp.), Benkert (*Mykol. MittBl.* **20**: 47, 1977; Germany), Spooner (*Biblthca Mycol.* **116**, 1987; key Australasian spp.), Verkley (*Persoonia* **15**: 405, 1994; asci), Zhuang & Wang (*Mycotaxon* **63**: 307, 1997), Zhuang (*Fl. Fung. Sinicorum* **8**, 1998; 15 spp. China), Wang (*Bull. natn. Mus. Nat. Sci.* Taiwan **13**: 147, 2001; Taiwan), Wang *et al.* (*Mycol.* **94**: 641, 2002; phylogeny), Wang *et al.* (*Mycol.* **98**: 1065, 2006; phylogeny), Wang *et al.* (*Mol. Phylogen. Evol.* **41**: 295, 2006; phylogeny).

trichogyne, the receptive hypha of the female organ, esp. in certain ascomycetes.

Trichohelotium Killerm. (1935), Helotiales. 2, Europe.

Trichohleria Sacc. (1908) ? = Trichosphaerella fide von Arx & Müller (*Stud. Mycol.* **9**, 1975), Samuels & Barr (*CJB* **75**: 2165, 1998).

Tricholechia A. Massal. (1853) ≡ Byssoloma.

Tricholeconium Corda (1837) = Sarcopodium fide Saccardo (*Syll. fung.* **4**: 312, 1886).

Tricholoma (Fr.) Staude (1857) nom. cons., Tricholomataceae. *c.* 200, widespread (esp. north temperate). See Horak (*Sydowia* **17**: 153, 1964; key 11 S. Am. spp.), Bon (*Docums Mycol.* **3**: 1, 1971), Gulden (*Musseronflora Slekton Tricholoma sensu lato*, 1972), Haluwyn (*Docums Mycol.* **4**: 43, 1972; ecology), Bon (*Docums Mycol.* **6**: 165, 1974-76), Bon (*Docums Mycol.* **4**: 55, 1974-76), Bon (*Docums Mycol.* **5**: 111, 1974-76), Bon (*Encycl. Mycol.* **36**, 1984), Riva (*Tricholoma*, 1988) See matsutake, Riva (*Fungi Europaei* **3** A: 626, 2003), Matsushita *et al.* (*Mycoscience* **46**: 90, 2005; genetic relationship of *Tricholoma matsutake* and *T. nauseosum*), Jacobsson *et al.* (*Mycotaxon* **95**: 195, 2006; new sp. Fennoscandia).

Tricholomataceae R. Heim ex Pouzar (1983) nom. cons., Agaricales. 78 gen. (+ 57 syn.), 1020 spp.

Lit.: Mankel *et al.* (*Microbiol. Res.* **153**: 377, 1999), Noordeloos (*Coolia* **42**: 163, 1999), Hwang & Kim (*Curr. Microbiol.* **40**: 250, 2000), Kalamees (*Folia cryptog. Estonica* **38**: 13, 2001), Suh *et al.* (*Mycobiology* **29**: 179, 2001), Moncalvo *et al.* (*Mol. Phylogen. Evol.* **23**: 357, 2002), Lian *et al.* (*Mycorrhiza* **13**: 27, 2003), Chapela & Garbelotto (*Mycol.* **96**: 730, 2004), Matsushita *et al.* (*Mycoscience* **46**: 90, 2005), Murata & Babasaki (*Mycorrhiza* **15**: 381, 2005).

Tricholomella Zerova ex Kalamees (1992) = Calocybe fide Kuyper (*in litt.*).

tricholomic acid, an insecticidal amino-acid derivative produced by *Tricholoma muscarium* (Takemoto, *Jap. J. Pharm. Chem.* **33**: 252, 1961). Cf. muscazone.

Tricholomopsis Singer (1939), Agaricales. *c.* 30, widespread. Belongs to *Tricholomataceae* or *Marasmiaceae*. See Smith (*Brittonia* **12**: 41, 1960), Liu (*Acta Mycol. Sin.* **13**: 181, 1994; China).

Tricholosporum Guzmán (1975), Tricholomataceae. 5, widespread. See Guzmán (*Boletín de la Sociedad Mexicana de Micología* **9**: 61, 1975), Contu & Mua (*Rivista di Micologia* **43**: 249, 2000; European spp.), Guzmán *et al.* (*Docums Mycol.* **33** no. 131: 23, 2004).

Trichomaris Hibbits, G.C. Hughes & Sparks (1981), Halosphaeriaceae. 1 (on tanner crab), Alaska. See Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **34**: 1, 1991), Sakayaroj *et al.* (*Mycol.* **97**: 804, 2005; phylogeny).

Trichomatomyces Dorn.-Silva & Dianese (2004), anamorphic *Pezizomycotina*. 1, Brazil. See Dornelo-Silva & Dianese (*Mycol.* **96**: 879, 2004).

Trichomerium Speg. (1918), Capnodiaceae. Anamorph *Tripospermum*. 23, widespread. See Hughes (*Mycol.* **68**, 1976; synonymy with *Phragmocapnias*), Reynolds (*Mycotaxon* **14**: 189, 1982), Reynolds (*Mycotaxon* **27**: 377, 1986).

Trichometasphaeria Munk (1953), Lophiostomataceae. Anamorph *Ascochyta*-like. 7, N. America. See Barr (*Mycotaxon* **45**: 191, 1992).

Trichomonascaceae Locq. (1972), Saccharomycetales. 5 gen., 21 spp.

Lit.: Kurtzman & Robnett (*FEMS Yeast Res.* **7**: 141, 2007).

Trichomonascus H.S. Jacks. (1948), Trichomonascaceae. Anamorph *Blastobotrys*. 1 (on *Corticium*), Canada. See Kurtzman & Blanz *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 69, 1998; rDNA), Malloch & de Hoog *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 197, 1998), Kurtzman & Robnett (*FEMS Yeast Res.* **7**: 141, 2007).

Trichomyces Malmsten (1848) = Trichophyton fide Dodge (*Medical Mycology*, 1935).

Trichomycetes Alexop. (1962), Zygomycota. A polyphyletic taxon as traditionally circumscibed at this rank. Manier & Lichtwardt (1968) recognized 4 Ords but two, the *Amoebidales* and *Eccrinales*, are now place in the *Protozoa* and the other two, the *Asellariales* and *Harpellales* and referred to the *Kickxellomycotina*.

Lit.: Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986, *in* Ainsworth *et al.* (Eds), *The Fungi* **4B**: 651, 1973, *in* Jones (Ed.), *Recent advances in aquatic mycology*, 1976; keys, *Mycol.* **65**: 1, 1973; phylogeny, *in* Parker (Ed.), 1982, **1**: 195), Cavalier-Smith (*in* Coombs *et al.*, *Evolutionary relationships among Protozoa*, 1998), Moss (*TBMS* **65**: 115, 1975; phylogeny), Moss & Young (*Mycol.* **70**: 944, 1978; phylogeny), Benjamin (*in* Kendrick (Ed.), *The whole fungus* **2**: 573, 1979; phylogeny), Porter & Smiley (*Exp. Mycol.* **3**: 188, 1979; phylogeny), Lichtwardt *et al.* (*Trans. mycol. Soc. Japan* **28**: 359, 1987; Japan).

Reviews: Duboscq *et al.* (*Arch. Zool. Exp. Gén.* **86**: 29, 1948), Manier (*Ann. Sci. nat., Bot.* sér. 12, **10**: 565, 1969), Moss (*in* Batra (Ed.), *Insect-fungus symbiosis*: 175, 1979), Lichtwardt & Williams (*CJB* **66**: 1259, 1988; spp. diversity & distrib., **68**: 1057, 1990; Australia), Williams & Lichtwardt (*CJB* **68**: 1045, 1990; NZ).

trichomycin, an antiobiotic from *Streptomyces hachijoensis* (Hosoya *et al.*, 1955); antifungal (esp. against *Candida albicans*) and anti-*Trichomonas*.

Trichonectria Kirschst. (1907), Bionectriaceae. 15 (rotten wood, often associated with lichen thalli or liverworts), widespread. See Döbbeler (*Mitt. bot. StSamml., München* **14**: 1, 1978; on *Musci*), Hawksworth (*Notes R. bot. Gdn Edinb.* **36**: 181, 1978), Hawksworth (*Lichenologist* **12**: 100, 1980; nomencl.), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Trichonosema E.U. Canninga, D. Refardtb, C.R. Vossbrinckc, B. Okamurad & A. Curry (2002), Microsporidia. 2. See Canninga *et al.* (*Eur. J. Protist.* **38**: 247, 2002).

Trichopeltella Höhn. (1910), ? Microthyriaceae. 1, Java.

Trichopeltheca Bat., C.A.A. Costa & Cif. (1958), Euantennariaceae. Anamorphs *Plokamidomyces*, *Trichothallus*. 2, Asia; Pacific. See Hughes (*N.Z. Jl Bot.* **10**: 230, 1972).

Trichopeltidaceae Theiss. (1914) = Microthyriaceae.

Trichopeltina Theiss. (1914), ? Microthyriaceae. 2, S. America.

Trichopeltinaceae Bat., C.A.A. Costa & Cif. (1958) = Microthyriaceae.

Trichopeltinites Cookson (1947), Fossil Fungi. 4 (Cretaceous, Tertiary), widespread.

Trichopeltis Speg. (1889) = Trichothyrium fide Spooner & Kirk (*MR* **94**: 223, 1990).

Trichopeltium Clem. (1909) ≡ Trichopeltulum fide Sutton (*Mycol. Pap.* **141**, 1977).

Trichopeltopsis Höhn. (1909) = Trichothyrium fide Spooner & Kirk (*MR* **94**: 223, 1990).

Trichopeltospora Bat. & Cif. (1958), ? Microthyriaceae. 1, Brazil. See Batista & Ciferri (*Publções Inst. Micol. Recife* **90**: 17, 1958).

Trichopeltula Theiss. (1914) = Trichothyrium fide Clements & Shear (*Gen. Fung.*, 1931).

Trichopeltulum Speg. (1889), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Brazil. See Petrak & Sydow (*Annls mycol.* **33**: 173, 1935), Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 265, 2005).

Trichopeltum Bat., Cif. & C.A.A. Costa (1957), ? Microthyriaceae. 1, Hawaii. See Batista *et al.* (*Publções Inst. Micol. Recife* **90**: 20, 1958).

Trichopeziza Fuckel (1870), Hyaloscyphaceae. 26, widespread (esp. temperate). See Raitviir (*Eesti NSV Tead. Akad. Toim.* Biol. seer **36**: 313, 1987), Verkley (*Nova Hedwigia* **63**: 215, 1996; ultrastr.), Cantrell & Hanlin (*Mycol.* **89**: 745, 1997; DNA).

Trichopezizella Dennis ex Raitv. (1969) = Lachnum fide Haines (*Mycol.* **66**: 216, 1974; key), Spooner (*Biblthca Mycol.* **116**, 1987; status).

Trichophaea Boud. (1885), Pyronemataceae. Anamorph *Dichobotrys*. *c.* 25, widespread (north temperate). See Kanouse (*Mycol.* **50**: 128, 1958; key), Svrček (*Česká Mykol.* **28**: 129, 1974), Svrček (*Česká Mykol.* **31**: 69, 1977), Waraitch (*TBMS* **68**: 303., 1977), Pant (*Norw. Jl Bot.* **27**: 31, 1980), Thind & Kaushal (*Kavaka* **7**: 47, 1980), Korf & Zhuang (*Mycotaxon* **22**: 483, 1985), Zhuang & Korf (*Mycotaxon* **35**: 297, 1989), Häffner & Christian (*Z. Mykol.* **57**: 161, 1991), Korf & Zhuang (*Mycotaxon* **40**: 413, 1991), Egger (*CJB* **74**: 773, 1996; DNA), Wu & Kimbrough (*Int. J. Pl. Sci.* **157**: 595, 1996; ultrastr.), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Jamoni (*Funghi e Ambiente* **76**: 13, 1998), Liu & Zhuang (*Mycosystema* **25**: 546, 2006), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Trichophaeopsis Korf & Erb (1972), Pyronemataceae. 3, widespread. See Häffner & Krieglsteiner (*Z. Mykol.* **57**: 167, 1991), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Perry *et al.* (*MR* **111**: 549, 2007; phylogeny).

Trichophila Oudem. (1889) ? = Piedraia fide Sutton (*Mycol. Pap.* **141**, 1977).

Trichophyma Rehm (1904), ? Arthoniales. 2 (on lichens), tropical. See Santesson (*Svensk bot. Tidskr.* **43**: 547, 1949), Matzer (*Mycol. Pap.* **171**, 1996).

Trichophysalospora Lebedeva (1933) = Physalospora fide von Arx & Müller (*Beitr. Kryptfl. Schweiz* **11** no. 1, 1954).

trichophytin, an antigen prepared from dermatophytes, esp. for use in skin testing. Commercial trichophytin is usually a mixture of antigens of several spp. of *Trichophyton* and *Microsporum*.

Trichophyton Malmsten (1848), anamorphic *Arthroderma*, Hso.≡ eP.2. 22 (on humans and animals, causing trichophytoses, and in soil and river sediments), widespread. *T. mentagrophytes* (syns. *T. asteroides*, *T. gypseum*); *T. schoenleinii* (human favus); *T. concentricum* (tinea imbricata); *T. verrucosum* (cattle ringworm). See also tinea. See Dodge (*Medical Mycology*, 1935), Ajello (*Sabouraudia* **6**: 153, 1968), Ajello & Padhye

(*Mykosen* **30**: 258, 1987; stimulation of macroconidia in culture), Padhye *et al.* (*J. Med. Vet. Mycol.* **25**: 195, 1987; mating behaviour), Mochizuki *et al.* (*J. Med. Vet. Mycol.* **28**: 191, 1990; taxonomy of *T. interdigitale*), Symoens *et al.* (*Mycoses* **32**: 652, 1990; isoelectric focusing to differentiate *T. mentagrophytes* and *T. interdigitale*), Devliotou-Panagiotidou *et al.* (*Mycoses* **35**: 375, 1992; *T. rubrum* in Greece). See also tinea), Nishio *et al.* (*Mycopathologia* **117**: 127, 1992; phylogeny by mitochondrial DNA), Kano *et al.* (*Curr. Microbiol.* **37**: 236, 1998; chitin synthase), Khosravi & Abedian (*Journal of the Faculty of Veterinary Medicine, University of Tehran* **53**: 11, 1998; protein electrophoresis), Makimura *et al.* (*J. Clin. Microbiol.* **38**: 3329, 2000; phylogeny), Kano *et al.* (*Medical Mycology* **38**: 47, 2000; chitin synthase), Kano *et al.* (*Mycopathologia* **146**: 111, 1999; phylogeny), Kim *et al.* (*Mycoses* **44**: 157, 2001; RAPDs), Liu *et al.* (*Journal of Medical Microbiology* **51**: 117, 2002; molecular identification), Summerbell *et al.* (*Stud. Mycol.* **47**: 75, 2002; biological species concept), Untereiner *et al.* (*Stud. Mycol.* **47**: 25, 2002; phylogeny), Gaedigk *et al.* (*J. Clin. Microbiol.* **41**: 5478, 2003; genetic diversity), Kaszubiak *et al.* (*Infect. Genet. Evol.* **4**: 179, 2004; population biology), Ohst *et al.* (*J. Clin. Microbiol.* **42**: 4444, 2004; microsatellites), Brilhante *et al.* (*Journal of Medical Microbiology* **55**: 1583, 2006; from dog).

Trichophytonaceae Vuill. ex E.K. Novák & Galgoczy (1969) = Arthrodermataceae.

Trichopilus (Romagn.) P.D. Orton (1991) = Entoloma fide Kuyper (*in litt.*).

Trichoplacia A. Massal. (1853) nom. dub., ? Dothideomycetes. See Zahlbruckner (*Nat. Pflanzenfam.* **8**: 61, 1926).

Trichopsora Lagerh. (1892), Pucciniosiraceae. 1 (on *Tournefortia* (0, III) (*Boraginaceae*)), Ecuador.

Trichoramalina Rundel & Bowler (1974) ? = Ramalina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Trichoscypha (Cooke) Sacc. (1889) ≡ Cookeina.

Trichoscypha Boud. (1885) [non *Trichoscypha* Hook. f. 1862, *Anacardiaceae*] ≡ Trichoscyphella.

Trichoscyphella Nannf. (1932) = Lachnellula fide Dennis (*Persoonia* **2**: 171, 1962).

Trichoseptoria Cavara (1892), anamorphic *Pezizomycotina*, Cpd.0fH.?. 2, Europe; N. America. *T. fructigena* (soft rot of apples).

Trichosia Bat. & R. Garnier (1960) = Trichasterina fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Trichoskytale Corda (1842) ≡ Trichocoma.

Trichosperma Speg. (1888) [non *Trichospermum* Blume 1825, *Tiliaceae*] ≡ Spermotrichum.

Trichospermella Speg. (1912), Pezizomycotina. 1, S. America. See Petrak & Sydow (*Annls mycol.* **33**: 175, 1935).

Trichosphaera Dumort. (1822) nom. dub., Pezizomycotina. Used for diverse fungi with flask-like sporocarps in stromata.

Trichosphaerella E. Bommer, M. Rousseau & Sacc. (1891), Niessliaceae. Anamorph *Acremonium*-like. 2, Europe; Africa. See Samuels & Barr (*CJB* **75**: 2165, 1998), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Trichosphaeria Fuckel (1870), Trichosphaeriaceae. 27 (from wood and bark), widespread. See Réblová *et al.* (*Sydowia* **51**: 49, 1999), Réblová (*Mycol.* **98**: 68, 2006; phylogeny).

Trichosphaeriaceae G. Winter (1885), Trichosphaeriales. 11 gen. (+ 11 syn.), 65 spp.

Lit.: Seifert (*CJB* **65**: 2196, 1987), Réblová (*Mycotaxon* **70**: 387, 1999), Réblová (*Mycotaxon* **70**: 421, 1999), Réblová (*Mycotaxon* **71**: 45, 1999), Réblová *et al.* (*Sydowia* **51**: 49, 1999), Réblová *et al.* (*Sydowia* **51**: 49, 1999), Gams (*Stud. Mycol.* **45**: 192, 2000), Campbell & Shearer (*Mycol.* **96**: 822, 2004), Réblová & Seifert (*Mycol.* **96**: 343, 2004).

Trichosphaeriales M.E. Barr (1983). Sordariomycetes. 1 fam., 14 gen., 73 spp. Stromata absent, or reduced to a hyphal subiculum. Ascomata perithecial, superficial, often aggregated, ± globose, black, often thick-walled, usually setose, the ostiole papillate, periphysate. Interascal tissue of narrow persistent thin-walled true paraphyses. Asci cylindrical, persistent, thin-walled, not fissitunicate, often with a small J- apical ring. Ascospores variously shaped, hyaline to versicolored, usually septate and rarely muriform, sometimes with polar pores, sometimes fragmenting at the septa, without germ pores, sometimes with a sheath. Anamorphs varied, hyphomycetous, with simple pigmented conidiophores, often with tretic conidiogenesis and often with complex conidia. Saprobic esp. on wood and bark, occ. on other fungi, cosmop. Fam.:

Trichosphaeriaceae

For *Lit.* see under fam.

Trichosphaeropsis Bat. & Nascim. (1960), Pezizomycotina. 1, Brazil. See Batista & Nascimento (*Atas Inst. Micol. Univ. Recife* **1**: 299, 1960).

trichospore, a caducous, dehiscent, monosporous sporangium with basal appendages characteristic of the *Harpellales* (Moss & Lichtwardt, *CJB* **54**: 2346, 1976).

Trichosporiella Kamyschko (1960), anamorphic *Laetinaevia*, Hso.0eH.1/10. 4, widespread. See van Oorschot (*Stud. Mycol.* **20**, 1980), de Hoog *et al.* (*Antonie van Leeuwenhoek* **51**: 79, 1985).

Trichosporites Félix (1894), Fossil Fungi. 1 (Cretaceous), Sweden.

Trichosporodochium Dorn.-Silva & Dianese (2004), anamorphic *Pezizomycotina*. 1, Brazil. See Dornelo-Silva & Dianese (*Mycol.* **96**: 881, 2004).

Trichosporon Behrend (1890), anamorphic *Trichosporonaceae*. c. 20, widespread. *T. beigelii* (**white piedra** of man). See Herbrecht *et al.* (*J. Mycol. Médic.* **3**: 129, 1993; medical), de Hoog *et al.* (*Mycotaxon* **63**: 345, 1997; nomenclature), Müller *et al.* (*Microbiology* **144**: 1721, 1998; ultrastr.), Sugita *et al.* (*Mycoscience* **39**: 7, 1998; mol. phylogeny), Sugita *et al.* (*J. Clin. Microbiol.* **36**: 1458, 1998; PCR detection), Barnett *et al.* (*Yeasts: Characteristics and Identification* 3rd edn, 2000), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Zhao *et al.* (*Mycosystema* **21**: 533, 2002; 26S rDNA), Middelhoven (*Mycoses* **46**: 7, 2003; clinically relevant species), Biswas *et al.* (*Journal of Clinical Microbiology* **43**: 5171, 2005; phylogeny).

Trichosporonaceae Nann. (1934), Tremellales. 2 gen.

(+ 8 syn.), 21 spp.

Trichosporonales Boekhout & Fell (2001) = Tremellales.

Trichosporonoides Haskins & J.F.T. Spencer (1967), anamorphic *Tremellomycetes*. 6, widespread. See de Hoog (*Stud. Mycol.* **15**: 20, 1979; gen. revision), Ramırez (*Mycopathologia* **108**: 25, 1989; key), Inglis *et al.* (*Mycol.* **84**: 555, 1992), de Hoog & Smith *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 873, 1998).

Trichosporum Fr. (1825) nom. conf., nom. illeg., Ascomycota. See Hughes (*CJB* **36**: 727, 1958; nomencl.).

Trichosporum Vuill. (1901) [non *Trichosporum* D. Don 1822, *Gesneriaceae*] ? = Piedraia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Trichosterigma Petch (1923) [non *Trichosterigma* Klotzsch & Garcke 1859, *Euphorbiaceae*] = Hirsutella fide Petch (*TBMS* **9**: 93, 1923).

Trichostroma Corda (1829) nom. dub., anamorphic *Pezizomycotina*. See Hughes (*CJB* **36**: 747, 1958).

Trichostroma Link (1826) nom. dub., anamorphic *Pezizomycotina*. No spp. Included.

Trichothallaceae Bat. & Cif. (1959) = Euantennariaceae.

Trichothallus F. Stevens (1925), anamorphic *Trichopeltheca*, Cpt.-.-. 1, Hawaii. See Reynolds & Gilbert (*Aust. Syst. Bot.* **18**: 282, 2005).

Trichotheca P. Karst. (1887) ? = Bloxamia fide Sutton (*Mycol. Pap.* **141**, 1977).

trichothecenes, toxins (scirpenes) of *Fusarium tricinctum, F. sporotrichioides, F. poae, Trichothecium*, etc.; the cause of alimentary toxic aleukia in farm animals and humans. See Beasley (*Trichothecene mycotoxicosis*, 2 vols, 1991).

trichothecin, an antifungal metabolic product of *Trichothecium roseum* (Freeman & Morrison, *Biochem. J.* **44**: 1, 1949).

Trichotheciopsis J.M. Yen (1979) = Trichothecium fide Sutton (*in litt.*).

Trichothecium Link (1809), anamorphic *Hypocreales*, Hso.1eH.34. 5, widespread. *T. roseum* (pink rot of apples). See Park (*TBMS* **39**: 239, 1956; conidia), Rifai & Cooke (*TBMS* **49**: 147, 1966; status), Sesan (*Probl. Prot. Plant.* **13**: 381, 1985; bibliogr.), Seifert *et al.* (*Mycol.* **89**: 250, 1997; phylogeny).

Trichotheliaceae Bitter & F. Schill. (1927) = Porinaceae.

Trichotheliales Hafellner & Kalb (1995) = Ostropales.

Trichotheliomyces Cif. & Tomas. (1953) ≡ Trichothelium.

Trichothelium Müll. Arg. (1885), Porinaceae (L). 40, widespread (tropical). See Santesson (*Symb. bot. upsal.* **12** no. 1: 1, 1952), Vězda (*Nova Hedwigia* **58**: 123, 1995; key 4 spp.), McCarthy & Malcolm (*Lichenologist* **29**: 1, 1997), Lücking (*Nova Hedwigia* **66**: 375, 1998), McCarthy (*Lichenologist* **33**: 393, 2001; Christmas Island), McCarthy (*Biblthca Lichenol.* **87**, 2003), Grube *et al.* (*MR* **108**: 1111, 2004; phylogeny), Lücking (*Biblthca Lichenol.* **88**: 409, 2004; key), Lücking & Cáceres (*MR* **108**: 571, 2004; corticolous spp.), Baloch & Grube (*MR* **110**: 125, 2006; phylogeny).

Trichothyriaceae Theiss. (1914) = Microthyriaceae.

Trichothyriella Theiss. (1914), Microthyriaceae. 1, S.E. Asia. See Spooner & Kirk (*MR* **94**: 223, 1990).

Trichothyrina (Petr.) Petr. (1950) = Lichenopeltella fide Santesson (*SA* **9**: 15, 1991).

Trichothyrinula Petr. (1950), Microthyriaceae. 1, Ecuador. See Petrak (*Sydowia* **4**: 171, 1950).

Trichothyriomyces Bat. & H. Maia (1955), Microthyriaceae. 1, Brazil. See Spooner & Kirk (*MR* **94**: 223, 1990).

Trichothyriopsis Theiss. (1914), Microthyriaceae. 3 or 4, Indonesia; Brazil. See Spooner & Kirk (*MR* **94**: 223, 1990).

Trichothyrites Rosend. (1943), Fossil Fungi. 2 (Eocene, Pleistocene), British Isles; USA. See Smith (*The mushroom hunter's field guide* edn 3, 1980).

Trichothyrium Speg. (1889), Microthyriaceae. Anamorphs *Hansfordiella, Isthmospora*. 12, widespread (subtropical). See Hughes (*Mycol. Pap.* **50**, 1953), Spooner & Kirk (*MR* **94**: 223, 1990).

trichotomous, with three branches arising from the same point.

Trichotrema Clem. (1909) ? = Pleurotrema fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Trichotuzetia J. Vavra, J.I.R. Larsson & Baker (1997), Microsporidia. 1.

Trichozygospora Lichtw. (1972), Legeriomycetaceae. 1 (in *Diptera*), USA; Europe. See Moss & Lichtwardt (*CJB* **54**: 2346, 1976), Moss & Lichtwardt (*CJB* **55**: 3099, 1977; ultrastr.), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986).

Trichurus Clem. (1896), anamorphic *Microascaceae*, Hsy.0eP.19. 5, widespread (temperate). See Issakainen *et al.* (*Medical Mycology* **41**: 31, 2003; phylogeny).

Tricladiella K. Ando & Tubaki (1984), anamorphic *Pezizomycotina*, Hso.1bH.1. 1 (aquatic), Japan. See Ando & Tubaki (*TMSJ* **25**: 41, 1984).

Tricladiomyces Nawawi (1985), anamorphic *Agaricomycetes*. 1 (aquatic, dolipore septa), Malaysia. See Nawawi (*J. Linn. Soc.* Bot. **91**: 58, 1985), Nawawi & Kuthubutheen (*TBMS* **90**: 670, 1988).

Tricladiopsis Descals (1982), anamorphic *Pezizomycotina*, Hso.1bH.10. 2 (aquatic), British Isles. See Descals (*TBMS* **78**: 417, 1982).

Tricladiospora Nawawi & Kuthub. (1988), anamorphic *Pezizomycotina*, Hso.1bH.19. 3, Malaysia. See Nawawi & Kuthubutheen (*TBMS* **90**: 484, 1988).

Tricladium Ingold (1942), anamorphic *Hymenoscyphus, Cudoniella*, Hso.1bH.1/10. 10 (aquatic), widespread. See Petersen (*Mycol.* **54**: 135, 1962; key), Ando & Kawamoto (*TMSJ* **26**: 471, 1985), Marvanová & Bandoni (*TBMS* **85**: 747, 1985), Webster *et al.* (*Nova Hedwigia* **60**: 493, 1995; teleomorph), Baschien *et al.* (*Nova Hedwigia* **83**: 311, 2006; phylogeny).

Triclinum Fée (1825), Pannariaceae (L). 1, widespread (tropical). See Jørgensen (*Op. Bot.* **45**, 1978).

Tricornia Pell & E.U. Canning (1992), Microsporidia. 1.

Tricornispora Bonar (1967) = Tridentaria fide Kendrick (*in litt.*).

Tridens Massee (1901), ? Rhytismataceae. 1, N. America.

Tridentaria Preuss (1852), anamorphic *Pezizomycotina*, Hso.1bH.1. 2, widespread (temperate). See Drechsler (*J. Wash. Acad. Sci.* **27**: 391, 1937), van der Aa & Oorschot (*Persoonia* **12**: 415, 1985; redisposition spp.).

Trifurcospora K. Ando & Tubaki (1988), anamorphic *Pezizomycotina*, Hso.1bH.10. 1 (aquatic), Japan; USA. See Ando & Tubaki (*TMSJ* **28**: 471, 1987).

Triglyphium Fresen. (1852), anamorphic *Pezizomycotina*, Hso.1bH.?. 2, widespread. See Marvanová & Bärlocher (*Czech Mycol.* **53**: 1, 2001; Canada).
Trigonia J.F.H. Beyma (1933) [non *Trigonia* Aubl. 1775, *Trigoniaceae*] ≡ Triangularia.
Trigonipes Velen. (1939) = Clitocybe fide Singer (*Agaric. mod. Tax.* edn 3, 1975).
Trigonopsis Schachner (1929), anamorphic *Saccharomycetales*, Hso.0eH.?. 1, Europe. See Sentheshanmuganathan & Nickerson (*J. gen. Microbiol.* **27**: 437, 1962; nutrition, form), Yarrow *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 605, 1998), Kurtzman & Robnett (*FEMS Yeast Res.* **7**: 141, 2007).
Trigonosporium Tassi (1900), anamorphic *Pezizomycotina*, Cpd.0eP.?. 2, Australasia. See Sutton (*Mycol. Pap.* **123**, 1971).
Trihyphaecites Peppers (1970), Fossil Fungi. 1 (Carboniferous), USA.
Trihyphites Kalgutkar & Janson. (2000), Fossil Fungi, anamorphic *Ascomycota*. 1, China. See Kalgutkar & Jansonius (*AASP Contributions Series* **39**: 305, 2000).
trimerous, in threes.
trimitic, see hyphal analysis.
Trimitiella Dhingra (2006), Agaricomycetes. 1. See Dhingra (*Mycotaxon* **97**: 126, 2006).
Trimmatostroma Corda (1837), anamorphic *Helotiales*, Hsp.#eP.36. 18, widespread. See Ellis (*More Dematiaceous Hyphomycetes*, 1976), Zalar *et al.* (*Stud. Mycol.* **43**: 57, 1999), Hawksworth & Cole (*Fungal Diversity* **11**: 87, 2002), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Crous *et al.* (*Stud. Tripterosporaceae Cain (1956) = Lasiosphaeriaceae.
Tripterosporella Subram. & Lodha (1968), Lasiosphaeriaceae. 1 (coprophilous), India; Africa. See Subramanian & Lodha (*Curr. Sci.* **37**: 246, 1968).
triquetrous, three-edged, three-cornered.
Triramulispora Matsush. (1975), anamorphic *Pezizomycotina*, Hso.1bH.1. 3, Japan. See Matsushima (*Icon. microfung. Matsush. lect.*: 158, 1975).
Triscelophorus Ingold (1944), anamorphic *Pezizomycotina*, Hso.1bH.1. 4 (aquatic), widespread. See Petersen (*Mycol.* **54**: 162, 1962; key).
Triscelosporium Nawawi & Kuthub. (1987), anamorphic *Pezizomycotina*, Hso.0bP.2. 1 (aero-aquatic), Malaysia. See Nawawi & Kuthubutheen (*Mycotaxon* **29**: 285, 1987).
trisporic acid C, a hydroxy-keto acid from mated cultures of *Blakeslea trispora* able to induce caro-

tenogenesis in separate strains (Caglioti *et al.*, *Chimica Industria* **46**: 961, 1964).

tristichous, in three rows.

Trisulcosporium H.J. Huds. & B. Sutton (1964), anamorphic *Pezizomycotina*, Hso.1bH.1. 1 (aquatic), British Isles. See Hudson & Sutton (*TBMS* **47**: 200, 1964).

Tritirachium Limber (1940), anamorphic *Pezizomycotina*, Hso.0eH.10. 3 (some on humans), widespread. See MacLeod (*CJB* **32**: 818, 1954), de Hoog (*Stud. Mycol.* **1**, 1972; 2 spp. accepted).

trivial name (1) the zoological term for specific epithet; (2) a common name for a chemical, see Fungal metabolites.

Trochila Fr. (1849), Helotiales. Anamorph *Cryptocline*. *c.* 15, widespread (temperate). See Greenhalgh & Jones (*TBMS* **47**: 311, 1964), Nauta & Spooner (*Mycologist* **14**: 65, 2000; key British spp.).

Trochodium Syd. & P. Syd. (1920) = Uromyces fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Trochoideomyces Thaxt. (1931), Laboulbeniaceae. 1, Indonesia. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

Trochophora R.T. Moore (1955), anamorphic *Pezizomycotina*, Hso.0-≡ hP.10. 1, India; S.E. Asia. See Goos (*Mycol.* **78**: 744, 1986).

Trogia Fr. (1836), Marasmiaceae. *c.* 20, widespread (tropical). See Corner (*Monogr. Cantharelloid Fungi*, 1966), Corner (*Gdns' Bull.* Singapore, Suppl. 2, 1991; Asian species, very broad generic concept), Wilson & Desjardin (*Mycol.* **97**: 667, 2005; polyphyletic, sister group to marasmioid clade).

Troglobiomyces Pacioni (1980) = Hirsutella fide Samson *et al.* (*Persoonia* **12**: 123, 1984).

troglobiotic, living in caves.

Troglomyces S. Colla (1932), Laboulbeniaceae. 1, Europe. See Rossi & Balazuc (*Revue Mycol.* Parıs **41**: 525, 1977), Tavares (*Mycol. Mem.* **9**: 627 pp., 1985).

troll, a goblin or dwarf in Scandinavian mythology, said to carry off naughty children; dolls were traditionally made of *Alectoria*, *Bryoria* and *Usnea* spp. and given to children to remind them to behave.

Trolliomyces Ulbr. (1938) ≡ Teloconia.

Trombetta Adans. (1763) nom. rej. ≡ Craterellus.

Tromera A. Massal. ex Körb. (1865) = Sarea fide Hawksworth & Sherwood (*CJB* **59**: 357, 1981).

Tromera, see *Tromera A. Massal. ex Körb.*

Tromeropsis Sherwood (1981), Pezizomycotina. 1, Finland. See Sherwood (*CJB* **59**: 370, 1981).

troop, a group of sporocarps (esp. basidiomata), generally from one mycelium.

trophocyst (of *Pilobolus*), a hyphal swelling from which a sporangiophore is produced.

trophogonium (trophogone) (of ascomycetes), an antheridium of which the only use is supplying food (Dangeard).

Tropism (frequently as a suffix). A turning or growth in response to an environmental stimulus. The response is dependent on the direction of the stimulus and can be + (positive) when towards or – (negative) when away from the stimulus. Among the more important tropisms seen in fungi are:

(1) **autotropism**, an avoidance (–) response between neighbouring hyphae which in part is responsible for the spacing of hyphae at the colony margin (Trınci, *in* Jennings & Rayner (Eds), *The ecology and physiology of the fungal mycelium*: 23, 1984).

(2) **chemotropism**, a reaction to a chemical, e.g. oxygen (Robinson, *New Phytologist* **72**: 1349, 1973), a hormone (Banbury, *J. Exper. Bot.* **6**: 235, 1975) or (in the case of water moulds but not other fungi), nutrients (Musgrove *et al.*, *J. Gen. Microbiol.* **101**: 65, 1977) or toxic metals (Fomina *et al.*, *MR* **107**: 861, 2003). *Microdochium bolleyi* exhibited tropism toward oxygen released from roots or air-filled tubes in an anoxic environment (Damm *et al.*, *FEMS Microbiology Ecology* **45**: 293, 2003); *Trichophyton rubrum* reacts positively to oxygen (Behzadi & Behzadi, *Turkiye Klinikleri J. Med. Sci.* **26**: 607, 2006); the dry rot fungus, *Serpula lacrymans*, however has linear tropism away from the air supply, and applying a controlled air flow results in mycelium shrivelling, discolouring and becoming susceptible to attack by moulds (Low *et al.*, *Holzforschung* **53**: 129, 1999). Species of *Aphanomyces*, *Phytophthora*, *Pythium* and the nematode-trapping fungus *Arthrobotrys oligospora* are characterized by positive chemotropism to root diffusates due to receptor-based recognition systems (Deacon, *New Phytologist* **133**: 135, 1996; Bordallo *et al.*, *New Phytologist* **154**: 491, 2002). Chemotropism observed in arbuscular mycorrhizal fungi may represent an important mechanism functional to host root location, appressorium formation and symbiosis establishment (Sbrana & Giovannetti, *Mycorrhiza* **15**: 539, 2005). Toxic metals stimulate negative tropism. Hyphae of *Geotrichum candidum*, *Gliocladium roseum*, *Humicola grisea* and *Trichoderma viride* curl and grow away from Cu and Cd (Fomina *et al.*, *FEMS Microbiol. Lett.* **193**: 207, 2000).

(3) **galvanotropism**, a reaction to an electrical field (McGillivray & Gow, *J. Gen. Microbiol.* **132**: 2515, 1986).

(4) **geotropism (gravitropism)**, a reaction to gravity, e.g. sporangiophores of *Mucorales* and stipes, gills and tubes of fruit bodies of *Basidiomycota* (Moore, *New Phytol.* **117**: 3, 1991). A mathematical model for gravitropic reactions of fruit bodies has been made for *Coprinus cinereus*, with potential as a predictive tool for further analysis of mushroom gravitropism (Meskauskas*et al.*, *New Phytologist* **143**: 387, 1999).

(5) **phototropism**, a reaction of conidiophores, sporangiophores, asci, stipes etc. to light (Bergman *et al.*, *Bact. Rev.* **33**: 99, 1969; Carlile, *J. gen. Microbiol.* **28**: 161, 1962; Shropshire, *Physiological Reviews* **43**: 38, 1963). Classical examples are fungi of the genera *Phycomyces* and *Pilobolus* which have spore-bearing structures showing a phototropic response, bending towards a light source to facilitate dispersal. *Trichophyton rubrum* exhibits negative tropism to ultraviolet light (Behzadi & Behzadi, *Turkiye Klinikleri J. Med. Sci.* **26**: 607, 2006).

(6) **thigmotropism**, a reaction of germ tubes and hyphae to plant and other sufaces (Dickson, *Phytopath. Z.* **66**: 38, 1969; Kwon & Hoch, *Exp. Mycol.* **15**: 116, 1991). Almost all rust fungi show topographical sensing of stomata location by uredospore germ tubes and respond by producing an appressorium. Rust fungi respond to different surface microheights, reflecting adaptations to different host plants: the elevation of stomatal guard cells may provide the signal for production of an appressorium (Allen *et al.*, *Phytopathology* **81**: 323, 1991). Surface topography provides

signals for growth orientation in *Uromyces appendiculatus* (Hoch *et al.*, *Science* **235**: 1659, 1987). Tests with this fungus on silicon wafers demonstrated that germ tubes produce appressoria in the presence of a ridge/groove of about 0.5 µm high, and heights above 1 µm elicit no fungal response (Kwon & Hoch, 1991). Germ tubes of *Puccinia graminis* grow perpendicular to the rows of wheat leaf cells or even to an inert replica of a wheat leaf (Read *et al.*, *Perspectives in Plant Cell Recognition* pp. 137-172, 1992). Germ tube thigmotropism, induction and formation of appressoria following topographic signals have been observed for *Cochliobolus sativus* on artificial replicas of barley leaf surfaces (Clay *et al.*, *Protoplasma* **178**: 1615, 1994).
(6) **ecotropism**, a reaction to a particular ecological niche (close to **chemotropism** and **host specificity**, see **gene for gene, phytoalexin, axeny**). Dermatophytes (such as *Microsporum* spp. or *Trichophyton* spp.) exhibit tropism in the presence of cutaneous adnexa such as skin, nails or hair (Martino *et al.*, *Proceedings of the 8th Congress of the World Rabbit Science Association* Mexico, 576, 2004); *Paracoccidioides brasiliensis* exhibits tropism to lymphoid tissues (Brummer *et al.*, *Clin. Microbiol. Rev.* **6**: 89, 1993); germinating spores of *Verticillium biguttatum* show tropism towards the host-fungus hyphae of *Rhizoctonia solani*, leading to invasion and production of haustoria within the living host hypha (Boogert & Deacon, *Eur. J. Plant Path.* **100**: 137, 1994).
(7) **radiotropism**, the reaction of germ tubes and hyphae to a source of ionizing radiation (Zhdanova *et al.*, *MR* **108**: 1089, 2004). Free-living and mycorrhizal fungi can colonize depleted uranium and transform it into uranyl phosphate (Fomina *et al.*, *Curr. Biol.* **18**: 375, 2007). Some microfungi can grow into and decompose radioactive graphite and direct their growth toward sources of radioactivity. This response was studied for 2000 strains of 200 species of 98 genera of soil microfungi, most of which expressed positive tropism towards sources of beta and gamma radiation (See also Radiation and fungi).

Lit.: Carlile (*Ann. Rev. Plant Phys.* **16**: 175, 1965); Deacon (*Modern Mycology*, edn 3, 303 pp., 1997); Moore (*Int. J. Medicinal Mushrooms* **7**: 79, 2005).

Troposporella P. Karst. (1892), anamorphic *Pezizomycotina*, Hsp.0-≡ hP.1. 2, widespread (north temperate). See Sutton (*Mycol. Pap.* **132**, 1973).

Troposporium Harkn. (1884), anamorphic *Pezizomycotina*, Hsp.0-≡ hH.1. 1, N. America. See Peek & Solheim (*Mycol.* **50**: 847, 1959).

Troposporopsis S.R. Whitton, McKenzie & K.D. Hyde (1999), anamorphic *Pezizomycotina*. 2, widespread. See Whitton *et al.* (*Fungal Diversity* **3**: 174, 1999).

Trotteria Sacc. (1919) = Actinopeltis fide Sutton (*Mycol. Pap.* **141**, 1977).

Trotterula Speg. (1921) = Chaetothyrium fide Petrak & Sydow (*Annls mycol.* **32**: 6, 1934), Hughes (*Mycol.* **68**: 693, 1976).

TRTC, Cryptogamic Herbarium, Royal Ontario Museum (Toronto, Canada); founded 1887; transferred from the University of Toronto to the Museum in 1992.

Truffle. An ascoma, generally subterranean, of *Tuber* or other *Pezizales* or *Elaphomycetales* (see below), or a basidioma of *Hymenogastrales*; over 180 truffle-forming spp. are known. **Burgundy -**, *Tuber uncinatum*; **desert -**, *Mattirolomyces*, *Terfezia* and *Tirmania*; **false -**, *Hymenogaster*; **hart's -**, *Elaphomyces*; **Périgord (French) -**, *T. melanosporum*; **red -**, *Melanogaster variegatus*; **summer-**, *T. aestivum* (the best British sp.); **white-**, *Choiromyces meandriformis*; **white Piedmont -**, *T. magnatum*; **white winter -**, *T. hiemalbum*; **winter -**, *T. brumale*; **yellow -**, *Mattirolomyces*, *Terfezia* and *Tirmania*.

Growth of many truffles is best in well-drained, calcareous soils, and there is, probably always, an association between truffles and the roots of certain trees, esp. oaks (*Quercus petraea*, *Q. robur*, and the evergreen *Q. ilex* and *Q. coccifera*, among others) or, for desert-truffles, *Cistus* or *Helianthemum*. The position of the truffles is sometimes given by cracks in the soil, by the 'scorched' look of the plants over the truffles, by the look of the 'truffle trees', or by noting the habitat of the truffle fly, *Anistoma cinnamomea*; but they are generally looked for with the help of trained dogs or pigs. The ascomata themselves can be regarded as a complex ecosystem in that they frequently host mycelium of other fungi (Pacioni *et al.*, *MR* **111**: 1450, 2007).

For over one hundred years truffle culture has been undertaken in France where 'truffières' have been started by planting oak trees in good places, by inoculating the soil with soil from under truffle trees or with truffle tissue, and (the best method) by planting young trees taken from soil in which the truffle fungus is present. Truffles are first produced under such trees after 7 to 15 years; then generally for 20 to 30 or more years. In the south of France and Italy the crop is taken from December to March. Over the last about twenty years truffle culture technology has improved and some successful truffle plantations have been established well outside the natural range of these fungi, for example in Australia and New Zealand. There is also, however, concern about competition from exotic truffles, e.g. *Tuber indicum* from China. In addition to their use as food, truffles have been used in liqueur making, for scenting tobacco, and in certain perfumes; the widespread belief that some may be aphrodisiacs, together with their culinary value, high cost, strange ecology, and association in the public eye with chocolate products has resulted in them enjoying a mystique and a positive image almost unique among fungi, making them ideal as charismatic species for the conservation movement.

See Malençon (*Rev. Myc.* n.s. 3(Mém. hors sér.), **1**, 1938, *Persoonia* **7**: 261, 1973), Kaltenbach (*Int. Rev. Agric.* **26**: 267T, 1935), Singer (*Mushrooms and truffles*, 1961), Chang & Hayes (Eds) (*Biology and cultivation of edible mushrooms*, 1978), Torini (*Jl Tartufo e la sua coltivazione*, 1984; cultivation), Bokhary (*Arab Gulf J. scient. Res., agric. biol. sci.* **B5**: 245, 1987; desert truffles).

The ascomycete truffles were formerly placed in a special order, the *Tuberales*, characterized by fleshy to leathery, ± globose ascomata with the hymenium lining a single or complex series of locules. They are now believed to be the result of the convergent evolution of various discomycete lines and are mainly referred to the *Pezizales* by Trappe (*Mycotaxon* **9**: 247, 1979) except for the isolated *Elaphomycetales* (for *Elaphomyces* only).

Trypetheliomyces Cif. & Tomas. (1953) = Trypethelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Trypetheliopsis Asahina (1937), Monoblastiaceae (L). 6, widespread (tropical). fide Lücking & Sérusiaux (*Nordic Jl Bot.* **16**: 661, 1996), Aptroot *et al.* (*Biblthca Lichenol.* **64**, 1997), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Trypethelium Spreng. (1804) nom. cons., Trypetheliaceae (L). *c.* 50, widespread (esp. tropical). See Lambright & Tucker (*Bryologist* **83**: 170, 1980; ultrastr., biology), Harris (*Acta Amazon.* Supl. **14**: 55, 1984; key 11 spp. Amazonia), Makhija & Patwardhan (*J. Hattori bot. Lab.* **73**: 183, 1993; key 30 spp. India), Prado *et al* (*MR* **110**: 511, 2006; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Tryssglobulus B. Sutton & Pascoe (1987), anamorphic *Pezizomycotina*, Hso.0eP.16. 1, Australia. See Sutton & Pascoe (*TBMS* **88**: 44, 1987).

Tsuchiyaea Y. Yamada, H. Kawas., Itoh, I. Banno & Nakase (1988), anamorphic *Tremellaceae*, Hso.0eH.1. 1, S. Africa. See Yamada *et al.* (*Agric. Biol. Chem.* **53**: 2993, 1989; phylogeny), Yamada & Banno (*The Yeasts, A Taxonomic Study*: 878, 1998).

Tubaki (Keisuke; 1924-2005; Japan). Student, Tokyo University of Agriculture (1948); DSc, Hiroshima University (1959); Institute for Fermentation, Osaka (1961-1976), becoming Deputy Director (1974); Professor, Institute of Biological Sciences, University of Tsukuba (1976-1988). An expert on hyphomycetes, particularly their systematics and role in nature. He, like Barron, contributed to the classification system for anamorphic fungi initiated by Hughes (see Conidiogenesis), which became known as the Hughes-Tubaki-Barron system. Author of over 200 papers and an outstanding ambassador of Japanese mycology. President, Mycological Society of Japan (1985-1987), Chairman of the IMA Committee for Asia (q.v.) (1983-1990), and General Secretary of the 3rd International Mycological Congress (q.v.). *Publs*. Studies on Japanese hyphomycetes. *J. Hattori Bot. Lab.* **20**: 142, 1958. *Biogs, obits etc.* Bandoni (*Mycoscience* **46**: 381, 2005).

Tubakia B. Sutton (1973), anamorphic *Dicarpella*, Cpt.0eH/1eH.15. 5, widespread (north temperate). See Limber & Cash (*Mycol.* **37**: 129, 1945), Yokoyama & Tubaki (*Res. Commun.* Inst. Ferm., Osaka **5**: 43, 1971), Glawe & Crane (*Mycotaxon* **29**: 101, 1987; *T. dryina* revised), Belisario (*Inftore fitopatol.* **40**: 54, 1990; disease caused by *T. dryina*), Belisario (*Mycotaxon* **41**: 147, 1991; teleomorph), Munkvold & Neely (*CJB* **69**: 1865, 1991; development of *T. dryina* in host tissue).

Tubaria (W.G. Sm.) Gillet (1876), Inocybaceae. *c.* 20, widespread (temperate). See Romagnesi (*Revue Mycol.* Paris **5**: 29, 1940), Romagnesi (*Revue Mycol.* Paris **8**: 26, 1943), Volders (*Sterbeeckia* **21-22**: 3, 2002; Belgium spp.), Horak & Moreau (*BSMF* **120**: 215, 2004; France spp.).

Tubariella E. Horak & Hauskn. (2002), Bolbitiaceae. 1, Papua New Guinea. See Horak & Hausknecht (*Öst. Z. Pilzk.* **11**: 213, 2002).

Tubariopsis R. Heim (1931), Bolbitiaceae. 1, Madagascar. See Heim (*Inocybe*: 62, 1931).

Tuber P. Micheli ex F.H. Wigg. (1780), Tuberaceae. 86 (hypogeous), widespread. See truffles. See Gross (*Z. Pilzk.* **41**: 143, 1975; key 13 spp.), Parguey-Leduc & Janex-Favre (*Revue Mycol.* Paris **41**: 1, 1977; ontogeny), Janex-Favre & Parguey-Leduc (*Cryptog. Mycol.* **4**: 353, 1984; spore ultrastr.), Mostecchi & Lazzari (*Boll. Gruppo Micol. 'G. Bresadola'* **27**: 196, 1984; col. pls), Parguey-Leduc *et al.* (*C.R. Acad. Sci. Paris* Sér. III **301**: 143, 1985; ontogeny), Parguey-Leduc *et al.* (*Cryptog. Mycol.* **8**: 173, 1987; ascoma), Parguey-Leduc *et al.* (*CJB* **65**: 1491, 1987; ascospores), Parguey-Leduc *et al.* (*BSMF* **105**: 227, 1989; ascoma ontogeny), Gross (*Docums Mycol.* **21**: 1, 1991; key 30 spp., Europe), Parguey-Leduc *et al.* (*Cryptog. Mycol.* **12**: 165, 1991; ontogeny), Pegler *et al.* (*British truffles*, 1993; key 11 Br. spp.), Trappe *et al.* (*Mycotaxon* **60**: 365, 1996), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Amicucci *et al.* (*Mol. Ecol.* **7**: 273, 1998; ITS primers), Mello *et al.* (*New Phytol.* **141**: 511, 1999; primers), Neuner-Plattner *et al.* (*MR* **103**: *403, 1999; immunology)*, Percudani *et al.* (*Mol. Phylogen. Evol.* **13**: 169, 1999; phylogeny), Roux *et al.* (*FEMS Microbiol. Lett.* **180**: 147, 1999; ITS), Amicucci *et al.* (*FEMS Microbiol. Lett.* **189**: 265, 2000; molecular identification), Giomaro *et al.* (*Mycorrhiza* **10**: 107, 2000; mycorrhizas), Frizzi *et al.* (*MR* **105**: 365, 2001; isozymes), Mello *et al.* (*Microbiol. Res.* **155**: 279, 2001), Murat *et al.* (*New Phytol.* **164**: 401, 2004; evolution), Paolocci *et al.* (*FEMS Microbiol. Lett.* **235**: 109, 2004), Patil *et al.* (*Journal of Mycology and Plant Pathology* **34**: 778, 2004; phylogeography), Urban *et al.* (*MR* **108**: 749, 2004; anamorph), Mello *et al.* (*Environmental Microbiology* **7**: 55, 2005; genetic diversity), Zhang *et al.* (*FEMS Microbiol. Lett.* **245**: 85, 2005; phylogeny), Baciarelli-Falini *et al.* (*Mycorrhiza* **16**: 475, 2006; novel morphotypes), Bertini *et al.* (*Microbiol. Res.* **161**: 59, 2006; molecular detection), Chen *et al.* (*Mycotaxon* **94**: 1, 2005; key), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Paolocci *et al.* (*Appl. Environm. Microbiol.* **72**: 2390, 2006; life cycle), Suz *et al.* (*FEMS Microbiol. Lett.* **254**: 251, 2005; molecular detection), Tedersoo *et al.* (*New Phytol.* **170**: 581, 2006; mycorrhizas), Wang *et al.* (*MR* **110**: 1034, 2006; phylogeny), Chen & Liu (*Mycol.* **99**: 475, 2007; China), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Tuberaceae Dumort. (1822), Pezizales. 7 gen. (+ 13 syn.), 111 spp.

Lit.: Beaton & Malajczuk (*TBMS* **86**: 503, 1986), Trappe *et al.* (*Aust. Syst. Bot.* **5**: 597, 1992), Pegler *et al.* (*British truffles*, 1993), Comandini & Pacioni (*Mycotaxon* **63**: 77, 1997), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Amicucci *et al.* (*Mol. Ecol.* **7**: 273, 1998), Bertini *et al.* (*New Phytol.* **139**: 565, 1998), Harrington *et al.* (*Mycol.* **91**: 41, 1999), Mello *et al.* (*New Phytol.* **141**: 511, 1999), Percudani *et al.* (*Mol. Phylogen. Evol.* **13**: 169, 1999; phylogeny), Roux *et al.* (*FEMS Microbiol. Lett.* **180**: 147, 1999), Amicucci *et al.* (*FEMS Microbiol. Lett.* **189**: 265, 2000), Mello *et al.* (*Mycol.* **92**: 326, 2000), Zambonelli *et al.* (*Mycotaxon* **74**: 57, 2000), Iotti *et al.* (*New Phytol.* **155**: 499, 2002), Mello *et al.* (*Envir. Microbiol.* **4**: 584, 2002), Mabru *et al.* (*Int. J. Food Microbiol.* **94**: 33, 2004), Paolocci *et al.* (*FEMS Microbiol. Lett.* **235**: 109, 2004), Urban *et al.* (*MR* **108**: 749, 2004), Halász *et al.* (*Mycol. Progr.* **4**: 281, 2005), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny), Læssøe & Hansen (*MR* **111**: 1075, 2007; phylogeny).

Tuberales G. Winter (1884) = Pezizales. See also *Elaphomycetaceae* and truffles.

Tuberaster Boccone (1697) ≡ Polyporus P. Micheli ex Adans.

Tubercolarites Barsanti (1903), Fossil Fungi, anamorphic *Pezizomycotina*. 1 (Carboniferous), Italy.

Tubercularia Weber ex F.H. Wigg. (1780) nom. rej. prop. = Dibaeis fide Gierl & Kalb (*Herzogia* **9**: 593, 1993).

Tubercularia Tode (1790) nom. cons., anamorphic *Nectria*, Hsp.0eH.15. 26, widespread. See Seifert (*Stud. Mycol.* **27**: 95, 1985), Wang *et al.* (*FEMS Microbiol. Lett.* **193**: 249, 2000; taxol production), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny).

Tuberculariaceae Fr. (1825) = Nectriaceae. (obsol.). Anamorphic fungi (hyphomycetes) with conidiomata.

Tuberculariella Höhn. (1915) = Cryptosporiopsis fide Petrak (*Sydowia* **19**: *227, 1966)*.

Tuberculariopsis Höhn. (1909), anamorphic *Pezizomycotina*, Hsp.0eH.10. 1, Java.

Tubercularis Clem. & Shear (1931) ≡ Tuberculariopsis.

Tubercularites Arcang. (1903), Fossil Fungi. 1 (Carboniferous), Italy.

tuberculate solarium, see solarium.

tubercule (tubercle), a small wart-like process; **tuberculate**, having tubercles, syn. of punctate (Fig. 20.5);.

Tuberculina Tode ex Sacc. (1880), anamorphic *Helicobasidium*, Hsp.0eH.15. *c.* 10 (on rusts), widespread. See Bauer *et al.* (*Mycol.* **96**: 960, 2004), Lutz *et al.* (*Mycol.* **96**: 1316, 2004), Lutz *et al.* (*MR* **108**: 227, 2004).

Tuberculinia Velen. (1922) nom. nud., Agaricomycetidae. See Stalpers (*in litt.*).

Tuberculis Clem. & Shear (1931) ≡ Tuberculariella.

Tuberculispora Deighton & Piroz. (1972), anamorphic *Pezizomycotina*, Hso.1bH.15. 1 (on *Irenopsis*), Jamaica. See Deighton & Pirozynski (*Mycol. Pap.* **128**: 92, 1972).

Tuberculopsis Sacc. (1914) nom. nud., Fungi. See Saccardo (*Annls mycol.* **12**: 303, 1914).

Tuberculostoma Sollm. (1864) = Robergea fide Sherwood (*Mycotaxon* **6**: 215, 1977).

Tuberium Raf. (1815) ≡ Tuber.

Tuberosurculus Paulet (1791) nom. dub., Pezizomycotina. Used for diverse taxa, incl. *Clavicipitaceae* and *Xylariaceae*.

Tubeufia Penz. & Sacc. (1898), Tubeufiaceae. Anamorphs *Helicoma*, *Helicosporium*, *Monodictys*-like. 29, widespread (esp. tropical). See Rossman (*Mycol. Pap.* **157**, 1987; key *Tubeufia* s.l.), Crane *et al.* (*CJB* **76**: 602, 1998), Kodsueb *et al.* (*Mycol.* **96**: 667, 2004; Hong Kong), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Tsui *et al.* (*Mycol.* **98**: 94, 2006; phylogeny), Tsui *et al.* (*Mycol.* **99**: 884, 2007; phylogeny, anamorph).

Tubeufiaceae M.E. Barr (1979), Dothideomycetes (inc. sed.). 32 gen. (+ 17 syn.), 241 spp.

Lit.: Barr (*Mycotaxon* **12**: 137, 1980), Goos (*Mycol.* **78**: 744, 1986), Goos (*Mycol.* **79**: 1, 1987), Rossman (*Mycol. Pap.* **157**, 1987; key gen.), Rossman (*Mycol. Pap.* **157**: 71 pp., 1987), Goos

(*Mycol.* **81**: 356, 1989), Scheuer (*MR* **95**: 811, 1991), Rodrigues & Samuels (*Mycol.* **86**: 254, 1994), Untereiner *et al.* (*MR* **99**: 897, 1995), Crane *et al.* (*CJB* **76**: 602, 1998; saprobic gen.), Inderbitzin *et al.* (*Am. J. Bot.* **88**: 54, 2001), Lumbsch & Lindemuth (*MR* **105**: 901, 2001), Kodsueb *et al.* (*Mycol.* **96**: 667, 2004), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny), Tsui *et al.* (*Mycol.* **98**: 94, 2006).

Tubipeda Falck (1923) ≡ Leptopodia.

Tubiporus P. Karst. (1881) ≡ Boletus Fr.

Tubolachnum Velen. (1934), ? Helotiales. 2, former Czechoslovakia.

Tubosaeta E. Horak (1967), Boletaceae. 5, Africa (tropical), Asia. See Horak (*Ber. schweiz. bot. Ges.* **77**: 367, 1967), Zang (*Mycosystema* **20**: 8, 2001; China).

Tubulicium Oberw. (1965), Hydnodontaceae. 7, widespread. See Oberwinkler (*Sydowia* **19**: 53, 1965), Hjortstam (*Windahlia* **24**: 1, 1998), Dämon & Hausknecht (*Öst. Z. Pilzk.* **12**: 129, 2003; on tree ferns in Europe).

Tubulicrinaceae Jülich (1982) Schizoporaceae.

Tubulicrinis Donk (1956), Tubulicrinaceae. 31, widespread. See Weresub (*CJB* **39**: 1456, 1961), Hayashi (*Bull. Govt For. Exp. Stn* **260**, 1974), Hjortstam (*Windahlia* **24**: 1, 1998).

Tubulicrinopsis Hjortstam & Kotir. (2007), Agaricomycetes. 4, Europe. See Kotiranta, H.; Hjortstam, K.; Miettinen, O.; Kulju, M. (*Ann. bot. fenn.* **44**: 128, 2007).

Tubulinosema C. Franzen, S. Fischer, J. Schroeder, J. Schölmerich & S. Schneuwly (2005), Microsporidia. 3. See Franzen *et al.* (*J. Eukary. Microbiol.* **52**: 141, 2005).

Tubulixenasma Parmasto (1965) ≡ Tubulicium.

Tuburcinia Fr. (1832) [non *Tuburcinia* Woronin 1882] nom. rej. ≡ Urocystis.

Tuburcinia Woronin (1882) = Urocystis fide Vánky (*Europ. Smut Fungi*: 280, 1994).

Tuburciniella Zambett. (1970) = Urocystis fide Vánky (*in litt.*) Anamorph name only.

Tucahus Raf. (1830) ≡ Gemmularia.

tuckahoe (or Indian bread), the sclerotia (*Pachyma cocos*) of *Poria cocos* (Weber, *Mycol.* **21**: 113, 1929), USA. **Canadian -**, see stone-fungus.

Tuckerman (Edward; 1817-1886; USA). Student, Union College, Schenectady, New York (1834-1837), then Harvard University (1837-1840); visited Europe (1841-1842) [greatly influenced by E.M. Fries (q.v.)]; Curator of collections, Union College, Schenectady (1843-1844); Professor of Oriental History (1855) and Professor of Botany (1858-1886), Harvard University. Father of American lichenology. *Publs. Genera Lichenum* (1872); *Synopsis of the North American Lichens* 2 vols (1882, 1888). *Biogs, obits etc.* Culberson (*Collected Lichenological Papers of Edward Tuckerman* 2 vols, 1964); Grummann (1974: 197); Reid (*Mycotaxon* **26**: 3, 1986); Stafleu & Cowan (*TL-2* **6**: 523, 1986).

Tuckermanella Essl. (2003), Parmeliaceae (L). 6, Mexico; USA. See Esslinger (*Mycotaxon* **85**: 135, 2003), Thell *et al.* (*Mycol. Progr.* **4**: 303, 2005).

Tuckermanopsis Gyeln. (1933), Parmeliaceae (L). *c.* 28, widespread. See Kärnefelt *et al.* (*Pl. Syst. Evol.* **183**: 113, 1992), Kärnefelt *et al.* (*Bryologist* **96**: 394, 1993), Thell (*Folia Cryptog. Estonica* **32**: 113, 1998), Kärnefelt & Thell (*Biblthca Lichenol.* **78**: 193, 2001), Thell *et al.* (*Mycol. Progr.* **1**: 335, 2002; phylogeny), Thell *et al.* (*Symb. bot. upsal.* **34** no. 1: 429, 2004; Scandinavia), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny).

Tuckneraria Randlane & A. Thell (1994), Parmeliaceae (L). 5, Asia. See Ando (*TMSJ* **33**: 223, 1992; phylogeny), Randlane *et al.* (*Acta Bot. Fenn.* **150**: 144, 1994), Thell *et al.* (*J. Hattori bot. Lab.* **78**: 237, 1995).

Tulasne (Charles, 1816-1884; France). Student of medicine, Paris (1840); practising doctor (1840-1865); retired to Hyères (1865-1884). Collaborated with his brother, L.R. Tulasne (q.v.), particularly by illustrating their joint major works; these illustrations set a standard rarely matched by later mycologists. *Publs.* (with L.R. Tulasne) *Selecta Fungorum Carpologia* 3 vols (1861-1865) [English translation Grove, 1931; biographical notes in vol. 1]. *Biogs, obits etc.* Stafleu & Cowan (*TL-2* **6**: 529, 1986).

Tulasne (Louis René, 1815-1885; France). Student of law; public notary (1835-1839); private scientists, Paris (1839-1865); Research Associate, Muséum d'Histoire Naturelle, Paris (1842-1865); retired to Hyères (1865-1885). The 'reconstructor of mycology'; in more than 50 papers he made additions to the knowledge of ergots, lichen-forming fungi, pyrenomycetes, rusts, smuts and subterranean fungi; some work with brother C. Tulasne (q.v.) who prepared the illustrations (their joint works explicitly promoted their respect for a divine creator); an important new concept introduced in the *Selecta Fungorum Carpologia*, a work which has had a great effect on mycology, was that of pleomorphism in fungi. *Publs. Fungi Hypogaei. Histoire et Monographie des Champignons Hypogés* (1851); Mémoire pour servir à l'histoire organographique et physiologique des lichens. *Annales des Sciences Naturelles* Botanique, Série 3 (1852); (with C. Tulasne) *Selecta Fungorum Carpologia* 3 vols (1861-1865) [English translation Grove, 1931; biographical notes in vol. 1]. *Biogs, obits etc.* Stafleu & Cowan (*TL-2* **6**: 530, 1986).

Tulasneinia Zobel ex Corda (1854) ≡ Terfezia.

Tulasnella J. Schröt. (1888), Tulasnellaceae. Anamorph *Epulorhiza*. *c.* 50, widespread. See Jülich & Jülich (*Persoonia* **9**: 49, 1976), Currah & Zelmer (*Rep. Tottori mycol. Inst.* **30**: 43, 1992; 6 spp. with orchids), Roberts (*MR* **98**: 1431, 1994; key Eur. spp.).

Tulasnellaceae Juel (1897), Cantharellales. 3 gen. (+ 4 syn.), 54 spp.

Lit.: Roberts (*MR* **98**: 1235, 1994), Stalpers & Andersen *in* Sneh *et al.* (Eds) (*Rhizoctonia Species* Taxonomy, Molecular Biology, Ecology, Pathology and Disease Control: 58, 1996), Ginns (*Mycol.* **90**: 19, 1998), Greslebin & Rajchenberg (*MR* **105**: 1149, 2001), Gleason & McGee (*Australasian Mycologist* **21**: 12, 2002), Kottke *et al.* (*MR* **107**: 957, 2003), Ma *et al.* (*MR* **107**: 1041, 2003), Kristiansen *et al.* (*Mol. Phylogen. Evol.* **33**: 251, 2004), Larsson *et al.* (*MR* **108**: 983, 2004), McCormick *et al.* (*New Phytol.* **163**: 425, 2004).

Tulasnellales Gäum. (1926) = Cantharellales.

Tulasnia Lesp. [not traced] = Terfezia fide Saccardo (*Syll. fung.* **8**: 902, 1889).

Tulasnodea Fr. (1849) ≡ Tulostoma.

Tulostoma Pers. (1794), Agaricaceae. *c.* 80, widespread (esp. dry regions). See Long (*Mycol.* **36**: 320, 1944; orthogr.), Wright (*Pap. Mich. Acad. Sci.* **40**:

79, 1955; sp. characters), Maas Geesteranus (*Gorteria* **5**: 189, 1971; Netherlands), Wright (*The genus Tulostoma (Gasteromycetes)* [*Bibl. Mycol.* **113**], 1987), Calonge & Wright (*Boln Soc. Micol. Madrid* **13**: 119, 1989; Spain), Moncalvo *et al.* (*Mol. Phylogen. Evol.* **23**: 357, 2002), Sarasini (*Rivista di Micologia* **46**: 7, 2003; mediterranian), Esqueda *et al.* (*Mycotaxon* **90**: 409, 2004), Masuya & Asai (*Bull. natn. Sci. Mus.* Tokyo, B **30**: 9, 2004), Fan *et al.* (*Mycosystema* **24**: 340, 2005; China).

Tulostomataceae E. Fisch. (1900) = Agaricaceae.

Tulostomatales = Agaricales.

tumid, swollen; inflated.

Tumidapexus D.A. Crawford (1954), Aphelariaceae. 1, New Zealand. See Crawford (*Trans. & Proc. Roy. Soc. New Zealand* **82**: 626, 1954).

Tumularia Descals & Marvanová (1987), anamorphic *Pezizomycotina*, Hso.1-≡ eH.21. 2 (aquatic), Europe. See Marvanová & Descals (*TBMS* **89**: 506, 1987), Bussaban *et al.* (*Mycol.* **97**: 1002, 2005; phylogeny).

Tunbridge ware, Ornaments made from coloured wood, usually using marquetry techniques; the green wood used is that of deciduous trees attacked by *Chlorociboria aeruginascens*.

tunic, see exospore.

tunica, a coat, esp. a thin white membrane round the peridiole in most species of the *Nidulariaceae*. See also spore wall (2) and basidiospore.

Tunicago B. Sutton & Pollack (1977), anamorphic *Pezizomycotina*, Cpd.1eP.15. 2, USA; Australia. See Sutton & Pollack (*CJB* **55**: 326, 1977), Alcorn & Sutton (*Aust. Syst. Bot.* **12**: 169, 1999; Australia).

Tunicatispora K.D. Hyde (1990), Halosphaeriaceae. 1 (marine), Australia. See Hyde (*Aust. Syst. Bot.* **3**: 711, 1990), McKeown *et al.* (*MR* **100**: 1247, 1996; ultrastr.), Pang *et al.* (*Nova Hedwigia* **77**: 1, 2003).

Tunicopsora Suj. Singh & P.C. Pandey (1971) = Kweilingia fide Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi rev. edit.*, 1983).

Tunstallia Agnihothr. (1961), ? Sydowiellaceae. 1, India. *T. aculeata* (thorny stem blight of tea, *Camellia*). fide Vasilyeva (*Mycoscience* **42**: 401, 2001).

Tupia L. Marchand (1830) nom. rej. ≡ Icmadophila fide Gierl & Kalb (*Herzogia* **9**: 593, 1993).

turbid, not clear; cloudy.

turbinate, like a top in form (Fig. 23.21). **- organ** or **cell** (of *Cladochytriaceae*), a swelling on the vegetative thallus (see Karling, *Am. J. Bot.* **18**: 528, 1931); spindle-organ.

Turbinellus Earle (1909) = Gomphus Pers. fide Donk (*Beih. Nova Hedwigia* **6**: 291, 1962).

Tureenia J.G. Hall (1915) = Arthrinium fide Höhnel (*Mitt. bot. Inst. tech. Hochsch. Wien* ser. 2 **2**: 9, 1925).

turgid, tightly swollen.

Turgidosculum Kohlm. & E. Kohlm. (1972), Mastodiaceae. 2 (on algae), widespread. See Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979), Schatz (*Mycol.* **72**: 110, 1980), Kohlmeyer & Volkmann-Kohlmeyer (*Bot. Mar.* **46**: 285, 2003).

turgor pressure, of mycelium, see Adebayo *et al.* (*TBMS* **57**: 145, 1971).

Turturconchata J.L. Chen, T.L. Huang & Tzean (1999), anamorphic *Pezizomycotina*, Hso.?.?. 2, Taiwan. See Chen *et al.* (*MR* **103**: 830, 1999).

Tuzetia Maurand, Fize, Fenwick & Michel (1971), Microsporidia. 4.

TWA, see Media.

twist, a disease of cereals and grasses (*Dilophospora alopecuri*).

Tylochytrium Karling (1939) ≡ Phlyctidium (A. Braun) Rabenh.

Tylodon Banker (1902) ≡ Radulum fide Donk (*Taxon* **12**: 155, 1963).

Tylomyces Cortini (1921), anamorphic *Pezizomycotina*. 1, Italy.

Tylophoma Kleb. (1933) = Dothichiza fide Petrak (*Sydowia* **10**: 201, 1957).

Tylophorella Vain. (1890), Arthoniales (L). 1, tropical. See Egea & Tibell (*Nordic Jl Bot.* **13**: 207, 1993), Aptroot & Tibell (*Mycotaxon* **65**: 339, 1997), Grube (*Bryologist* **101**: 377, 1998; phylogeny).

Tylophorellomyces Cif. & Tomas. (1953) ≡ Tylophorella.

Tylophoron Nyl. ex Stizenb. (1862), Lecanorales (L). 3, widespread (tropical). See Tibell (*Lichenologist* **14**: 219, 1982), Tibell (*Beih. Nova Hedwigia* **79**: 597, 1984), Tibell (*Symb. bot. upsal.* **27** no. 1, 1987), Tibell (*MR* **95**: 290, 1991; anamorph), Tibell (*MR* **107**: 1403, 2003), Aptroot *et al.* (*Biblthca Lichenol.* **97**, 2008; Costa Rica).

Tylophoropsis Sambo (1938) nom. dub., ? Caliciaceae. 1, Africa.

Tylopilus P. Karst. (1881), Boletaceae. *c.* 75, widespread. See Smith (*Mycol.* **60**: 954, 1968), Wolfe (*Biblthca Mycol.* **69**, 1979; N. Am.), Henkel (*Mycol.* **91**: 655, 1999; Guyana), Chen *et al.* (*Taiwania* **49**: 109, 2004; Taiwan), Fu *et al.* (*Mycotaxon* **96**: 41, 2006; China).

Tylosperma Donk (1957) [non *Tylosperma* Botsch. 1952, *Rosaceae*] ≡ Tylospora.

Tylospora Donk (1960), Atheliaceae. 2, widespread. See Donk (*Taxon* **9**: 220, 1960).

Tylosporaceae Jülich (1982) = Atheliaceae.

Tylostoma, see *Tulostoma*.

Tylothallia P. James & H. Kilias (1981), ? Ramalinaceae (L). 1, Europe. See James & Kilias (*Herzogia* **5**: 409, 1981), Ekman (*MR* **105**: 783, 2001).

Tympanella E. Horak (1971), Bolbitiaceae. 1, New Zealand. Basidioma gasteroid. See Horak (*N.Z. Jl Bot.* **9**: 485, 1971), Soop (*Cortinarioid Fungi of New Zealand, An Iconography and Key*: 80 pp., 2003; key).

Tympanicysta Malme (1980), Fossil Fungi. 2 (late Permian – early Triassic), widespread.

Tympanis Tode (1790), Helotiaceae. Anamorph *Sirodothis*. 29, widespread (temperate). See Groves (*CJB* **30**: 571, 1952; monogr.), Ouellette & Pirozynski (*CJB* **52**: 1889, 1974; key), Yao & Spooner (*Kew Bull.* **51**: 187, 1996; Brit. spp.).

Tympanopsis Starbäck (1894) = Nitschkia fide Nannfeldt (*Svensk bot. Tidskr.* **66**: 49, 1975), Huhndorf *et al.* (*MR* **108**: 1384, 2004).

Tympanosporium W. Gams (1974), anamorphic *Pezizomycotina*, Hso.0eH.19. 1 (on *Tubercularia*), Netherlands. See Gams (*Antonie van Leeuwenhoek Ned. Tijdschr. Hyg.* **40**: 478, 1974).

Type (in nomenclature). The element on which the descriptive matter fulfilling the conditions of valid publication of a scientific name is based, or is considered to have been based, and which fixes the application of the name; e.g. a family name on a genus, a generic name on a species (a **- species**; see also nomen species), a specific name generally a **- specimen**, which may be a slide, sometimes on a **- culture** (incorrectly for fungi if still metabolically

active), a Figure, or a description. Numerous terms with the suffix '-type' have been used in nomenclature, both formally and informally (*see* Hawksworth, *A draft glossary of terms used in bionomenclature*, [IUBS Monogr. 9], 1994), and only a selection of those most used by mycologists are included here: **epi-** a specimen or illustration used to serve as an interpretive type where the existing type material is inadequate for the precise application of the name; **ex-type**, out of the type, used especially for living cultures where the holotype is a dried culture or one preserved in a metabolically inactive state; **holo-**, the single element on which the describing author based a name; **iso-**, a duplicate or part of the type collection (other than the holotype) [(in immunology), part of the imunoglobin molecule from the mouse used in the characterization of sera]; [**histo-**, a reaction between different types of cells]; **lecto-**, an element selected in a later work from the original material where no holotype was designated; **mono-**, the only species included in a genus when first described; **neo-**, specimen or other material designated as nomenclatural type when all the original material is missing; **para-**, any specimen other than the holotype on which the first account of a species or other group is based; **patho-**, see pathovar; **phyco-**, each of the morphologically distinct structures derived by symbiosis between a single mycobiont and different photobionts (Swinscow, *Lichenologist* **9**: 89, 1977; see Lichens); **syn-** one of several elements cited by an author when originally proposing a name but where no holotype was selected ; **topo-**, a later collection from the original locality; **typo-**, the specimen used to prepare an illustration where the latter is the type. See Nomenclature, wild type.

Type culture collections, see Genetic resource collections.

Typhella L. Léger & M. Gauthier (1935) nom. nud. ? = Smittium fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Typhoderma Gray (1821) nom. dub., ? Fungi.

Typhodium Link [not traced] = Epichloë fide Tulasne & Tulasne (*Select. fung. carpol.* **3**: 23, 1865).

Typhula (Pers.) Fr. (1818), Typhulaceae. 68, widespread (temperate). *T. incarnata* injures cereals under snow. See Berthier (*Bull. mens. Soc. linn. Lyon* Num. Spéc. **45**, 1976), Siepe (*Beitr. Kenntn. Pilze Mitteleur.* **13**: 47, 2000).

Typhulaceae Jülich (1982), Agaricales. 6 gen. (+ 11 syn.), 229 spp.

Lit.: Brodie (*Lejeunia* n.s. **112**: 1, 1984), Metzler (*CJB* **66**: 1321, 1988), Villarreal & Pérez-Moreno (*Micol. Neotrop. Aplic.* **4**: 119, 1991), Matsumoto *et al.* (*Eur. J. Pl. Path.* **102**: 431, 1996), Hsiang *et al.* (*Pl. Typhulochaeta S. Ito & Hara (1915), Erysiphaceae. 4, Asia; N. America. See Solheim *et al.* (*J. Elisha Mitchell scient. Soc.* **84**: 236, 1968), Braun (*Beih. Nova Hedwigia* **98**, 1987; key), Mori *et al.* (*Mycol.* **92**: 74, 2000; phylogeny), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny).

typonym, a name having the same type as another name which is neither its basionym nor synisonym (Donk, *Persoonia* **1**: 175, 1960).

Tyrannosorus Unter. & Malloch (1995), Dothideomycetes. Anamorph *Helicodendron*. 1 (on wood), Canada; Pakistan. See Untereiner *et al.* (*MR* **99**: 897, 1995), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Tyridiomyces W.A. Wheeler (1907), ? Saccharomycetales. 1 (from ants). See Schultz *et al.* (*Insect-Fungal Associations* Ecology and Evolution: 149, 2005).

Tyrodon P. Karst. (1881) ≡ Hydnum.

Tyromyces P. Karst. (1881), Polyporaceae. *c.* 30, widespread. See David (*Bull. Soc. linn. Lyon* **49**: 596, 1980; key 16 Afr. spp.), Gilbertson & Ryvarden (*N. Amer. Polyp.* **2**: 781, 1987; key N. Am. spp.), Spirin (*Mycena* **1**: 64, 2001), Hattori (*Mycoscience* **44**: 453, 2003; type studies Corner spp.), Ipulet & Ryvarden (*Syn. Fung.* **20**: 79, 2005; tropical Afr.).

UAMH, University of Alberta Microfungus Collection and Herbarium (Edmonton, Alberta, Canada); founded 1960; see Sigler (*J. Ind. Microbiol.* **13**: 191, 1994).

Uberispora Piroz. & Hodges (1973), anamorphic *Pezizomycotina*, Hso.0bP.1. 3, widespread. See Castañeda Ruíz *et al.* (*Nova Hedwigia* **64**: 473, 1997).

ubiquinones, a class of terpenoid lipids involved in electron transport and of potential use in fungal systematics due to variation in the isoprenoid side chain in some taxa. See Kuraishi *et al.* (*MR* **95**: 705, 1991).

Ubrizsya Negru (1965), anamorphic *Pezizomycotina*, St.0eH.?. 1, Rumania. See Negru (*Acta Bot. Hung.* **11**: 217, 1965).

Ucographa A. Massal. (1860) = Pragmopora fide Nannfeldt (*Nova Acta R. Soc. Scient. upsal.*, 1932).

Udeniomyces Nakase & Takem. (1992), anamorphic *Cystofilobasidiaceae*. 4, Japan; Europe. See Nakase *et al.* (*Stud. Mycol.* **38**: 163, 1995; mol. phylogeny), Suh *et al.* (*Microbiology* **141**: 901, 1995; mol. phylogeny), Fell *et al.* (*Int. J. Syst. Evol. Microbiol.* **50**: 1351, 2000; mol. phylogeny), Niwata *et al.* (*International Journal of Systematic and Evolutionary Microbiology* **52**: 1887, 2002; n.sp. Hungary).

Ugola Adans. (1763), anamorphic *Asterophora*. 3. See Stalpers (*Stud. Mycol.* **24**: 80, 1984; anamorph name), Redhead & Seifert (*Taxon* **50**: 243, 2001).

ulcerose, ulcer-like.

Ulea J. Schröt. (1892) nom. inval. = Uleiella.

Uleiella J. Schröt. (1894), Uleiellaceae. 2 (on *Araucaria*), S. America. See Thirumalachar (*Bull. Torrey bot. Club* **76**: 339, 1949), Thirumalachar (*Indian Phytopath.* **3**: 4, 1950), Vánky (*MR* **102**: 513, 1998), Vánky (*Fungal Diversity* **6**: 131, 2001).

Uleiellaceae Vánky (2001), Ustilaginales. 1 gen. (+ 1 syn.), 2 spp.

Lit.: Butin & Peredo (*Biblthca Mycol.* **101**: 100 pp., 1986), Vánky (*MR* **102**: 513, 1998), Vánky (*Fungal Diversity* **6**: 131, 2001).

Uleodothella Syd. & P. Syd. (1921) = Tomasellia fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Uleodothis Theiss. & Syd. (1915), Venturiaceae. 4, S. America.

Uleomyces Henn. (1895), Cookellaceae. 10 (on rusts and ascomycetes), widespread. See Eriksson & Yue (*Mycotaxon* **38**: 201, 1990).

Uleomycina Petr. (1954) = Elsinoë fide von Arx (*Persoonia* **2**: 421, 1963).

Uleopeltis Henn. (1904) = Mendogia fide Clements & Shear (*Gen. Fung.*, 1931).

Uleoporthe Petr. (1941), Diaporthales. 1 (from leaves), America (tropical). See Barr (*Mycol. Mem.* **7**, 1978), Cannon (*Fungal Diversity* **7**: 17, 2001).

Uleothyrium Petr. (1929), Asterinaceae. Anamorph *Septothyrella*. 1, Brazil.

Uljanishchev (Valery Ivanovich; 1898-1996; Russia, later Azerbaijan). Laboratory assistant, Institute of Plant Protection, Leningrad (1924-1927); Lecturer, Azerbaijan Agricultural Institute (1927-1931); founder then head, Station of Plant Protection, Azerbaijan SSR (1927-1938); Head of Department of Lower Plants, Institute of Botany, Azerbaijan SSR Academy of Sciences (1938-1993); Order of Lenin and Lenin Prize (1964). Pioneer work on epidemiology and control of smut fungi, particularly on cereals, in the Caucasus; also on the mycota of Azerbaijan. *Publs.* [*Mycoflora of Azerbaijan*] vols 1-4 (1952-1967) [in Russian]; [*Guide to the Identification of Smut Fungi of the USSR*] (1968) [in Russian]; (with collaborators) [*Guide for Identification of Fungi of Transcaucasia* vol. 1 (1985) [in Russian]. *Biogs, obits etc.* Anon. ([*Mikologiya i Fitopatologiya*] **13**: 439, 1976, portrait [in Russian]); Guseinov ([*Mikologiya i Fitopatologiya*] **31**: 92, 1997, portrait [in Russian]).

Ulocladium Preuss (1851), anamorphic *Pleosporaceae*, Hso.#eP.26. 15, widespread. See Simmons (*Mycol.* **59**: 77, 1967; key), Bottalico & Logrieco *in* Sinha & Bhatnagar (Eds) (*Mycotoxins in Agriculture and Food Safety*: 65, 1998; mycotoxins), Simmons (*CJB* **76**: 1533, 1998), Pryor & Gilbertson (*MR* **104**: 1312, 2000; phylogeny), Câmara *et al.* (*Mycol.* **94**: 660, 2002; phylogeny), Hoog & Horré (*Mycoses* **45**: 259, 2002; from humans), Pryor & Bigelow (*Mycol.* **95**: 1141, 2003; phylogeny), Hong *et al.* (*Fungal Genetics Biol.* **42**: 119, 2005; allergens, phylogeny), Zhang & Zhang (*Mycosystema* **25**: 516, 2006; China), Xue & Zhang (*Sydowia* **59**: 161, 2007).

Ulocodium A. Massal. (1855) = Catillaria fide Zahlbruckner (*Catalogus Lichenum Universalis* **4**, 1926).

Ulocolla Bref. (1888) = Exidia fide Donk (*Persoonia* **4**: 166, 1966).

Ulocoryphus Michaelides, L. Hunter & W.B. Kendr. (1982), anamorphic *Pezizomycotina*, Hsy.0fH.19. 1, New Zealand. See Michaelides *et al.* (*Mycotaxon* **14**: 61, 1982).

Uloploca Kleb. (1933) nom. dub., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

Uloporus Quél. (1886) = Gyrodon fide Patouillard (*Essai taxonomique sur les familles et les genres des Hyménomycètes*, 1900).

Uloseia Bat. (1963) ? = Chaetothyrium fide Hughes (*Mycol.* **68**: 693, 1976).

Ulospora D. Hawksw., Malloch & Sivan. (1979), Testudinaceae. 1, India. See Hawksworth *et al.* (*CJB* **57**: 96, 1979), Hoog *et al.* (*Mycoses* **47**: 121, 2004), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Ultrastructure. Studies with the electron microscope have shown fungi to have a typical eukaryotic structure but the nuclei of some show unusual features. Transmission electron microscopy is usually used for studying fungal ultrastructure, but the scanning electron microscope may also sometimes be applicable (Tsuchiya *et al.*, *Mycol.* **92**: 208, 2004). See Hawker (*Rev. Biol.* **40**: 52, 1965), Bracker (*Ann. Rev. Phytopath.* **5**: 343, 1967; reviews), Beckett *et al.* (*An atlas of fungal ultrastructure*, 1975), Cole & Samson (*Patterns of development in conidial fungi*, 1979), Hess (*Shokubutsu Byogai Kenkyi* **8**: 71, 1973; of germination), Littlefield & Heath (*Ultrastructure of rust fungi*, 1979), Mimms (*Mycol.* **83**: 1, 1991; plant pathogens). For some organelles of which the structure has been elucidated by electron microscopy see: apical granule, concentric bodies, dictyosome, dolipore septum, flagellum, parenthesome, Spitzenkörper. Lichen ultrastructure, see Jacobs & Ahmadjian (*J. Phycol.* **5**: 227, 1969; review), Hale (*in* Brown *et al.*, *Lichenology: progress and problems*: 1, 1976; scanning electron microscope).

For *Lit.* see under fam.

Umbilicariomyces Cif. & Tomas. (1953) ≡ Lasallia.

umbilicate, having a small hollow; esp. of a pileus having a hollow on the top above the stipe (Fig. 19M).

umbilicus (1) the central hold-fast occurring in some foliose lichens (e.g. *Umbilicaria*), navel, umbo; (2) the pore in the perispore of an ascospore (Eriksson, *Opera bot.* **60**, 1981).

umbo, a central swelling like the boss at the centre of a shield; esp. one on top of a pileus above the stipe; see also umbilicus; **-nate**, having an umbo (Fig. 19L).

Umbrinosphaeria Réblová (1999), Chaetosphaeriaceae. Anamorph *Sporidesmium*-like. 1 (from wood), widespread (temperate). See Réblová (*Mycotaxon* **71**: 13, 1999), Shenoy *et al.* (*MR* **110**: 916, 2006; phylogeny).

Unamunoa Urries (1942) = Rechingeriella fide Petrak (*Sydowia* **23**: 265, 1970).

Uncigera Sacc. (1885) = Cylindrotrichum fide Réblová & Gams (*Czech Mycol.* **51**: 1, 1999).

uncinate (uncate), (1) hooked (Fig. 23.35); (2) of gill insertion, near sinuate (q.v.).

Uncinia Velen. (1934) [non *Uncinia* Pers. 1807, *Cyperaceae*] ≡ Hamatocanthoscypha.

Unciniella K. Holm & L. Holm (1977) ≡ Hamatocanthoscypha.

Uncinocarpus Sigler & G.F. Orr (1976), ? Onygenaceae. Anamorph *Malbranchea*. 3, USA. The human pathogen *Coccidioides immitis* may be closely related. See Currah (*Mycotaxon* **24**: 1, 1985), Pan *et al.* (*Microbiol.* Reading **140**: 1481, 1994), Sigler *et al.* (*CJB* **76**: 1624, 1999), Koufopanou *et al.* (*Mol. Biol. Evol.* **18**: 1246, 2001), Guarro & Cano (*Stud. Mycol.* **47**: 1, 2002; phylogeny), Sugiyama *et al.* (*Stud. Mycol.* **47**: 5, 2002; phylogeny).

Uncinula Lév. (1851) = Erysiphe fide Braun & Takamatsu (*Schlechtendalia* **4**: 3, 2000), Mori *et al.* (*Mycoscience* **41**: 437, 2000; phylogeny), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny), Takamatsu *et al.* (*Mycoscience* **46**: 9, 2005).

Uncinulella Hara (1936) = Erysiphe fide Braun & Takamatsu (*Schlechtendalia* **4**: 3, 2000).

Uncinuliella R.Y. Zheng & G.Q. Chen (1979) = Erysiphe fide Braun & Takamatsu (*Schlechtendalia* **4**: 3, 2000), Takamatsu (*Mycoscience* **45**: 147, 2004; phylogeny).

Uncinulites Pampal. (1902), Fossil Fungi ? Fungi. 1 (Miocene), Italy. See Salmon (*J. Bot., Lond.* **41**: 127, 1903).

Uncinulopsis Sawada (1916) = Pleochaeta fide Kimbrough & Korf (*Mycol.* **55**: 619, 1963).

Uncispora R.C. Sinclair & Morgan-Jones (1979), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 1, USA. See Sinclair & Morgan-Jones (*Mycotaxon* **8**: 140, 1979).

Uncobasidium Hjortstam & Ryvarden (1978), Meruliaceae. 1, Norway. See Hjortstam & Ryvarden (*Mycotaxon* **7**: 407, 1978).

Uncol Buriticá & Rodríguez (2000), Uncolaceae. 1 (on *Pteridophyta*), S. America. See Buriticá & Rodríguez (*Revta Acad. colomb. cienc. exact. fís. nat.* **24**: 112, 2000), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003; excluded from *Pucciniales*).

Uncolaceae Buriticá (2000), Pucciniales. 2 gen., 3 spp.

Lit.: Rodríguez & Buriticá (*ASCOLFI Informa* **28**: 12, 2002), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003).

under cortex, lower cortex in foliose lichens.

Underwoodia Peck (1890), Pezizales. 3 (from soil), widespread. See Harmaja (*Karstenia* **14**: 102, 1974), O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Landvik *et al.* (*Mycol.* **91**: 278, 1999), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).

Underwoodina Kuntze (1891) ≡ Aschersonia Mont.

undulate, wavy.

Unger (Franz; 1800-1870; Austria). Medic, Stockerau (1828-1830); forensic physician, Kitzbühel; Professor of Botany & Zoology, Graz (1835-1849); Professor of Plant Anatomy & Physiology, Vienna (1849-1866). Contributed to the development of ideas in plant pathology, although still regarding fungi as the result rather than the cause of disease. *Publs. Die Exantheme der Pflanzen* (1833). *Biogs, obits etc.* Anon. (*Journal of Botany* London **8**: 192, 1870); Stafleu & Cowan (*TL-2* **6**: 594, 1986).

Unguicularia Höhn. (1905), Hyaloscyphaceae. 7, Europe. See Raschle (*Sydowia* **29**: 170, 1977; key), Korf & Kohn (*Mycotaxon* **10**: 503, 1980), Inman *et al.* (*Pl. Path.* **41**: 646, 1992; on *Brassica*), Baral (*SA* **13**: 113, 1994; posn), Raitviir (*Scripta Mycologica* Tartu **20**, 2004).

Unguiculariella K.S. Thind & R. Sharma (1990), Hyaloscyphaceae. 1, Bhutan. See Thind & Sharma (*Proc. Indian Acad. Sci.* Pl. Sci. **100**: 279, 1990),

Raitviir (*Scripta Mycol.* **20**, 2004).
Unguiculariopsis Rehm (1909), Helotiaceae. Anamorph *Deltosperma*. 20 (on lichens and other fungi), widespread. See Spooner (*Biblthca Mycol.* **116**, 1987), Zhuang (*Mycotaxon* **32**: 1, 1988; key), Alstrup & Hawksworth (*Meddr Grønland* Biosc. **31**: 3, 1990), Kondrateva *et al.* (*Acta Bot. Fenn.* **150**: 93, 1994), Kondrateva & Galloway (*Biblthca Lichenol.* **58**: 235, 1995), Etayo & Diederich (*Bull. Soc. Nat. Luxemb.* **97**: 93, 1996), Zhuang (*MR* **104**: 507, 2000; 2 spp. China).
Unguiculella Höhn. (1906), Hyaloscyphaceae. *c.* 17, Europe. See Dennis (*Mycol. Pap.* **32**, 1949), Raitviir (*Mikol. Fitopatol.* **21**: 200, 1987), Huhtinen (*Karstenia* **29**: 45, 1990), Raitviir (*Scripta Mycol.* **20**, 2004), Huhtinen & Spooner (*Mycologist* **19**: 59, 2005; UK).
Ungularia Lázaro Ibiza (1916) ≡ Piptoporus.
ungulate, shaped like a horse's hoof.
Ungulina Pat. (1900) ≡ Fomes.
unialgal (of cultures of lichen photobionts), ones in which a single algal species is present but which may also contain bacteria, fungi, or other organisms.
Unicellomycetales, yeasts (Kudriavtsev, 1954).
Unikaryon E.U. Canning, P.F. Lai & J.K. Lie (1974), Microsporidia. 8. See Canning *et al.* (*J. Protozool.* **21**: 19, 1974).
union, see Phytosociology.
unipolar, at one end only (esp. of a bacterial cell).
uniseriate, in one row.
Uniseta Ciccar. (1948), anamorphic *Cryptodiaporthe*, St.1eP.19. 1, USA.
Unisetosphaeria Pinnoi, E.B.G. Jones, McKenzie & K.D. Hyde (2003), Trichosphaeriaceae. 1, Thailand. See Pinnoi *et al.* (*Mycoscience* **44**: 377, 2003).
universal veil (of agarics and gasteromycetes), a layer of tissue covering the basidioma while development takes place; teleblem; blematogen; cf. volva; **primary - -** = protoblem.
unorientated, not arranged in any particular direction.
unstratified (of lichen thalli), not layered; homoiomerous (q.v.).
Uperhiza Bosc (1811) = Melanogaster fide Stalpers (*in litt.*).
UPS, Botanical Museum, University of Uppsala (Uppsala, Sweden); founded 1785; genetic resource collection **UPSC**.
Uraecium Arthur (1933), anamorphic *Pucciniales*. 12, widespread (esp. tropical). Anamorph name for (I). See Berndt (*Nova Hedwigia* **75**: 415, 2002) Established for uredium-like aecia.
Urceola Quél. (1886), Helotiales. 1, Europe.
Urceolaria Ach. (1803) [non *Urceolaria* Molina ex Brandis 1786, *Gesneriaceae*] nom. rej. = Diploschistes fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Urceolaria Bonord. (1851), Pezizales. 100, Europe.
Urceolaria Hook. (1821) [non *Urceolaria* Molina ex Brandis 1786, *Gesneriaceae*] = Aspicilia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Urceolariaceae Chevall. (1826) = Thelotremataceae.
Urceolariomyces Cif. & Tomas. (1953) ≡ Diploschistes fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
urceolate, pitcher-like in form.
Urceolella Boud. (1885), Hyaloscyphaceae. 23, widespread. See Raschle (*Sydowia* **29**: 170, 1977; key), Korf & Kohn (*Mycotaxon* **10**: 503, 1980), Huhtinen (*Karstenia* **27**: 8, 1988), Raitviir & Galán (*Sydowia* **45**: 34, 1993), Huhtinen & Raitviir (*Mycotaxon* **62**: 453, 1997), Raitviir (*Scripta Mycologica* Tartu **20**, 2004).
Urceolina Tuck. (1875) [non *Urceolina* Rchb. 1828, nom. cons., *Amaryllidaceae*] ≡ Orceolina.
Urceolus Velen. (1939) [non *Urceolus* Mereschk. 1879, *Algae*] = Resupinatus fide Stalpers (*in litt.*).
Uredendo Buriticá & J.F. Hennen (1994), anamorphic *Phakopsoraceae*. 1 (on *Tripsacum* (*Poaceae*)), America (tropical). Anamorph name for (II).
Uredinales G. Winter (1880) = Pucciniales.
Uredinaria Chevall. (1826) nom. conf., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).
Uredinella Couch (1937), Septobasidiaceae. 2 (on *Insecta*), widespread. See Couch (*Mycol.* **33**: 405, 1941).
Urediniomycetes D. Hawksw., B. Sutton & Ainsw. (1983) = Pucciniomycetes.
urediniospore (uredinospore, urediospore), see *Pucciniomycetes*.
Uredinites Velen. (1889), Fossil Fungi ? Pucciniales. 1 (Cretaceous), former Czechoslovakia.
uredinium (uredium, uredosorus), see *Urediniales*.
Uredinophila Rossman (1987), Tubeufiaceae. 2 (on rusts), widespread. See Rossman (*Mycol. Pap.* **157**, 1987), Kodsueb *et al.* (*Fungal Diversity* **21**: 105, 2006; phylogeny).
Uredinopsis Magnus (1893), Pucciniastraceae. *c.* 25 (on *Abies* (0, I; where known) (*Pinaceae*); *Pteridophyta* (II, III)), widespread (esp. north temperate). See Faull (*J. Arnold Arbor.* **19**: 402, 1938), Faull (*Contr. Arnold Arbor.* **11**: 1, 1938), Hiratsuka (*Revision of taxonomy of the Pucciniastreae*, 1958).
Uredinula Speg. (1880) = Tuberculina fide Spegazzini (*Anal. Soc. cient. argent.* **10**: 64, 1880).
Uredites Babajan & Tasl. (1970), Fossil Fungi. 1 (Tertiary), former USSR.
Uredo Pers. (1801), anamorphic *Pucciniales*. *c.* 500, widespread (esp. tropical). Anamorph name for (II).
uredoconidium (of *Cumminsiella*), see Kuhnholtz-Lordat (*RAM* **26**: 469, 1947).
Uredopeltis Henn. (1908), Phakopsoraceae. 5 (on *Bignoniaceae*, *Burseraceae*, *Euphorbiaceae*), Africa, Australia, India; America (tropical). See Laundon (*TBMS* **46**: 503, 1963), Walker & Shivas (*Australas. Pl. Path.* **33**: 41, 2004; nomencl. sp. on *Grewia*).
Uredostilbe Buriticá & J.F. Hennen (1994), anamorphic *Phakopsoraceae*. 1 (on *Annona* (*Annonaceae*)), Honduras. Anamorph name for (II).
Urnobasidium Parmasto (1968) = Sistotrema Fr. fide Eriksson *et al.* (*Cortic. N. Europ.* **7**, 1984).
Urnula Fr. (1849), Sarcosomataceae. Anamorph *Strumella*. 6, Europe; N. America. See Dissing (*Mycol.* **73**: 272, 1981; key), Bellemère *et al.* (*Cryptog. Mycol.* **11**: 203, 1990; ultrastr.), Landvik *et al.* (*Nordic Jl Bot.* **17**: 403, 1997; DNA), Brunelli (*Bres. Nuova Ser.* **40**: 199, 1998), Harrington *et al.* (*Mycol.* **91**: 41, 1999; phylogeny), Köpcke *et al.* (*Phytochem.* **60**: 709, 2002; chemistry), Hansen & Pfister (*Mycol.* **98**: 1029, 2006; phylogeny).
Urnularia P. Karst. (1866) nom. rej. prop. = Chaetosphaeria fide Kohlmeyer & Kohlmeyer (*Marine Mycology*, 1979).
Urobasidium Giesenh. (1893) = Zygosporium fide Mason (*Mycol. Pap.* **5**: 134, 1941).
Uroconis Clem. (1909) ≡ Urohendersonia.
Urocystidaceae Begerow, R. Bauer & Oberw. (1998),

Urocystidales. 7 gen. (+ 8 syn.), 185 spp.

Lit.: Vánky (*MR* **94**: 269, 1990), Bauer *et al.* (*CJB* **75**: 1273, 1997), Begerow *et al.* (*CJB* **75**: 2045, 1998), Piepenbring *et al.* (*Protoplasma* **204**: 202, 1998), Ershad (*Rostaniha* **1**: 151, 2000), Vánky (*Aust. Syst Bot.* **14**: 385, 2001), Denchev (*Mycotaxon* **87**: 475, 2003), Vánky (*Mycol. Balcanica* **1**: 175, 2004).

Urocystidales R. Bauer & Oberw. (1997). Ustilaginomycetidae. 4 fam., 1 gen., 4 spp. Fams:
(1) **Doassansiopsidaceae**
(2) **Glomosporiaceae**
(3) **Melanotaeniaceae**
(4) **Urocystidaceae**
For *Lit.* see under fam.

Urocystis Rabenh. ex Fuckel (1870) nom. cons., Urocystidaceae. Anamorph *Paepalopsis*. *c.* 170, widespread. Spore balls comprising spores completely or incompletely covered by sterile cells. Pathogens of anemone (*U. anemones*), cabbage (*Brassica*); *U. brassicae*, onion (*Allium*; *U. magica*, syn. *U. cepulae*), autumn crocus (*Colchicum*; *U. colchici*), gladioli (*Gladiolus*; *U. gladiolicola*), rye (*Secale*; *U. occulta*), *Ranunculus* (*U. ranunculi*), *Trientalis* (*U. trientalis*), violet (*Viola*; *U. violae*), wheat (*Triticum*; *U. agropyri* (syn. *U. tritici*), flag smut). See Liro (*Ann. Univ. Åbo.* A **1** no. 1, 1922; monograph, as *Tuburcinia*), Vánky (*Europ. Smut Fungi*: 570 pp., 1994), Piepenbring (*Caldasia* **24**: 103, 2002; Colombia, key), Vánky & McKenzie (*Fungal Diversity Res. Ser.* **8**: 259 pp., 2002; New Zealand), Wang & Piepenbring (*Mycol. Progr.* **1**: 399, 2002; China), Wolczanska & Rozwalka (*Polish Botanical Journal* **50**: 93, 2005; Poland).

Urocystites Babajan & Tasl. (1970), Fossil Fungi. 1 (Tertiary), former USSR.

Urohendersonia Speg. (1902), anamorphic *Pezizomycotina*, Cpd.≡ eP.19. 5, S. America; India. See Nag Raj & Kendrick (*CJB* **49**: 1853, 1971; key), Roux & Warmelo (*MR* **92**: 223, 1989; ontogeny), Masilamani & Muthumary (*Acta Bot. Indica* **23**: 157, 1995; ultrastr.).

Urohendersoniella Petr. (1955), anamorphic *Pezizomycotina*, Cpd.#eP.19. 1, Australia. See Nag Raj (*CJB* **67**: 3169, 1989; revision).

Uromyces (Link) Unger (1832) nom. cons., Pucciniaceae. *c.* 800 (on angiosperms, esp. species-rich on *Leguminosae*: *Faboideae*), widespread. *U. appendiculatus* (*Phaseolus*), *U. fabae* (*Vicia*), *U. trifolii* (*Trifolium*), *U. striatus* (*Medicago*). See Tranzschel (*Annls mycol.* **8**: 1, 1910), Guyot (*Les Urédinées. Genre Uromyces*, 1938), Guyot (*Les Urédinées. Genre Uromyces*, 1951), Guyot (*Les Urédinées. Genre Uromyces*, 1957), Hiratsuka (*Rep. Tottori Mycol. Inst.* **10**, 1973), El-Gazzar *in* Polhill & Raven (Eds) (*Advances in Legume Systematics* **1(ii)**: 979, 1981) Probably not separable from *Puccinia*.

Uromycetites Braun (1840), Fossil Fungi ? Pucciniales. 1 (Triassic), Germany.

Uromycladium McAlpine (1905), Pileolariaceae. 7 (on *Acacia*, *Albizia* (*Leguminosae*)), Australasia (and spread with cultivated hosts). See Burges (*Proc. Linn. Soc. N. S. W.* **59**: 212, 1934; morphology).

Uromycodes Clem. (1909) ≡ Schroeteriaster.

Uromycopsis Arthur (1906) = Uromyces fide Arthur (*N. Amer. Fl.* **7**: 440, 1921).

Urophiala Vuill. (1910) = Zygosporium fide Mason (*Mycol. Pap.* **5**: 134, 1941).

Urophlyctis J. Schröt. (1886) = Physoderma fide Karling (*Chytriomyc. Iconogr.*, 1977).

Urophlyctites Magnus (1903), Fossil Fungi. 1 (Carboniferous), Europe. See Weiss (*New Phytol.* **3**: 68, 1904).

Urophora Sommerf. ex Arnold (1899) = Bacidia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Uropolystigma Maubl. (1920), Phyllachorales. 1 (in living leaves), Brazil.

Uropyxidaceae Cummins & Y. Hirats. (1983), Pucciniales. 15 gen. (+ 9 syn.), 143 spp.

Lit.: Eriksson (*Systematic Botany*: 560, 1981), Ferreira & Hennen (*Mycol.* **78**: 795, 1986), Ono (*CJB* **72**: 1178, 1994), Barreto *et al.* (*MR* **99**: 779, 1995), Hennen & Sotão (*Sida* **17**: 173, 1996), Cummins & Hiratsuka (*Illustr. Gen. Rust Fungi* edn 3: 225 pp., 2003), Maier *et al.* (*CJB* **81**: 12, 2003), Wingfield *et al.* (*Australas. Pl. Path.* **33**: 327, 2004), Aime (*Mycoscience* **47**: 112, 2006).

Uropyxis J. Schröt. (1875), Uropyxidaceae. *c.* 15 (mostly on *Faboideae* (autoecious) (*Leguminosae*)), America; Africa; Taiwan. See Baxter (*Mycol.* **51**: 210, 1959; key).

Urospora Fabre (1879) [non *Urospora* Aresch. 1866, nom. cons., *Algae*] ≡ Urosporella.

Urospora Fayod (1889) = Panellus fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

Urosporella G.F. Atk. (1897), Xylariales. 1 or 2 (from stems), Europe; N. America. Possibly close to *Ceriospora*. See Barr (*Mycol.* **58**: 690, 1966), Kang *et al.* (*Mycoscience* **40**: 151, 1999).

Urosporellina E. Horak (1968) = Panellus fide Pegler (*in litt.*).

Urosporellopsis W.H. Hsieh, Chi Y. Chen & Sivan. (1994), Xylariales. 1 (from wood), Taiwan. See Cannon (*in litt.*), Hsieh *et al.* (*MR* **98**: 101, 1994).

Urosporium Fingerh. (1836) nom. dub., anamorphic *Pezizomycotina*.

Ursicollum Gryzenh. & M.J. Wingf. (2006), anamorphic *Cryphonectriaceae*. 1, USA. See Gryzenhout & Wingfield (*Stud. Mycol.* **55**: 44, 2006).

Urupe Viégas (1944), Meliolaceae. 1 (from leaves), Brazil.

US, US National Herbarium (Washington, DC, USA); founded 1868; a part of the Smithsonian Institution.

Uslaria Nieuwl. (1916) ≡ Gautieria.

Usnea Dill. ex Adans. (1763), Parmeliaceae (L). *c.* 338, widespread. See Asahina (*Lichens of Japan* **3**, 1956), Swinscow & Krog (*Norw. Jl Bot.* **25**: 221, 1978), Swinscow & Krog (*Lichenologist* **11**: 207, 1979; E. Afr., keys), Walker (*Bull. Br. Mus. nat. hist.* Bot. **13**: 1, 1985; *Neuropogon*, key 15 spp.), Awasthi (*J. Hattori Bot. Lab.* **61**: 333, 1986; key 54 spp. India), Tavares (*Mycotaxon* **30**: 39, 1987; *U. strigosa*, N. Am., key), Clerc (*Lichenologist* **29**: 209, 1997), Clerc & Herrera-Campos (*Bryologist* **100**: 281, 1997; saxicolous N. Am. spp.), Clerc (*Lichenologist* **30**: 321, 1998; species concepts), Halonen *et al.* (*Bryologist* **101**: 36, 1998; British Columbia), Herrera-Campos *et al.* (*Bryologist* **10**: 303, 1998; Mexico), Tavares & Sanders *in* Glenn *et al.* (Eds) (*Lichenogr. Thomsoniana*: 171, 1998; USA), Heibel *et al.* (*Am. J. Bot.* **86**: 753, 1999; genetic diversity), Stevens (*Biblthca Lichenol.* **72**: 128, 1999; Australia), Halonen (*Bryologist* **103**: 38, 2000; Pacific NW), Ohmura & Kashiwadani (*J. Jap. Bot.* **75**: 164, 2000; E Asia), Herrera-Campos *et al.* (*Bryologist* **104**: 235, 2001;

Mexico), Ohmura (*J. Hattori bot. Lab.* **90**: 1, 2001; Japan, Taiwan), Articus *et al.* (*MR* **106**: 412, 2002; phylogeny), Ohmura (*J. Hattori bot. Lab.* **92**: 231, 2002; phylogeny), Tavares (*Constancea* **83**, 2002; nomencl.), Articus (*Taxon* **53**: 925, 2004; phylogeny), Mallavadhani *et al.* (*Biochemical Systematics and Ecology* **32**: 95, 2003; chemistry), Ohmura & Kanda (*Lichenologist* **36**: 217, 2004), Clerc (*Lichenologist* **38**: 191, 2006; Azores), Miądlikowska *et al.* (*Mycol.* **98**: 1088, 2006; phylogeny), Wirtz *et al.* (*Taxon* **55**: 367, 2006; phylogeny), Torra & Randlane (*Lichenologist* **39**: 415, 2007; Baltic region), Wirtz *et al.* (*MR* **112**: 472, 2008; phylogeny, biogeography).

Usneaceae Fée ex Zenker (1827) = Parmeliaceae.

Usneomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Usnea fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

usnic acid, yellow dibenzofuran derivative occurring in lichens (e.g. some spp. of *Cladonia*, *Usnea*) which has some antibiotic properties (anti-Gram + bacterial; antifungal). Usually occurs in lichen cortices. See antibiotics, Lichen products, Pigments.

Ussurithyrites Krassilov (1967), Fossil Fungi, Ascomycota. 1 (Cretaceous), former USSR. See Krasilov (*Rannemelovaya Flora Yuzhnogo Primor'ya* i Ee Znachenie Dlya Stratigrafii: 90, 1967).

Ustacystis Zundel (1945), Urocystidaceae. 2 (on *Rosaceae*), N. America; Europe. See Bauer *et al.* (*Mycol.* **87**: 18, 1995; ultrastr.).

Ustalia Fr. (1825) ≡ Pyrochroa.

Ustanciosporium Vánky (1999), ? Anthracoideaceae. 22 (on *Cyperaceae*), widespread. See Piepenbring (*Nova Hedwigia* **70**: 289, 2000; monogr.), Pérez & Minter (*IMI Descr. Fungi Bact.* **164**, 2005).

Usteria Bat. & H. Maia (1962) [non *Usteria* Willd. 1790, *Loganiaceae*] ≡ Mycousteria.

ustic acid (1) a hydroxyquinol from *Aspergillus ustus* (*Biochem. J.* **48**: 53, 1951); (2) an antimycobacterial product from *Ustilago maydis* (Haskins *et al.*, *Can. J. Microbiol.* **1**: 749, 1955).

ustilagic acids, metabolic products from *Ustilago maydis*; antifungal and antibacterial (Haskins & Thorn, *CJB* **29**: 585, 1951).

Ustilaginales G. Winter (1880). Ustilaginomycetidae. 8 fam., 49 gen., 851 spp. Fams:

(1) **Anthracoideaceae**
(2) **Cintractiaceae**
(3) **Clintramraceae**
(4) **Geminaginaceae**
(5) **Melanopsichiaceae**
(6) **Uleiellaceae**
(7) **Ustilaginaceae**
(8) **Websdaneaceae**

The *Ustilaginales*, which have long been regarded as a distinct group, have a mycelial parasitic phase and are yeast-like when cultured *in vitro*. Their taxonomic status has always been uncertain. Brefeld (*Unters. Gesammtgeb. Mykol.* **12**, 1895) introduced *Hemibasidiomycetes* (*Hemibasidii*) for them (the rusts being assigned to the *Protobasidiomycetes*) and although *Hemibasidiomycetes* was subsequently used in wider senses to include the rusts, Donk (see *Basidiomycota*) again restricted it to the smuts. Von Arx (1967) classified the smuts and the associated saprobic yeasts together with other yeasts in a class *Endomycetes* and in this he was followed by Kreisel (1969) who restricted the *Ustilaginales* to the *Ustilaginaceae*. Moore (*Ant. v. Leeuwenh.* **38**: 567, 1972) on the basis of ultrastructural studies and other considerations treated the group as two classes, *Ustomycetes* and *Sporidiomycetes*, of a division (*Ustomycota*) intermediate between ascomycetes and the basidiomycetes with which smuts have been traditionally associated. The current concept of *Ustomycetes* (q.v.) is broad and includes 7 orders, with the smuts divided into 2 families. Characters of the promycelium in these families are sufficiently distinct to indicate possible ordinal rank, but elevation requires additional support from molecular and ultrastructural data at present available for few species. In many species ustilospore germination (metabasidium development) has never been observed (or is mycelial) and some investigators (e.g. Vánky, 1994) therefore prefer not to emphasize the family division.

The smut fungi occur typically as host-specific endophytes which, but for 2 spp. of *Melanotaenium* on *Selaginella*, are parasitic on flowering plants, esp. *Gramineae* and *Cyperaceae*. Sori are commonly limited to the ovary, anthers, inflorescence, or leaves (*Entyloma*) and stem of the host, though the root is attacked by *Entorrhiza*. The mycelium of delicate hyaline hyphae made up of 1-, 2-, or multinucleate cells which may be throughout the plant or only at the points of infection; it is commonly annual but sometimes, as in *Ustilago segetum* var. *avenae* on *Arrhenatherum*, perennial. The hyphae are generally intercellular (in *U. maydis*) and frequently with haustoria and sometimes clamp connexions; dolipore septa lacking (Moore, *Ant. v. Leeuwenh.* **38**: 567, 1972); conidia may be formed on the surface of the host (esp. in *Entyloma*) although in most genera only the smut spores (chlamydospores, brand spores, resting spores, pseudospores, teliospores, ustospores, ustilospores) and basidiospores. Ustilospores (the preferred term, introduced by Donk, 1972), when mature, are generally exposed as a dark powder (sometimes as in *Anthracoidea* and *Cintractia* they are compacted); less frequently they are enclosed within host tissue or are unpigmented. The spores may be in ones (*Ustilago*, *Tilletia*) or twos (*Mycosyrinx*, *Schizonella*), or in balls made up of fertile spores only (*Sorosporium*, *Tolyposporium*, *Thecaphora*), a sterile layer covering fertile spores (*Urocystis*, *Doassansia*), or fertile spores covering sterile tissue (*Testicularia*, *Doassansiopsis*). Every mature spore has one diploid nucleus (Sampson, *TBMS* **23**: 1, 1939), and limited by a thin endospore and a thicker smooth or ornamented exospore (Zogg & Schwinn, *TBMS* **57**: 403, 1971; Mordue, *TBMS* **87**: 407, 1986). At germination meiosis takes place and a promycelium

(basidium, hemi-, or metabasidium, germ tube) having 4 or more basidiospores (sporidia (q.v.), sporidiola, 'conidia', promycelial spores) is produced.

Smuts are facultative saprobes after ustilospore development when their growth on culture media is mycelial or yeast-like (and composed of budding cells variously known as sporidia or sprout cells). Completion of the life cycle in culture is infrequent. There is segregation for sex in the promycelium and conjugation between two basidiospores, a basidiospore and a promycelial cell, two cells of one promycelium, or infrequently, two promycelia (Durán, *Ustilaginales of Mexico*, 1987; Ingold, *Nova Hedw.* **55**: 153, 1992). Many physiologic races are on record. Hybridization of smuts takes place and methods for its experimental study have been perfected. See Whitehouse (*TBMS* **34**: 340, 1951; heterothallism), Carris & Gray (*Mycol.* **86**: 157, 1994), Bakkuren & Kronstad (*Plant Cell* **5**: 123, 1993).

Species have frequently been based on physiologic races and a number of these become conspecific if morphological characters are used for the differentiation of species.

The three chief types of infection are: (1) seedling infection from ustilospores on the seed; (2) seedling infection by mycelium in the seed as a result of ustilospore germination on the stigma at flowering time; (3) infection by wind-borne sporidia from promycelia among decaying plant material (as for *Ustilago maydis*, *Entyloma*). Dusting seed with a fungicide is of use against (1), hot water seed treatment against (2), and spraying and dusting susceptible plants is a possible control for (3). Resistant varieties are used whenever possible.

Ustilaginoidella Essed (1911) = Fusarium fide Brandes (*Phytopathology* **9**: 373, 1919).

Ustilaginomycetes R. Bauer, Oberw. & Vánky (1997), Basidiomycota. 3 ord., 12 fam., 62 gen., 1113 spp. smut fungi. Ords:

(1) **Urocystidiales**
(2) **Ustilaginales**
Usually plant parasites, with very few exceptions on angiosperms. The soma of the smut fungi consists of saprobic haploid cells and parasitic dikaryotic hyphae. Host-parasite interactions with deposits of specific fungal vesicles. Basidiospores in sori. The hyphae are septate, branched, usually intercellular, in some groups also intracellular, in some taxa emitting haustoria into the host cells. In many cases hyphae are perennial, and usually giving little if any evidence of their presence before spore formation sets in. At spore formation karyogamy takes place and diploid spores are produced. The smut spores or teliospores (ustilospores, ustospores, chlamydospores, probasidia) are the organs of dispersion and of resistance. They are formed in the sori which consist of host tissues, of the spore mass, and in several genera also of modified fungal cells or tissues. Sori may be produced in the roots, stems, leaves, inflorescence, flowers, anthers, ovaries, etc. The spores may be single, in pairs, or aggregated in more or less persistent spore balls. The spore balls may be composed entirely of fertile spores, or of a combination of fertile spores, sterile cells, and/or hyphae. At germination of the diploid spore a basidium (promycelium, ustidium) is formed and meiosis takes place. The basidia give rise to haploid basidiospores (sporidia), or more rarely to haploid hyphae. These, or sometimes compatible basidial cells fuse in pairs to restore the parasitic dikaryophase. Frequently, the haploid basidiospores are capable of prolonged reproduction on non-living substrata as yeast-like cells or also as hyphal anamorphs developed from basidiospores, capable to produce forcibly discharged ballistoconidia. The limits toward pure saprobic fungi is not as sharp as was thought earlier and there is even a pure saprobic smut fungus, *Tilletiaria*, known only from culture. The infection may be localized, restricted to a certain organ or part of it, or generalized (systemic). Several species within a few genera may possess anamorphs (conidial states). Ultrastructural and molecular biological investigations showed that there are groups of microfungi closely related with the smut fungi which do not have teliospores (*Microstromatales*, *Malesseziales*, *Exobasidiales*). On the other hand, the *Microbotryales*, with teliospores and life cycle as all other smut fungi, are more closely related with the rust fungi than with other smut fungi. There are even human pathogens belonging to the *Ustilaginomycetes* (*Malessezia*). The number of 'true smut fungus species' (possessing teliospores) is about 1450, distributed in 77 genera. The taxonomic status of the smuts has often changed. Brefeld (*Unters. Gesammtgeb. Mykol.*: 12, 1895) introduced *Hemibasidiomycetes* (*Hemibasidii*) for the smuts (the rusts being assigned to the *Protobasidiomycetes*) and although *Hemibasidiomycetes* was subsequently used in wider senses to include the rusts, Donk (see *Basidiomycota*) again restricted this taxon to the smuts. Von Arx (1967) classified the smuts and the associated saprobic yeasts together with other yeasts in a class *Endomycetes* and in this he was followed by Kreisel (1969) who restricted the *Ustilaginales* to the *Ustilaginaceae*. Moore (*Ant. v. Leeuwenhoek* **38**: 567, 1972) on the basis of ultrastructural studies and other considerations treated the group as two classes, *Ustomycetes* and *Sporidiomycetes*, of a new phylum (*Ustomycota*) intermediate between ascomycetes and the basidiomycetes with which smuts have been traditionally associated. 5S rRNA analyses (Blanz & Gottschalk, 1984), supported also by biochemical analyses (Prillinger *et al.*, 1991) demonstrated an isolated position of some smut fungi, classified today into the *Microbotryales* within the *Pucciniomycetes*. Bauer *et al.* (1997) elaborated a new classification, based on ultrastructural characters. This was slightly modified and perfected by Begerow *et al.* (1997/1998), Piepenbring *et al.* (1999), Begerow *et al.* (2000), Vánky (2001), Bauer *et al.* (2001), based on molecular and classical morphological studies.

Collections of over 33,000 specimens now in Turku (**TUR**). *Publs.* Monographia Cladoniarum universalis, I-III. *Acta Societatis pro Fauna et Flora Fennica* **4** (1887), **10** (1894), **14** (1897) [reprint 1978]; Lichenes Insularum Philippinarum, I-IV. *Philippine Journal of Science* Section C **4** (1909), **8** (1913), *Annales Academiae Scientiarum Fennicae* Section A **15** (1921), **19** (1923); Lichens du Brésil, I-II. *Acta Societatis pro Fauna et Flora Fennica* **7** (1890); Lichenographia Fennica I-IV. *Acta Societatis pro Fauna et Flora Fennica* **49** (1921), **53** (1922), **57** (1927), **57** (1934); also produced papers on lichens of central Africa, east Asia, Siberia, etc. *Biogs, obits etc.* Alava (*Publications from the Herbarium. University of Turku* **1**, 1986) [journey to Brazil]; Alava (*Publications from the Herbarium. University of Turku* **2**, 1988) [types in **TUR**]; Grummann (1974: 612); Linkola (*Acta Societatis pro Fauna et Flora Fennica* **57** (3), 1934) [bibliography, portrait]; Magnusson (*Annales de Cryptogamie Exotique* **3**: 5, 1930) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **6**: 636, 1986).
Vainiocora, see *Wainiocora*.
Vainiona Werner (1943) ≡ Neonorrlinia.
Vainionia Räsänen (1943) nom. inval. = Calicium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).
Vainionora Kalb (1991), Lecanoraceae (L). 5, S. America. See Lumbsch *et al.* (*Bryologist* **99**: 269, 1996), Kalb (*Biblthca Lichenol.* **88**: 301, 2004).
Vairimorpha Pilley (1976), Microsporidia. 11.
Vakrabeeja Subram. (1957) ≡ Nakataea fide Ellis (*Dematiaceous Hyphomycetes*, 1971).
Valdensia Peyronel (1923), anamorphic *Valdensinia*, Hso.0fP.1. 1, Italy. See Redhead & Perrin (*CJB* **50**: 409, 1972), Redhead & Perrin (*CJB* **50**: 2083, 1972).
Valdensinia Peyronel (1953), Sclerotiniaceae. Anamorph *Valdensia*. 1, Europe; N. America. See Norvell & Redhead (*Can. J. For. Res.* **24**: 1981, 1994), Holst-Jensen *et al.* (*Mycol.* **89**: 885, 1997; phylogeny).
Valentinia Velen. (1939) = Xeromphalina fide Kuyper (*in litt.*).
Valetoniella Höhn. (1909), Niessliaceae. 3 (dead wood or fungicolous), widespread (esp. tropics). See Samuels & Barr (*CJB* **75**: 2165, 1998).
Valetoniellopsis Samuels & M.E. Barr (1998), Niessliaceae. Anamorph *Acremonium*-like. 1 (dead *Palmae*), N. America. See Samuels & Barr (*CJB* **75**: 2165, 1998), Zhang & Blackwell (*MR* **106**: 148, 2002; phylogeny).
valid (of names), published in accord with the Code Arts 29-45; such names may be illegitimate or legitimate; **pre-** (of names or authors), published before 1753, the starting point for the nomenclature of fungi under the Code; devalidated; cf. Nomenclature.
Valsa Adans. (1763) nom. rej. = Diatrype fide Cannon & Hawksworth (*Taxon* **32**: 478, 1983), Læssøe (*SA* **13**: 43, 1994).
Valsa Fr. (1849) nom. cons., Valsaceae. Anamorph *Cytospora*. 70 (from bark), widespread. See Défago (*Phytopath. Z.* **14**: 103, 1944), Barr (*Mycol. Mem.* **7**, 1978), Spielman (*CJB* **63**: 1355, 1985; N. Am.), Dargan & Sharma (*Kavaka* **19**: 27, 1, 1994; Indian spp.), Farr *et al.* (*Sydowia* **53**: 185, 2001; phylogeny), Adams *et al.* (*Australas. Pl. Path.* **35**: 521, 2006; Australia), Kalkanci *et al.* (*Medical Mycology* **44**: 531, 2006; from human), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).
Valsaceae Tul. & C. Tul. (1861), Diaporthales. 16 gen. (+ 23 syn.), 217 spp.

Lit.: Barr (*Iranian Journal of Plant Pathology*, 1978), Monod (*Beih. Sydowia* **9**: 1, 1983), Spielman (*CJB* **63**: 1355, 1985), Gille (*Arch. phytopath. Pflanz.* **26**: 237, 1990), Vasil'eva (*Pyrenomycetes of the Russian Far East* **1**, 1993; keys), Vasil'eva (*Pyrenomycetes of the Russian Far East* **2**, 1994; keys), Wang *et al.* (*Phytopathology* **88**: 376, 1998), Adams *et al.*

(*Mycol.* **94**: 947, 2002), Castlebury *et al.* (*Mycol.* **94**: 1017, 2002), Adams *et al.* (*Stud. Mycol.* **52**: 146 pp., 2005), Rossman *et al.* (*Mycoscience* **48**: 135, 2007; phylogeny).

Valsales = Diaporthales.

Valsaria Ces. & De Not. (1863), Diaporthales. 41, widespread. See Petrak (*Sydowia* **15**: 299, 1962), Glawe (*Mycol.* **77**: 62, 1985; anamorphs), Ju *et al.* (*Mycotaxon* **58**: 419, 1996), Waldner (*Rheinl.-Pfälz. Pilzj.* **5-6**: 119, 1995).

Valsarioxylon Höhn. (1929) nom. nud., Pezizomycotina.

Valsella Fuckel (1870), Valsaceae. Anamorph *Cytospora*. 2 (on *Salix*), Europe. See Barr (*Mycol. Mem.* 7, 1978), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Valseutypella Höhn. (1919), Valsaceae. Anamorph *Cytospora*. 2, Europe; N. America. See Hubbes (*Phytopath. Z.* **39**: 389, 1960), Checa *et al.* (*Mycotaxon* **25**: 323, 1988), Checa & Martínez (*Mycotaxon* **36**: 43, 1989; anamorph).

valsoid, having groups of perithecia with their beaks pointing inward (convergent), or even parallel to the surface, as in *Valsa*. Cf. eutypoid.

Valsonectria Speg. (1881), Hypocreales. 6 (living and dead plant tissues), widespread. See Huhndorf (*Mycol.* **84**: 642, 1992), Seifert & Samuels (*Mycol.* **89**: 512, 1997), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny).

VAM fungi, vesicular-arbuscular mycorrhizal fungi; VA fungi; see Mycorrhiza.

Vamsapriya Gawas & Bhat (2006), anamorphic *Pezizomycotina*. 1, Karnataka. See Gawas & Bhat (*Mycotaxon* **94**: 150, 2006).

van Tieghem cell, a ring of glass or other material, fixed to a glass slide, over which is placed a coverglass with a 'hanging drop' of the microorganism under investigation. See Duggar (*Fungous diseases of plants*, 1909).

Vanakripa Bhat, W.B. Kendr. & Nag Raj (1993), anamorphic *Pezizomycotina*, Hsp.0-1eP.1. 2, India. See Bhat & Kendrick (*Mycotaxon* **49**: 76, 1993), Pinnoi *et al.* (*Nova Hedwigia* **77**: 213, 2003), Tsui *et al.* (*Mycol.* **95**: 124, 2003), Castañeda Ruíz *et al.* (*Mycotaxon* **91**: 339, 2005).

Vanbeverwijkia Agnihothr. (1961), anamorphic *Pezizomycotina*, Hsp.0-≡ hH.15. 1, Assam; USA. See Agnihothrudu (*TBMS* **44**: 51, 1961), Shearer & Crane (*Mycol.* **63**: 249, 1971).

Vanbreuseghemia Balab. (1965) ≡ Keratinomyces.

Vandasia Velen. (1922) nom. dub., ? Phallales.

Vanderbylia D.A. Reid (1973), Polyporaceae. 5, widespread. See Sikombwa & Piearce (*Bull. BMS* **19**: 124, 1985; medicinal use *V. ungulata*), Corner (*Beih. Nova Hedwigia* **86**: 241, 1987; key), Decock & Ryvarden (*Mycol.* **91**: 386, 1999), Decock (*Mycol.* **93**: 774, 2001; S.E. Asia), Decock & Masuka (*Systematics and Geography of Plants* **73**: 161, 2003; Africa).

Vanderwaltia E.K. Novák & Zsolt (1961) = Kloeckeraspora fide Batra *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 187, 1978), von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981).

Vanderwaltozyma Kurtzman (2003), Saccharomycetaceae. 2, Europe; S. Africa. See Kurtzman (*FEMS Yeast Res.* **4**: 242, 2003), Lopandic *et al.* (*Mycol. Progr.* **4**: 205, 2005), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Vanderystiella Henn. (1908), anamorphic *Pezizomycotina*, Cac.0eP.15. 1, Africa.

Vanhallia L. Marchand (1828) = Chaetomium fide Mussat (*Syll. fung.* **15**: 449, 1901).

Vanibandha Manohar., N.K. Rao, Kunwar & D.K. Agarwal (2006), anamorphic *Pezizomycotina*. 1, India. See Manoharachary *et al.* (*Indian Phytopath.* **59**: 212, 2006).

Vankya D. Ershad (2000), Urocystidaceae. 2 (on *Liliaceae*), widespread. See Bacigálová *et al.* (*Polish Botanical Journal* **50**: 145, 2005).

Vanrija R.T. Moore (1980) = Apiotrichum fide Moore (*MR* **95**: 639, 1991).

Vanrijia R.T. Moore (1980) = Cryptococcus Vuill.

Vanromburghia Holterm. (1898) ? = Marasmius fide Singer (*Agaric. mod. Tax.* edn 2: 808, 1962).

Vanterpoolia A. Funk (1982), anamorphic *Pezizomycotina*, Hsp.1bH.3. 1, Canada. See Funk (*CJB* **60**: 973, 1982).

Vantieghemia Kuntze (1891) ≡ Syncephalis.

Vanudenia Bat. & H. Maia (1963) = Schizothyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Vararia P. Karst. (1898), Lachnocladiaceae. 54, widespread. See Boidin & Lanquetin (*BSMF* **91**: 457, 1975), Boidin & Lanquetin (*BSMF* **92**: 247, 1976), Boidin & Lanquetin (*Mycotaxon* **6**: 277, 1977), Pascoe *et al.* (*TBMS* **82**: 723, 1984; white rot of *Rubus*), Stalpers (*Stud. Mycol.* **40**: 103, 1996; key), Larsson & Larsson (*Mycol.* **95**: 1037, 2003; phylogeny).

Vargamyces Tóth (1980), anamorphic *Pezizomycotina*, Hso.≡ eP.1/10. 1 (aquatic). See Gönczöl *et al.* (*Mycotaxon* **39**: 301, 1990; growth and development in culture).

Variation in fungi, The text of this entry is unrevised and remains the same as for the ninth edition. Variation in fungi may be the result of environment and not heritable (modifications, Bauer) or may be heritable and (1) determined by the coming together or separating of heritable factors (as in combinations) or (2) not so determined (mutations). Modifications ('temporary' or 'reversible' variations, such as changes in mycelial growth and pathogenicity) frequently take place in culture, sometimes in association with non-reversible (discontinuous) variations of a mutation (saltation, dissociation) type. The composition of the medium may have an effect on frequency of saltation; *Fusarium*, for example, saltating less readily on a poor medium, *Aspergillus* more readily in a mannitol-nitrite solution.

The polymorphic variation (Snyder & Hansen) in a species in nature may be so great that the forms are put in three, four or more genera. The existence of the 'dual phenomenon' (Hansen) in anamorphic fungi, has the effect of giving two kinds of culture.

Lit.: Brierley (*Proc. Int. Congr. Pl. Sci.* **2**, 1929), Snyder & Hansen (*Proc. 6th Pacific Sci. Congr.* **4**, 1940), Hansen (*Mycol.* **30**: 242, 1938), Day (*Ann. Rev. Microbiol.* **14**: 1, 1960; plant pathogenic fungi), Sugiyama (Ed.) (*Pleomorphic fungi*, 1987).

Varicellaria Nyl. (1858), Ochrolechiaceae (L). 3, widespread. See Erichsen (*Rabenh. Krypt.-Fl.* **9** 2.2: 687, 1935; Eur.), Oshio (*J. Sci. Hiroshima Univ.* B(2) **12**: 81, 1968; Japan), Schmitt *et al.* (*Biblthca Lichenol.* **86**: 147, 2003; phylogeny), Schmitt & Lumbsch (*Mol. Phylogen. Evol.* **33**: 43, 2004; chemistry, phylogeny), Lumbsch *et al.* (*Biol. J. Linn. Soc.* **89**: 615, 2006), Schmitt *et al.* (*J. Hattori bot. Lab.* **100**: 753, 2006; phylogeny).

Varicellariomyces Cif. & Tomas. (1953) = Varicel-

lana fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Varicosporina Meyers & Kohlm. (1965), anamorphic *Corollospora*, Hso.1bH.10. 2 (marine), widespread (tropical to subtropical). See Nakagiri (*TBMS* **90**: 265, 1988; conidia form and function), Spatafora *et al.* (*Am. J. Bot.* **85**: 1569, 1998; phylogeny), Zhang *et al.* (*Mycol.* **98**: 1076, 2006; phylogeny).

Varicosporium W. Kegel (1906), anamorphic *Hymenoscyphus*, Hso.1bH.1. 5, widespread. See Tubaki (*TBMS* **49**: 345, 1966; teleomorph), Nawawi (*TBMS* **63**: 27, 1974), Baschien *et al.* (*Nova Hedwigia* **83**: 311, 2006).

variecolin, an anti-tubercle bacillus antibiotic from *Aspergillus variecolor* (teleomorph, *Emericella variecolor*) (Gupta & Viswanathan, *Antibiot. & Chemother* **5**: 496, 1955).

variety, see Classification.

Variocladium Descals & Marvanová (1999), anamorphic *Pezizomycotina*, Hso.?.?. 1, British Isles. See Descals *et al.* (*CJB* **76**: 1658, 1998).

Variolaria Bull. [not traced] nom. dub., ? Fungi.

Variolaria Gray (1821) nom. dub., Fungi.

Variolaria Pers. (1794) nom. rej. = Pertusaria.

variolarioid, having powdery or granular tubercules.

Varisulcosporites Rouse & Mustard (1997), Fossil Fungi. 1, British Columbia. See Rouse & Mustard (*Palynology* **21**: 208, 1997).

Varmasporites Kalgutkar & Janson. (2000), Fossil Fungi, anamorphic *Ascomycota*. 1, India. See Kalgutkar & Jansonius (*AASP Contributions Series* **39**: 309, 2000).

Vascellum F. Smarda (1958) = Lycoperdon Pers. See Ponce de Leon (*Fieldiana, Bot.* **32**: 109, 1970; key), Smith (*Bull. Soc. linn. Lyon* num. spéc. **43**: 407, 1974; N America), Homrich & Wright (*CJB* **66**: 1285, 1988; S America), Kreisel (*Blyttia* **51**: 125, 1993; key), Larsson & Jeppson (*MR* **112**: 4, 2008; synonym of *Lycoperdon*).

Vasculomyces S.F. Ashby (1913), anamorphic *Pezizomycotina*, Hso.-.-. 1, West Indies. See Ciferri (*Sydowia* **8**: 258, 1954).

Vasudevella Chona, Munjal & Bajaj (1957), anamorphic *Pezizomycotina*, Cpd.1eH.19. 1, India. See Nag Raj (*CJB* **51**: 1337, 1973).

Vavraia J. Weiser (1977), Microsporidia. 6.

vector, an organism that carries and transmits a pathogen to the host which it attacks, such as an insect carrying fungal mycelium or spores (e.g. *Scolytus* spp. beetles transmitting *Ophiostoma novo-ulmi* to *Ulmus* trees). A **fungus** - carries a virus infection with it when moving from its existing host to a new host; some plant viruses are transmitted to new host plants by association with root-infecting fungi; the vector phase is the motile zoospores in *Olpidium* sp. transmitting *Tombusvirus* and *Necrovirus* spp. and the lettuce big vein and tobacco stunt viruses; *Polymyxa graminis*, *P. betae* and *Spongospora subterranea* transmit viruses in the genus *Furovirus*, and *P. graminis* transmit viruses in the genus *Bymovirus* (see Viruses); **plasmid** -, a plasmid constructed to include a particular gene sequence, and inserted into another fungus where its properties are expressed (see Genetic engineering).

vegetable caterpillar, a mummified lepidopteran larva from which arise teleomorph stromata of *Cordyceps* spp.

vegetative, see assimilative.

vegetative compatibility, the ability of vegetative hyphae to anastomose and form a stable heterokaryon. This ability is restricted genetically by the vegetative incompatibility system such that hyphae differing at one or more loci, termed 'vegetative compatibility' (vc) or 'heterokaryon compatibility (het) loci, are unable to form a stable heterokaryon. Mycelia sharing the same vc loci belong to the same vegetative compatibility group (vcg). Vcg's have been used to determine genetic structures of fungal populations. In most fungi, the vegetative compatibility system is independant of the mating system, which controls sexual compatibility (see sex).

Lit.: Anagnostakis (*Exp. Mycol.* **1**: 306, 1977), Beadle & Coonradlt (*Genetics* **29**: 291, 1944), Brayford (*MR* **94**: 745, 1990), Carlisle (*in* Rayner *et al.* (Eds), *Evolutionary biology of the fungi*, 1987), Caten (*J. Gen. Microbiol.* **72**: 221, 1972), Coates *et al.* (*TBMS* **76**: 41, 1981), Leslie (*Ann. Rev. Phytopath.* **31**: 127, 1993), Mylyk (*Genetics* **83**: 275, 1976), Puhalla (*CJB* **63**: 179, 1985), Todd & Rayner (*Sci. Progress* Oxford **66**: 331, 1980).

veil, see annulus (**apical** -, **hymenial** -), cortina, **marginal** -, **partial** - (**inner** -), **pellicular** -, protoblem (**primordial** -), **universal** -.

veins (of lichens), strands of tissue on the lower surface of foliose lichens, esp. *Peltigera* where they may replace a lower cortex. Gyelnik (*Bot. Közlemén.* **24**: 122, 1927) distinguished 2 types: **caninoid** - where the strands are separated to the tips of the lobes; **polydactyloid** - where the strands are confluent towards the tips of the lobes. Maas Geesteranus also recognized **malaceoid** -, where the undersurface has a few whitish interstices faintly indicating venation.

velar, pertaining to a veil.

Velenovský (Josef; 1858-1949; Czech). Extraordinary Professor of Phytopathology (1892) then Professor of Phytopathology & Plant Systematics (1898-1927) and Director of Botanic Garden of Charles University (1900-1927), Charles University, Prague. Expert on discomycetes. *Publs. České Houby.* 5 parts (1920-1922); *Monographia Discomycetum Bohemiae* 2 vols (1934). Work. *Biogs, obits etc.* Lloyd (*Mycological Notes by C.G. Lloyd* **75**: 1349, 1925); Pilát (*Česká Mykologie* **3**: 65, 1949, portrait) [in Czech]; Kotlaba & Skalický (*Preslia* **30**: 327, 1938).

Veligaster Guzmán (1970) = Scleroderma fide Demoulin & Dring (*Bull. Jard. bot. nat. Belg.* **45**: 343, 1975).

Vellosiella Rangel (1915) [non *Vellosiella* Baill. 1887, *Scrophulariaceae*] ≡ Mycovellosiella.

Velolentinus Overeem (1927) nom. nud. = Panus fide Pegler (*Kew Bull.* Addit. Ser. **10**, 1983).

Velomycena Pilát (1953) = Galerina fide Singer (*Agaric. mod. Tax.* edn 3, 1975).

Veloporphyrellus L.D. Gómez & Singer (1984), Boletaceae. 1, C America. See Gómez & Singer (*Brenesia* **22**: 293, 1984), Watling & Turnbull (*Edinb. J. Bot.* **49**: 343, 1993; South and East Central Africa).

Veloporus Quél. (1888) = Boletus Fr. fide Killermann *in* Engler & Prantl (*Naturl. Pflanzenfam.* **2**, 1928).

velum, see veil.

Velutaria Fuckel (1870), Hyaloscyphaceae. 1, Europe. See Korf (*Mycol.* **45**: 298, 1953).

Velutarina Korf ex Korf (1971), Helotiaceae. 2, widespread. See Korf ex Korf (*Phytologia* **21**: 201, 1971), Zhuang *et al.* (*Mycosystema* **19**: 478, 2000; phylogeny).

Veluticeps (Cooke) Pat. (1894), Gloeophyllaceae. 9, widespread. *V. berkeleyi* (wood rot of *Pinus*). See Gilbertson *et al.* (*Mycol.* **60**: 29, 1968), Hjortstam & Tellería (*Mycotaxon* **37**: 53, 1990), Nakasone (*Mycol.* **82**: 622, 1990; key), Nakasone (*Sydowia* **56**: 258, 2004).

velutinate (**velutinous**), thickly covered with delicate hairs; like velvet; see phalacrogenous.

Velutipila D. Hawksw. (1987), anamorphic *Pezizomycotina*, Hso.0fH.10. 1 (on *Algae*), Austria. See Hawksworth (*Notes R. bot. Gdn Edinb.* **44**: 555, 1987).

Venenarius Earle (1909) ≡ Amanita Pers.

venose, having veins.

ventral, front, or lower surface; the surface facing the axis, cf. dorsal; frequently used for the lower surface of foliose lichens.

ventricose, swelling out in the middle or at one side; inflated (Fig. 23.38).

Ventrographium H.P. Upadhyay, Cavalc. & A.A. Silva (1986), anamorphic *Pezizomycotina*, Hsy.0fH.15. 1, Brazil. See Upadhyay *et al.* (*Mycol.* **78**: 494, 1986).

Venturia De Not. (1844) nom. rej. ≡ Protoventuria.

Venturia Sacc. (1882) nom. cons., Venturiaceae. Anamorph *Fusicladium*. 57, widespread. *V. cerasi* (cherry scab), *V. chlorospora* (willow (*Salix*) scab and canker), *V. inaequalis* (apple scab), *V. pirina* (pear scab) (see *Fusicladium*). See Sivanesan (*Biblthca Mycol.* **59**, 1977; key), Morelet (*Cryptog. Mycol.* **6**: 101, 1985; key 10 spp. on *Populus*), Barr (*Sydowia* **41**: 25, 1989; key 39 N. Am. spp.), Schnabel *et al.* (*Phytopathology* **89**: 100, 1999; DNA), Tenzer & Gessler (*Eur. J. Pl. Path.* **105**: 545, 1999; mol. var.), Ishii & Yanase (*MR* **104**: 755, 2000; spp. on pears), Kasanen *et al.* (*MR* **105**: 338, 2001; on *Populus*), Stehmann *et al.* (*Phytopathology* **91**: 633, 2001; genetics), Ahlholm *et al.* (*Evolution* Lancaster, Pa. **56**: 1566, 2002; genetic diversity), Newcombe (*MR* **107**: 108, 2003; on *Populus*), Beck *et al.* (*Mycol. Progr.* **2**: 8, 2003), Newcombe (*MR* **107**: 108, 2003), Crous *et al.* (*Stud. Mycol.* **58**: 185, 2007; phylogeny).

Venturiella Speg. (1909) [non *Venturiella* Müll. Hal. 1875, *Musci*] ≡ Neoventuria.

Venturiocistella Raitv. (1978), Hyaloscyphaceae. 7, widespread. See Baral (*Z. Mykol.* **59**: 3, 1993; key), Hosoya & Harada (*Mycoscience* **40**: 401, 1999), Raitviir (*Scripta Mycologica* Tartu **20**, 2004; key).

Venturiola.

Venularia Pers. (1822) nom. nud., ? Fungi.

Venustisporium R.F. Castañeda & Iturr. (1999), anamorphic *Pezizomycotina*, Hso.?.?. 1, Venezuela. See Castañeda-Ruíz & Iturriaga (*Mycotaxon* **72**: 455, 1999).

Venustocephala Matsush. (1995), anamorphic *Pezizomycotina*, Hso.0eH.9. 1, Ecuador. See Matsushima (*Matsush. Mycol. Mem.* **8**: 41, 1995).

Venustosynnema R.F. Castañeda & W.B. Kendr. (1990), anamorphic *Pezizomycotina*, Hsy.0eH.15. 1, Cuba. See Castañeda & Kendrick (*Univ. Waterloo Biol. Ser.* **32**: 45, 1990).

Veracruzomyces Mercado, Guarro, Heredia & J. Mena (2002), anamorphic *Pezizomycotina*. 1, Mexico. See Mercado-Sierra *et al.* (*Nova Hedwigia* **75**: 534, 2002).

Veralucia D.R. Reynolds & P.H. Dunn (1982) = Cephaleuros fide Reynolds & Dunn (*Mycol.* **76**: 719, 1984).

Veramyces Matsush. (1993), anamorphic *Pezizomycotina*, Hso.≡ eP.3/10. 1, Peru. See Matsushima (*Matsush. Mycol. Mem.* **7**: 71, 1993).

Veramyces Subram. (1993) [non *Veramyces* Matsush. 1993, anamorphic Ascomycota] nom. inval. = Veramycina fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Veramycina Subram. (1995), anamorphic *Chaetosphaerella*, Hso.0eH.15. 1, Himalaya. See Subramanian (*Kavaka* **20/21**: 58, 1992/1993), Réblová (*Mycotaxon* **70**: 387, 1999).

Verdipulvinus A.W. Ramaley (1999), anamorphic *Pezizomycotina*, Hso.?.?. 1, USA. See Ramaley (*Mycol.* **91**: 132, 1999).

Verlandea Bat. & Cif. (1957) = Stomiopeltis fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Verlotia Fabre (1879) = Heptameria fide Lucas & Sutton (*TBMS* **57**: 283, 1971).

Vermicularia Tode (1790) [non *Vermicularia* Moench 1802, *Verbenaceae*] = Colletotrichum fide Duke (*TBMS* **13**: 156, 1928), Sutton *in* Bailey & Jeger (Eds) (*Colletotrichum: biology, pathology and control*, 1992).

Vermiculariella Oudem. (1898) nom. conf., Fungi. See Petrak (*Annls mycol.* **42**: 58, 1944).

Vermiculariopsiella Bender (1932), anamorphic *Echinosphaeria*, Hsp.0eH.15. 10, widespread. See Nawawi *et al.* (*Mycotaxon* **37**: 173, 1990; key), Mel'nik (*Mikol. Fitopatol.* **33**: 169, 1999), Puja *et al.* (*Cryptog. Mycol.* **27**: 11, 2006; teleomorph).

Vermiculariopsis Höhn. (1918) ≡ Vermiculariopsiella.

Vermiculariopsis Torrend (1912) nom. conf., anamorphic *Pezizomycotina*. See Sutton (*Mycol. Pap.* **141**, 1977).

vermiform, worm-like.

Vermilacinia Spjut & Hale (1995) ? = Ramalina fide Aptroot (*in litt.*).

Vermispora Deighton & Piroz. (1972), anamorphic *Pezizomycotina*, Hso.≡ eH.10. 4 (on *Irenopsis*), widespread. See Deighton & Pirozynski (*Mycol. Pap.* **128**: 87, 1972), Burghouts & Gams (*Mem. N. Y. bot. Gdn* **49**: 57, 1989), Rajashekhar *et al.* (*Mycol.* **83**: 230, 1991).

Vermisporium H.J. Swart & M.A. Will. (1983), anamorphic *Pezizomycotina*, Cac.0fH.19. 14, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*, 1993).

Veronaea Cif. & Montemart. (1957), anamorphic *Pezizomycotina*, Hso.1eP.10. 24 (parasitic on plants, also from humans), widespread. See Ellis (*More Dematiaceous Hyphomycetes*, 1976; key), de Hoog *et al.* (*TBMS* **81**: 485, 1983; relationship to *Ramichloridium*), Wang *et al.* (*Acta Mycol. Sin.* **10**: 159, 1991; *V. botryosa* from humans), Matsushita *et al.* (*J. Clin. Microbiol.* **41**: 2219, 2003; China), Sutton *et al.* (*J. Clin. Microbiol.* **42**: 2843, 2004; USA).

Veronaella Subram. & K.R.C. Reddy (1975), anamorphic *Pezizomycotina*, Cpt.1bH.10. 1, India. See Subramanian & Reddy (*Kavaka* **2**: 27, 1974).

Veronaeopsis Arzanlou & Crous (2007), anamorphic *Venturiaceae*. 1, S. Africa. See Arzanlou *et al.* (*Stud. Mycol.* **58**: 57, 2007), Crous *et al.* (*Stud. Mycol.* **58**: 185, 2007; phylogeny).

Veronaia Benedek (1961), Eurotiales. 3, widespread. See Benedek (*Mycopathologia* **14**: 115, 1961).

Veronidia Negru (1964), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, Rumania. See Negru (*Mycopath. Mycol. appl.* **23**: 241, 1964).

Verpa Sw. (1815), Morchellaceae. *c.* 5, widespread (north temperate). See O'Donnell *et al.* (*Mycol.* **89**: 48, 1997; phylogeny), Wipf *et al.* (*Can. J. Microbiol.* **45**: 769, 1999; ITS diversity), Hansen *et al.* (*Mycol.* **93**: 958, 2001; phylogeny).

Verpatinia Whetzel & Drayton (1945) = Scleromitrula fide Schumacher & Holst-Jensen (*Mycoscience* **38**: 55, 1997).

verruca (pl. **verrucae**), a wart-like swelling.

Verrucaria Weber ex F.H. Wigg. (1780) = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Verrucaria Schrad. (1794) nom. cons., Verrucariaceae (L). *c.* 387 (some on lichens), widespread (esp. north temperate). See Swinscow (*Lichenologist* **4**: 34, 1968; freshwater spp.), Fletcher (*Lichenologist* **7**: 1, 1975; coastal spp.), Zehetleitner (*Nova Hedwigia* **29**: 683, 1978; spp. on lichen spp.), Navarro-Rosinés & Roux (*Bull. Soc. linn. Provence* **39**: 129, 1988; key 8 spp. on lichens), Hawksworth (*Lichenologist* **21**: 23, 1989; Brit., aquatic), McCarthy (*Lichenologist* **27**: 105, 1995; aquatic, Australia), Breuss (*Linzer biol. Beitr.* **30**: 831, 1998; key corticolous & lichenicolous spp.), Bermúdez (*Clementeana* **4**: 52, 1999; key Galician spp.), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000), McCarthy (*Lichenologist* **34**: 207, 2002; Australia), Aragón & Sarrión (*Nova Hedwigia* **77**: 169, 2003; Spain), Halda (*Acta Musei Richnoviensis* Sect. Natur. **10**, 2003; calcicolous spp.), Orange (*Lichenologist* **36**: 173, 2004; GB, Ireland), Sparrius (*Biblthca Lichenol.* **89**: 141 pp., 2004), Schmitt *et al.* (*Mycol.* **97**: 362, 2005; phylogeny), Geiser *et al.* (*Mycol.* **98**: 1053, 2006; phylogeny), Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny).

Verrucaria Scop. (1777) nom. rej. = Dibaeis fide Gierl & Kalb (*Herzogia* **9**: 593, 1993).

Verrucariaceae Zenker (1827), Verrucariales (±L). 46 gen. (+ 98 syn.), 931 spp.

Lit.: Thomson (*Bryologist* **90**: 27, 1987), Aptroot (*Willdenowia* Beih. **21**: 263, 1991), Thomson (*Bryologist* **94**: 351, 1991), Ménard & Roux (*Mycotaxon* **53**: 129, 1995), Breuss (*Annln naturh. Mus. Wien* Ser. B, Bot. Zool. **98**: 35, 1996), Breuss (*Öst. Z. Pilzk.* **5**: 65, 1996), Harada (*Hikobia* **12**: 133, 1996), Breuss (*Annln naturh. Mus. Wien* Ser. B, Bot. Zool. **100**: 671, 1998), Grube (*Nova Hedwigia* **68**: 241, 1999), Hyde & Wong (*MR* **103**: 347, 1999), Heiðmarsson (*MR* **107**: 459, 2003), Andjic *et al.* (*MR* **111**: 1184, 2007; phylogeny).

Verrucariales Mattick ex D. Hawksw. & O.E. Erikss. (1986), (±L). Chaetothyriomycetidae. 2 fam., 54 gen., *c.* 1032 spp. Thallus usually crustose, rarely squamulose or umbilicate, rarely absent. Ascomata perithecial, ± globose, sometimes strongly aggregated, ± superficial or immersed, usually black, thin-walled, sometimes clypeate. Interascal tissue of gelatinized pseudoparaphysis-like hyphae, often evanescent and sometimes altogether absent, the ostiole periphysate. Asci clavate, thin-walled, sometimes with two layers visible near the apex but these not separable, sometimes blueing in iodine, persistent or evanescent. Ascospores usually ellipsoidal, aseptate to muriform, hyaline or brown. Anamorphs pycnidial. Lichenized with green algae, a few lichenicolous or saprobic, cosmop. Fams:

(1) **Adelococcaceae**
(2) **Verrucariaceae**

The *Dermatocarpaceae* are sometimes treated as distinct (e.g. Wanger, *CJB* **65**: 2441, 1987). Gen. concepts still largely based on ascospore colour and septation and in need of a modern revision taking into account ascomatal structure etc.

Lit.: Doppelbauer (*Planta* **53**: 246, 1959; ontogeny), Geiser *et al.* (*Mycol* **98**: 1051, 2006), Grube (*Nova Hedwigia* **68**: 241, 1999; asci), Janex-Favre (1970), McCarthy (*Muelleria* **7**: 317, 1991; Australia), Servít (*Československé lišejníky čelidi Verrucariaceae*, 1954), Swinscow (*Lichenologist* **1-5**, 1960-71; many papers, UK).

Verrucariella S. Ahmad (1967), anamorphic *Pezizomycotina*, Cpd.1eP.?. 1, Pakistan. See Ahmad (*Biologia* Lahore **13**: 41, 1967).

Verrucarina (Hue) Zahlbr. (1931) = Coccotrema fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

verrucarioid (of asci), see ascus.

Verrucariomyces E.A. Thomas ex Cif. & Tomas. (1953) = Verrucaria Schrad. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Verrucarites Göpp. (1845), Fossil Fungi, Ascomycota (?L). 2 (Tertiary), Europe. See Watelet (*Descr. Pl. Foss.*, 1866).

Verrucaster Tobler (1912) nom. dub., anamorphic *Pezizomycotina*. See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **9**: 88, 1981).

Verrucispora D.E. Shaw & Alcorn (1967) [non *Verrucospora* E. Horak, 3 Aug. 1967] ≡ Verrucisporota.

Verrucisporota D.E. Shaw & Alcorn (1993), anamorphic *Mycosphaerellaceae*, Hso.≡ eP.10. 2, Australia; Papua New Guinea. See Shaw & Alcorn (*Aust. Syst. Bot.* **6**: 273, 1993), Beilharz & Pascoe (*Mycotaxon* **82**: 357, 2002), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003).

Verrucobotrys Hennebert (1973), anamorphic *Seaverinia*, Hso.0eP.7. 1, N. America. See Hennebert (*Persoonia* **7**: 193, 1973).

Verrucocladosporium K. Schub., Aptroot & Crous (2007), anamorphic *Capnodiales*. 1 (lichenicolous), British Isles. See Crous *et al.* (*Stud. Mycol.* **58**: 33, 2007).

Verrucophragmia Crous, M.J. Wingf. & W.B. Kendr. (1994), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 1, S. Africa. See Crous *et al.* (*Mycol.* **86**: 448, 1994).

verrucose, having small rounded processes or 'warts'

(Fig. 20.7).

Verrucospora E. Horak (1967), Agaricaceae. 2, Africa (tropical). See Horak (*Ber. schweiz. bot. Ges.* **77**: 363, 1967), Pegler (*Kew Bull.* Addit. Ser. **6**: 384, 1977).

Verrucosporaceae Jülich (1982) = Agaricaceae.

Verrucula J. Steiner (1896), Verrucariaceae (L). 20 (lichenicolous). See Gueidan *et al.* (*MR* **111**: 1145, 2007; phylogeny), Navarro-Rosinés *et al.* (*Bull. Soc. linn. Provence* **38**: 133, 2007; key).

Verruculina Kohlm. & Volkm.-Kohlm. (1990), Testudinaceae. 1 (marine), Liberia. See Kohlmeyer & Volkmann-Kohlmeyer (*MR* **94**: 685, 1990), Schoch *et al.* (*Mycol.* **98**: 1041, 2006; phylogeny).

Verruculopsis Gueidan, Nav.-Ros. & Cl. Roux (2007), Verrucariaceae (±L). 3 (sometimes lichenicolous), Europe. See Navarro-Rosinés *et al.* (*Bull. Soc. linn. Provence* **38**: 133, 2007).

verruculose, delicately verrucose (Fig. 20.6).

verruculotoxin, a tremorgenic toxin from *Penicillium verruculosum* (Cole *et al.*, *Toxicol. appl. Pharmacol.* **31**: 465, 1975).

Versicolorisporium Sat. Hatak., Kaz. Tanaka & Y. Harada (2008), anamorphic *Pezizomycotina*. 1, Japan. See Hatakeyama *et al.* (*Mycoscience* **49**: 211, 2008).

versiform, of different forms; changing form with age.

Versiomyces Whalley & Watling (1989) = Daldinia fide Læssøe (*SA* **13**: 43, 1994).

Versipellis Quél. (1886) nom. rej. ≡ Boletus Fr.

vertex (1) the top of an organ; (2) pileus (obsol.).

Vertexicola K.D. Hyde, V.M. Ranghoo & S.W. Wong (2000), Annulatascaceae. 1, Philippines; Hong Kong. See Hyde *et al.* (*Mycol.* **92**: 1019, 2000).

Verticicladiella S. Hughes (1953) = Leptographium fide Kendrick (*CJB* **40**: 771, 1962), Wingfield (*TBMS* **85**: 81, 1985), Harrington (*Leptographium Root Diseases on Conifers*: 1, 1988).

Verticicladium Preuss (1851), anamorphic *Desmazierella*, Hso.0eP.10. 1, Europe. See Hughes (*Mycol. Pap.* **43**, 1951).

Verticicladus Matsush. (1993), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 1, Peru. See Matsushima (*Matsush. Mycol. Mem.* **7**: 71, 1993).

verticillate, having parts in rings (**verticils**); whorled.

Verticilliaceae Nann. (1934) = Plectosphaerellaceae.

Verticilliastrum Dasz. (1912) ? = Trichoderma Pers. (1794) fide Sutton (*in litt.*).

Verticilliodochium Bubák (1914) = Clonostachys fide Schroers *et al.* (*Mycol.* **91**: 365, 1999).

Verticilliopsis Costantin (1892) nom. dub., anamorphic *Pezizomycotina*. See Gams (*Cephalosporium-artige Schimmelpilze*: 18, 1971).

Verticillis Clem. & Shear (1931) ≡ Verticilliodochium.

Verticillium Nees (1816), anamorphic *Plectosphaerellaceae*, Hso.0eH.15. 51, widespread. *V. alboatrum* and *V. dahliae* cause wilt disease (hadromycosis) in many plants. See also *Lecanicillium*. See Rudolph (*Hilgardia* **5**: 197, 1931; host list), Isaac (*TBMS* **32**: 137, 1949), Rudolph (*Plant Dis. Reptr* Suppl. **244**, 1957), Rudolph (*Plant Dis. Reptr* Suppl. **255**, 1959; deciduous fruit trees), Isaac (*Ann. Rev. Phytopath.* **5**: 201, 1967; speciation), Isaac (*IMI Descr. Fungi Bact.* **255-256**, 1970), Anon. (*IMI Descr. Fungi Bact.* **498**, 1976), Gams & van Zaayen (*Neth. Jl Pl. Path.* **88**: 57, 1982; fungicolous spp., keys sects., 9 spp.), Evans & Samson (*Fundamental and Applied Aspects of Invertebrate Pathology*: 186, 1986; spp. taxonomy on invertebrate hosts), Gams (*Neth. Jl Pl. Viennotidea, see *Viennotidia*.

Viennotidia Negru & Verona ex Rogerson (1970) = Sphaeronaemella fide Hawksworth & Cannon (*J. Linn. Soc.* Bot. **84**: 115, 1982; key), Hutchinson & Reid (*N.Z. Jl Bot.* **26**: 63, 1988), Dissing *in* Hawksworth (Ed.) (*Ascomycete Systematics. Problems and Perspectives in the Nineties* NATO ASI Series vol. **269 269**: 375, 1994; status), Hausner & Reid (*CJB* **82**: 752, 2004; phylogeny).

Viennotiella Negru (1964) ? = Heteropatella fide Sutton (*Mycol. Pap.* **141**, 1977).

villi (sing. **villus**), long soft hairs.

villose (villous), covered with villi, which are not matted; cf. tomentose.

Vinculum R.Y. Roy, R.S. Dwivedi & P.K. Khanna (1965) = Barnettella fide Rao & Rao (*Indian Phytopath.* **26**: 233, 1973).

vinescent, turning wine-red.

violet root rot, of a number of plants (*Helicobasidium purpureum*).

virescent, turning green.

Virgaria Nees (1816), anamorphic *Ascovirgaria*, Hso.0eP.10. 1, widespread. See Rogers & Ju (*CJB* **80**: 478, 2002; teleomorph).

Virgariella S. Hughes (1953), anamorphic *Pezizomycotina*, Hso.0eP.10. 11, widespread. See Sutton (*Sydowia* **44**: 321, 1993; related genera), Delgado-Rodríguez & Mena-Portales (*Cryptog. Mycol.* **24**: 153, 2003; Cuba).

Virgasporium Cooke (1875) = Cercospora Fresen. fide Saccardo (*Syll. fung.* **4**: 435, 1886).

virgate, banded; streaked.

Virgatospora Finley (1967), anamorphic *Pezizomycotina*, Hsy.≡ eP.?. 2, Panama. See Finley (*Mycol.* **59**: 538, 1967).

Virgella Darker (1967), Rhytismataceae. 1, N. America. See Darker (*CJB* **45**: 1419, 1967).

Viridiannula Etayo (2002), Pezizomycotina. 1.

viridin, an antibiotic from *Gliocladium virens*; antifungal (Brian *et al.*, *Ann. appl. Biol.* **33**: 190, 1946).

Viridispora Samuels & Rossman (1999), Nectriaceae. Anamorph *Penicillifer*. 4 (bark, wood etc.), widespread (tropical). See Rehner & Samuels (*CJB* **73** Suppl. 1: S816, 1995; phylogeny), Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999), Rossman *et al.* (*Mycol.* **93**: 100, 2001; phylogeny), Samuels *et al.* (*CBS Diversity Ser.* **4**, 2006; USA).

virose (1) poisonous; (2) having a strong and unpleasant smell.

virulence, the degree or measure of pathogenicity; **virulent**, strongly pathogenic.

Viruses in fungi (mycoviruses). The text of this entry is unrevised and remains the same as for the ninth edition. Many fungi are infected by viruses which typically have double-stranded RNA genomes but 'mycoviruses' with DNA or single-stranded RNA genomes are also known. Those viruses so far classified are in the families *Barnaviridae* (gen. *Barnavirus*) and *Totiviridae* (gen. *Totivirus*) or the genus *Rhizidiovirus*. Unclassified viruses are known which infect fungi in the genera *Agaricus*, *Allomyces*, *Aspergillus*, *Colletotrichum*, *Gaeumannomyces*,

Helminthosporium, *Lentinus* and *Periconia*.

Most viruses of fungi induce only inapparent effects. However some notable effects are hypovirulence of chestnut blight fungus (see *Hypovirus*) and die-back of cultivated mushrooms.

Some fungi act as vectors in the transmission of plant viruses from plant to plant (see vectors).

The naming of viruses has undergone extensive revision in recent years, rendering much of the early literature difficult to interpret. The main viruses infecting fungi (see Murphy *et al.*, 1995) are:

Barnavirus (fam. *Barnaviridae*): bacilliform virions containing a single molecule of positive-sense single-stranded RNA, *c.* 4.4 kb in size; infecting *Agaricus* spp.

Chrysovirus (fam. *Partitiviridae*): isometric virions containing 1 of 3 molecules of linear 2-stranded RNA about 3 kbp in size; infecting *Penicillium* and probably *Helminthosporium*.

Hypovirus (fam. *Hypoviridae*): genomes of linear 2-stranded RNA of 10 to 13 kbp in size, no virions are formed by infected cells contain lipid vesicles which contain the genome RNA; infecting *Cryphonectria parasitica* and causing hypovirulence.

Partitivirus (fam. *Partitiviridae*): isometric particles and genomes which comprise 2 molecules of linear 2-stranded RNA, 1.4 to 2.2 kpb in size; infecting *Agaricus*, *Aspergillus*, *Gaeumannomyces*, *Penicillium*, *Rhizoctonia* and probably *Diplocarpon* and *Phialophora*; the infections are latent.

Rhizidiovirus (fam. uncertain): isometric virions which contain a single molecule of *c.* 25 kbp linear 2-stranded DNA; infecting *Rhizidiomyces*.

Totivirus (fam. *Totiviridae*): isometric virions which contain a single molecule of linear 2-stranded RNA, 4.6 to 6.7 kbp in size; infecting *Helminthosporium*, *Saccharomyces*, *Ustilago* and probably *Aspergillus*, *Gaeumannomyces* and *Mycogone*; the infections are often latent.

Waldemaria Bat., H. Maia & Cavalc. (1960) [non *Waldemaria* Klotzsch 1862, *Ericaceae*] = Arachniotus fide Orr & Kuehn (*Mycol.* **63**: 191, 1971), Currah (*Mycotaxon* **24**: 1, 1985).

Walkeromyces Thaung (1976) = Mycovellosiella fide Deighton (*Mycol. Pap.* **144**, 1979).

wall building, descriptive of hyphal growth in which cell wall material is produced by certain ultrastructural secretory bodies in the cytoplasm. Three types of wall building may be distinguished (Fig. 26): **apical** - in which the bodies are concentrated at the hyphal tip, producing new wall by distal growth, forming a cylindrical hypha in which the youngest wall material is at the tip; **ring** -, in which the bodies are concentrated adjacent to the cell wall at some point below the tip, in the shape of an imaginary ring, producing new wall by proximal growth, forming a cylindrical hypha in which the youngest wall material is always at the base; **diffuse** -, in which the bodies occur throughout the cytoplasm at a low concentration, producing lateral growth (i.e. swelling of the cylindrical hypha) by alteration of pre-existing wall.

The terms assume special significance in conidial development, where they have been used to clarify the concepts of thallic and blastic. Apical wall building occurs in *Geniculosporium*, *Cladosporium* and *Scopulariopsis*, and 'phialides' where conidia are produced in gummy masses (e.g. *Trichoderma*) or false chains (e.g. *Mariannaea*). Ring wall building occurs in 'phialides' with conidia in true chains (e.g. *Penicillium, Chalara*), in so-called meristem arthrospores (e.g. *Wallemia*) and in conidiogenous cells of basauxic fungi (e.g. *Arthrinium*). Diffuse wall building occurs simultaneously with or shortly after apical or ring wall building in most of the preceding examples, but its occurrence is much delayed or even absent in thallic development (e.g. *Geotrichum*). Wall building is a preferable term to meristem which implies growth by cell division rather than within a single cell. See Minter *et al.* (*TBMS* **79**: 75, 1982, **80**: 39, 1983, **81**: 109, 1983). Also see Anamorphic fungi.

Wallemia Johan-Olsen (1887), anamorphic *Wallemiaceae*, Hso.0eH.?38. 2, widespread. *W. sebi* is osmophilic. WDCM. World Data Center on Microorganisms (National Institute of Genetics, Nishima, Japan; formerly University of Queensland), administered jointly by the World Federation of Culture Collections and MIRCEN, this centre maintains records of over 475 culture collections (including fungal collections) in over 60 countries; website (www.wfcc.info/datacenter.html), see also Genetic resource collections, MIRCEN.

Weathering. Physical, chemical and biological processes can bring about the weathering of rocks. All these factors ultimately result in fragmentation of the rock into smaller particles which can then contribute to the mineral fraction of soils. The biological weathering of rocks and their constituent minerals involves biogeochemical and biogeophysical weathering processes, the former bringing about a change in the chemical stability and composition of rocks and their minerals through the action of living organisms and their metabolic activities and the latter resulting in a mechanical disruption of the rocks and their constituent minerals (Silverman, *in* Trudinger & Swaine, *Studies in environmental science* **3**: 445, 1979).

One of the few detailed studies of life on rock surfaces was by Webley *et al.* (*J. Soil Sci.* **14**: 102, 1963) who recorded the numbers of fungi (as well as of bacteria, actinomycetes and other microorganisms) in the interior of porous weathered stones (none were found in unweathered stones). Fungi, notably *Trichoderma* sp. were found growing directly on sandstone (Williams & Rudolph, *Mycol.* **66**: 648, 1974). *Alternaria* sp., *Acremonium* sp. and various species of *Penicillium* were also noted by these authors. *Penicillium simplicissimum* has been isolated from the surface of weathered basalt (Silverman & Munoz, *Science* **169**: 985, 1970). The biodegradation of basalt by *P. simplicissimum* was studied by Mehta *et al.* (*Biotechnol. & Bioengin.* **21**: 875, 1979) who showed that organic acids were responsible for the decomposition processes although the organism was not isolated from the rock substratum. A range of fungi have been found from the interior of rock, mostly in deserts (including Antarctic dry deserts) but also from exposed rocks in other ecosystems, and even rocks of buildings and statues. These species, mostly black yeasts (see Yeasts: black) have been described as cryptoendolithic, and their biology has been extensively studied, particularly by Friedmann (q.v.), partly because of their importance in biodegradation but also, in the case of Antarctic fungi, as a model for possible life on Mars (Selbmann *et al.*, *Studies in Mycology* **51**: 1, 2005).

A high proportion of the organisms isolated by Webley *et al.* (1963) rendered silicates soluble when tested in pure culture and the authors (Henderson & Duff, *J. Soil Sci.* **14**: 236, 1963) concluded that fungi which produced citric and/or oxalic acid proved effective in decomposing certain natural silicates while an oxalic acid-producing strain also released metallic ions and silica from rocks and soils. Among the fungi studied were *Penicillium* spp. and species of *Trichoderma*, *Mucor* and *Spicaria*. Weathering of the edges of biotite flakes by *Aspergillus niger* was noted by Boyle & Voigt (*Science* **169**: 193, 1967) in pure culture studies and the activity was attributed to oxalic and citric acids. Cromack *et al.* (*Soil Biol. Biochem.* **11**: 463, 1979) have presented evidence for the accumulation of calcium oxalate in the fungal mats of the ectomycorrhizal fungus *Hysterangium crassum* associated with Douglas fir (*Pseudotsuga menziesii*) roots. This precipitation was brought about by oxalic acid secreted by the fungus and this was considered to be the reason for weathering of the igneous rock, andesite, in the root vicinity.

The weathering effects of crustose lichens on rock surfaces can manifest themselves as etch patterns on the rock minerals which can involve the transformation of certain minerals to siliceous relics and the formation of crystalline organic salts such as oxalates in the lichen thallus; the chemical composition of these oxalates is directly related to the substrate (Jones, *in* Galun (Ed.), *Handbook of lichenology* **3**: 109, 1988; Wilson & Jones, *in* Wilson (Ed.), *Residual deposits*, Sp. Publ. **11**: 5, 1983). See also Biodeterioration.

Wine making. E.C. Hansen (q.v.), later a director of the Carlsberg Physiological Laboratory, first showed that yeasts were invariably present in the soils of vineyards. Hansen's use of pure culture techniques in brewing were introduced into the wine industry between 1880 and 1890. The first distribution of pure yeast cultures for wine making was made from Geisenheimam Rhein in 1890. The term 'pure yeast culture' as used in wine making is not precise, since grape **must** (the juice produced after the grapes are crushed) is not sterile before the addition of the yeast starter. Sulphur dioxide and large amounts of yeast starter overwhelm the other organisms naturally present and result in a fermentation by *Saccharomyces cerevisiae*. Suitable strains must have: a high ethanol-producing ability (18-20% vol/vol), be cold resistant (fermenting at 4°C), be resistant to sulphite, ethanol (have an ability to start a new fermentation at 8-12% ethanol), tannin, and high concentrations of sugar (able to start fermentation above 30% wt/vol of sugar), be heat resistant (ability to ferment at 30-32°C), and be able to produce low volatile acidity (mostly as acetic acid). In wine making sulphur dioxide is added to the grape must at the rate of 50-200 ppm for 2 h prior to adding the yeast. The temperature of the fermentation (in vats) is controlled and usually below 30°C; high temperatures can destroy the wine. In general, red wines ferment for 3-6 days at 20-30°C, and white for 1-2 weeks at 10-21°C. The fermented juice is then drawn off from the residues and stored in a second vat for 7-11 days at 20-30°C. The wine is then racked, stored and aged to allow for clearing and flavour and colour development. Another form of wine depends on the 'noble rot' (*Botrytis cinerea*); grapes left on the vine until they are overripe become mouldy with *B. cinerea*, the grapes crack open, and the fungus lives on the juice and the sugar content increases; the mouldy and shrivelled grapes are hand-picked, and made into Sauterne (France), Tokai (Hungary), and Trockenbeerenauslesen (Germany).

wolf's-moss, *Letharia vulpina*, from Scandinavian belief that it was poisonous to wolves.

Wolkia Ramsb. (1915), Pezizomycotina. 1, Java.

Wood-attacking fungi. Wood is not an easily degraded substratum. It is usually low in nitrogen and phosphorus, two elements essential for hyphal growth; hardwoods contain tannings, and softwoods various phenolic compounds, and these are generally toxic to fungi; wood also contains few easily assimilable sugars and starches, most of the organic material being in the form of cellulose, hemicellulose and lignin. Lignin in particular is resistant to enzymes, and covers other cellular material in the wood protecting it from decay. As a result, only certain specialized fungi are associated with wood decay. These, with the exception of a few ascomycetes (e.g. *Chaetomium, Ustulina, Xylaria*) are basidiomycetes, the following genera being specially important: *Armillaria, Coniophora, Collybia, Coriolus, Daedalea, Echinodontium, Fistulina, Fomes, Ganoderma, Heterobasidion, Hydnum, Hymenochaete, Lentinus, Lenzites, Merulius, Peniophora, Phellinus, Pholiota, Piptoporus, Polyporus, Poria, Serpula, Schizophyllum, Stereum, Trametes*.

There are three generally-recognized types of timber decay, based partly on symptoms: (1) **Brown rots** - cellulose and hemicellulose are decayed, but lignin remains more or less intact; symptoms are brick-shaped cracks, the wood becoming brown and crumbling when handled; production of the enzyme glucose oxidase is associated with this type of rot and may be a diagnostic feature; only basidiomycetes are associated with brown rots, typical examples being *Piptoporus betulinus* and *Serpula lacrymans*; (2) **White rots** - all components of the wood (cellulose, hemicellulose and lignin) are degraded more or less simultaneously, and the wood becomes progressively more fragile while remaining pale; *Armillaria* and *Heterobasidion* are two basidiomycete genera causing economically important white rots in standing timber, and white rots are also caused by some ascomycetes, e.g. species of *Xylaria*. (3) **Soft rots** - similar to brown rots (in that cellulose and hemicellulose are decayed, with lignin remaining more or less intact), but occurring in wood with a high moisture content and with nitrogen available; soft rot fungi are found in rotting window frames, decaying floor boards, jetties, cooling tower slats and fence posts (where, typically, nitrogen is obtained from the surrounding soil).

Rots of standing timber, due to colonization by fungi via wounds, broken branches and dead roots are sometimes classified by rot position, e.g. **top rot** (branches), **core** or **heart rot** (trunk), **butt rot** (base). Two other terms used to describe wood rots should be noted: (1) **Dry rot** - a brown rot caused by *Serpula lacrymans*. This is a major decay fungus of buildings in temperate areas. The name is misleading as stable damp conditions are needed for initiation of growth. As the fungus develops, it conducts water to drier wood through hyphal strands which penetrate masonry and plaster though not feeding on those materials. Eradication can be difficult and costly. See Jennings & Bravery (*Serpula lacrymans: fundamental biology and control strategies*, 1991). (2) **Wet rot** - caused by many fungal species, including brown, white and soft rot types. A common example is *Coniophora puteana*, the 'cellar fungus'.

Certain fungi are a cause of staining in wood. Stored wood may be stained by the growth of surface moulds (*Alternaria, Aspergillus, Mucor, Penicillium, Rhizopus*, etc.) or by fungi in the wood (e.g. *Ophiostoma*, a cause of 'blue stain'), sometimes of living trees. Brown oak (*Quercus*) wood stained by *Fistulina hepatica*; Cartwright, *TBMS* **21**: 68, 1937) is valued, and wood coloured green by *Chlorociboria aeruginascens* is used in making 'Tunbridge Ware'. Wood having 'zone lines' (q.v.) is sometimes used for ornaments (see spalted wood). Some wood staining fungi also damage wood pulp; see Melin & Nannfeldt (*Svenska Skogvs Fören. Tidskr.* **314**: 397, 1934).

Forest hygiene and good forestry practice are the chief methods by which decay in living trees is controlled. In cut trees, in stored wood, and wood in buildings, steps may be taken to maintain conditions in which fungal growth does not take place: water content of the wood and the air are kept low, with good ventilation, and fungicides used. A range of preservatives is available for preservation of wood, but subject to various mational regulations in their use. In the UK, for example, only products cleared for use under the Control of Pesticides Regulations (www.hse.gov.uk/biocides/copr/index.htm) should be

used. Active ingredients may include coal tar creosote (a coal tar oil), copper and zinc naphthenates, organotin compounds, phenolic compounds, and copper, chromium and arsenic salts.

J. Med. Mycol.* **47**: 113, 2006; phylogeny), Lindblom & Ekman (*Lichenologist* **39**: 259, 2007; population biology), Gaya *et al.* (*MR* **112**: 528, 2008; phylogeny).

Xanthoriicola D. Hawksw. (1973), anamorphic *Pezizomycotina*, Hsp.0eP.15. 1 (on lichens, *Xanthoria*), Europe. See Hawksworth (*Bull. Br. Mus. nat. hist.* Bot. **6**: 183, 1979; SEM).

Xanthoriomyces E.A. Thomas ex Cif. & Tomas. (1953) ≡ Xanthoria.

Xanthothecium Arx & Samson (1973), Onygenaceae. 1, widespread. See Currah (*Mycotaxon* **24**: 1, 1985; posn).

Xeilaria, see *Cheilaria.*

Xenasma Donk (1957), Xenasmataceae. 9, Europe; N. America. See Hjortstam *et al.* (*Cortic. N. Europ.* **8**, 1988; key Eur. spp.) Sensu lato 48 spp., Liberta (*Mycol.* **52**: 884, 1962; key).

Xenasmataceae Oberw. (1966), Polyporales. 3 gen., 27 spp.

Lit.: Hallenberg (*Mycotaxon* **27**: 361, 1986), Hjortstam & Larsson (*Mycotaxon* **29**: 315, 1987), Lin & Chen (*Taiwania* **35**: 69, 1990), Nakasone (*Mycol. Mem.* **15**: 412 pp., 1990), Maekawa (*Rep. Tottori Mycol. Inst.* **31**: 1, 1993), Ginns (*Mycol.* **90**: 19, 1998), Greslebin & Rajchenberg (*N.Z. Jl Bot.* **41**: 437, 2003), Larsson *et al.* (*MR* **108**: 983, 2004).

Xenasmatella Oberw. (1966), Xenasmataceae. 14, widespread. See Hjortstam *et al.* (*Cortic. N. Europ.* **8**, 1988; sub *Phlebiella*).

Xenidiocercus Nag Raj (1993), anamorphic *Pezizomycotina*, Cpd.0eH.19. 3, India; W. Africa. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*: 975, 1993), Wu & Sutton (*Mycoscience* **36**: 271, 1995).

xenobiotic (1) a chemical not normally synthesized or metabolized by living organisms, e.g. a manufactured drug; (2) chemical waste or other pollutant toxic to a living organism.

Xenobotrytis R.F. Castañeda & W.B. Kendr. (1990) = Paracostantinella fide Kendrick (*in litt.*).

Xenocalonectria Crous & C.L. Schoch (2000), Nectriaceae. Anamorph *Xenocylindrocladium*. 1, Ecuador. See Schoch *et al.* (*Stud. Mycol.* **45**: 45, 2000), Crous (*Taxonomy and Pathology of Cylindrocladium (Calonectria) and Allied Genera*: 278 pp., 2002).

Xenochalara M.J. Wingf. & Crous (2000), anamorphic *Pezizomycotina*. 1, Netherlands. See Coetsee *et al.* (*S. Afr. J. Bot.* **66**: 101, 2000).

Xenochora Petr. (1948), anamorphic *Pezizomycotina*, Cpd.0eH/1eP.?. 1, Ecuador.

Xenocylindrocladium Decock, Hennebert & Crous (1997), anamorphic *Xenocalonectria*, Hso.?.?. 3, Ecuador. See Decock *et al.* (*MR* **101**: 788, 1997), Schoch *et al.* (*Stud. Mycol.* **45**: 45, 2000), Crous *et al.* (*Mycoscience* **42**: 559, 2001), Crous (*Taxonomy and Pathology of Cylindrocladium (Calonectria) and Allied Genera*: 278 pp., 2002).

Xenodiella Syd. (1935), anamorphic *Xenodium*, Hsp.0eH.?. 1, S. America.

Xenodimerium Petr. (1947) ? = Eudarluca fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Xenodiscella Petr. (1954) = Rhagadolobium fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Xenodium Syd. (1935), Elsinoaceae. Anamorph *Xenodiella*. 1, S. America.

Xenodochus Schltdl. (1826), Phragmidiaceae. 2 (on *Sanguisorba* (*Rosaceae*)), widespread (north temperate). See Sato & Sato (*TMSJ* **21**: 411, 1980; life cycle).

Xenodomus Petr. (1922), anamorphic *Pezizomycotina*, Cpd.0eH.?. 1, N. America.

Xenogliocladiopsis Crous & W.B. Kendr. (1994), anamorphic *Arnaudiella*, Hso.0eH.15. 1, S. Africa. See Crous & Kendrick (*CJB* **72**: 63, 1994).

Xenogloea Syd. & P. Syd. (1919) ≡ Kriegeria Bres.

Xenoheteroconium Bhat, W.B. Kendr. & Nag Raj (1993), anamorphic *Pezizomycotina*, Hso.≡ eP.1. 1, India. See Bhat & Kendrick (*Mycotaxon* **49**: 80, 1993).

Xenokylindria DiCosmo, S.M. Berch & W.B. Kendr. (1983), anamorphic *Pezizomycotina*, Hso.1eH.19. 1, Japan. See DiCosmo *et al.* (*Mycol.* **75**: 971, 1983).

Xenolachne D.P. Rogers (1947), Tremellales. 2, USA; Europe. See Grauwinkel (*Rheinland-Pfälzisches Pilzjournal* **3**: 3, 1993).

Xenolecia Hertel (1984), Porpidiaceae (L). 1, Chile. See Hertel (*Nova Hedwigia* Beih. **79**: 439, 1984).

Xenolophium Syd. (1925), Melanommataceae. 4, widespread (tropical). See Huhndorf (*Mycol.* **85**: 490, 1993).

Xenomeris Syd. (1924), Capnodiales. Anamorphs *Hormonema*-like, *Sclerophoma*. *c.* 11, widespread. *X abietis* (dieback of conifers). See Funk & Shoemaker (*Mycol.* **63**: 567, 1971), Samuels *et al.* (*Brittonia* **40**: 392, 1988), Barr (*Sydowia* **41**: 25, 1989), Winton *et al.* (*Mycol.* **99**: 240, 2007; phylogeny).

Xenomyces Ces. (1879) = Sclerocystis fide Zycha *et al.* (*Mucorales*, 1969).

Xenomyxa Syd. (1939), Pezizomycotina. 1, Ecuador.

Xenonectria Höhn. (1920) = Byssosphaeria fide Barr (*Mycotaxon* **20**, 1984).

Xenonectriella Weese (1919), Nectriaceae. 4 (lichenicolous), widespread. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Xenopeltis Syd. & P. Syd. (1919), anamorphic *Pezizomycotina*, Cpt.0eH.?. 1, Philippines.

Xenoplaca Petr. (1949), anamorphic *Pezizomycotina*, Hso.0eP.?. 1, S. America. See von Arx (*Persoonia* **11**: 388, 1981; redescr.).

Xenopus Penz. & Sacc. (1901) nom. dub., Agaricomycetes. 'basidiomycetes'. See Hughes (*CJB* **36**: 747, 1958).

Xenosoma Syd. & P. Syd. (1921) nom. dub., Agaricomycetes. 'gasteromycetes' or ? *Trichosphaeriales*.

Xenosperma Oberw. (1965), Xenasmataceae. 4, widespread. See Oberwinkler (*Sydowia* **19**: 45, 1965).

Xenosphaeria Trevis. (1860) = Dacampia fide Alstrup & Hawksworth (*Meddr Grønland* Biosc. **31**, 1990).

xenospore, a spore dispersed from its place of origin (Gregory, *in* Madelin, 1966). Cf. memnospore.

Xenosporella Höhn. (1923) = Xenosporium fide Pirozynski (*Mycol. Pap.* **105**, 1966).

Xenosporium Penz. & Sacc. (1901), anamorphic *Thaxteriellopsis*, Hso.#eP.1. 13, widespread (esp. tropical). See Pirozynski (*Mycol. Pap.* **105**, 1966; key), Goos (*Mycol.* **82**: 742, 1990; key), Bussaban *et al* (*Fungal Diversity* **14**: 61, 2003; Thailand), Zhao *et al.* (*Nova Hedwigia* **82**: 127, 2006).

Xenostele Syd. & P. Syd. (1921), Pucciniaceae. 4 (on *Lauraceae*), Asia. See Cummins (*Illustr. Gen. Rust Fungi*, 1959; as *Puccinia*), Zhuang (*Mycosystema* **3**: 29, 1990; species on *Lauraceae* (as *Puccinia*)).

Xenostigme Syd. (1930), ? Meliolaceae. 1 (from leaves), S. America.

Xenostigmella Petr. (1950) ? = Balladynopsis fide Sivanesan (*Mycol. Pap.* **146**, 1981).

Xenostigmina Crous (1998) ? = Pseudocercospora fide Crous (*Mycol. Mem.* **21**: 154, 1998), Crous & Braun (*CBS Diversity Ser.* **1**: 571 pp., 2003), Batzer *et al.* (*Mycol.* **97**: 1268, 2005).

Xenostilbum Petr. (1959) = Calostilbella fide von Arx (*Persoonia* **11**: 391, 1981).

Xenostomella Syd. (1930), Microthyriaceae. 2, S. America.

Xenostroma Höhn. (1915), anamorphic *Pezizomycotina*, St.0eH/1eP.?. 1, Europe.

Xenothecium Höhn. (1919), ? Hyponectriaceae. 1, S. America.

Xenotypa Petr. (1955), Valsaceae. 1, Europe; N. America. See Pirozynski (*CJB* **52**: 2129, 1974), Barr (*Mycol. Mem.* **7**, 1978).

Xenus Kohlm. & Volkm.-Kohlm. (1992), Pyrenulales. 1 (on coralline alga), Belize. See Eriksson & Hawksworth (*SA* **11**: 189, 1993).

Xepicula Nag Raj (1993), anamorphic *Pezizomycotina*, Ccu.0eH/1eP.15. 2, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*: 979, 1993), Seifert *et al.* (*Mycotaxon* **87**: 317, 2003).

Xepiculopsis Nag Raj (1993), anamorphic *Pezizomycotina*, Ccu.0eH/1eP.15. 2, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*: 9823, 1993), Seifert *et al* (*Mycotaxon* **87**: 317, 2003).

xero- (prefix), dry; drought.

Xerocarpus P. Karst. (1881) [non *Xerocarpus* Guill., Perr. & A. Rich. 1832, *Papilionaceae*] = Phanerochaete fide Donk (*Taxon* **6**: 17, 1957).

Xerocomaceae Pegler & T.W.K. Young (1981) = Boletaceae.

Xerocomellus Šutara (2008) = Boletus Fr. fide Kuyper (*in litt.*).

Xerocomopsis Reichert (1940) ≡ Boletus Fr.

Xerocomus Quél. (1887) nom. cons. = Boletus Fr. fide Kuyper (*in litt.*).

Xeroconium D. Hawksw. (1981), anamorphic *Pezizomycotina*, Cpd.0eP.19. 1, Finland. See Hawksworth (*Bull. Br. Mus. nat. Hist.* Bot. **9**: 33, 1981).

Xerocoprinus Maire (1907), Agaricaceae. 1, Africa.

Xerodiscus Petr. (1943) = Arthonia fide Müller & von Arx (*Beitr. Kryptfl. Schweiz* **11** no. 2, 1962).

Xeromedulla Korf & W.Y. Zhuang (1987), Helotiaceae. 3, China; Philippines. See Zhuang & Korf (*Mycotaxon* **30**: 189, 1987).

Xeromphalia, see *Xeromphalina*.

Xeromphalina Kühner & Maire (1934), ? Mycenaceae. *c.* 30, widespread. See Smith (*Pap. Mich. Acad. Sci.* **38**: 53, 1953; N. Am.), Singer (*Boln Soc. argent. Bot.* **10**: 302, 1965), Miller (*Mycol.* **60**: 156, 1968; key 12 N. Am. spp.), Horak (*Sydowia* **32**: 131, 1979; Indomalaya & Austral. spp.), Klán (*Česká Mykol.* **38**: 205, 1984; Eur. spp.), Antonín (*Mykol. Listy* **82**: 1, 2002; key Centr. Eur. spp.), Antonín & Noordeloos (*A monograph of the genera Hemimycena,* □, 2004), Clémençon (*Persoonia* **18**: 449, 2005; basidiome developm).

Xeromyces L.R. Fraser (1954) = Monascus fide Hawksworth & Pitt (*Aust J. Bot.* **31**: 51, 1983; posn), Pitt & Hocking (*CSIRO Food Res. Q* **42**: 1, 1983), Udagawa *et al.* (*TMSJ* **27**: 303, 1986), Kuraishi *et al.* (*Antonie van Leeuwenhoek* **77**: 179, 2000; ubiquinones), Park & Jong (*Mycoscience* **44**: 25, 2003; phylogeny), Stchigel *et al.* (*Stud. Mycol.* **50**: 299, 2004; phylogeny).

xerophilic, favouring habitats in which water is not available; either living in desert conditions or where water is not generally available because of the physiological status of cells (c.f. water activity).

xerophyte, a plant of dry habitats; sometimes incorrectly applied to fungi.

Xerosporae, hyphomycetes and coelomycetes with dry spores. Cf. *Gloiosporae* See Wakefield & Bisby (*TBMS* **25**: 49, 1942).

Xerotinus Rchb. (1828) ≡ Xerotus.

xerotolerant, able to grow under dry conditions (Pitt *in*

Duckworth (Ed.), *Water relations of foods*, 1975).

Xerotrema Sherwood & Coppins (1980), Odontotremataceae. 1, British Isles. See Sherwood & Coppins (*Notes R. bot. Gdn Edinb.* **38**: 368, 1980), Lumbsch *et al.* (*Mol. Phylogen. Evol.* **31**: 822, 2004; phylogeny).

Xerotus Fr. (1828), Polyporaceae. 4, Africa. See Pegler (*The polypores [Bull. BMS Suppl.]*, 1973; sub *Xerotinus*), Ryvarden (*Syn. Fung.* **5**, 1991).

Xerula Maire (1933), Physalacriaceae. *c.* 15, widespread (north temperate). See Dörfelt (*Mycotaxon* **15**: 62, 1982; nomencl., bibliogr.), Petersen & Nagasawa (*Rep. Tottori Mycol. Inst.* **43**, 2006).

Xerulaceae Jülich (1982) = Physalacriaceae.

Lit.: Redhead (*CJB* **66**: 479, 1988) however, they fit well in the *Physalacriaceae* clade; see, Moncalvo *et al.* (*Syst. Biol.* **49**: 278, 2000), Matheny *et al.* (*Mycol.* **98**: 982, 2006).

Xerulina Singer (1962) = Cyptotrama fide Kuyper (*in litt.*).

Xiambola Minter & Hol.-Jech. (1981), anamorphic *Pezizomycotina*, Ccu.1eH.38. 1, Czech Republic. See Minter & Holubová-Jechová (*Folia geobot. phytotax.* **16**: 213, 1981).

Xiphomyces Syd. & P. Syd. (1916), anamorphic *Pezizomycotina*, Hsp.0eP.?. 2, Philippines; Tristan da Cunha.

Xylaria Hill ex Grev. (1823) nom. rej. prop. ≡ Cordyceps.

Xylaria Hill ex Schrank (1789) nom. cons., Xylariaceae. Anamorphs *Moelleroclavus*, *Geniculosporium*-like, *Xylocoremium*. *c.* 300, widespread (esp. tropical). *X. digitata* (root rot of hardwoods); *X. hypoxylon*, the Candle-snuff fungus (black root rot of apple); *X. vaporaria* (an invader of mushroom beds). Xylariales Nannf. (1932). Xylariomycetidae. 9 fam., 209 gen., 2487 spp. Stromata usually well-developed, mostly consisting only of fungal tissue. Ascomata perithecial, rarely cleistothecial, ± globose, superficial or immersed in the stroma, usually black- and thick-walled, the ostiole usually papillate, periphysate. Interascal tissue well-developed, of narrow paraphyses. Asci cylindrical, persistent, relatively thick-walled but without separable layers, with an often complex J+ apical ring, usually 8-spored, ± spherical in some cleistocarpous taxa and without apical apparatus. Ascospores usually pigmented, sometimes transversely septate, with germ pores or slits, sometimes with a mucous sheath or mucous appendages. Anamorphs varied, usually hyphomycetous, some pycnidial. Saprobes and plant parasites, mainly on bark or wood, some associated with termitaria, cosmop.

Probably polyphyletic; the *Amphisphaeriaceae* have been given their own order by some authors and other fams (esp. *Hyponectriaceae*) are still poorly understood. Fams:

(1) **Amphisphaeriaceae**
(2) **Cainiaceae**
(3) **Clypeosphaeriaceae**
(4) **Diatrypaceae**
(5) **Graphostromataceae**

(6) **Hyponectriaceae**
(7) **Iodosphaeriaceae**
(8) **Myelospermataceae**
(9) **Xylariaceae**

Yatesula Syd. & P. Syd. (1917), Chaetothyriaceae. 3 or 2, widespread (tropical). See Magnes (*Biblthca Mycol.* **165**, 1997).

Ybotromyces Rulamort (1986), anamorphic *Pezizomycotina*, Hso.0eP.38. 1 (from humans), Spain. See Benoldi *et al.* (*J. Med. Vet. Mycol.* **29**: 9, 1991; cutaneous phaeohyphomycosis, as *Botryomyces*).

yeasticidal, able to kill yeasts (q.v.).

Yeasts. Unicellular, budding fungi. The yeasts are not a formal taxonomic unit but a growth form exhibited by a range of unrelated fungi, and one exhibited in some cases by primarily filamentous forms as a part of the life-cycle or under particular environmental conditions. The yeast growth form is typically unicellular, with asexual reproduction occurring by budding (an at least some cases this seems to involve the same processes as conidiogenesis but in the context of organisms existing as separate individual cells); occasionally yeast cells may be seen in short branched or unbranched chains, and in some species hyphae may also be encountered. Different genera are included depending on the authority and definition used; Kurtzman & Fell (Eds) (1998) accept 100 gen. and ›700 spp., and Barnett *et al.* (*Yeasts: characteristics and identification*, 2000) 93 gen. and 678 spp. The best known fungi with a yeast form of growth are those used in baking and fermentation of alcoholic drinks, particularly *Saccharomyces cerevisiae*. The yeast form of growth also occurs in fungi in a wide range of other habitats, including leaf surfaces, soil (Slávikóvá & Vadkertiová, *J. Basic Microbiol.* **43**: 430, 2003) and medical and veterinary environments. They have also, more recently, been noted from insect guts (Suh *et al*, *MR* **103**: 261, 2005) and the deep ocean (Bass *et al.*, *Proc. Roy. Soc.* B. Biol. Sci. **274**: 3069, 2007), and probably many of these fungi remain undiscovered. The yeast form of growth makes these organisms ideal for genetic and other research (e.g. Ostergaard *et al.*, *Microbiol. Mol. Biol. Rev.* **64**: 34, 2000; d'Enfert & Hube (*Candida, comparative and functional genomics*, 2008), and the yeast *Saccharomyces cerevisiae* was the first eukaryote to have its genome fully sequenced (Williams, *Science* **272**: 481, 1996).

Sporogenous yeasts have teleomorphs in either the ascomycetes (esp. *Saccharomycetales* and *Schizosaccharomycetales*) or the basidiomycetes (*Sporidiales*, *Tremellales*); **asporogenous yeasts** are conidial fungi; **apiculate -**, yeasts (e.g. *Saccharomycodes*, *Nadsonia*, *Hanseniaspora*, *Kloeckera*) having minute polar projections which are multiple scars (annellides) (Streiblova *et al.*, *J. Bact.* **88**: 1104, 1964); **baker's, brewer's** or **beer -**, *Saccharomyces cerevisiae*; **black -**, yeast-like states of *Aureobasidium*, *Cladosporium*, *Moniliella*, etc., and esp. anamorphs of *Herpotrichielleae* (q.v.) incl. *Exophiala*, *Ramichloridium* and *Rhinocladiella* (de Hoog & Hermanides-Nijhof, *Stud. Mycol.* **15**, 1977; de Hoog (Ed.), *Stud. Mycol.* **19**, 1979; *Ann. Rep. Res. Center Path. Fungi, Chiba* **7**: 50, 1993, surveys); **bottom -**, one settling out at the bottom of a fermented liquid (the wort), e.g. *S. uvarum*; **top -**, one accumulating at the surface of the fermented wort, e.g. *S. cerevisiae*; **Chinese -**, *Amylomyces rouxii* and other fungi (Ellis *et al.*, *Mycol.* **68**: 131, 1976); **'flor' -**, one to which special qualities of wines (e.g. bouquet, taste) are due; **food -**, dry *Candida utilis* (q.v.) and other yeasts; **petite -**, a respiratory deficient mutant (Bulder, *Ant. v. Leeuwenhoek* **30**: 1, 1964); **scum -**, one (e.g. *Trichosporon cutaneum*) forming a surface scum or slime layer; **shadow (mirror) -**, *Bullera*, *Sporobolomyces* etc., producing ballistospores; **springer -**, the Institut Pasteur, Paris, strain of *S. cerevisiae*; **toddy -**, a mixture of yeasts which ferment the juice of the palmyra palm (*Borassus flabellifer*) (Ahmad *et al.*, *Mycol.* **46**: 708, 1954); **wine -**, races of *S. cerevisiae*.

Lit. (covering anamorphs and teleomorphs): **Identification**: Arx *et al.* (*Stud. Mycol.* **14**, 1977; genera), Barnett (*J. gen. Microbiol.* **99**: 183, 1977; nutritional tests), Barnett & Pankhurst (*A new key to the yeasts*,

Zaghouaniaceae Syd. & P. Syd. (1915) = Pucciniaceae.

Zahlbruckner (Alexander; 1860-1938; Slovakia, later Austria). Born, St Georgen [then in Hungary], near Pressburg [now Bratislava]; PhD, Vienna University (1883); member of staff (1883-1899), then Keeper (1899-1918) then Director (1918-), Naturhistorischen Museum, Vienna. Published important regional works on lichen-forming fungi of central Africa, China, Chile (Easter Island and Juan Fernández Island), Dalmatia, Formosa, Hawaii (partly with Magnusson, q.v.), Japan, Java, Samoa and South America; was the first author to provide a comprehensive account of genera and families of lichen-forming fungi. planned the sections for lichen-forming fungi in *Rabenhorst's Kryptogamenflora* (**9**, 1930-1960); published exsiccata (e.g. *Lichenes Rariores Exsiccati*). Collections in Padua (**PAD**) and Vienna (**W**). *Publs*. Flechten. *Engler & Prantl, Die Naturlichen Pflanzenfamilien* (1903-1907); *Catalogus Lichenum Universalis* 10 vols (1921-1940) [a major catalogue of lichen-forming fungi, publications in which their names have been used, and details of synonymy; it remains the basic nomenclatural reference work on lichen-forming fungi]. *Biogs, obits etc.* Dickinson (*Kew Bulletin* **1938**: 304, 1938); Grummann (1974: 444); Keissler (*Revue de Mycologie* **4**: 3, 1939) [portrait]; Lackovičova (*Dr Alexander Zahlbruckner (1860-1938) Osonosť a Dielo*, 1988) [bibliography, biography]; Redinger (*Annales de Cryptogamie Exotique* **6**: 85, 1933) [bibliography, portrait]; Stafleu & Cowan (*TL-2* **7**: 500, 1988).

Zahlbrucknera Herre (1910) [non *Zahlbrucknera* Rchb. 1832, *Saxifragaceae*] ≡ Zahlbrucknerella.

Zahlbrucknerella Herre (1912), Lichinaceae (L). 8, widespread. See Henssen (*Lichenologist* **9**: 17, 1977; key), Schultz & Büdel (*Lichenologist* **34**: 39, 2002; key), Henssen (*Biblthca Lichenol.* **88**: 195, 2004).

Zakatoshia B. Sutton (1973), anamorphic *Pezizomycotina*, Hso.0eH.15. 2 (on fungi), Canada; Austria. See Gams (*Windahlia* **16**: 59, 1986).

Zalerion R.T. Moore & Meyers (1962), anamorphic *Lulwoana*, Hsy.0-≡ hP.1. 9 (mainly marine), N. America; Europe. See Buczacki (*TBMS* **59**: 159, 1972), Fisher & Webster (*Nova Hedwigia* **54**: 77, 1992), Campbell *et al.* (*MR* **109**: 556, 2005; phylogeny, teleomorph), Baschien *et al.* (*Nova Hedwigia* **83**: 311, 2006).

Zamenhofia Clauzade & Cl. Roux (1985) = Porina Müll. Arg. fide Roux (*SA* **6**: 156, 1987), McCarthy (*Biblthca Lichenol.* **52**, 1993).

Zanchia Rick (1958) nom. dub., Basidiomycota. See Donk (*Taxon* **12**: 167, 1963).

Zanclospora S. Hughes & W.B. Kendr. (1965), anamorphic *Pezizomycotina*, Hso.0eH.15. 6, southern hemisphere. See Hughes & Kendrick (*N.Z. Jl Bot.* **3**: 151, 1965).

Zasmidium Fr. (1849) nom. dub., anamorphic *Mycosphaerellaceae*. fide Hawksworth & Riedl (*Taxon* **26**: 208, 1977), Arzanlou *et al.* (*Stud. Mycol.* **58**: 75, 2007).

zearalenone, a toxin of *Fusarium graminearum* (teleomorph *Gibberella zeae*); the cause of vulvovaginitis and infertility in cattle and pigs.

Zebrospora McKenzie (1991), anamorphic *Pezizomycotina*, Hso.≡ eP.10. 1, Australasia; Pacific Islands. See McKenzie (*Mycotaxon* **41**: 189, 1991).

Zelandiocoela Nag Raj (1993), anamorphic *Pezizomycotina*, St.0eH.15. 1, New Zealand. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*: 990, 1993).

Zelleromyces Singer & A.H. Sm. (1960) = Lactarius. Gasteroid forms are polyphyletic and have formerly been morphologically recognised as a separate genus. fide Miller *et al.* (*Mycol.* **93**: 344, 2001), Lebel (*Australasian Mycol.* **21**: 4, 2002; Australian spp.), Nuytinck *et al.* (*Belgian Jour. Bot.* **136**: 145, 2004; European spp.), Miller *et al.* (*Mycol.* **98**: 960, 2006).

Zeloasperisporium R.F. Castañeda (1996), anamorphic *Venturiaceae*, Hso.?.?. 2, Cuba. See Castañeda Ruíz *et al.* (*Mycotaxon* **60**: 284, 1996), Crous *et al.* (*Stud. Mycol.* **58**: 185, 2007; phylogeny).

Zelopelta B. Sutton & R.D. Gaur (1984), anamorphic *Pezizomycotina*, Cpt.1bH.10. 1, India. See Sutton & Gaur (*TBMS* **82**: 558, 1984).

Zelosatchmopsis Nag Raj (1991), anamorphic *Pezizomycotina*, Ccu.0eH.15. 1, Cuba. See Nag Raj (*CJB* **69**: 633, 1991).

Zelotriadelphia R.F. Castañeda, Saikawa, M. Stadler & Iturr. (2005), anamorphic *Pezizomycotina*. 1, Cuba. See Castañeda Ruiz *et al.* (*Mycotaxon* **91**: 340, 2005).

Zendera Redhead & Malloch (1977) = Dipodascus fide von Arx (*Persoonia* **9**: 393, 1977).

Zeora Fr. (1825) = Lecanora fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

zeorine (of apothecia), like those of *Zeora*.

Zephirea Velen. (1947) = Mycena fide Horak (*Synopsis generum Agaricalium*, 1968).

Zercosporidium Thor (1930) nom. dub., ? Fungi. 1, Svalbard.

Zernya Petr. (1947), anamorphic *Pezizomycotina*, Cpd.1eH.?. 1, Brazil.

Zerovaemyces Gorovij (1977) = Rhacophyllus fide Kuyper (*in litt.*).

Zerovaemycetaceae Gorovij (1977) = Agaricaceae.

Zeta Bat. & R. Garnier (1961) nom. dub., Pseudoperisporiaceae. 1, Brazil. See Rossman *et al.* (*Stud. Mycol.* **42**: 248 pp., 1999).

Zetesimomyces Nag Raj (1988), anamorphic *Pezizomycotina*, Ccu.1eH.15. 1, Cuba. See Nag Raj (*CJB* **66**: 2143, 1988).

Zetiasplozna Nag Raj (1993), anamorphic *Amphisphaeriaceae*, Cpd.≡ eP.19. 5, widespread. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*: 996, 1993), Jeewon *et al.* (*Mol. Phylogen. Evol.* **25**: 378, 2002).

Zeuctomorpha Sivan., P.M. Kirk & Govindu (1984), Pleosporaceae. 1, India. See Sivanesan *et al.* (*Bitunicate Ascomycetes and their Anamorphs*: 572, 1984).

Zeugandromyces Thaxt. (1912), Laboulbeniaceae. 3, widespread. See Nannfeldt (*Svensk bot. Tidskr.* **43**: 468, 1949).

zeugite, the organ in which fertilization is completed and the dikaryophase ends; e.g. an ascus or a basidium.

Zeus Minter & Diam. (1987), Rhytismataceae. 1, Greece. See Minter *et al.* (*TBMS* **88**: 55, 1987).

Zevadia J.C. David & D. Hawksw. (1995), anamorphic *Pezizomycotina*, Hso.?.?. 1, Ireland. See David & Hawksworth (*Biblthca Lichenol.* **58**: 64, 1995).

Zignoëlla Sacc. (1878) = Chaetosphaeria. A highly confused genus in need of further revision. fide Müller (*SA* **6**: 156, 1987), Cannon (*SA* **15**: 121, 1997), Réblová & Gams (*Czech Mycol.* **51**: 1, 1999), Fernández *et al.* (*Mycol.* **98**: 121, 2006).

Zignoina Cooke (1885) ? = Wallrothiella fide Eriksson & Hawksworth (*SA* **6**: 253, 1987), Réblová & Seifert (*Mycol.* **96**: 343, 2004).

Zilingia Petr. (1934), anamorphic *Pezizomycotina*, St.0eH.?. 1, Siberia.

Zimmermanniella Henn. (1902), Phyllachoraceae. 1 (from living leaves), S.E. Asia. See Petrak (*Hedwigia* **68**, 1928), Cannon (*IMI Descr. Fungi Bact.* **140**: no. 1140, 1992).

Zinzipegasa Nag Raj (1993), anamorphic *Pezizomycotina*, Cac.≡ eH.15/19. 1, Argentina. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*: 1005, 1993).

Zobelia Opiz (1855) = Choiromyces fide Trappe (*TBMS* **65**: 496, 1975).

Zodiomyces Thaxt. (1891), Laboulbeniaceae. 2, widespread. See Weir & Blackwell (*MR* **105**: 1182, 2001; phylogeny).

Zodiomycetaceae Nann. (1934) = Laboulbeniaceae.

Zoellneria Velen. (1934), Sclerotiniaceae. Anamorph *Amerosporium*. 1, Europe. See Spooner (*Biblthca Mycol.* **116**, 1987), Johnston & Gamundí (*N.Z. Jl Bot.* **38**: 493, 2000).

Zoggium Lar.N. Vassiljeva (2001), Mytilinidiaceae. 1, Europe. See Vasil'eva (*Mikol. Fitopatol.* **35**: 17, 2001).

Zografia Bogoyavl. (1922) = Coelomomyces fide Keilin (*Parasitol.* **19**: 365, 1927).

zonate, having concentric lines often forming alternating pale and darker zones near the margins; used of crustose lichen thalli, polypore surfaces, etc.

zonation (of cultures), regular concentric variation of

texture, pigmentation or sporulation frequently associated with fluctuations (esp. diurnal) in light, temperature, or other factors; 'Liesegang' phenomenon. See Bisby (*Mycol.* **17**: 89, 1925), Hein (*Am. J. Bot.* **17**: 143, 1930), Kafi & Tarr (*TBMS* **46**: 549, 1964). **ecological -**, see Ecology.

zone lines, narrow, dark brown, or black, lines (pseudosclerotia) or plates (pseudosclerotial plates) in decayed wood (èsp. hardwoods) generally caused by fungi (Lopez *et al.*, *TBMS* **64**: 465, 1975); see also spalted (wood).

Zonilia Raf. (1815) nom. dub., Fungi. No spp. included.

Zonosporis Clem. (1931) ≡ Schwanniomyces.

zoogametes, a motile gamete; planogametes.

Zoogloea Eberth (1873) = Trichosporon fide Kirk (*in litt.*).

zoogloea (of bacteria), a colony embedded in a slimy substance.

zoogonidium (1) ? = zoospore (q.v.), (2) an aplanospore of a photobiont within the thallus of a lichen (obsol.).

Zoopagaceae Drechsler (1938), Zoopagales. 5 gen., 67 spp.

Lit.: Drechsler (*Mycol.* **26**: 135, 1934) *et seq.*; family proposed by, Drechsler (*Mycol.* **30**: 152, 1938), Duddington *in* Ainsworth *et al.* (Eds) (*The Fungi* **4B**: 231, 1973; emend. & keys), Dyal (*Sydowia* **27**: 293, 1973), Dayal (*Sydowia* **27**: 293, 1976; keys) Predacious fungi, Tanabe *et al.* (*Mol. Phylogen. Evol.* **16**: 253, 2000), Barron (*Biodiversity of Fungi* Inventory and Monitoring Methods: 435, 2004).

Zoopagales Bessey ex R.K. Benj. (1979). Zoopagomycotina. 5 fam., 22 gen., 190 spp. Asexual reproduction by conidia or merosporangia, sexual reproduction by zygospores; cosmop. parasites of fungi (mycoparasites), nematodes, amoebae, and other small terrestrial animals. Fams:

(1) **Cochlonemataceae**
(2) **Helicocephalidaceae**
(3) **Piptocephalidaceae**
(4) **Sigmoideomycetaceae**
(5) **Zoopagaceae**

Lit.: Duddington (*in* Ainsworth *et al.*, *The Fungi* **4B**: 231, 1973, *Biol. Rev.* **31**: 152, 1956), Drechsler (*Biol. Evol.* **16**: 253, 2000; phylogeny), White *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), Hibbett *et al.* (*MR* **111**: 109, 2007), and see under Families.

Zoopage Drechsler (1935), Zoopagaceae. 11, N. America. See Drechsler (*Mycol.* **27**: 30, 1935), Drechsler (*Mycol.* **28**: 363, 1936), Drechsler (*Mycol.* **29**: 229, 1937), Drechsler (*Mycol.* **39**: 379, 1947), Jones (*TBMS* **45**: 348, 1962), Dyal (*Sydowia* **27**: 293, 1976; keys parasites of nematodes and amoebae, bibliogr.).

Zoopagomycotina Benny (2007), Zygomycota. 22 gen., 190 spp., Ord.:

Zoopagales

Lit.: James *et al.* (*Mycol.* **98**: 860, 2006; molecular phylogeny), Hibbett *et al.* (*MR* **111**: 109, 2007), Hoffmann *et al.* (in: Gherbawy (Ed.) *Current Advances in Molecular Mycology*): in press, 2008).

Zoophagus Sommerst. (1911), Zoopagaceae. 5 (on *Algae*), Europe; N. America. See Dick *in* Ainsworth *et al.* (Eds) (*The Fungi* **4A**: 145, 1973), Coffell *et al.* (*Mycol.* **82**: 326, 1990; status; based on a misidentified *Cephaliophora*), Dick (*MR* **94**: 347, 1990; key, emend. of genus), Dick *et al.* (*Mycol.* **82**: 316, 1990; status), Powell *et al.* (*Mycol.* **82**: 460, 1990; status; based on a misidentified *Cephaliophora*), Morikawa *et al.* (*MR* **97**: 421, 1993; status), Glocking (*MR* **101**: 1179, 1997), Saikawa (*Mycol.* **89**: 268, 1997; ultrastr.), Liu *et al.* (*Mycosystema* **17**: 105, 1998), Tanabe *et al.* (*Mycol.* **91**: 830, 1999; phylogeny), White *et al.* (*Mycol.* **98**: 872, 2006; phylogeny).

zoophilic (of dermatophytes, etc.), preferentially pathogenic for animals; cf. anthrophilic.

Zoophthora A. Batko (1964), Entomophthoraceae. 32, widespread. See Remaudière & Hennebert (*Mycotaxon* **11**: 269, 1980), Ben-Ze'ev & Kenneth (*Mycotaxon* **14**: 456, 1982), Glare *et al.* (*Aust. J. Bot.* **35**: 49, 1987), Humber (*Mycotaxon* **34**: 441, 1989), Keller (*Sydowia* **43**: 39, 1991; key), Bałazy (*Flora Polska* **24**: 1, 1993), Keller & Petrini (*Sydowia* **57**: 23, 2005; key), Keller (*Sydowia* **58**: 38, 2006; Switzerland), Keller (*Sydowia* **59**: 75, 2007; Switzerland, comb.nov.).

zoosporangium (zoosporange), a sporangium producing zoospores.

zoospore, a motile sporangiospore, i.e. one having flagella; swarm spore; swarmer; simblospore; planospore; planont; cf. swarm-cell; see Waterhouse (*TBMS* **45**: 1, 1962), Fuller (*Mycol.* **69**: 1, 1977), Lange & Olson (*Dansk bot. Arkiv.* **33**, 1979; uniflagellate zoospores).

Zopf (Wilhelm; 1846-1909; Germany). Student under O. Brefeld (q.v.), Berlin (1874-1877); PhD, Halle (1878); Assistant Professor (1883) then Professor (1887), Halle University. Made major contributions to knowledge of an exceptionally wide range of fungi and lichens, including accounts of *Chaetomium*, lichenicolous fungi, and lichen chemistry. *Publs. Die pilze in Morphologischer, Physiologischer, Biologischer und Systematischer Beziehung* (1890); *Untersuchungen über die durch Parasitische Pilze Hervorgerufenen Krankheiten der Flechten* (1897-1898); *Die Flechtenstoffe* (1907). *Biogs, obits etc.* Grummann (1974: 55); Huneck *et al.* (*Willdenowia* **7**: 31, 1973) [application of Zopf's chemical names]; Stafleu & Cowan (*TL-2* **7**: 553, 1988); Tobler (*Bericht der Deutschen Botanischen Gesellschaft* **27**: (58), 1910) [portrait].

Zopfia Rabenh. (1874), Zopfiaceae. 5, widespread. See Hawksworth (*CJB* **57**: 91, 1979), Kruys *et al.* (*MR* **110**: 527, 2006; phylogeny).

Zopfiaceae G. Arnaud ex D. Hawksw. (1992), ? Pleosporales. 8 gen. (+ 2 syn.), 18 spp. Polyphyletic as currently circumscribed.

Lit.: Hawksworth (*CJB* **57**: 91, 1979), Hawksworth (*SA* **6**: 153, 1987), Hyde (*Trans. Mycol. Soc. Japan* **30**: 333, 1989), LoBuglio *et al.* (*Mol. Phylogen. Evol.* **6**: 287, 1996), Ranghoo & Hyde (*MR* **103**: 938, 1999), Kruys *et al.* (*MR* **110**: 527, 2006).

Zopfiella G. Winter (1884), Lasiosphaeriaceae. 24, widespread. See Malloch & Cain (*CJB* **49**: 869, 1971), Guarro *et al.* (*SA* **10**: 79, 1991; key), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004; phylogeny), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005; phylogeny), Cai *et al.* (*MR* **110**: 359, 2006; phylogeny).

Zopfinula Kirschst. (1939) = Keissleriella fide Bose (*Phytopath. Z.* **41**, 1961).

Zopfiofoveola D. Hawksw. (1979), Zopfiaceae. 1,

Sweden. See Hawksworth (*CJB* **57**: 91, 1979).

Zopheromyces B. Sutton & Hodges (1977), anamorphic *Pezizomycotina*, Hso.1eP.6. 1, Brazil. See Sutton & Hodges (*Nova Hedwigia* **28**: 493, 1977).

Zosterodiscus Hertel (1984) = Lecidea fide Hertel (*Mitt. bot. StSamml., München* **23**: 321, 1987).

Zschackea M. Choisy & Werner (1932) = Verrucaria Schrad. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Zugazaea Korf, Iturr. & Lizoň (1998), Helotiales. 1, Canary Islands. See Itturriaga *et al.* (*Mycol.* **90**: 697, 1998).

Zukalia Sacc. (1891) = Chaetothyrium fide von Arx & Müller (*Stud. Mycol.* **9**, 1975).

Zukalina Kuntze (1891) ? = Ascozonus fide Velenovský (*Monogr. Dicom. Boehm.*, 1934), van Brummelen (*Persoonia* **16**: 425, 1998).

Zukaliopsis Henn. (1904) = Molleriella fide von Arx (*Persoonia* **2**: 421, 1963).

Zundeliomyces Vánky (1987), Microbotryaceae. 1 (on *Polygonum*), Kazakhstan. See Vánky (*TBMS* **89**: 477, 1987), Piepenbring (*Frontiers in Basidiomycote Mycology*: 117, 2004; gall morphology).

Zundelula Thirum. & Naras. (1952) = Dermatosorus fide Langdon (*TBMS* **68**: 447, 1977).

Zunura Nag Raj (1993), anamorphic *Pezizomycotina*, Cac.0eH.19. 1, India. See Nag Raj (*Coelomycetous Anamorphs with Appendage-bearing Conidia*: 1006, 1993).

Zwackhia Körb. (1855) = Opegrapha Ach. fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Zwackhiomyces Grube & Hafellner (1990), Xanthopyreniaceae. 9 (lichenicolous), widespread. See Grube & Hafellner (*Nova Hedwigia* **51**: 283, 1990; monogr.), Harris (*More Florida Lichens*, 1995), Aptroot (*Lichenologist* **30**: 501, 1998), Hoffmann & Hafellner (*Biblthca Lichenol.* **77**: 1, 2000), Calatayud *et al.* (*Lichenologist* **39**: 129, 2007; Spain, Iran, key).

Zychaea Benny & R.K. Benj. (1975), Syncephalastraceae. 1, Mexico. See Benny & Benjamin (*Aliso* **8**: 334, 1975), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny).

Zygaenobia Weiser (1951), Entomophthorales. 1, former Czechoslovakia. See Weiser (*Ent. Listy* **14**: 134, 1951).

zygangium, gametangium of a zygomycete.

Zygnemomyces K. Miura (1973), Meristacraceae. 2, Japan; Australia. See Miura (*Rep. Tottori Mycol. Inst.* **10**: 520, 1973), McCulloch (*TBMS* **68**: 173, 1977), Tucker (*Mycotaxon* **13**: 481, 1981; key), Saikawa *et al.* (*CJB* **75**: 762, 1997; ultrastr.).

Zygoascus M.T. Sm. (1986), Trichomonascaceae. Anamorph *Candida*. 1, widespread. See von Arx & van der Walt (*Stud. Mycol.* **30**: 167, 1987), Smith *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 422, 1998), Brandt *et al.* (*J. Clin. Microbiol.* **42**: 3363, 2004; from human), Smith *et al.* (*Int. J. Syst. Evol. Microbiol.* **55**: 1353, 2005; phylogeny), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny), Kurtzman & Robnett (*FEMS Yeast Res.* **7**: 141, 2007).

Zygochytrium Sorokīn (1874), ? Chytridiomycetes. 1 (on dead insect), Europe.

zygoconidium, Asexual propagule formed from the fusion or conjoining of two conidia generated simultaneously from adjacent conidiogenous loci. Kendrick & Watling (*The Whole Fungus*: 543, 1979) applied the term isthmospore (q.v.) to this structure and although similar in appearance, it is distinct in the nature of its origin. Zygoconidia are known in a number of genera, mainly basidiomycete anamorphs (e.g. *Anastomyces*, *Christiansenia* and *Zygogloea*). The term was first introduced by Boidin (*Bull. Soc. Linn. Lyon* **39**: 132, 1970) but more recently taken up by others following Oberwinkler & Bandoni (*Norw. J. Bot.* **2**: 501, 1982).

Zygodesmella Gonz. Frag. (1917) nom. dub., Fungi. See Donk (*Taxon* **11**: 103, 1962).

Zygodesmus Corda (1837) nom. dub., Pezizomycotina. See Rogers (*Mycol.* **40**: 633, 1948).

Zygofabospora Kudrjanzev (1960) = Kluyveromyces fide Naumov (*Mikrobiologiya* **57**: 114, 1988; key), Kurtzman *et al.* (*Taxon* **50**: 907, 2001; nomencl.), Naumov & Naumova (*FEMS Yeast Res.* **2**: 39, 2002), Naumova *et al.* (*FEMS Yeast Res.* **5**: 263, 2004; phylogeny).

Zygogloea P. Roberts (1994), Pucciniomycotina. 1, British Isles. See Roberts (*Mycotaxon* **52**: 241, 1994).

Zygohansenula Lodder (1932) = Pichia fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Zygolipomyces Krassiln., Babeva & Meavahd (1967) = Lipomyces fide Lodder (*Yeasts, a taxonomic study* 2nd edn, 1970).

Zygomycetes G. Winter (1880), Zygomycota. Saprobes or parasites (esp. of arthropods). A polyphyletic taxon as traditionally circumscibed at this rank; see subphyla of the *Zygomycota*.

zygomycosis, a mycosis caused by a member of the Zygomycetes. Cf. Mucormycosis, phycomycosis.

Zygomycota Moreau (1954), Fungi. 10 ord., 27 fam., 168 gen., 1065 spp. A polyphyletic (or paraphyletic) taxon including four subphyla:

(1) **Entomophthoromycotina**
(2) **Kickxellomycotina**
(3) **Mucoromycotina**
(4) **Zoopagomycotina**

Lit.: Benjamin (*in* Kendrick (Ed.), *The whole fungus*: 579, 1979), Benny (*in* Parker, 1982, **1**: 184), O'Donnell (*Zygomycetes in culture*, 1979), Jeffries (*Bot. J. Linn. Soc.* **91**: 135, 1985; mycoparasitism), Schipper (*in* Rayner *et al.* (Ed.), *Evolutionary biology of the fungi*: 261, 1987), Morton & Benny (*Mycotaxon* **37**: 471, 1990; *Endogonales*, *Glomales*), Chien (*in* Peng & Chou (Eds), *Biodiversity & terrestrial ecosystems* (*Acad. Sinica Monogr.* **14**) p. 215, 1994), Weitzman & Della-Latta (*Clin. Microbiol. Newsletter* **19**: 81, 1997; zygomycosis), Cavalier-Smith (*Biol. Rev.* **73**: 203, 1998), Benny *et al.* (*in* McLaughlin *et al.* (Eds), *The Mycota* **7A**, 113, 2000), Tanabe *et al.* (*Mol. Phylogen. Evol.* **16**: 253, 2000), Strauss *et al.* (*South African Journal of Science* **96**: 597, 2000; medium for selective isolation of *Kickxellales*, *Mortierellales*, *Mucorales*, and *Piptocephalidaceae* [*Zoopagales*]), Shalchian-Tabrizi *et al.* (*PLoS ONE* **3**(3): e2098, 2008; phylogeny), Benny (*Aliso* **26**: 37, 2008; methods of isolation, culture, observation and preservation), and under Subphyla and Orders.

Zygomycotina Caval.-Sm. (1998), see *Zygomycota*.

Zygophiala E.W. Mason (1945), anamorphic *Schizothyrium*, Hso.1eP.10. 1, Jamaica. See Nasu & Kunoh (*TMSJ* **27**: 225, 1986; on grapes), Williamson & Sutton (*Pl. Dis.* **84**: 714, 2000; on apple), Batzer *et al.* (*Mycol.* **97**: 1268, 2005; phylogeny).

zygophore (of *Mucorales*), a special hyphal branch producing copulation branches.

Zygopichia (Klöcker) Kudrjanzev (1960) = Pichia fide

Batra *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 187, 1978), Wu *et al.* (*FEMS Yeast Res.* **6**: 305, 2006).

Zygopichia E.K. Novák & Zsolt (1961) = Pichia fide von Arx (*Gen. Fungi Sporul. Cult.* Edn 3, 1981).

Zygopleurage Boedijn (1962), Lasiosphaeriaceae. 1 (coprophilous), widespread (tropical). See Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972; key), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004), Miller & Huhndorf (*Mol. Phylogen. Evol.* **35**: 60, 2005), Cai *et al.* (*MR* **110**: 359, 2006; phylogeny).

Zygopolaris S.T. Moss, Lichtw. & Manier (1975), Legeriomycetaceae. 2 (in *Ephemeroptera*), Mexico; USA. See Moss & Lichtwardt (*CJB* **55**: 3099, 1977; ultrastr.), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), White (*MR* **110**: 1011, 2006; phylogeny), Valle *et al.* (*Mycol.* **100**: 149, 2008; Mexico).

Zygorenospora Krassiln. (1954) = Zygofabospora fide Naumov (*Mikol. Fitopatol.* **21**: 131, 1987).

Zygorhizidium Löwenthal (1904), Chytridiaceae. *c.* 11, Europe; N. America. See Sparrow (*Aquatic Phycomycetes* Edn 2: 548, 1960; key), Doggett & Porter (*Mycol.* **88**: 720, 1996; sexual reproduction).

Zygorhynchus Vuill. (1903), Mucoraceae. 8 (esp. in soil), widespread. See Hesseltine *et al.* (*Mycol.* **51**: 173, 1959; key), Schipper *et al.* (*Persoonia* **8**: 321, 1975; zygospore ornamentation), O'Donnell *et al.* (*CJB* **56**: 1061, 1978; ontogeny), Heath & Rethoret (*Eur. J. Cell Biol.* **28**: 180, 1982; mitosis, ultrastr.), Schipper (*Persoonia* **13**: 97, 1986; key), Brown (*J. Phytopath.* **120**: 298, 1987), Taiwo *et al.* (*Microbios* **51**: 23, 1987), Taiwo *et al.* (*Microbios* **52**: 183, 1987; physiology), Brown (*J. Phytopath.* **123**: 222, 1988; biocontrol), Brown & Surgeoner (*Ann. appl. Biol.* **118**: 39, 1991; plant growth enhancement), Edelmann & Klomparens (*Mycol.* **87**: 304, 1995; ultrastr. zygospore dev.), Voigt & Wöstemeyer (*Gene* **270**: 113, 2001; phylogeny), Zheng (*Mycotaxon* **84**: 367, 2002; China).

Zygorrhynchus, see *Zygorhynchus*.

Zygosaccharis Clem. & Shear (1931) ≡ Zygosaccharomyces.

Zygosaccharomyces B.T.P. Barker (1901), Saccharomycetaceae. 11 (osmotolerant), widespread. See von Arx *et al.* (*Stud. Mycol.* **14**: 1, 1977), Kreger-van Rij (Ed.) (*Yeasts, a taxonomic study* 3rd edn, 1984; key), Kurtzman (*Yeast* Chichester **6**: 213, 1990; 9 spp. by DNA complementarity), James *et al.* (*Yeast* Chichester **10**: 871, 1994; molec. syst.), James *et al.* (*Int. J. Syst. Bacteriol.* **46**: 189, 1996; ITS), Kurtzman *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 424, 1998), Steels *et al.* (*Int. J. Syst. Bacteriol.* **49**: 319, 1999), Steels *et al.* (*FEMS Yeast Res.* **2**: 113, 2002; physiology), Esteve-Zarzoso *et al.* (*Syst. Appl. Microbiol.* **26**: 404, 2003; phylogeny), James & Stratford (*Yeasts in Food* Beneficial and Detrimental Aspects: 171, 2003; spoilage-causing spp.), Kurtzman (*FEMS Yeast Res.* **4**: 233, 2003), Duarte *et al.* (*Syst. Appl. Microbiol.* **27**: 436, 2004; isozymes), Rawsthorne & Phister (*Int. J. Food Microbiol.* **112**: 1, 2006; molecular detection), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Zygosaccharomycodes Nishiw. (1929) = Saccharomyces fide Batra *in* Subramanian (Ed.) (*Taxonomy of fungi* **1**: 187, 1978).

Zygospermella Cain (1935), Lasiosphaeriaceae. 2 (coprophilous), N. America; Europe. See Lundqvist (*Symb. bot. upsal.* **20** no. 1, 1972; key), Huhndorf *et al.* (*Mycol.* **96**: 368, 2004).

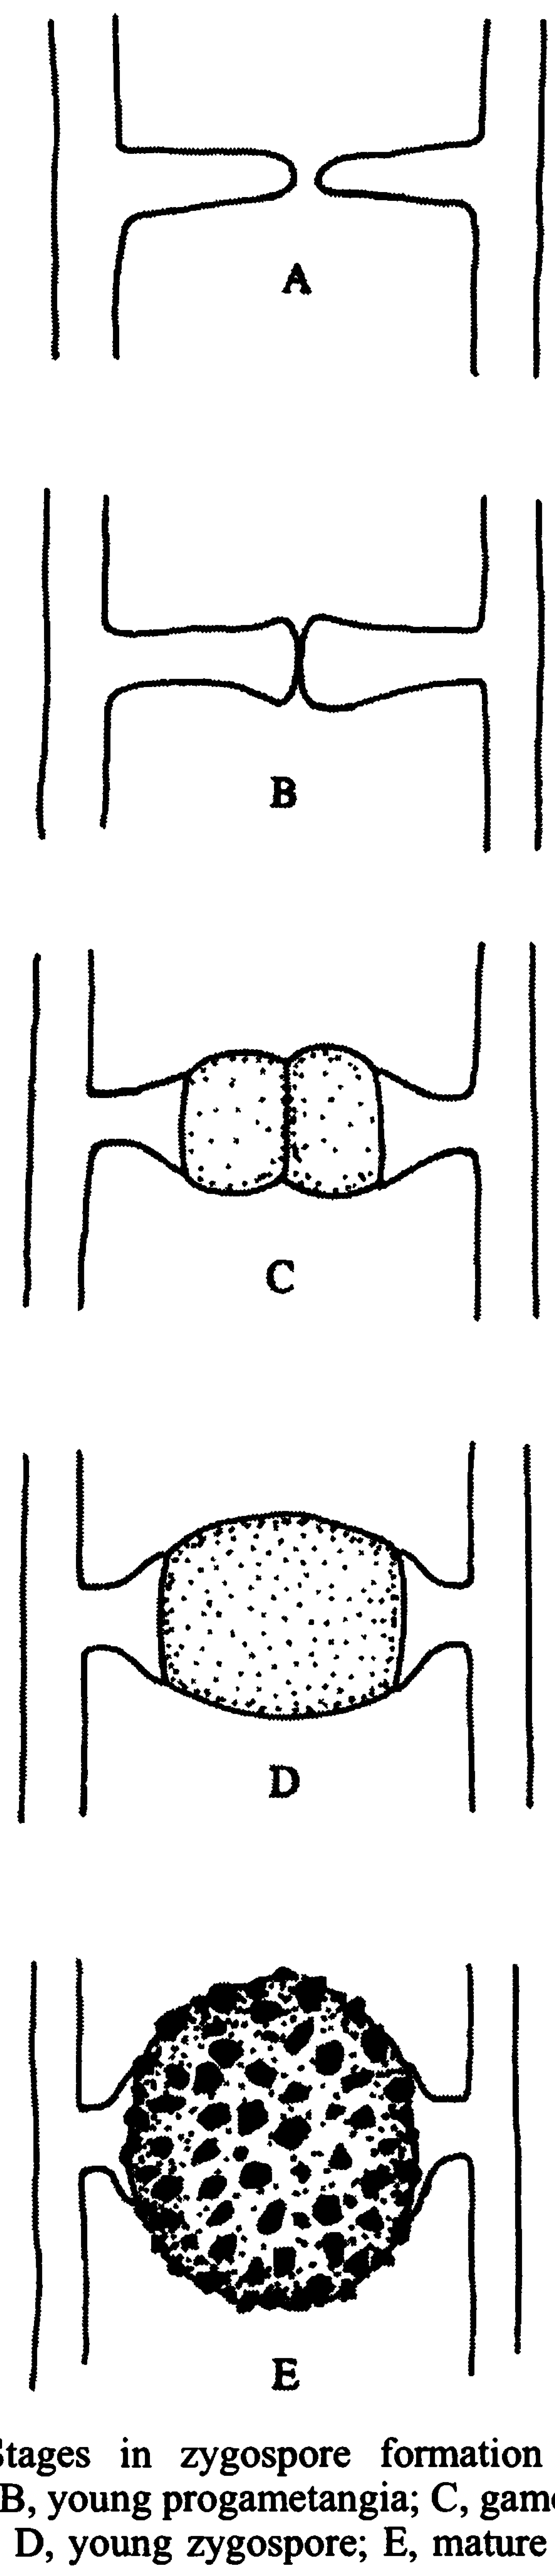

Fig. 27. Stages in zygospore formation in *Mucor mucedo*. A,B, young progametangia; C, gametangia and suspensors; D, young zygospore; E, mature zygospore. Not to scale.

Zygospermum Cain (1934) [non *Zygospermum* Thwaites ex Baill. 1858, *Euphorbiaceae*] ≡ Zygospermella.

zygospore, the resting spore resulting from the conjugation of isogametes or (in *Zygomycetes*), from the fusion of like gametangia (Fig. 27).

Zygosporites Will. (1880), Fossil Fungi, Zygomycetes. 1 (Carboniferous), British Isles. See Pia *in* Hirnier (*Handb. Paläobot.* **1**, 1927).

Zygosporium Mont. (1842), anamorphic *Pezizomycotina*, Hso.0eP.1. 11, widespread. See Hughes (*Mycol. Pap.* **44**, 1951), Ichinoe (*Bull. natn Inst. Hyg. Sci.* **89**: 135, 1971), Heredia Abarca & Mercado Sierra (*Mycotaxon* **68**: 137, 1998), Whitton *et al.* (*Fungal Diversity* **12**: 207, 2003; review).

zygote, the result of fusion of two gametes; a cell in which two nuclei of opposite sex have undergone fusion (Buller, 1941).

Zygothrix Reinsch ex Rabenh. (1866) nom. dub., Fungi. Based on sterile hyphae.

Zygotorulaspora Kurtzman (2003), Saccharomycetaceae. 2. See Kurtzman (*FEMS Yeast Res.* **4**: 243, 2003), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny).

Zygowillia (Klöcker) Kudrjanzev (1960) = Pichia fide Lodder (*Yeasts, a taxonomic study* 2nd edn, 1970).

Zygowilliopsis Kudrjanzev (1960) = Williopsis fide Yamada *et al.* (*Biosc., Biotechn., Biochem.* **58**: 1236, 1994; status), Yamada *et al.* (*Biosc., Biotechn., Biochem.* **63**: 827, 1999), Naumova *et al.* (*Syst. Appl. Microbiol.* **27**: 192, 2004).

Zygozyma Van der Walt & Arx (1987) = Lipomyces fide van der Walt *et al.* (*Syst. Appl. Microbiol.* **12**: 288, 1989; key 3 spp.) but see van der Walt *et al.* (*Antonie van Leeuwenhoek* **59**: 77, 1991; ultrastr.), Doublés & McLaughlin (*Mycol.* **84**: 671, 1992), Smith *in* Kurtzman & Fell (Eds) (*Yeasts, a taxonomic study* 4th edn: 433, 1998), Suh *et al.* (*Mycol.* **98**: 1006, 2006; phylogeny), Kurtzman *et al.* (*FEMS Yeast Res.* **7**: 1027, 2007; phylogeny).

zymurgy, the practice of fermentation as in brewing and wine-making.

Zythia Fr. (1849), anamorphic *Pezizomycotina*, Cpd.0-1eH.?. 25, widespread.

ZythiaceaeClem. (1909). See *Nectrioidaceae.*

Zythiostroma Höhn. ex Falck (1923), anamorphic *Nectria*, St.0eH.15. 2 or 3, Europe; Java.

Zyxiphora B. Sutton (1981), anamorphic *Pezizomycotina*, Hsy.0eP.1. 1, India. See Sutton (*Kavaka* **8**: 55, 1980).

Achlya Nees (1823), Saprolegniaceae. *c.* 50, widespread (north temperate). See Johnson (*The genus Achlya*, 1956), Riethmüller *et al.* (*Mycol.* **94**: 834, 2002; phylogeny), Spencer *et al.* (*MR* **106**: 549, 2002; revision), Markovskaja (*Botanica Lithuanica* **10**: 141, 2004; Lithuania), Johnson *et al.* (*Mycotaxon* **92**: 11, 2005; systematics).

Achlyopsis De Wild. (1896) nom. dub., Pythiales. ? = Pythiogeton (Pythiogeton.). See Voglmayr *et al.* (*MR* **103**: 591, 1999).

Actinobotrys H. Hoffm. (1856) = Bremia fide Saccardo (*Syll. fung.* **7**: 1, 1888).

Adlerocystis Feldm.-Muhs. & Havivi (1963), ? Chromista. 2 (symbiotic on *Ornithodorus*), Israel. See Feldman-Muhsam & Havivi (*Parasitology* **53**: 183, 1963; related to *Blastocystis*).

Albuginaceae J. Schröt. (1893), Albuginales. 3 gen. (+ 1 syn.), 53 spp.

Albuginales Thines (2005). Albuginomycetidae. 1 fam., 3 gen., 53 spp. Fam.:
Albuginaceae
Lit.: Thines & Spring (*Mycotaxon* **92**: 443, 2005). See also *Lit.* under *Peronosporales*.

Albuginomycetidae Thines (2005), Oomycetes. Ord.:
Albuginales
For *Lit.* see fam.

Albugo (Pers.) Roussel (1806), Albuginaceae. *c.* 45, widespread. The 'White Blisters' or 'White Rusts'; *A. candida* (white blister of crucifers). See Biga (*Sydowia* **9**: 339, 1955; key), Pound & Williams (*Phytopathology* **53**: 1146, 1963; physiologic races *A. candida*), Choi & Priest (*Mycotaxon* **53**: 261, 1995; key), Priest (*Mycotaxon* **58**: 69, 1996; spp. on *Gentianaceae*), Legon *et al.* (*Mycologist* **16**: 114, 2002; *A. tragopogonis* var. *inulae* in UK), Thines & Spring (*Mycotaxon* **92**: 443, 2005; split into three genera), Choi *et al.* (*Molecular and Phylogenetic Evolution* **40**: 400, 2006), Constantinescu & Thines (*Sydowia* **58**: 178, 2006; sporangial dimorphism), Voglmayr & Riethmüller (*MR* **110**: 75, 2006; phylogeny), Choi *et al.* (*Fungal Diversity* **27**: 11, 2007; genetic diversity in *A. candida*).

Althornia E.B.G. Jones & Alderman (1972), Thraustochytriaceae. 1, British Isles. See Jones & Alderman (*Nova Hedwigia* **21**: 381, 1971), Raghukumar (*European Journal of Protistology* **38**: 127, 2002; ecology).

Anisolpidiaceae Karling (1943), Anisolpidiales. 1 gen., 3 or 6 spp.

Anisolpidiales M.W. Dick (2001). Chromista. 1 fam., 1 gen., 6 spp. Fam.:
Anisolpidiaceae
For *Lit.* see under fam.

Anisolpidium Karling (1943), Anisolpidiaceae. 6 (in marine algae), widespread. See Dick (*Straminipilous Fungi*: 670 pp., 2001).

Aphanodictyon Huneycutt ex M.W. Dick (1971), Leptolegniellaceae. 1, USA; Australia. See Dick (*TBMS* **57**: 422, 1971), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Aphanomyces de Bary (1860), Leptolegniaceae. *c.* 15 (aquatic), widespread. *A. euteiches* (pea root rot); *A. astaci* (pathogenic for European crayfish, *Astacus*); *A. cochlioides* (sugar beet black rot); *A. invadans* [Epizootic Ulcerative Syndrome in fish]. See Scott (*Tech. Bull. Va agric. Exp. Stn* **151**, 1961; keys), Dick (*Straminipilous Fungi*: 670 pp., 2001), Levenfors & Fatehi (*MR* **108**: 682, 2004; molecular characterization of *Aphanomyces* species on legumes).

Aphanomycopsis Scherff. (1925), Leptolegniellaceae. 8, Europe; N. America. See Dick (*Straminipilous Fungi*: 670 pp., 2001).

Aplanes de Bary (1888) = Achlya fide Johnson (*The genus Achlya*, 1956).

Aplanochytrium Bahnweg & Sparrow (1972), Thraustochytriaceae. 8 (marine), Kerguelen. See Bahnweg & Sparrow (*Arch. Mikrobiol.* **81**: 46, 1972), Leander & Porter (*Mycotaxon* **76**: 439, 2000; monogr.), Moro *et al.* (*Protist* **154**: 331, 2003; sp. nov. from Ross Sea, Antarctica).

Aplanopsis Höhnk (1952), Saprolegniaceae. 2, Europe. See Höhnk (*Veröff. Inst. Meeresf. Bremerhaven* Sonderband **1**: 127, 1952), Spencer *et al.* (*MR* **106**: 549, 2002; revision).

Apodachlya Pringsh. (1883), Leptomitaceae. 3, widespread. See Jacobs (*Antonie van Leeuwenhoek* **48**: 389, 1982; key), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Apodachlyella Indoh (1939), Apodachlyellaceae. 1, widespread. See Longcore *et al.* (*Mycol.* **79**: 621, 1987), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Apodachlyellaceae M.W. Dick (1986), Leptomitales. 2 gen., 2 spp.

Apodya Cornu (1872) = Leptomitus fide Sparrow (*Aquatic Phycomycetes* Edn 2: 1187 pp., 1960).

Aqualinderella R. Emers. & W. Weston (1967), Rhipidiaceae. 1 (anaerobic), widespread. See Emerson (*Mycol.* **62**: 359, 1970; oogonium production), Held (*Mycol.* **62**: 339, 1970; nutrition), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Araiospora Thaxt. (1896), Rhipidiaceae. 4, America; Europe. See Dick (*Straminipilous Fungi*: 670 pp., 2001).

Archilegnia Apinis (1935) nom. conf., Saprolegniaceae.

Artotrogus Mont. (1845) nom. rej. = Pythium Pringsh. fide Middleton (*Mem. Torrey bot. Club* **20**, 1943).

Atkinsiella Vishniac (1958), Saprolegniomycetidae. 1 (on *Crustacea*), Europe; N. America. See Sparrow & Gotelli (*Mycol.* **61**: 199, 1969), Martin (*Am. J. Bot.* **64**: 760, 1977; posn), Kitancharoen *et al.* (*Mycoscience* **35**: 265, 1994; disease of abalone), Dick (*MR* **102**: 1062, 1998; revision of taxa), Dick (*Straminipilous Fungi*: 670 pp., 2001), Hudspeth *et al* (*Fungal Diversity*: 577, 2004; phylogeny).

Basidiophora Roze & Cornu (1869), Peronosporaceae. 1, widespread. See Barreto & Dick (*J. Linn. Soc.* Bot. **107**: 313, 1991; key), Constantinescu (*Nova Hedwigia* **66**: 251, 1998; revision), Voglmayr *et al.* (*MR* **108**: 1011, 2004; phylogeny).

Benua Constant. (1998), Peronosporaceae. 1, USA. See Constantinescu (*Nova Hedwigia* **66**: 258, 1998), Thines *et al.* (*MR* **111**: 1377, 2007; phylogeny).

Bicilium H.E. Petersen (1910) = Eurychasma fide Dick (*Straminipilous Fungi*: 670 pp., 2001).

Blastocystis Alexeev (1911), Chromista. 3 (in alimentary tract of humans and animals), widespread. See Lavier (*Annls Parasit. hum. comp.* **27**: 339, 1952; synonymy), Lee (*TBMS* **54**: 313, 1970; ultrastr.), Nakamura *et al.* (*Mol. Biochem. Parasit.* **77**: 241, 1996; phylogeny), Silberman *et al.* (*Nature* **380**: 398, 1996; phylogeny), Stenzel & Boreham (*Clin. Microbiol. Rev.* **9**: 563, 1996; review), Yoshikawa *et al.* (*J. Eukary. Microbiol.* **43**: 127, 1996; DNA polymorphism), Konig & Müller (*Z. Bakteriol.* **286**: 435,

1997; incidence), Yoshikawa & Oishi (*Protoplasma* **200**: 31, 1997; biodiversity), Hanbold *et al.* (*Medical Mycol.* **36**: 263, 1998).

Blastulidiopsis Sigot (1931) = Blastulidium fide Manier (*Protistologia* **12**: 225, 1976).

Blastulidium Pérez (1903), Leptomitales. 1, France. See Manier (*Protistologia* **12**: 225, 1976), Dick (*Straminipilous Fungi*: 670 pp., 2001; asexual genus *inc. sed.*).

Blepharospora Petri (1917) = Phytophthora fide Buisman (*Mededelingen uit het Phytopathologisch Laboratorium 'Willie Commelin Scholten'* **11**: 1, 1927).

Branchiomyces Plehn (1912), ? Saprolegniales. 2 (on fish), widespread. See Peduzzi (*Mem. Ist. ital. Idrobiol.* **30**: 81, 1973), Neish & Hughes (*Diseases of Fish* **6**: 50, 1980).

Bremia Regel (1843), Peronosporaceae. 1, widespread (north temperate). *B. lactucae* (lettuce downy mildew). See Ling & Tai (*TBMS* **28**: 16, 1945), Marlatt (*Bull. agric. Exp. Stns Univ. Fla* **764**: 1, 1974), Michelmore & Ingram (*TBMS* **75**: 47, 1980; heterothallism), Crute & Dixon *in* Spencer (Ed.) (*The Downy Mildews (London)*: 421, 1981), Morgan (*CMI Descr.*: 682, 1981), Riethmüller *et al.* (*Mycol.* **94**: 834, 2002; phylogeny), Göker *et al.* (*CJB* **81**: 672, 2003; phylogeny), Voglmayr *et al.* (*MR* **108**: 1011, 2004; phylogeny), Thines *et al.* (*MR* **110**: 646, 2006; phylogeny; exclusion of *Bremia graminicola*), Choi *et al.* (*Mycopathologia* **163**: 91, 2007; ITS characteristics), Voglmayr & Constantinescu (*MR* **112**: 487, 2008; phylogeny).

Bremiella G.W. Wilson (1914) = Plasmopara fide Riethmüller *et al.* (*Mycol.* **94**: 834, 2002), Voglmayr *et al.* (*Mycotaxon* **100**: 11, 2007).

Chlorospora Speg. (1891) = Harzia fide Constantinescu (*Sydowia* **54**: 137, 2002).

CHROMISTA. 3 class., 16 ord., 29 fam., 126 gen. (+ 46 syn.), 1036 spp. (incl. Heterokonta, Pseudofungi, Pseudomycotina, stramenopiles). Kingdom of *Eukaryota*. Predominantly unicellular, filamentous, or colonial primarily phototrophic organisms; cell walls not of chitin and β-glucan (often cellulosic); chloroplasts (when present) located in the lumen of a generally rough endoplasmic reticulum, lack starch and phycobilisomes and have a two-membraned envelope inside a periplastid membrance, chlorophylls when present *a* and *c*; mitochonidia generally with tubular cristae; Golgi bodies and peroxisomes always present; flagella when present, with at least one with rigid, tubular, and usually tripartite flagellar hairs or mastigonemes (except haptophytes); mostly free-living; many microscopic in size (with major exceptions, e.g. brown algae).

Formerly often included in *Protoctista* (syn. *Protista*; e.g. Margulis *et al.*, 1990), but now recognized as a kingdom separate from the *Protozoa*. Includes 10 phyla (Corliss, 1994) or 5 phyla and 7 subphyla (Cavalier-Smith, 1998); encompasses a wide range of golden and brown algae, diatoms, chrysophytes and cryptomonads (but not chlorophyte and red algae; in *Plantae*). Dick (2001) formally proposes the kingdom *Straminipila* (q.v.) with a narrower delimitation than Cavalier-Smith (1998) but also includes the *Plasmodiophoromycetes*.

The 'fungal' phyla are interpreted as having lost chloroplasts secondarily, and are part of subkingdom *Heterokonta*. The classification within the kingdom is unsettled; 2 of the phyla Corliss (1994) accepted comprise organisms studied by mycologists: *Labyrinthomorpha* (incl. *Labyrinthulea* and *Thraustochytriaceae*) and *Pseudofungi* (incl. *Oomycetes* and *Hyphochytriomycetes*); Barr (1992) included the same fungi but used different ranks. Cavalier-Smith (1997, 1998) places the fungal groups in two separate phyla: *Sagenista* (*Labyrinthista* or *Labyrinthulomycetes*) and *Bigyra* (*Pseudofungi* or *Oomycetes* and *Hyphochytriomycetes*). Dick (2001) regards all these groups as belonging to the phylum *Heterokonta*.

Various arrangements and ranks have been proposed for the main groupings of 'fungi' within the *Chromista*; selected ones are compared in Table 3 (Fungi, q.v.). Three fungal phyla belonging to the *Chromista* are accepted in this edition of the *Dictionary*:

(1) **Hyphochytriomycota.**
(2) **Labyrinthulomycota.**
(3) **Oomycota.**

Jaraia Němec (1912) nom. dub., ? Saprolegniaceae.

Kawakamia Miyabe (1903) = Phytophthora fide Fitzpatrick (*The lower fungi. Phycomycetes*, 1930).

Labyrinthista, Chromista. 1 class., 2 ord., 2 fam., 12 gen., 53 spp. (Labyrinthomorpha, Labyrinthulomycota); labyrinthids and thraustochytrids. Trophic stage with an ectoplasmic network, and spindle-shaped or sphaerical cells that move by gliding within the network; uniquely contain bothrosomes; zoospores when present with two flagellae, one with mastigonemes; sexual reproduction known in some spp.
The spp. occur in salt and freshwater, often associated with plants and algal chromists, some as pathogens; culturable. Class:
Labyrinthulea (≡ *Labyrinthulomycota*)
Data from recent molecular investigations conflict with current morphological based classifications and suggest that new lineages need to be recognized.

Olpidiomorpha Scherff. (1926), Rozellopsidales. 1 (on *Pseudospora*), Europe. See Dick (*Straminipilous Fungi*: 670 pp., 2001).

Olpidiopsidaceae Sparrow ex Cejp (1959), Olpidiopsidales. 2 gen. (+ 5 syn.), 20 spp.

Olpidiopsidales M.W. Dick (2001). Oomycetes. 1 fam., 3 gen., 22 spp. Thallus holocarpic, initially plasmodial, olpidioid, subspherical or allantoid, nonseptate, without rhizoids; each thallus becoming transformed into a reproductive structure; asexual reproduction by zoosporangia, zoosporogenesis intrasporangial, zoospores heterokont with subapical flagellar insertion; sexual reproduction heterothallic, larger thalli functioning as oogonia, smaller contiguous thalli as antheridia (companion cells); oospores plerotic. Obligate parasites of flagellate fungi and green algae in freshwater and damp soil. Fam.: Olpidiopsidaceae

Lit.: Dick (*in* Margulis *et al.* (Eds), 1990), Dick (1995), Dick (2001).

Olpidiopsis Cornu (1872), Olpidiopsidaceae. 16 (on *Oomycetes*), widespread. See Dick (*Straminipilous Fungi*: 670 pp., 2001), Elíades *et al.* (*Darwiniana* **40**: 39, 2002; Argentina).

Oomycetes G. Winter (1880), Oomycota. 8 ord., 19 fam., 95 gen., 911 spp. Ords:
(1) **Albuginales**
(2) **Leptomitales**
(3) **Myzocytiopsidales**
(4) **Olpidiopsidales**
(5) **Peronosporales**
(6) **Pythiales**
(7) **Rhipidiales**
(8) **Saprolegniales**

For *Lit.* see ord. and fam.

Oomycota Arx (1967), Chromista. 1 class., 13 ord., 25 fam., 106 gen., 956 spp. Aquatic or terrestrial, freshwater or marine, saprobic or parasitic (some economically important on higher plants); thallus unicellular to mycelial (hyphae coenocytic), mainly aseptate; assimilative phase diploid (as in plants); zoospores with unequal (anisokont, heterokont) flagella, a tinsel one diverted with 2 rows of mastigonemes formed, and a whiplash one smooth or with fine flexous hairs backwards; with protoplasmic and nucleus-associated microtubules; the cell walls are a glucan-cellulose, rarely with minor amounts of chitin. Cosmop. and widespr.

Dick (*CJB* **73**(Suppl.): S712, 1995) and (2001) has proposed that the oomycetes should be recognized as class *Peronosporomycetes* and divided into three subclasses: *Peronosporomycetidae*; *Rhipidiomycetidae*; *Saprolegniomycetidae*. The sequence data in Riethmüller *et al.* (*CJB* **77**: 1790, 1999) support these subclasses.

Peronosporaceae de Bary (1863), Peronosporales. 20 gen. (+ 15 syn.), 365 spp.

Peronosporales E. Fisch. (1892). Oomycetes. 1 fam., 20 gen., 365 spp. Mycelium intercellular with intracellular haustoria; dispersal by sporangia (zoosporangia) or conidia (conidiosporangia); sexual reproduction by oogamy: oospheres fertilized by nuclei from an antheridium, resulting in an oospore with thick and smooth or ornamented wall; cosmop., obligate parasites, almost totally confined to dicots, some economically important plant pathogens. Fam:
Peronosporaceae

Protoachlya Coker (1923), Saprolegniaceae. 6, N. America; Europe. See Dick (*Straminipilous Fungi*: 670 pp., 2001), Padgett & Johnson (*Mycol.* **96**: 205, 2004; zoosporangial discharge), Johnson *et al.* (*Mycotaxon* **92**: 11, 2005; systematics).

Protobremia Voglmayr, Riethm., Göker, Weiss & Oberw. (2004), Peronosporaceae. 1. See Voglmayr *et al.* (*MR* **108**: 1023, 2004).

Pseudolpidiaceae H.E. Petersen (1909) = Olpidiopsidaceae.

Pseudolpidiella Cejp (1959) = Sirolpidium fide Dick (*in litt.*).

Pseudolpidiopsis Minden (1911) = Pleocystidium fide Dick (*in litt.*).

Pseudolpidium A. Fisch. (1892) = Olpidiopsis fide Shanor (*J. Elisha Mitchell scient. Soc.* **55**: 179, 1939).

Pseudoperonospora Rostovzev (1903), Peronosporaceae. 6, widespread. *P. cubensis* (cucurbit downy mildew); *P. humuli* (hop (*Humulus*) downy mildew). See Waterhouse & Brothers (*Mycol. Pap.* **148**, 1981; monogr., keys), Constantinescu (*Crypt. Mycol.* **21**: 93, 2000; sporangium ultrastr.), Göker *et al.* (*CJB* **81**: 672, 2003; phylogeny), Voglmayr (*MR* **107**: 1132, 2003; phylogeny), Choi *et al.* (*MR* **109**: 841, 2005; *P. humuli* as syn. of *P. cubensis*).

Pseudoplasmodium Molisch (1925) = Labyrinthula fide Olive (*The mycetozoans*, 1975).

Pseudoplasmopara Sawada (1922) = Plasmopara fide Fitzpatrick (*The lower fungi. Phycomycetes*, 1930).

Pseudosphaerita P.A. Dang. (1895), Pseudosphaeritaceae. 4 (on *Algae*), France; Mexico. See Karling (*Bull. Torrey bot. Club* **99**: 223, 1973), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Pseudosphaeritaceae M.W. Dick (2001), Rozellopsidales. 2 gen., 14 spp.

Pustula Thines (2005), Albuginaceae. 4. See Thines & Spring (*Mycotaxon* **92**: 454, 2005), Constantinescu & Thines (*Sydowia* **58**: 178, 2006; sporangial dimorphism).

Pyrrhosorus Juel (1901), ? Labyrinthulales. 1 (on red algae), Europe. See Dick (*Straminipilous Fungi*: 670 pp., 2001; systematic posn).

Pythiaceae J. Schröt. (1893), Pythiales. 7 gen. (+ 5 syn.), 163 spp.

Lit.: See Middleton (*Tijdschr. PlZiekt.* **58**: 226, 1952; generic concepts), Rangaswami (*Pythiaceous fungi*, 1962; host list), Dick *in* Margulis *et al.* (Eds) (*Handbook of Protoctista*: 661, 1990), Barr *et al.* (*CJB* **70**: 2163, 1992; flagellum ultrastr.).

Pythiacystis R.E. Sm. & E.H. Sm. (1906) = Phytophthora fide Leonian (*Am. J. Bot.* **12**: 444, 1925).

Pythiales M.W. Dick (2001). Oomycetes. 2 fam., 10 gen., 174 spp. Thallus mycelial or pseudomycelial. Asexual reproduction by sporangia or conidiosporangia; zoosporogenesis intrasporangial or extrasporangial in a vesicle; zoosporangia terminal, or sequential (percurrent or by internal or sympodial proliferation); sporangiophores rarely differentiated. Sexual reproduction by thin-walled oogonia; oospores usually single, aplerotic or nearly plerotic, periplasm absent or minimal and not persistent; oospore wall almost always smooth, ooplast solid and translucent. Cosmop., in plants, fungi and animals, or saprotrophic. Fams:

(1) **Pythiaceae**

(2) **Pythiogetonaceae**
Lit.: Dick *et al.* (1984), Dick (1995), Dick (2001).

Pythiella Couch (1935), Lagenaceae. 2 (in *Pythium*), Cuba; N. America. See Dick (*Straminipilous Fungi*: 670 pp., 2001).

Pythiogeton Minden (1916), Pythiogetonaceae. 9, widespread (north temperate). See Drechsler (*J. Wash. Acad. Sci.* **22**: 421, 1932), Batko (*Acta Mycologica* Warszawa **7**: 241, 1971; key), Voglmayr *et al.* (*MR* **103**: 591, 1999), Dick (*Straminipilous Fungi*: 670 pp., 2001), Ann *et al.* (*Mycol.* **98**: 116, 2006; sp.n. Taiwan).

Pythiogetonaceae M.W. Dick (1999), Pythiales. 2 gen. (+ 1 syn.), 10 spp.

Pythiomorpha H.E. Petersen (1909) = Phytophthora fide Blackwell *et al.* (*TBMS* **25**: 148, 1941), Waterhouse (*TBMS* **41**: 196, 1958).

Pythiopsis de Bary (1888), Saprolegniaceae. 5, widespread. See Spencer *et al.* (*MR* **106**: 549, 2002; revision), Johnson *et al.* (*Mycotaxon* **92**: 1, 2005; systematics).

Pythium Nees (1823) nom. rej., Saprolegniales.

Pythium Pringsh. (1858) nom. cons., Pythiaceae. *c.* 150, widespread. Causing damping-off, root diseases, and mycoparasitic; a few marine (*P. thalassium*; on marine pea-crab, *Pinnotheres*). See Middleton (*Mem. Torrey bot. Club* **20** no. 1, 1943), Atkins (*TBMS* **38**: 31, 1955; *P. thalassium*), Rangaswami (*Pythiaceous fungi*, 1962; host list), Waterhouse (*Mycol. Pap.* **110**, 1968; diagnoses, descriptions, figs. from original papers), Hendrix & Campbell (*Mycol.* **66**: 681, 1974), van der Plaats-Niterink (*Stud. Mycol.* **21**, 1981; key), Dick (*Keys to Pythium*, 1990; key), Bailey *et al.* (*FEMS Microbiol. Microbiol.* **72**: 2691, 2006; identification and detection), Villa *et al.* (*Mycol.* **98**: 410, 2006; phylogeny).

Reessia C. Fisch (1883), Rhizidiomycetaceae. 2 (on *Lemna*), Europe.

Resticularia P.A. Dang. (1890) = Syzygangia fide Dick (*in litt.*).

Rheosporangium Edson (1915) = Pythium Pringsh. fide Fitzpatrick (*Mycol.* **15**: 166, 1923).

Rhipidiaceae Sparrow ex Cejp (1959), Rhipidiales. 6 gen. (+ 2 syn.), 15 spp.

Rhipidiales M.W. Dick (2001). Oomycetes. 1 fam., 6 gen., 15 spp. Thallus eucarpic, monocentric, saccate or pseudomycelial, with rhizoids. Asexual reproduction by zoosporangia; zoosporogenesis intrasporangial sometimes with a plasmamembranic vesicle; zoosporangia terminal; sporangiophores absent. Sexual reproduction by oogonia; oogonia more or less thick-walled; oospores usually single, aplerotic, periplasm persistent, sometimes permanent; oospore wall with a more or less rugose exospore. Saprotrophs in fresh or stagnant water; facultatively or obligately fermentative. Fam.:
Rhipidiaceae
Lit.: Dick *et al.* (1984), Dick (1995), Dick (2001).

Rhipidiomycetidae, Oomycetes. See *Oomycota*.

Rhipidium Cornu (1871) nom. cons., Rhipidiaceae. 4, widespread. See Dick (*Straminipilous Fungi*: 670 pp., 2001).

Rhizidiomyces Zopf (1884), Rhizidiomycetaceae. 13, widespread. See Sparrow (*Aquatic Phycomycetes* Edn 2: 751, 1960; key), Fuller (*Am. J. Bot.* **49**: 64, 1962; culture), Dick (*Straminipilous Fungi*: 670 pp., 2001), Fuller *in* McLaughlin *et al.* (Eds) (*The Mycota A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research* **7A**: 73, 2001), Letcher *et al.* (*Australasian Mycologist* **22**: 99, 2004; Australia).

Rhizidiomycetaceae Karling ex P.M. Kirk, P.F. Cannon & J.C. David (2001), Hyphochytriales. 3 gen. (+ 1 syn.), 16 spp.

Rhizidiomycopsis Sparrow (1960) = Rhizidiomyces fide Longcore (*in litt.*).

Rhizoblepharis P.A. Dang. (1900) nom. dub., Chromista. 'phycomycetes'.

Rhysotheca G.W. Wilson (1907) = Plasmopara fide Fitzpatrick (*The lower fungi. Phycomycetes*, 1930).

Rozellopsidaceae M.W. Dick (2001), Rozellopsidales. 1 gen. (+ 1 syn.), 4 spp.

Rozellopsidales M.W. Dick (2001). Oomycota. 2 fam., 5 gen., 23 spp. Thallus holocarpic, plasmodial following infection and during the assimilative phase, plasmodium sometimes capable of vegetative division, transformed into a single sporangium or into discrete walled segments or sporangia, or into a single resting spore; asexual reproduction by zoospores, zoosporogenesis intrasporangial; zoospores motile within the zoosporangium prior to discharge; zoospores often with posterior refractive granules, and one or two flagella, biflagellate zoospores anisokont; sexual reproduction not established. Obligate endoparasites of flagellate fungi, algae or protoctists in freshwater. Fams:
(1) **Pseudosphaeritaceae**
(2) **Rozellopsidaceae**
Lit.: Dick (2001; systematics).

Rozellopsis Karling ex Cejp (1959), Rozellopsidaceae. 4, Europe; Japan. See Karling ex Cejp (*Fl. ČSR* **B(2), Oomycetes**: 342, 454, 1959), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Salilagenidiaceae M.W. Dick (2001), Salilagenidiales. 1 gen., 6 spp.

Salilagenidiales M.W. Dick (2001). Saprolegniomycetidae. 1 fam., 1 gen., 6 spp. Fam.:
Salilagenidiaceae
For *Lit.* see under fam.

Salilagenidium M.W. Dick (2001), Salilagenidiaceae. 6, widespread. See Dick (*Straminipilous Fungi*: 314, 2001).

Saprolegnia Nees (1823), Saprolegniaceae. 15 (in freshwater), widespread (esp. north temperate). *S. parasitica* and other spp. pathogenic to fish and other aquatic vertebrates. See Tiffney (*Mycol.* **31**: 310, 1939; of fish), Scott *et al.* (*Virg. J. Sci.* **14**: 42, 1963), Seymour (*Nova Hedwigia* **19**: 1, 1970; gen. account, key 19 spp.), Mil'ko (*Mikol. Fitopatol.* **13**: 288, 1979), Neish & Hughes (*Fungal diseases of fishes* **6**, 1980), Willoughby *in* Roberts (Ed.) (*Microbial diseases of fish*, 1982; of salmon), Bruno & Wood *in* Wood & Bruno (Ed.) (*Fish Diseases & Disorders* **3**: 599, 1999), Steciow (*FEMS Microbiol. Lett.* **219**: 253, 2003; Argentina), Markovskaja (*Botanica Lithuanica* **12**: 97, 2006; Lithuania).

Saprolegniaceae Kütz. ex Warm. (1884), Saprolegniales. 19 gen. (+ 4 syn.), 145 spp.

Saprolegniales E. Fisch. (1892). Saprolegniomyceti-

dae. 2 fam., 24 gen., 172 spp. 'water moulds'. Mycelium frequently stout and able to increase in diam., obvious cytoplasmic streaming. Asexual reproduction by sporangia; zoosporogenesis intrasporangial; zoospores released by papillate or operculate dehiscence or disintegration of sporangium, discharge vesicles not formed; zoosporangial formation sequential, percurrent or sympodial. Sexual reproduction by thick-walled, papillate or pitted oogonia, oosporogenesis centrifugal, periplasm absent or minimal and not persistent; oospores single or numerous, oospore wall almost always smooth. Freshwater, rarely marine, saprobic or parasitic; widespr. Fams:
(1) **Saprolegniaceae**
(2) **Leptolegniaceae**
Lit.: Coker (*The Saprolegniaceae with notes on other water molds*, 1923 [reprint 1968]), Fitzpatrick (1930), Cejp (1969), Seymour (1970), Dick (1973; *in* Margulis *et al.* (Eds), 1990: 661), Dick (2001).

Amoeboaphelidium Scherff. (1925), Protozoa. See monads.

Amoebosporus Ivimey Cook (1933), Protozoa. 2, West Indies.

Amoebozoa, Protozoa. 3 class., 7 ord., 20 fam., 82 gen., 1019 spp. A phylum of Protozoa (q.v.) containing the 'fungal' slime moulds [*Myxomycota* (orth. bot.)] and their allies.
Lit.: see under *Mycetozoa*.

Amphisporium Link (1815) = Didymium fide Martin & Alexopoulos (*Myxomycetes*: 383, 1969).

Amylotrogus Roze (1896) nom. dub., Myxogastria.

Ancyrophorus Raunk. (1888) = Enerthenema fide Torrend (*Brotéria* sér. bot. **7**: 72, 1908).

Andohaheloa Manier (1955) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Angioridium Grev. (1827) = Physarum fide Saccardo (*Syll. Fung.* **7**: 347).

Anisomyxa Němec (1913) = Ligniera fide Kirk (*in litt.*).

Antonigeppia Kuntze (1898) = Lycogala fide Martin & Alexopoulos (*Myxomycetes*: 62, 1969).

Arcyodes O.F. Cook (1902), Trichiaceae. 1, N. America; Europe. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Arcyrella (Rostaf.) Racib. (1884) = Arcyria fide Pando (*in litt.*).

Arcyria Hill ex F.H. Wigg. (1780), Arcyriaceae. *c.* 50, widespread. See Robbrecht (*Bull. Jard. bot. nat. Belg.* **44**: 303, 1974; key 13 spp.), Dörfelt *et al.* (*MR* **107**: 123, 2003; fossil), Yamamoto & Hagiwara (*Bull. natn. Sci. Mus.* Tokyo, N.S. **31**: 79, 2005; Japan).

Arcyriaceae Rostaf. ex Cooke (1877), Trichiida (inc. sed.). 2 gen. (+ 4 syn.), 51 spp.

Arcyriatella Hochg. & Gottsb. (1989), Trichiaceae. 1, Brazil. See Hochgesand & Gottsberger (*Nova Hedwigia* **48**: 485, 1989).

Arscyria, see *Arcyria*.

Arundinella L. Léger & Duboscq (1905) [non *Arundinella* Raddi 1823, *Gramineae*] = Arundinula fide Lichtwardt (*in litt.*).

Arundinula L. Léger & Duboscq (1906), Eccrinaceae. 6 (in *Decapoda*), widespread. See Lichtwardt (*Mycol.* **54**: 440, 1962; morphology), Hibbets (*Syesis* **11**: 213, 1978; development), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), van Dover & Lichtwardt (*Biol. Bull.* **171**: 461, 1986), White *et al.* (*Mycol.* **98**: 333, 2006).

Astereptonema, see *Astreptonema*.

Astreptonema Hauptfl. (1895), Eccrinaceae. 5 (in *Amphipoda*), Europe; USA. See Moss (*TBMS* **65**: 115, 1975; ultrastr.), Hibbets (*Syesis* **11**: 213, 1978; development), Lichtwardt (*The Trichomycetes. Fun-

gal associates of arthropods, 1986; key), Cafaro (*Mol. Phylogen. Evol.* **35**: 21, 2005; phylogeny).

Bactridiopsis Henn. (1904) = Coccospora Wallr. fide Damon & Downing (*Mycol.* **46**: 209, 1954).

Bactriexta Preuss (1852) nom. dub., ? Protozoa.

Badhamia Berk. (1853), Physaraceae. *c.* 30, widespread. See Sekhon (*J. Indian bot. Soc.* **58**: 56, 1979; key 8 Indian spp.), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Badhamiopsis T.E. Brooks & H.W. Keller (1976), Physaraceae. 3, Australia; Hawaii; Japan; British Isles. See Brooks & Keller (*Mycol.* **68**: 835, 1976), Eliasson (*MR* **95**: 257, 1991; Hawaii), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), McHugh *et al.* (*N.Z. Jl Bot.* **41**: 487, 2003; Australia).

Barbeyella Meyl. (1914), Clastodermataceae. 1 (montane), widespread. See Schnittler *et al.* (*Karstenia* **40**: 159, 2000; ultrastr.), Schnittler *et al.* (*MR* **104**: 1518, 2000; ecol.).

Biomyxa Leidy (1875), Protozoa. 2 or. Amoeboid protist. See Anderson & Hoefler (*J. Ultrastr. Res.* **66**: 276, 1979; ultrastr.), Patterson (*Amer. Nat.* **154**: S96, 1999; systematic posn).

Brefeldia Rostaf. (1873), Stemonitidaceae. 1, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Crespo & Lugo (*Mycotaxon* **87**: 91, 2003; Argentina).

Brefeldiaceae Rostaf. ex Cooke (1877) = Stemonitidaceae.

Bursulla Sorokīn (1876), Echinosteliopsidaceae. 1 (coprophilous), former USSR. See Olive (*The mycetozoans*: 111, 1975).

Bursullaceae Zopf ex Berl. (1888) = Echinosteliopsidaceae.

Calomyxa Nieuwl. (1916), Dianemataceae. 2, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key).

Calonema Morgan (1893), Trichiaceae. 4, widespread. See Rammeloo (*Icones Mycologicae*: [1], 1984; *Calonema aureum*), Estrada Torres *et al.* (*Mycol.* **95**: 354, 2003; Mexico sp.nov.), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key).

Calospeira G. Arnaud (1949) nom. inval., ? Dictyostelida.

Calyssosporium Corda (1831) nom. dub., ? Myxogastria.

Capillus Granata (1908) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Carcerina Fr. (1849) = Diderma fide Pando (*in litt.*).

Cavosteliaceae L.S. Olive (1964), Protostelida (inc. sed.). 4 gen., 8 spp.

Lit.: Spiegel (*Handbook of Protoctista*: 484, 1990).

Cavostelium L.S. Olive (1965), Cavosteliaceae. 2, widespread (tropical). See Olive & Stoianovitch (*Am. J. Bot.* **56**: 979, 1969), Spiegel & Feldman (*Protoplasma* **163**: 189, 1991).

Ceratiomyxa J. Schröt. (1889), Ceratiomyxaceae. 4, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand), Lado *et al.* (*Taxon* **54**: 543, 2005; nomencl.).

Ceratiomyxaceae J. Schröt. (1889), Protostelida (inc. sed.). 1 gen. (+ 3 syn.), 4 spp.

Lit.: Spiegel (*Handbook of Protoctista*: 484, 1990).

Ceratiomyxales G.W. Martin ex M.L. Farr & Alexop. (1977). See *Protostelida.*

Ceratiomyxella L.S. Olive & Stoian. (1971), Cavosteliaceae. 1, Brazil; Tahiti. See Olive & Stoianovitch (*Am. J. Bot.* **58**: 32, 1971), Glushchenko & Leontiev (*Mikol. Fitopatol.* **36**: 7, 2002; Ukraine).

Ceratiomyxomycetes. See *Protostelia.*

Ceratiopsis De Wild. (1896) = Ceratiomyxa fide Saccardo (*Syll. fung.* **14**, 1899).

Ceratium Alb. & Schwein. (1805) [non *Ceratium* Schrank 1793, *Algae*] ≡ Ceratiomyxa.

Cercozoa, Protozoa. 1 class., 1 ord., 2 fam., 15 gen., 50 spp. A phylum of Protozoa (q.v.) containing the 'fungal' plasmodiophorids [*Plasmodiophoromycota* (orth. bot.)] and their allies; included in the class *Phytomyxea*. Trophic phase intracellular in algal, fungal or plant host cells; plasmodia multinucleate, unwalled, cell division mitotic and cruciform (division producing a cross-like structure at metaphase), developing into either sporangia (forms zoospores or cytosori; resting structures); zoospores with two anteriorly directed whiplash flagella; flagellae smooth, lacking mastigonemes, equal in length. Obligate symbionts in soil or freshwater habitats; require coculturing with their hosts needed for laboratory studies. A single Ord.

Plasmodiophorida [*Plasmodiophorales* (orth. bot.)]

The placement of these fungi has varied. Dylewski (1990) kept them with the mastigomycete fungi (e.g. *Chromista*); they are retained in the *Protozoa* following Barr (1992) and Corliss (1994). Olive (1975) treated them as a separate class, while Corliss (1994) placed them as one of several orders in the phylum *Opalozoa.*

Lit.: Corliss (1994), Dylewski (*in* Margulis *et al.* (Eds), *Handbook of the Protoctista*: 399, 1990), Karling (*The Plasmodiophorales*, 1943; edn 2, 1968), Olive (1975), Waterhouse (*in* Ainsworth *et al.*, *The Fungi* **4B**: 75, 1973; key gen.), and see under subordinate taxa.

Cestodella Tuzet, Manier & Jolivet (1957) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Chondrioderma Rostaf. (1873) = Diderma fide Martin & Alexopoulos (*Myxomycetes*: 347, 1969).

Cienkowskia Rostaf. (1873) [non *Cienkowskia* Regel & Rach 1859, *Boraginaceae*] ≡ Willkommlangea.

Cienkowskiaceae Rostaf. ex Cooke (1877) = Physaraceae.

Cionium Link (1809) ≡ Didymium.

Clastoderma A. Blytt (1880), Clastodermataceae. 2, widespread. See Eliasson & Keller (*MR* **100**: 610, 1996).

Clastodermataceae Alexop. & T.E. Brooks (1971), Echinostelida (inc. sed.). 2 gen. (+ 2 syn.), 3 spp.

Clastostelium L.S. Olive & Stoian. (1977), Protosteliaceae. 1, Guam. See Olive & Stoianovitch (*TBMS* **69**: 83, 1977), Spiegel & Feldman (*Mycol.* **80**: 525, 1988; trophic cells).

Clathrodastrum, see *Clathroidastrum P. Micheli ex Adans.*

Clathroidastrum Kuntze (1891) ≡ Stemonitis Gled.

Clathroidastrum P. Micheli ex Adans. (1763) ≡ Stemonitis Gled.

Clathroides P. Micheli (1729) = Arcyria fide Pando (*in*

litt.).

Clathroptychiaceae Rostaf. ex Cooke (1877) = Reticulariaceae.

Clathroptychium Rostaf. (1875) = Dictydiaethalium fide Martin & Alexopoulos (*Myxomycetes*: 59, 1969).

Clathrosorus Ferd. & Winge (1920) = Spongospora fide Kirk (*in litt.*).

Clatroidastron, see *Clathroidastrum P. Micheli ex Adans.*

Claustria Fr. (1849) = Physarum fide Martin & Alexopoulos (*Myxomycetes*: 274, 1969).

Coccospora Wallr. (1833) nom. dub., Myxogastria. See Carris (*Sydowia* **45**: 92, 1993).

Coenonia Tiegh. (1884), Dictyosteliaceae. 1, Europe. See Dykstra & Keller *in* Lee, Leedale & Bradbury (Eds) (*An Illustrated Guide to the Protozoa, Organism Traditionally Referred to as Protozoa, or Newly Discovered Groups* **2**: 952, 2000).

Collaria Nann.-Bremek. (1975) = Comatricha fide Martin & Alexopoulos (*Myxomycetes*: 222, 1969).

Colloderma G. Lister (1910), Stemonitidaceae. 4, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand), McHugh (*Mycotaxon* **92**: 107, 2005; Ecuador), Yamamoto & Hagiwara (*Bull. natn. Sci. Mus.* Tokyo, N.S. **31**: 79, 2005; Japan).

Collodermataceae Lister (1925) = Stemonitidaceae.

Comatricha Preuss (1851), Stemonitidaceae. *c.* 50, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Camino *et al.* (*Mycotaxon* **88**: 315, 2003; Cuba), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key gen.).

Comatrichoides Hertel (1956) = Comatricha fide Martin & Alexopoulos (*Myxomycetes*: 222, 1969).

Coniocephalum Brond. (1828) nom. dub., Myxogastria. See Martin (*in litt.*).

Copromyxa Zopf (1884), Copromyxaceae. 2, Europe; N. America. See Nesom & Olive (*Mycol.* **64**: 1359, 1972), Spiegel & Olive (*Mycol.* **70**: 843, 1978), Raper (*The dictyostelids*, 1984), Dykstra & Keller *in* Lee, Leedale & Bradbury (Eds) (*An Illustrated Guide to the Protozoa, Organism Traditionally Referred to as Protozoa, or Newly Discovered Groups* **2**: 952, 2000).

Copromyxaceae L.S. Olive & Stoian. (1975), Acrasida (inc. sed.). 2 gen., 6 spp. [*Copromyxidae* (orth. zool.)].

Copromyxella Raper, Worley & Kurzynski (1978), Copromyxaceae. 4, USA; Costa Rica. See Raper *et al.* (*Am. J. Bot.* **65**: 1013, 1978), Dykstra & Keller *in* Lee, Leedale & Bradbury (Eds) (*An Illustrated Guide to the Protozoa, Organism Traditionally Referred to as Protozoa, or Newly Discovered Groups* **2**: 952, 2000).

Cornuvia Rostaf. (1873), Arcyriaceae. 1, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Coscinium Endl. [not traced] = Lamproderma fide Mussat (*Syll. fung.* **15**: 397, 1901).

Crateriachea Rostaf. (1873) = Physarum fide Martin & Alexopoulos (*Myxomycetes*: 274, 1969).

Craterium Trentep. (1797), Physaraceae. 16, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stojanowska & Panek (*Acta Mycologica* Warszawa **38**: 65, 2003; Poland).

Cribraria Pers. (1794) nom. cons., Cribrariaceae. *c.* 40, widespread. See Novozhilov (*Mikol. Fitopatol.* **27**: 39, 1993), Lado *et al.* (*Mycol.* **91**: 157, 1999; *Cribraria zonatispora*), Li (*Mycoscience* **43**: 247, 2002; China), Lado *et al.* (*Taxon* **54**: 829, 2005; nomencl.).

Cribraria Schrad. ex J.F. Gmel. (1792) nom. rej., Myxogastria.

Cribrariaceae Corda (1838), Liceida (inc. sed.). 2 gen. (+ 2 syn.), 41 spp.

Cupularia Link (1833) = Craterium fide Pando (*in litt.*).

Cylichnium Wallr. (1833) = Licea fide Martin & Alexopoulos (*Myxomycetes*: 47, 1969).

Cystobacter J. Schröt. (1886) = Polyangium fide Buchanan *et al.* (*Index Bergeyana*, 1966).

Cystospora J.E. Elliot (1916) nom. dub., Plasmodiophoraceae. See Karling (*Plasmodiophorales*, 1968).

Cytidium Morgan (1896) = Physarum fide Martin & Alexopoulos (*Myxomycetes*: 292, 1969).

Daloala Tuzet, Manier & Vog.-Zuber (1952) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Demordium Link (1809) nom. dub., Myxogastria. 1, Europe.

Dermocystidium Pérez (1908), Protozoa. *D. cochliopodii* on *Cochliopodium bilimbosum* (see Valkanov, *Nova Hedw.* **12**: 393, 1967). See Dykova & Lom (*J. appl. Ichthyology* **8**: 180, 1992; evidence of fungal nature) Now assigned to the DRIPs clade, q.v. *D. marinum* now belongs in the genus *Perkinsus*.

Dermocystis Pérez (1907) ≡ Dermocystidium.

Dermodium Link (1809) nom. conf., Myxogastria.

Dermodium Rostaf. (1875) = Lycogala fide Martin & Alexopoulos (*Myxomycetes*: 61, 1969).

Dermosporidium Carini (1940) = Rhinosporidium fide Azevedo (*Rev. Cien. Biol.* **1**: 97, 1963).

Diachaeella Höhn. (1909) = Diachea fide Martin & Alexopoulos (*Myxomycetes*: 177, 1969).

Diachea Fr. (1825), Stemonitidaceae. 10, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand), Gaither & Keller (*Systematics and Geography of Plants* **74**: 217, 2004; SEM).

Diacheopsis Meyl. (1930), Stemonitidaceae. 16, widespread. See Kowalski (*Mycol.* **67**: 616, 1975; key), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key gen.), Moreno *et al.* (*Mycol. Progr.* **5**: 129, 2006; *Diacheopsis metallica* and *Diacheopsis kowalskii*).

Dianema Rex (1891), Dianemataceae. 9, widespread. See Kowalski (*Mycol.* **59**: 1080, 1968), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key to corticolous spp.).

Dianemataceae T. Macbr. (1899), Trichiida (inc. sed.). 2 gen. (+ 3 syn.), 11 spp.

Dianemina A.R. Loebl. & Tappan (1961) ≡ Dianema.

Dichosporium Nees (1816) nom. dub., Physaraceae.

Dictydiaethaliaceae Nann.-Bremek. ex H. Neubert, Nowotny & K. Baumann (1993), Liceida (inc. sed.). 1 gen. (+ 2 syn.), 2 spp.

Dictydiaethalium Rostaf. (1873), Dictydiaethaliaceae. 2, widespread. See Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; NZ), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key).

Dictydium Schrad. (1797) = Cribraria Pers. fide Lado & Pando (*Fl. Mycol. Iberica* **2**, 1997).

Dictyostelia, Mycetozoa. 1 ord., 2 fam., 4 gen., 93 spp. [*Dictyosteliomycetes* (orth. bot.)]. Dictyostelid slime moulds, dictyostelids. Ord.:
Dictyosteliales
For *Lit.* see ord. and fam.

Dictyosteliaceae Rostaf. ex Cooke (1877), Dictyostelida (inc. sed.). 3 gen. (+ 1 syn.), 77 spp. [*Dictyosteliidae* (orth. zool.)].

Dictyosteliales L.S. Olive ex P.M. Kirk, P.F. Cannon & J.C. David (2001). See *Dictyostelida.*

Dictyostelida [*Dictyosteliales* (orth. bot.)]. Dictyostelia. 2 fam., 4 gen., 93 spp. An order of 'fungal' slime moulds of *Mycetozoa* (q.v.) comprising Fams:
(1) **Actyosteliaceae**
(2) **Dictyosteliaceae**
See Cavender (1990; key 15 spp. Ohio).
For *Lit.* see under fam.

Dictyosteliomycetes. See *Dictyostelea.*

Dictyosteliomycota = Mycetozoa. See *Amoebozoa.*

Dictyostelium Bref. (1870), Dictyosteliaceae. *c.* 60, widespread. See Raper (*Quart. Rev. Biol.* **26**: 169, 1951; culture), Lee (*TMSJ* **12**: 142, 1971; Japanese spp.), Loomis (*Dictyostelium discoideum: a developmental system*, 1975), Olive (*The mycetozoans*: 55, 1975; key), Waddell (*Nature* **298**: 464, 1983; *D. caveatum* predacious on *Dictyostelium* spp.), Raper (*The dictyostelids*, 1984), Cavender *et al.* (*N.Z. Jl Bot.* **40**: 235, 2002; New Zealand), Glöckner *et al.* (*Nature* London **417**: 79, 2002; Sequence and analysis of chromosome 2 of *Dicyostelium discoideum*), Yeh (*Mycotaxon* **86**: 103, 2003; Taiwan), Cavender *et al.* (*Mycol.* **97**: 493, 2005; USA), Hagiwara (*Bull. natn. Sci. Mus.* Tokyo, N.S. **32**: 47, 2006), Hagiwara & Hosono (*Bull. natn. Sci. Mus.* Tokyo, N.S. **32**: 1, 2006; Japan).

Diderma Pers. (1794), Didymiaceae. *c.* 75, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Lado (*Cuadernos de Trabajo de Flora Micológica Ibérica* **16**, 2001; nomenclature), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Didymiaceae Rostaf. ex Cooke (1877), Physarida (inc. sed.). 7 gen. (+ 12 syn.), 166 spp.

Didymium Schrad. (1797), Didymiaceae. *c.* 75, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Diphtherium Ehrenb. (1818) = Lycogala fide Martin & Alexopoulos (*Myxomycetes*: 64, 1969).

Diplophysalis Zopf (1884), Protozoa. (Algal parasite). Heterotrophic amoeboflagellate protist formerly included in the monads or proteomyxids. See Karling (*Am. J. Bot.* **17**: 928, 1930).

Disporium Léman (1819) = Didymium fide Martin & Alexopoulos (*Myxomycetes*: 383, 1969).

Eccrina Leidy (1852) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Eccrinaceae L. Léger & Duboscq ex P.M. Kirk, P.F. Cannon & J.C. David (2001), Eccrinales. 14 gen. (+ 14 syn.), 53 spp.

Eccrinales Léger & Duboscq (1929). Protozoa. 3 fam., 17 gen., 63 spp. Thallus unbranched or branched only at the base, vegetatively coenocytic, with basal, secreted holdfast; asexual reproduction by endogenous sporangiospores produced in basipetal succession from the thallus tip, (a) multinucleate, thin-walled sporangiospores germinating within the digestive tract of the same host, (b) usually uninucleate, thick-walled sporangiospores which in aquatic forms are frequently appendaged and on release function as re-infestive spores; microthallus present in some genera; sexual reproduction known only in *Enteropogon*; endocommensals of aquatic and terrestrial *Crustacea, Diplopoda* and *Insecta.* Fams:
(1) Eccrinaceae
(2) Palavasciaceae
(3) Parataeniellaceae
Lit.: Lichtwardt (*Mycol.* **46**: 564, 1954, **52**: 410, 1960; taxonomy, 1986), Manier (1969, taxonomy), Hibbits (*Syesis* **11**: 213, 1978; development, sexual repr.), Moss (1979).

Eccrinella L. Léger & Duboscq (1933) = Astreptonema fide Manier (*Annls Sci. Nat.* Bot., sér. 12 **5**: 767, 1964).

Eccrinidus Manier (1970), Eccrinaceae. 1 (in *Diplopoda*), France. See Manier & Grizel (*C.R. Acad. Sci. Paris* **274**: 1159, 1972; ultrastr.), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), Cafaro (*Mol. Phylogen. Evol.* **35**: 21, 2005; phylogeny).

Eccrinoides L. Léger & Duboscq (1929), Eccrinaceae. 4 (in *Isopoda* and *Diplopoda*), Europe. See Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986).

Eccrinopsis L. Léger & Duboscq (1916) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Echinosteliaceae Rostaf. ex Cooke (1877), Echinostelida (inc. sed.). 1 gen. (+ 1 syn.), 15 spp.

Echinosteliales G.W. Martin (1961). See *Echinostelida.*

Echinostelida [*Echinosteliales* (orth. bot.)]. Myxogastria. 2 fam., 3 gen., 18 spp. Spore mass white, pale pink, or yellow, columella present, peridium fugaceous. Fams:
(1) **Clastodermataceae**
(2) **Echinosteliaceae**
Lit.: Alexopoulos & Brooks (*Mycol.* **63**: 925, 1971).

Echinosteliopsidaceae L.S. Olive (1970), Protostelida (inc. sed.). 2 gen., 2 spp.

Echinosteliopsidales L.S. Olive (1970). See *Protostelida.*

Echinosteliopsis D.J. Reinh. & L.S. Olive (1967), Echinosteliopsidaceae. 1, widespread. See Reinhardt & Olive (*Mycol.* **58**: 967, 1967), Olive (*The mycetozoans*: 110, 1975).

Echinostelium de Bary (1873), Echinosteliaceae. 15, widespread. *E. lunatum*, the smallest known myxomycete. See Olive & Stoianovitch (*Mycol.* **63**: 1051, 1971), Whitney (*Mycol.* **72**: 950, 1980; key), Lado & Pando (*Flora Mycologica Iberica* **2**, 1997; Spain, Portugal), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key to corticolous spp.), Adamonytė (*Acta Mycologica* Warszawa **41**: 169, 2006; Lithuania).

Elaeomyxa Hagelst. (1942), Elaeomyxaceae. 2, widespread (north temperate). See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Elaeomyxaceae Hagelst. ex M.L. Farr & H.W. Keller (1982), Physarida (inc. sed.). 1 gen., 2 spp.

Ellobiocystis Coutière (1911) nom. dub., Protozoa. See Whisler *in* Margulis *et al.* (Eds) (*Handbook of Protoctista*: 715, 1990; systematic position).

Ellobiopsis Caullery (1910), Protozoa. 1 (parasite of marine copepods). See Whisler *in* Margulis *et al.* (Eds) (*Handbook of Protoctista*: 715, 1990; placed in the class *Ellobiopsida*).

Embolus Haller (1768) nom. dub., Mycetozoa.

Endemosarca L.S. Olive & Erdos (1971), Endemosarcaceae. 3, widespread. See Erdos (*Mycol.* **64**: 423, 1972; nuclear cycle), Olive (*The mycetozoans*: 212, 1975), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Endemosarcaceae L.S. Olive & Erdos (1971), ? Plasmodiophorida (inc. sed.). 1 gen., 3 spp.

Endodromia Berk. (1841) nom. dub. ? = Echinostelium fide Höhnel (*Sitzungsber. Kaiserl. Akad. Wiss.* Math.-Naturwiss. Cl. Abt. 1 **123**: 97, 1914).

Endostelium L.S. Olive, W.E. Benn. & Deasey (1984), Protosteliaceae. 1, Papua New Guinea. See Olive *et al.* (*Mycol.* **76**: 884, 1984).

Enerthenema Bowman (1830), Stemonitidaceae. 3, widespread (north temperate). See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Enerthenemataceae Rostaf. ex Cooke (1877) = Stemonitidaceae.

Enigma G. Arnaud (1949) nom. inval., ? Protozoa.

Enteridiaceae M.L. Farr (1982) = Tubiferaceae.

Enteridium Ehrenb. (1819) nom. rej. = Reticularia Bull. fide Lado *et al.* (*Taxon* **47**: 109, 1998; nomencl.).

Enterobryus Leidy (1850), Eccrinaceae. 24 (in *Coleoptera, Diplopoda* and *Decapoda*), widespread. See Lichtwardt (*Mycol.* **46**: 564, 1954), Lichtwardt (*Mycol* **49**: 463, 1957), Lichtwardt (*Mycol.* **49**: 734, 1957), Lichtwardt (*Mycol.* **50**: 550, 1958), Lichtwardt (*Mycol.* **52**: 248, 1960), Lichtwardt (*Mycol.* **52**: 410, 1960), Lichtwardt (*Mycol.* **52**: 743, 1960), Tuzet & Manier (*Protistologia* **3**: 413, 1967; ultrastr.), Manier *et al.* (*Biol. Gabon.* **3-4**: 305, 1972), Manier *et al.* (*Bull. Inst. Fund. Afrique Noire* **36**: 614, 1974), Wright (*Proc. Helminthol. Soc. Wash.* **46**: 213, 1979; ultrastr.), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), Gorter (*Bothalia* **23**: 85, 1990), Cafaro (*Mol. Phylogen. Evol.* **35**: 21, 2005; phylogeny), White *et al.* (*Mycol.* **98**: 333, 2006).

Enteromyces Lichtw. (1961), Eccrinaceae. 1 (in *Decapoda*), widespread. See McCloskey & Caldwell (*J. Elisha Mitchell scient. Soc.* **81**: 114, 1965), Hibbets (*Syesis* **11**: 213, 1978), Cafaro (*Mol. Phylogen. Evol.* **35**: 21, 2005; phylogeny).

Enteromyxa Cienk. (1884), Protozoa. Amoeboflagellate protist formerly included in the monads or proteomyxids.

Enteropogon Hibbits (1979), Eccrinaceae. 2 (in *Decapoda*), USA. See Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986), Chien & Hsieh (*Trichomycetes and Other Fungal Groups, Robert W. Lichwardt Commemoration Volume*: 55, 2001; Taiwan), Cafaro (*Mol. Phylogen. Evol.* **35**: 21, 2005; phylogeny).

Erionema Penz. (1898) = Fuligo fide Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004).

Famintzinia Hazsl. (1877) nom. rej. = Ceratiomyxa fide Martin & Alexopoulos (*The myxomycetes*, 1969).

Fictoderma Preuss (1852), ? Protozoa.

Fonticula Worley, Raper & M. Hohl (1979), Fonticulaceae. 1, USA. See Worley *et al.* (*Mycol.* **71**: 746, 1979), Blanton *in* Margulis *et al.* (Eds) (*Handbook of Protoctista*: 75, 1990), Cavalier-Smith *in* Coombs *et al.* (Eds) (*Evolutionary Relationships Among Protozoa*: 375, 1998; placed in *Choanozoa*), Dykstra & Keller *in* Lee, Leedale & Bradbury (Eds) (*An Illustrated Guide to the Protozoa, Organism Traditionally Referred to as Protozoa, or Newly Discovered Groups* **2**: 952, 2000).

Fonticulaceae Worley, Raper & M. Hohl (1979), Acrasida (inc. sed.). 1 gen., 1 spp.

Frankiella Maire & A. Tison (1909) ? = Plasmodiophora fide Hawker & Fraymouth (*J. gen. Microbiol.* **5**: 369, 1951).

Fuliginaceae Chevall. (1826) = Physaraceae.

Fuligo Haller (1768), Physaraceae. 7, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser* **11**, 2003; New Zealand).

Galeperdon Weber ex F.H. Wigg. (1780) ≡ Lycogala.

Galoperdon, see *Galeperdon*.

Guttulina Cienk. (1874) [non *Guttulina* Orb. 1839, *Invertebrata*] = Pocheina fide Ing (*in litt.*).

Guttulinaceae Zopf ex Berl. (1888), Acrasida (inc. sed.). 2 gen. (+ 1 syn.), 5 spp.

Guttulinopsidaceae L.S. Olive (1970) = Guttulinaceae.

Guttulinopsis L.S. Olive (1901), Guttulinaceae. 2, N. America. See Raper *et al* (*Mycol.* **69**: 1016, 1977), Dykstra & Keller *in* Lee, Leedale & Bradbury (Eds) (*An Illustrated Guide to the Protozoa, Organism Traditionally Referred to as Protozoa, or Newly Discovered Groups* **2**: 952, 2000).

Gymnococcus Zopf (1884), Protozoa. 2 (Algal parasite). Amoeboflagellate protist formerly included in the monads or proteomyxids.

Gymnomycota. See *Mycetozoa*.

Gymnomyxa. See *Mycetozoa*.

Halterophora Endl. (1836) nom. dub., ? Myxogastria.

Heimerlia Höhn. (1903) nom. dub., ? Echinosteliaceae. See Martin *et al.* (*The genera of Myxomycetes*, 1983).

Heimerliaceae G. Arnaud (1949) = Echinosteliaceae.

Heliomycopsis Arnaud (1949) nom. inval., ? Dictyostelida.

Hemiarcyria Rostaf. (1875) ≡ Hemitrichia.

Hemitrichia Rostaf. (1873), Trichiaceae. 26, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Kuhnt (*Z. Mykol.* **71**: 165, 2005), Lado *et al.* (*Taxon* **54**: 543, 2005; nomencl.), Liu *et al.* (*Collection and Research* **19**: 27, 2006; Taiwan).

Heterodictyon Rostaf. (1873) = Cribraria Pers. fide Martin & Alexopoulos (*Myxomycetes*: 92, 1969).

Heterolobosea, Protozoa. 1 ord., 4 fam., 6 gen., 14 spp. [*Acrasiomycetes* (orth. bot.)]. An order of *Percolozoa* (q.v.) comprising the 'fungal' ord.:

Acrasida (syn. *Acrasiales*)

For *Lit.* see fam.

Heterotrichia Massee (1892) = Arcyria fide Martin & Alexopoulos (*Myxomycetes*: 121, 1969).

Hyalostilbum Oudem. (1885) = Dictyostelium fide Saccardo (*Syll. fung.* **6**: 1, 1888).

Hymenobolina Zukal (1893) = Licea fide Martin & Alexopoulos (*Myxomycetes*: 39, 1969).

Hymenobolus Zukal (1893) ≡ Hymenobolina.

Hyporhamma Corda (1854) nom. rej. = Hemitrichia fide Lado *et al.* (*Taxon* **54**: 829, 2005; nomencl.).

Hystricapsa Preuss (1851) nom. dub., ? Myxogastria. See Saccardo (*Syll. fung.* **18**, 1906).

Ichthyophonus Plehn & Mulsow (1911), Protozoa. 2 or 3 (in fish). See Sprague (*Syst. zool.* **14**: 110, 1965), Neish & Hughes (*Fungal diseases of fishes* **6**, 1980), Rand & Whitney (*Mycol. Soc. Amer. Newsl.*: 43 [abstract], 1987; ultrastr.), Grabda (*Marine fish parasitology. An outline*: 43, 1991), Spanggaard *et al.* (*J. Fish Dis.* **18**: 567, 1995; morphology), Ragan *et al.* (*Proc. natn Acad. Sci. U.S.A.* **93**: 11907, 1996; phylogeny), Baker *et al.* (*Microbiology* **145**: 1777, 1999; phylogeny), McVicar *in* Woo & Bruno (Eds) (*Fish Diseases & Disorders* **3**: 261, 1999; biology, treatment).

Ichthyosporea, Protozoa. Formal name for the organisms included in the DRIPs clade (q.v.) introduced at class level. See Cavalier-Smith (In: Coombs *et al.*, *Evolutionary Relationships of the Protozoa*: 375, 1998).

Iocraterium E. Jahn (1904) = Craterium fide Martin & Alexopoulos (*Myxomycetes*: 269, 1969).

Jundzillia Racib. ex L.F. Čelak. (1893) = Amaurochaete fide Martin & Alexopoulos (*Myxomycetes*: 174, 1969).

Kelleromyxa Eliasson (1991), ? Physarida. 1, Europe; N. America. See Eliasson (*MR* **95**: 1205, 1991).

Kleistobolus C. Lippert (1894) = Licea fide Martin & Alexopoulos (*Myxomycetes*: 39, 1969).

Labyrinthorhiza Chadef. (1956) nom. dub., Protozoa. See Olive (*The mycetozoans*: 215, 1975).

Lachnobolus (Fr.) Fr. (1849) = Arcyodes fide Pando (*in litt.*).

Lachnobolus Fr. (1825) nom. rej. = Amaurochaete fide Pando (*in litt.*).

Lactella Maessen (1955) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Lajassiella Tuzet & Manier ex Manier (1968), Parataeniellaceae. 1 (in *Coleoptera*), France. See Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986).

Lamproderma Rostaf. (1873), Stemonitidaceae. *c.* 45, widespread. See Kowalski (*Mycol.* **62**: 623, 1970; key), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Singer *et al.* (*Öst. Z. Pilzk.* **10**: 25, 2001; nivicolous spp. Austria), Clark & Haskins (*Nova Hedwigia* **75**: 237, 2002; reproductive systems), Poulain *et al.* (*BSMF* **119**: 267, 2003; type studies).

Lamprodermataceae T. Macbr. (1899) = Stemonitidaceae.

Lamprodermopsis Meyl. (1910) = Dianema fide Martin & Alexopoulos (*Myxomycetes*: 104, 1969), Kowalski (*Mycol.* **67**: 456, 1975).

Leangium Link (1809) = Diderma fide Martin & Alexopoulos (*Myxomycetes*: 347, 1969).

Leidyomyces Lichtw., M.M. White, Cafaro & Misra (1999), Eccrinaceae. 1, USA. See Lichtwardt *et al.* (*Mycol.* **91**: 695, 1999).

Leocarpus Link (1809), Physaraceae. 1, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Lepidoderma de Bary (1873), Didymiaceae. 10 (nivicolous), widespread. See Kowalski (*Mycol.* **63**: 492, 1971; key), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Lepidodermopsis Höhn. (1909) = Didymium fide Martin & Alexopoulos (*Myxomycetes*: 376, 1969) Used by, Lakhanpal (*Norw. Jl Bot.* **25**: 195, 1978).

Lepidodermopsis Wilczek & Meyl. (1934) nom. illegit. = Lepidoderma fide Martin & Alexopoulos 63: 492, 1971 (*Myxomycetes*: 403, 1969), Kowalski (*Mycol.* **63**: 492, 1971).

Leptoderma G. Lister (1913), Stemonitidaceae. 2, Europe; N. America. See Martin *et al.* (*The genera of Myxomycetes*, 1983), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Licaethalium Rostaf. (1873) = Reticularia Bull. fide Martin & Alexopoulos (*Myxomycetes*: 66, 1969).

Licea Schrad. (1797), Liceaceae. *c.* 66, widespread. See Keller & Brooks (*Mycol.* **69**: 669, 1977; key), Giler (*Nordic Jl Bot.* **16**: 515, 1996; ultrastr.), Flatau (*Stapfia* **73**: 63, 2000), Mitchell & McHugh (*Karstenia* **40**: 103, 2000; UK), Li *et al.* (*Mycotaxon* **90**: 437, 2004; China).

Liceaceae Chevall. (1826), Liceida (inc. sed.). 1 gen. (+ 9 syn.), 66 spp.

Liceales E. Jahn (1928). See *Liceida*.

Liceida [*Liceales* (orth. bot.)]. Myxogastria. 5 fam., 9 gen., 140 spp. Spore mass dingy or colourless, capillitium absent. Fams:

(1) **Cribrariaceae**
(2) **Dictydiaethaliaceae**
(3) **Liceaceae**
(4) **Listerellaceae**
(5) **Tubiferaceae**

Lit.: Martin (*Brittonia* **13**: 109, 1961; fam. key); Lado & Pando (*Flora Mycologica Iberica* **2**, 1997; keys Spain, Portugal).

Liceopsis Torrend (1908) = Reticularia Bull. fide Martin & Alexopoulos (*Myxomycetes*: 66, 1969).

Lignidium, see *Lignydium*.

Ligniera Maire & A. Tison (1911), Plasmodiophoraceae. 7, widespread (north temperate). See Karling (*The Plasmodiophorales* edn 2, 1968; key), Braselton *in* McLaughlin *et al.* (Eds) (*The Mycota* A Comprehensive Treatise on Fungi as Experimental Systems for Basic and Applied Research **7A**: 81, 2001).

Lignydium Link (1809) = Fuligo fide Martin (*Univ. Iowa Stud. nat. Hist.* **20**, 1966).

Lignyota Fr. (1849) nom. dub., Didymiaceae. See Martin & Alexopoulos (*Myxomycetes*: 416, 1969).

Lindbladia Fr. (1849), Cribrariaceae. 1, widespread (north temperate; Argentina; Sri Lanka). See Rex (*Bot. Gazette.* **17**: 201, 1982), Hatano (*Mycol.* **88**: 316, 1996).

Listerella E. Jahn (1906), Listerellaceae. 1 (on *Cladonia*), widespread. See Kowalski (*Mycol.* **59**: 1078, 1968), Eliasson & Gilert (*Nordic Jl Bot.* **2**: 249, 1982; SEM).

Listerellaceae E. Jahn ex H. Neubert, Nowotny & K. Baumann (1993) = Liceaceae.

Lycogala Pers. (1794), Tubiferaceae. *c.* 6, widespread. See Martin (*Mycol.* **59**: 158, 1967; key), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Lycogalaceae Corda (1828) nom. inval. = Tubiferaceae.

Lycoperdon Tourn. ex L. (1753) ≡ Lycogala.

Macbrideola H.C. Gilbert (1934), Stemonitidaceae. 13,

widespread. See Alexopoulos (*Mycol.* **59**: 103, 1967; key), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Margarita Lister (1894) [non *Margarita* Gaudin 1829, *Compositae*] ≡ Calomyxa.

Margaritaceae Lister (1894) = Dianemataceae.

Matruchotia Skup. (1924) nom. illegit. = Amaurochaete fide Martin & Alexopoulos (*Myxomycetes*: 171, 1969).

Matruchotiella Skup. ex G. Lister (1925) nom. illegit. = Amaurochaete fide Martin & Alexopoulos (*Myxomycetes*: 171, 1969).

Maullinia I. Maier, E.R. Parodi, R. Westermeier & D.G. Müll. (2000), Plasmodiophoraceae. 1, France. See Maier *et al.* (*Protist* **151**: 235, 2000).

Membranosorus Ostenf. & H.E. Petersen (1930), Plasmodiophoraceae. 1, USA. See Ostenfeld & Petersen (*Zeitschrift für Botanik* **23**: 13, 1930), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Mesenterica Tode (1790) nom. dub., Protozoa. Used for plasmodia fide Fries (1829).

Metatrichia Ing (1964), Trichiaceae. 7, Europe; tropical. See Lakhanpal & Mukerji (*Proc. Indian natn Sci. Acad.* Part B. Biol. Sci. **42**: 125, 1977), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Microcarpon Schrad. ex J.F. Gmel. (1792) nom. dub., ? Myxogastria.

Microglomus L.S. Olive & Stoian. (1977), Protosteliaceae. 1, Hawaii. See Olive *et al.* (*TBMS* **81**: 449, 1983), Spiegel (*Handbook of Protoctista*: 484, 1990).

Minakatella G. Lister (1921), Trichiaceae. 1, Japan; N. America. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004).

Minakatellaceae Nann.-Bremek. ex H. Neubert, Nowotny & K. Baumann (1993) = Trichiaceae.

Minutularia P.A. Dang. (1891) [not traced] nom. dub., Protozoa. Based on a protozoan fide Dangeard [not traced].

Molliardia Maire & A. Tison (1911) = Tetramyxa fide Kirk (*in litt.*).

Mucilago Battarra (1755), Didymiaceae. 1, widespread. See Lado (*Cuad. Trab. Flora Micol. Ibér.* **7**: 305 pp., 1993; Spain, Portugal), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Mycetozoa, Protozoa. (Myxomycota, Myxostelida, Myxobionta, Gymnomycota, Gymnomyxa); plasmodial slime moulds; acellular slime moulds. 3 classes. Free-living, unicellular or plasmodial, non-flagellate in single- or multi-celled phagotrophic stages; mitochondrial cristae tubular; with uni- or multicellular sporocarps with single to many spores; spore walls cellulosic or chitinous; spores germinating to produce 1- or 2-flagellate cells.

The circumscription and ranking of the higher taxa of plasmodial slime moulds varies according to different authors. No formal name at all was used in Margulis *et al.* (1990), while Corliss (1994) used *Mycetozoa* inclusive of the dictyostelids (see *Dictyosteliomycota*). Three classes are recognized in this edition of the *Dictionary*:

(1) **Dictyostelea**

(2) **Myxogastrea**

(3) **Protostelea**

Corliss (1994) suggested that the taxon could be expanded to include the *Promycetozoida*, certain enigmatic marine protists with reticulopodia such as *Corallomyxa*, *Megamoebomyxa* and *Thalassomyxa* (see Grell, *Protistologica* **21**: 215, 1985; *Arch. Protistenkde* **140**: 303, 1991); these taxa have not been studied by mycologists and are not treated elsewhere in this *Dictionary*.

Lit.: Corliss (*Acta Protozool.* **33**: 1, 1994), Keller (*in* Parker (Ed.), **1**: 165, 1982), Margulis *et al.* (1990), Teixeira (*Rickia* suppl. **3**, 1970; gen. except Myxomycetes), Olive (*The mycetozoans*, 1975; *in* Parker, *Synopsis and classification of living organisms*: 521, 1982), Raper (*The dictyostelids*, 1994). See also *Protozoa*.

Myrosporium Corda (1831) nom. dub., ? Trichiida.

Myxogastres. See *Myxogastria*.

Myxogastria, Mycetozoa. 5 ord., 14 fam., 62 gen., 888 spp. [*Myxomycetes* (orth. bot.)]. True slime moulds. Trophic phase a free-living, multinucleate, coenocytic, saprobic plasmodium with a shuttle-movement of the protoplasm; plasmodium sometimes becoming a resting body or sclerodium under poor conditions, and the swarm spores of myxamoebae microcysts; sporangia sessile or stalked, often bright coloured; spores developed after meiosis, produced in masses with a persistent or evanescent peridium; swarm cells usually with two-anterior flagellae and no cell wall, forming myxamoebae directly or after loss of the flagella, sometimes undergoing division before capulation; reproduction usual, the resultant zygote becoming the plasmodium. Esp. on old wood or other plant material undergoing decomposition (see Madelin, *TBMS* **83**: 1, 1984; ecological significance).

The chief diagnostic characters are the type of sporocarp, the structure of the peridium and capillitium of the sporangium, calcium carbonate ('lime'), if present, and the size, colour and ornamentation of the spores. Ords:

(1) **Echinosteliales**

(2) **Liceales**

(3) **Physarales**

(4) **Stemonitales**

(5) **Trichiales**

Frederick (1990) and Newbert *et al.* (1993) include the *Ceratiomyxaceae* in this class, but see under *Protostelea*.

Lit.: *General*: Lister & Lister (*Mycetozoa*, edn 3, 1925), Jahn (*Nat. Parataeniella R.A. Poiss. (1929), Parataeniellaceae. 6 (in *Isopoda*), widespread. See Lichtwardt & Chen (*Mycol.* **56**: 163, 1964), Scheer (*Arch. Protistenk.* **118**: 202, 1976), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key), Lichtwardt & Williams (*CJB* **68**: 1057, 1990), Chien & Hsieh (*Trichomycetes and Other Fungal Groups, Robert W. Lichwardt Commemoration Volume*: 55, 2001; Taiwan).

Paratrichella Manier (1947) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Passalomyces Lichtw., M.M. White, Cafaro & Misra (1999), Eccrinaceae. 1, Dominica. See Lichtwardt *et al.* (*Mycol.* **91**: 695, 1999).

Pecila Lepell. (1822) nom. dub., Myxogastria.

Peltomyces L. Léger (1909), ? Plasmodiophoraceae. 3, Europe.

Percolozoa, Protozoa. 1 class., 1 ord., 4 fam., 6 gen., 14 spp. An order of *Protozoa* (q.v.) comprising the acrasid cellular slime moulds; acrasids. Trophic phase amoeboid, pseudopodia lobose; aggregating without streaming; nuclei with a compact centrally placed nucleolus; sporocarp sessile, independent and dividing when vegetative, some with simple supportive stalks; multispored, in chains or deliminted sori; flagellate cells usually absent; sexual reproduction unknown. On dung and isolated from a wide range of decaying plant materials and macromycetes, and also soil.

Raper (1973) included the dictyostelids and protostelids (see *Mycetozoa*) in the class *Acrasiomycetes*,

later excluding the protostelids as a separate class (Raper, 1984). Molecular data show these three groups to be allied only at the phylum level.

Lit: Olive (1975), Raper (*in* Ainsworth *et al.* (Eds), *The fungi* **4B**: 9, 1973; keys gen.; *The dictyostelids*, 1984), and under Families.

Perichaena Fr. (1817), Trichiaceae. 17, widespread. See Cavalcanti (*Rickia* **6**: 99, 1974; key), Keller & Eliasson (*MR* **96**: 1095, 1992; key), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Moreno *et al.* (*Rivista di Micologia* **43**: 5, 2000; sp. nov.), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Perichaenaceae Rostaf. ex Cooke (1877) = Trichiaceae.

Perkinsus Levine (1978), Protozoa. 1 (parasitic on oysters (*Crassostrea virginica*)), Gulf of Mexico. *P. marinus*, formerly *Dermocystidium marinum*, recognized in its own class (Levine, *J. Parasitol.* **64**: 549, 1978) in the *Apicomplexa* but see Siddall & al. (*Parasitology* **115**: 165, 1997) where it considered to be closer to the dinoflagellates. See Levine (*J. Shellfish Res.* **15**: 67, 1996; taxonomy, phylogeny), Siddall *et al.* (*Parasitology* **115**: 165, 1997) where it considered to be closer to the dinoflagellates.

Phagomyxa Karling (1944), Plasmodiophorida. 3 (algal parasite), USA. See Cavalier-Smith & Chao (*Arch. Protistenk.* **147**: 227, 1997; order *Phagomyxida* proposed), Schnepf *et al.* (*Helgoland Mar. Res.* **54**: 237, 2000; new spp.), Bulman *et al.* (*Protist* **152**: 43, 2001; systematic position).

Phlebomorpha Pers. (1822) nom. dub., Mycetozoa. Based on myxomycete plasmodia fide Martin (1966).

Physaraceae Chevall. (1826), Physarida (inc. sed.). 9 gen. (+ 18 syn.), 195 spp.

Physarales T. Macbr. (1922). See *Physarida*.

Physarella Peck (1882), Physaraceae. 1, widespread. See Shi & Li (*Mycosystema* **23**: 381, 2004; life cycle).

Physarida [*Physarales* (orth. bot.)]. Myxogastria. 3 fam., 18 gen., 364 spp. Spore mass dark-coloured, peridium or capillitium calcareous. Fams:

(1) **Didymiaceae**
(2) **Elaeomyxaceae**
(3) **Physaraceae**

For *Lit.* see under fam.

Physarina Höhn. (1909), Didymiaceae. 3, pantropical. See Höhnel (*Sber. Akad. Wiss. Wien* Math.-naturw. Kl., Abt. 1 **118**: 431, 1909; nomencl.).

Physarum Pers. (1794), Physaraceae. *c*. 135, widespread. See Anon. *in* Hutterman (Ed.) (*Physarum polycephalum*, 1973; use in cell-biology), Anon. *in* Aldrich & Daniel (Eds) (*Cell biology of Physarum and Didymium*, 1982), Chen *et al.* (*Mycosystema* **18**: 77, 1999; China), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Clark & Stephenson (*Mycotaxon* **85**: 85, 2003), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Phytoceratiomyxa Sawada (1929) nom. dub., ? Myxogastria.

Phytomyxa J. Schröt. (1886) nom. dub., ? Plasmodiophoraceae.

Phytomyxaceae J. Schröt. (1886) = Plasmodiophoraceae.

Phytomyxea, Cercozoa. 1 ord., 2 fam., 15 gen., 50 spp. See *Cercozoa*.

Phytosarcodina. See *Myxogastria*.

Jl Bot.* **40**: 235, 2002; New Zealand), Kawakami & Hagiwara (*Mycoscience* **43**: 453, 2002; mating groups), Cavender *et al.* (*Systematics and Geography of Plants* **74**: 243, 2004; Caribbean).

Promycetozoida. See *Mycetozoa*.

Protochytrium Borzí (1884) nom. dub., ? Protozoa.

Protoderma Rostaf. (1874) [non *Protoderma* Kütz. 1854, *Algae*] ≡ Licea.

Protodermataceae Rostaf. ex Cooke (1877) =

Liceaceae.

Protodermium Rostaf. ex Berl. (1888) ≡ Licea.

Protodermodium Kuntze (1891) ≡ Licea.

Protomonas Cienk. (1865), Protozoa. 1. Amoeboflagellate protist formerly included in the monads or proteomyxids.

Protomyxa Haeckel (1870), Protozoa. Amoeboflagellate protist formerly included in the monads or proteomyxids.

Protophysaraceae A. Castillo, Illana & G. Moreno (1998) = Physaraceae.

Protophysarum M. Blackw. & Alexop. (1975), Physaraceae. 1, northern subtropical. See Blackwell & Alexopoulos (*Mycol.* **67**: 33, 1975), Castillo *et al.* (*MR* **102**: 838, 1998), Lizárraga *et al.* (*Mycotaxon* **88**: 409, 2003; Mexico), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key gen.).

Protosporangium L.S. Olive & Stoian. (1972), Cavosteliaceae. 4, USA. See Raper (*The dictyostelids*, 1984), Bennett (*Mycol.* **78**: 857, 1986).

Protostelia, Amoebozoa. 1 ord., 4 fam., 16 gen., 38 spp. [*Protosteliomycetes* (orth. bot.)]. Protostelid slime moulds, protostelids. Trophic phase of simple amoeboid cells with filose pseudopodia, plasmodia not with a shuttle movement of the protoplasm; ± flagellate cells (present in 'amoeboflagellates'); sporulation not proceeding by the long grex action of myxamoebae; sporocarps stalked, stalks simple and often very delicate; spores formed singly or several together in some spp. germinating to produce 8 haploid flagellate spores). Isolated mainly by moist-chamber culture of aerial dead or decaying plant parts, especially bark; also on dung. Ord.:

Protostelida

The *Ceratiomyxaceae* were recognized as the basis of a separate class (*Ceratiomyxomycetes*) in the ninth edition of this *Dictionary*, but Spiegel (1990) did not distinguish any rank above family.

Spiegel (1990) noted that the protostelid genera could be placed in five more natural groups, based on the number of kinetoids per cell, the presence/absence and nature of the nuclear attachments, and the type of cell coats in addition to colonial morphology and other macroscopic features; these were not given formal names.

Lit.: Corliss (1994), Olive (1975, 1982), Raper (1973), Spiegel (*in* Margulis *et al.* (Eds), *Handbook of the Protoctista*: 484, 1990).

Protosteliaceae L.S. Olive (1962), Protostelida (inc. sed.). 9 gen. (+ 1 syn.), 24 spp.

Lit.: Spiegel (*Handbook of Protoctista*: 484, 1990).

Protosteliales L.S. Olive & Stoian. ex P.M. Kirk, P.F. Cannon & J.C. David (2001). See *Protostelida*.

Protostelida [*Protosteliales* (orth. bot.)]. Protostelia. 4 fam., 16 gen., 38 spp. Fams:

(1) **Cavosteliaceae**
(2) **Ceratiomyxaceae**
(3) **Echinosteliopsidaceae**
(4) **Protosteliaceae**

Lit.: see *Protostelia*.

Protostelidaceae, see *Protosteliaceae*.

Protosteliomycetes. See *Protostelia*.

Protosteliopsis L.S. Olive & Stoian. (1966), Protosteliaceae. 1, widespread (subtropical). See Olive & Stoianovitch (*Mycol.* **58**: 452, 1966), Spiegel (*Handbook of Protoctista*: 484, 1990).

Protostelium L.S. Olive & Stoian. (1960), Protosteliaceae. 8, widespread. See Olive & Stoianovitch (*Bull. Torrey bot. Club* **87**: 12, 1960), Spiegel *et al.* (*Mycol.* **98**: 144, 2006; ballistosporous n.sp.).

Prototrichia Rostaf. (1876), Trichiaceae. 1, widespread (temperate). See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Prototrichiaceae T. Macbr. (1899) = Trichiaceae.

PROTOZOA. 6 class., 11 ord., 30 fam., 122 gen. (+ 118 syn.), 1161 spp. Kingdom of *Eukaryota*. Predominantly unicellular, plasmodial, or colonial phagotropic, wall-less in the trophic state; ciliary hairs never rigid or tubular; chloroplasts, where present lacking starch and phycobilisomes, with stalked thylakoid and 3 membranes; multicellular species with minimal cell differentiation and lacking collagenous connective tissue sandwiched between dissimilar epithelia.

The *Protozoa* have been included with the *Chromista* in a broader kingdom *Protoctista* (syn. *Protista*) by some (e.g. Margulis *et al.*, 1990) but the classification has been rejected by recent authors on both molecular and non-molecular grounds (Cavalier-Smith, 1993; Corliss, 1994).

Cavalier-Smith (1993) acceps 18 phyla in the *Protozoa* and Corliss (1994) 14; however, only one has been traditionally studied by mycologists: *Mycetozoa* (incl. 3 classes *Protostelea*, *Myxogastrea* and *Dictyostelea*). Other protozoan phyla are not treated further in this account or elsewhere in this edition of the *Dictionary*. Olive (1975) arranged the slime moulds into four classes and three subclasses; that system was adapted (using fungal terminations) in the seventh edition of the *Dictionary* which accepted *Acrasiomycetes*, *Ceratiomyxomycetes*, *Dictyosteliomycetes*, *Myxomycetes* and *Protosteliomycetes*. The eighth edition of the *Dictionary* recognized four phyla : *Acrasiomycota*; *Dictyosteliomycota*; *Myxomycota* (incl. *Ceratiomyxomycetes*, *Myxomycetes*, *Protosteliomycetes*); *Plasmodiophoromycota*. The ninth edition of the *Dictionary* recognized three phyla : *Acrasiomycota*; *Myxomycota* (incl. *Ceratiomyxomycetes*, *Dictyosteliomycetes*, *Myxomycetes*, *Protosteliomycetes*); *Plasmodiophoromycota*. More recent molecular and ultrastructural evidence has shown that the slime moulds and similar organisms are polyphyletic and appear to belong in five separate lineages:

(1) **Ramicristates** A group comprising the naked lobose amoebas, the filose and lobose testate ameobas, defined by the presence of branched mitochondrial cristae. Included are three slime mould classes: *Protostelea* (Protosteliomycetes), *Myxogastrea* (Myxomycetes) and *Dictylostelea* (Dictyosteliomycetes).

(2) **Heterolobosea** A group defined by flattened mitochondrial cristae and the mitochondria being associated with the endoplasmic reticulum. This group includes the schizopyrenid amoebae and the cellular slime moulds, now treated at the level of order, *Acrasida* (Acrasiales).

(3) **Copromyxida** *Copromyxa* was formerly included in the *Acrasiales* but the trophic phase lacks flagella and the mitochondrial cristae are tubular. For these reasons they are now regarded as distinct.

(4) **Fonticulida** *Fonticula*, also formerly included in the *Acrasiales*, has plate-like mitochondrial cristae, no flagella and the pseudopodia have subpseudopodia and are thus also distinct.

(5) **Plasmodiophorids** A group uniquely defined by the cruciate profile of the chromosomes and nucleolus at mitosis. One class included, *Plasmodiophorea* (Plasmodiophoromycetes).

The Heterolobosea are sometimes grouped with the Euglenozoa and some other smaller groups as the Excavates whilst the remaining fourare grouped as the Amoebozoa. There are many further protozoan organisms that have been studied or mentioned by mycologists and are listed in the *Dictionary*, some of which still await invesitgation using modern techniques. Larger groups include the Ellobiopsids, Nucleariids and Vampyrellids.

Lit.: Bonner (*The cellular slime molds*, 1959; edn 2, 1967), Cavalier-Smith (*Microbiol. Rev.* **57**: 953, 1993; *Biol. Siphoptychium Rostaf. (1876) = Tubifera fide Martin & Alexopoulos (*Myxomycetes*: 54, 1969).

Soliformovum Spiegel (1994) nom. inval. = Protostelium fide Hawksworth *et al.* (*Dictionary of the Fungi* edn 8, 1995).

Sorodiscus Lagerh. & Winge (1913), Plasmodiophoraceae. 5 (in *Chara*), widespread. See Karling (*The Plasmodiophorales* edn 2, 1968; key), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Sorolpidium Němec (1911) = Ligniera fide Karling (*The Plasmodiophorales* edn 2, 1968).

Sorophorae. See *Acrasiomycota*.

Sorosphaera J. Schröt. (1886), Plasmodiophoraceae. 3, Europe; N. America. See Dick (*Straminipilous Fungi*: 670 pp., 2001), Preece (*Mycologist* **16**: 27, 2002; *Sorosphaera veronicae* in UK), Kirchmair *et al.* (*Sydowia* **57**: 223, 2005; *Sorosphaera viticola*).

Sphaerocarpa Schumach. (1803) = Craterium fide Fries (*Syst. mycol.* **3**, 1829).

Sphaerocarpus Bull. (1791) [non *Sphaerocarpus* Adans. 1763, *Hepaticae*] = Physarum fide Martin (*Univ Iowa Stud. nat. Hist.* **20**, 1966).

Spongospora Brunch. (1887), Plasmodiophoraceae. 3 (obligate endoparasites of plants), widespread. *S. subterranea* (potato powdery scab), *S. nasturtii* (crook root of watercress). See Tomlinson (*TBMS* **41**: 491, 1958; *S. nasturtii*, crook root of watercress), Karling (*The Plasmodiophorales* edn 2, 1968), Dick (*Straminipilous Fungi*: 670 pp., 2001), Down *et al.* (*MR* **106**: 1060, 2002; phylogeny).

Sporigastrum Link [not traced] nom. dub., ? Mycetozoa.

Sporomyxa L. Léger (1908), ? Plasmodiophoraceae. 2, Europe; Africa. See Karling (*The Plasmodiophorales* edn 2: 101, 1968).

Spumaria Pers. (1792) = Mucilago fide Martin & Alexopoulos (*Myxomycetes*: 374, 1969).

Spumariaceae Rostaf. ex Cooke (1877) = Didymiaceae.

Squamuloderma Kowalski (1973) = Didymium fide Martin *et al.* (*The genera of Myxomycetes*, 1983).

Staphylocystis Coutière (1911) = Thalassomyces fide Kane (*N.Z. Jl Sci.* **7**: 289, 1964).

Stegasma Corda (1843) = Perichaena fide Martin & Alexopoulos (*Myxomycetes*: 109, 1969).

Stemonaria Nann.-Bremek., R. Sharma & Y. Yamam. (1984), Stemonitidaceae. 12, widespread. See Nannenga-Bremekamp *et al.* (*Proc. K. Ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **87**: 450, 1984), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Stemonitidales T. Macbr. (1922). See *Stemonitida*.

Stemonitida [*Stemonitales* (orth. bot.)]. Myxogastria. 1 fam., 15 gen., 201 spp. Spore mass dark-coloured, peridium and capillitium non-calcareous. Fam.: Stemonitidiaceae

For *Lit.* see under fam.

Stemonitidaceae Fr. (1829), Stemonitida (inc. sed.). 15 gen. (+ 16 syn.), 201 spp.

Stemonitis Gled. (1753), Stemonitidaceae. 16, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Mitchell (*Systematics and Geography of Plants* **74**: 261, 2004; key gen.).

Stemonitis Roth (1787) nom. illegit. = Stemonitis Gled. fide Farr & Alexopoulos (*Taxon* **30**: 357, 1981), Gams (*Taxon* **41**: 100, 1992).

Stemonitopsis (Nann.-Bremek.) Nann.-Bremek. (1975), Stemonitidaceae. 11, widespread. See Nannenga-Bremekamp (*Nederlandse Myxomyceten*: 203, 1974), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles).

Strongylium Ditmar (1809) = Reticularia Bull. fide Martin & Alexopoulos (*Myxomycetes*: 172, 1969).

Stylonites Fr. (1848) nom. dub., Physarida. See Martin & Alexopoulos (*Myxomycetes*: 420, 1969).

Symphytocarpus Ing & Nann.-Bremek. (1967), Stemonitidaceae. 9, widespread (north temperate). See Ing & Nannenga-Bremekamp (*Proc. K. Ned. Akad. Wet.* Ser. C, Biol. Med. Sci. **70**: 218, 1967), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Adamonyte (*Botanica Lithuanica* **9**: 55, 2003; Lithuania).

Taeniella L. Léger & Duboscq (1911), Eccrinaceae. 1 (in *Decapoda*), widespread. See Hibbets (*Syesis* **11**: 213, 1978), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986), Cafaro (*Mol. Phylogen. Evol.* **35**: 21, 2005; phylogeny).

Taeniellopsis R.A. Poiss. (1927), Eccrinaceae. 3 (in *Amphipoda*), Europe. See Manier (*Annls Sci. Nat.* Bot., sér. 12 **10**: 565, 1969), Lichtwardt (*The Trichomycetes. Fungal associates of arthropods*, 1986; key).

Tetramyxa K.I. Goebel (1884), Plasmodiophoraceae. 5, widespread (north temperate). See Karling (*The Plasmodiophorales* edn 2, 1968; key), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Thalassomyces Niezab. (1913), Protozoa. See Kane (*N.Z. Jl Sci.* **7**: 289, 1964), Karling (*Holocarpic Biflagellate Phycomycetes*: 204, 1981), Whisler *in* Margulis *et al.* (Eds) (*Handbook of Protoctista*: 715, 1990; placed in class *Ellobiopsida*).

Tilmadoche Fr. (1849) = Physarum fide Martin & Alexopoulos (*Myxomycetes*: 274, 1969).

Tipularia Chevall. (1822) [non *Tipularia* Nutt. 1818, *Orchidaceae*] ≡ Halterophora.

Trabrooksia H.W. Keller (1980), Didymiaceae. 1, USA; Ecuador. See Keller (*Mycol.* **72**: 396, 1980), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), McHugh (*Mycotaxon* **92**: 107, 2005; Ecuador).

Trichamphora Jungh. (1838) = Physarum fide Pando (*in litt.*).

Trichella Léger & Duboscq (1929) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Trichellopsis Maessen (1955) = Enterobryus fide Manier & Lichtwardt (*Annls Sci. Nat.* Bot., sér. 12 **9**: 519, 1968).

Trichia Haller (1768), Trichiaceae. *c.* 35, widespread. See Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Adamonyte (*Mycotaxon* **87**: 379, 2003; coprophilous sp.), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Trichiaceae Chevall. (1826), Trichiida (inc. sed.). 10 gen. (+ 8 syn.), 100 spp.

Trichiales T. Macbr. (1922). See *Trichiida*.

Trichidium Raf. (1815) ≡ Trichia.

Trichiida [*Trichiales* (orth. bot.)]. Myxogastria. 3 fam., 14 gen., 162 spp. Spore mass bright coloured, columella absent, peridium persistent. Fams:

(1) **Arcyriaceae**
(2) **Dianemataceae**
(3) **Trichiaceae**

Lit.: Blackwell & Busard (*Mycotaxon* **7**: 61, 1978; pigments in spp. separation).

Trichodermataceae Fr. (1825) = Hypocreaceae.

Trichulius Schmidel ex Corda (1842) ? = Trichia fide Mussat (*Syll. fung.* **15**: 425, 1901).

Tripotrichia Corda (1837) = Leocarpus fide Martin & Alexopoulos (*Myxomycetes*: 245, 1969).

Tubifera J.F. Gmel. (1792) nom. cons. prop., Tubiferaceae. 7, widespread. See Nelson *et al.* (*Mycol.* **74**: 541, 1982; key).

Tubiferaceae T. Macbr. (1899), Liceida (inc. sed.). 4 gen. (+ 14 syn.), 30 spp.

Tubulifera O.F. Müll. ex Jacq. (1778) = Tubifera fide Kirk (*in litt.*).

Tubulina Pers. (1794) = Tubifera fide Pando (*in litt.*).

Tubulinaceae Lister (1894) = Reticulariaceae.

Tychosporium Spiegel (1995), Protosteliaceae. 1, USA. See Spiegel *et al.* (*Mycol.* **87**: 265, 1995).

Vampyrella Cienk. (1865), Protozoa. 21 or. Filose amoeboid protist formerly treated as a proteomyxid or monad. See Patterson (*Amer. Nat.* **154**: S96, 1999, systematic position).

Vampyrellidium Zopf (1885), Protozoa. 1. Amoeboid protist formerly treated as a proteomyxid or monad. See Patterson (*Amer. Nat.* **154**: S96, 1999, systematic position].

Vampyrelloides Schepotieff (1911), Protozoa. Filose amoeboid protist formerly treated as a proteomyxid or monad. See Patterson (*Amer. Nat.* **154**: S96, 1999, systematic position).

Verrucosia Teng (1932) = Lycogala fide Martin & Alexopoulos (*Myxomycetes*: 62, 1969).

Wilczekia Meyl. (1925) = Diderma fide Kowalski (*Mycol.* **67**: 448, 1975).

Willkommlangea Kuntze (1891), Physaraceae. 1, widespread (north temperate). See McHugh & Reed (*MR* **94**: 710, 1990; plasmocarp formation), Ing (*The Myxomycetes of Britain and Ireland, An Identification Handbook*, 1999; British Isles), Stephenson (*Fungal Diversity Res. Ser.* **11**, 2003; New Zealand).

Wingina Kuntze (1891) ≡ Orthotricha.

Woronina Cornu (1872), Plasmodiophoraceae. 4 (in *Vaucheria*, *Saprolegniales*), widespread (north temperate). See Karling (*The Plasmodiophorales* edn 2, 1968; key), Dick (*Straminipilous Fungi*: 670 pp., 2001).

Woroninaceae H.E. Petersen (1909) = Plasmodiophoraceae.
Xyloidium Czern. (1845) nom. dub., ? Myxogastria. See Streinz (*Nom. fung.*, 1862).
Xyloon, see *Xyloidium*.
